The only legitimate meaning which can be attached to the statement that 'the strongest motive always prevails and must prevail' is the deterministic meaning that the *objectively strongest* motive must prevail; the will must necessarily follow the motive containing, among other

motives present, the *more preferable good* considered by the intellect as such.

J. Stuart Mill interprets the 'strongest' motive as the one which is *most pleasurable*, because that is the more preferable good. He contends that the will is constrained to accept this motive and yield to it. We claim that personal *experience* disproves this contention. It is not true that we always choose the course of action which is most pleasurable. Every decent person not infrequently resists temptations, recognized to be most pleasurable, for the sake of an ideal or from a sense of duty, conscious of the fact that yielding to the temptation would be easy and offering resistance to it is most difficult. Soldiers and martyrs prefer death to the violation of their duty, even when excruciating agony accompanies the performance of their duty. To uphold an ideal and to fulfill one's duty under such conditions is indeed the stronger motive, but only because *the will makes it so*; it is not more pleasurable in itself.

Most determinists interpret the 'strongest' motive as the one which, among others present before the mind, represents the *greatest good or value*, without specifying whether or not it be the most pleasurable; such an object or experience, presented as a motive, is the more preferable and as such forces the will into acceptance. The point at issue is this: Is the will compelled to choose the motive which the intellect proposes to it as possessing the greatest value or attractiveness among conflicting motives, so that this particular motive has *objective preference*, considered independently of any action of the will? Or, on the contrary,

can the will (the Ego) confer subjective preference on any of the motives presented, *irrespective of their objective merits*, thereby making an objectively weaker motive the strongest? In the former alternative the objectively 'strongest' motive prevails under all conditions, and the will is determined in its volition; in the second alternative the will itself determines which motive shall prevail, and it cannot be said to be determined in its volition by the (objectively) 'strongest' motive.

Of course, the will in choosing always *prefers* one motive to another and thereby shows that this one pleases it more than the others; but *does this preference of the will correspond to the preceding judgment of the intellect as to preferableness*? If man can act in opposition to this judgment of the intellect and can prefer the weaker motive, then he *determines himself* and is independent of the strength or weakness of the motives proposed by the intellect. Herein lies the crux of the problem of free will.

Ordinarily, the will accepts the side proposed as the better or best; but *not always*. If it were really true that the will always and necessarily prefers that which the intellect perceives to be better or best, how then can it happen that we frequently *deplore* after our decision that we have 'acted against our better judgment,' that we have 'acted foolishly,' having carelessly or obstinately disregarded what we knew to be the better or best course of action? In many instances we act contrary to our own interests, *simply because we so desire*, knowing full well that we are harming ourselves by acting according to the whim of our

will rather than according to the objective merits of the motives as recognized by the intellect.

It is not the objectively strongest motive which prevails against the will and determines it to act; it is the act of the will which determines which motive shall be strongest and shall actually prevail.

INFLUENCE OF CHARACTER

Some determinists, among them Schopenhauer, Wundt, Sidgwick, and others, impugn the freedom of the will on the grounds that *every act of man* is determined by his *character* and by the motives which influence the will at any particular moment. Oddly enough, some of these philosophers and psychologists are reluctant to discard the concept of man's responsibility for his actions; they attempt to reconcile responsibility and the determinacy of character by pointing out that 'character' is to a very great extent the result of man's own actions and habits.

Character, we admit, undoubtedly exerts a great influence on the decisions of our will. Knowing the character of a person often enables us to predict with probability how such a person will act in a given set of circumstances. However, we are not determined entirely in our will acts by the inherited and acquired dispositions of character.

Here again we must appeal to personal experience. We are conscious of the weakness and faultiness of character, of the pressure of long-standing acquired habits, of the frequency of yielding to urgent passions; but we are also

conscious that we can, though no doubt with difficulty, resist the impulses which storm the citadel of the will. Many a drunkard and drug addict has succeeded, perhaps after frequent relapses, in conquering his reigning passion by a persistent struggle of his will.

It is futile for the opponents to speak of 'responsibility' by stating that a person's character is the result of his own actions and habits. If the will is not free but determined, then all the actions and habits which contribute to the formation of character are also determined. Man cannot be held responsible for something he is incapable of doing or avoiding. Responsibility presupposes the freedom of the will.

The Principle of Causality

Many determinists find the freedom of the will 'inconceivable' and 'unintelligible' because, in their opinion, a free act of the will would be an *effect without a cause*. They contend that a free act would violate the *Principle of Causality*.

In answer to this argument, we deny emphatically the supposition that an act of the will, merely because it is a free act, is an effect without a cause. The Principle of Causality is a metaphysical principle, and it is immediately evident. It states that where there is an effect there must of necessity be a cause which produces this effect; that is to say, everything which receives being and existence must receive this being and existence from something or

somebody, because a nonexistent being cannot give being and existence to itself.

We admit the validity of the Principle of Causality in the case of the free act of the will as an effect. A *double cause* is active in its production: a *moral* cause, namely, the motive; and an *efficient* cause, namely, the Ego using the will as power. Hence, the opponents are wrong when they assert that a free act of the will violates the Principle of Causality.

The Principle of Causality demands that every effect must necessarily have a cause; but whether this cause acts in a free or in a determined manner, lies outside the purview of the principle. So long as there is an efficient cause for the effect produced, the principle is satisfied. In order that their objection be valid, determinists would have to prove that the Principle of Causality demands that every effect must be produced by a *necessary* and *not by a free cause*. They arbitrarily change the meaning of the axiom that 'Every effect must necessarily have a cause' into the axiom that 'Every effect must have a necessarily acting cause.' The latter axiom, however, involves an unwarranted assumption which amounts to a begging of the question, because the postulate of a necessarily acting cause is the very point at issue.

Physiological Determinism

Materialistic philosophers and psychologists reduce all mental events, including volition, to the level of *physiological* and *neurological* processes. The older materialists, such as Moleschott, Büchner, Haeckel, and

others, held the crass view that all psychical processes are nothing more than glandular in character. The more refined modern materialists identify volitions with *cerebral functions, motor impulses, or kinesthetic sensations* of some sort. Representatives of this general view are Maudsley, G. H. Lewes, M. Luys, E. B. Titchener, R. H. Wheeler, J. Watson, and many modern psychologists. There is obviously no place in such doctrines for a will capable of free acts.

Physiological and neurological processes play an important part in a man's mental life, because the operations of the senses furnish the materials from which the intellect abstracts its ideas. Any serious disturbance of the physiological and neurological processes is bound to hamper the intellect in its proper functions. Distortions of intellectual judgments, on their part, influence the will adversely, because the will is dependent on the intellect for the proper presentation of motives.

Nevertheless, determinists need more than this dependence of the will on physiological and neurological conditions in order to prove that the will is determined and necessitated by these conditions in its acts. They must prove that it is an *intrinsic dependence*; only then would the will be determined. An extrinsic dependence of the will on these conditions would leave the inner nature of the will intact and free. The *facts* we have adduced are proof that the will can and does determine itself. At any rate, the burden of proof rests on the shoulders of our opponents, and they fail to prove that the will is 'intrinsically' dependent on physiological and neurological conditions.

The will is to the human organism what the pilot is to a ship. The ship does not control the pilot; the pilot controls the ship. He directs the course of the ship by means of the steering gear. If the steering gear is defective, the pilot has difficulty in keeping a proper course; and if the steering gear breaks down completely, his control of the ship is lost. The pilot's dependence on the steering gear is very real, yet it does not determine the pilot's decisions. Under normal conditions the ship obeys the pilot's directions and follows the course he decrees. Similarly, the organism normally obeys the commands of the free will; but when serious disorders hamper or destroy the proper functioning of the organism, the will, notwithstanding its intrinsic freedom of action, suffers from the refractory medium through which it must control the organism.

Just *how* the will controls the organism, so far as it can do so at all, is a *mystery*. Every vital action is at bottom a profoundly mysterious reality which no scientific experiment or analysis is able to explain completely. A thousand difficulties, however, cannot disprove a fact. And it is a fact, as we have seen, that the human will is a power which *determines itself* to act or not to act, to act this way or that way, *as it desires*. It is *free* in its decisions, no matter whether or not we understand fully how the will operates.

The Conservation of Energy

Determinists also raise the objection that the freedom of the will would nullify the *Principle of the Conservation of Energy*. The principle states that the sum-total of energy in

a closed system, such as the universe, is always constant. They argue that the will, in causing bodily movements, introduces new energy into the organism, thereby increasing the sum-total of energy in the universe and overthrowing the principle mentioned.

Now, the Principle of the Conservation of Energy is an *empirical law*, the result of a partial scientific induction, generalized and applied to the universe at large. As applied to the universe, the principle is incapable of proof, because no one can measure the energy of the universe; it may not be true, as scientists generally admit. In fact, present-day physicists defend the view that energy can be converted into mass and mass into energy.³ Hence, even if the action of the will did actually increase the sum-total of energy by a small amount, that would be no reason to deny the free action of the will.

It does *not seem necessary* to admit that the will, in causing bodily movements, introduces any new energy into the organism. D. Card. Mercier explains the action of the will as follows: "The will is not an efficient cause producing mechanical effects. All that the will does is to direct the power of local movement possessed by the organism to some action. This effect does not require the expenditure of any active force, for the action of the will is not transitive, having an external effect, but is immanent. All the energy that is put forth externally comes from the sensitive appetite and the locomotive faculty, which are material faculties subject to the law of the conservation of energy."⁴

Moral Statistics

Determinists frequently quote *moral statistics* as a proof against the freedom of the will. If the acts of the will are really free, they argue, there should be *no uniformity* in human actions. Yet the records show that the number of marriages, illegitimate births, murders, burglaries, divorces, suicides, etc., vary but little in a country year after year. From these statistics they draw the conclusion that moral acts, which are supposedly free, are *subject to laws* and must be determined in their very nature.

We deny the validity of the argument. All men possess a *similar nature*. They are presumably influenced by the same general factors of natural inclinations, heredity, environment, education, and so forth. It is but natural, therefore, that human beings of a certain social level will act in a somewhat uniform manner. To a very great extent, the lives of men are governed by routine and habit, not by serious deliberation and decision. The impulses of self-preservation, of propagation, of parental and filial attachment, of love and hate, of greed and self-interest, are strong and urgent and universal; and men, as a general rule, are more inclined to yield to these influences than to resist. The regularity of these influences explains the regularity of human conduct.

It must be remembered, however, that this regularity is a *regularity of averages*. It is possible to predict the average number of events which will occur, but it is impossible to predict which *individuals* will be responsible for the events. Therein lies the difference between a *moral*

law and a *physical law*. Given all the conditioning antecedents in a specific instance in physical nature, we can predict the effect with absolute certainty, because such an effect is determined by physical law. In the case of a human being, however, we can predict his action only with moral probability, because he is not forced by the conditioning antecedents to act in a definite manner; he probably will act as expected, but he may, being free, act otherwise.

The will exists, and it is free. The objections raised against the freedom of the will fail to prove the determinacy of volitional acts.

Summary of Chapter XVI

It is a universal conviction of mankind that the will is free. Is this conviction rationally justified?

1. *Statement of the Problem.* Freedom means the absence of intrinsic necessity or determination in the performance of an act. The *conditions* required for the exercise of free will are: a normal state of attention; an objectively indifferent judgment of the intellect; and a conflict of motives.

There are *three types of freedom* in the acts of the will: the freedom of exercise or contradiction; the freedom of specification; and the freedom of contrariety.

Free will is *defined* as the ability of the will, all conditions for action being present, to decide whether to act or not to act and whether to act in this manner or in that manner. The doctrine of freedom of the will is called *indeterminism or libertarianism*. We advocate a *relative or moderate indeterminism*.

2. *Determinism.* The doctrine opposed to free will is styled *determinism or necessitarianism*. Among the ancients we find the doctrine of 'fate' or 'destiny.' In modern times, the doctrine of free will is denied by materialists and pantheists.

The *true problem is this*: All the conditions and circumstances for volition being given, is it within the ability of the will, through the active interposition of the Ego, to make an arbitrary choice between conflicting motives, irrespective of their relative attraction, by simply

determining itself to choose any one of the motives and thereby conferring a subjective preference on it over the others?

3. *Psychological Proof.* Introspection shows that the will, in many of its acts, decides the issue between conflicting motives through an active interposition of the Ego, by choosing *as it pleases*. The freedom of choice is particularly clear in indifferent acts. Free will can be observed in a number of *mental processes*, such as voluntary attention, deliberation, decision in matters of conduct. The laboratory *experiments* of Michotte and Wells confirm our experience.

4. *Ethical Proof.* Our experiences of *joy* and *satisfaction* or of *remorse* and *repentance*, and our sense of *obligation* and *responsibility* are meaningless without free will. This view is confirmed by the universal conviction of mankind and by the lives of the determinists themselves.

5. *Metaphysical Proof.* The nature of the will as a *rational appetency* is proof that it possesses freedom of choice. A creatural object or experience is neither altogether desirable nor altogether undesirable. Hence, the will can strive for it or reject it.

6. *Objections.* Determinists oppose the freedom of the will on *theoretical* grounds, not because the *facts* are not plain.

7. *Unconsciousness of Freedom.* We are, they say, conscious only of what we do, not of what we can do.

Answer. In the *developmental process* of many volitional acts, we are conscious of the impulse of the motive, eliciting but not compelling consent, and also of the positive consent supplementing the deficiency of the motive.

8. *Illusion*. The feeling of freedom is an illusion based on the *ignorance of the causes* determining the will.

Answer. Experience shows that the more we deliberate and understand the motives, weighing all conditions, the more we are conscious of freedom.

9. *The Strongest Motive*. The strongest motive, determinists assert, must prevail.

Answer. Usually it does, but not always. The 'strongest' motive, from a deterministic point of view, must mean the one having *objective preference* as proposed by the intellect. Experience proves, however, that the will gives *subjective preference* to a motive in its choice, irrespective of the objective merits of the motives as proposed by the intellect.

10. *Character*. Others claim that *character*, whether natural or acquired, determines the will.

Answer. Their contention disagrees with *personal experience*.

11. *The Principle of Causality*. Determinists say that a free act would be an *effect without a cause*.

Answer. Every act of the will, even when free, has a moral cause, the motive, and an efficient cause, the will or, rather, the Ego using the will as power. The Principle of Causality demands that every effect have a cause, but it does not demand that it have a necessarily acting cause.

12. *Physiological Determinism*. Materialists identify volition with glandular or cerebral functions, with motor impulses, or with kinesthetic sensations.

Answer. Determinists cannot prove that the dependence of the will on these factors is an *intrinsic* dependence; we

claim it is *extrinsic*. The facts proving the freedom of the will are plain.

13. *The Conservation of Energy*. The opponents maintain that a free act would introduce new energy into the organism, thereby increasing the sum-total of energy in the universe.

Answer. The law is an *empirical* law and not proved for the universe at large. Besides, the will would, in all probability, merely *direct the use* of the energy present in the organism.

14. *Moral Statistics*. Statistics prove that moral acts follow laws, making it possible to predict their frequency. Hence, the opponents conclude, the will cannot be free.

Answer. The general factors found in all men explain the *similarity* and *regularity* of moral acts. But, unlike physical laws, this is only a law of averages. It is impossible to predict which *individuals* will perform the acts and thus fall under the statistical law.

Chapter 17

CONSCIOUSNESS

ONE OF THE FOREMOST PHENOMENA OF HUMAN MENTAL LIFE IS *consciousness*. The term 'consciousness' is used frequently in the ordinary affairs of human beings. It is a very general term; nevertheless, the concept underlying the use of the term is fundamentally the same. In psychology, we must attempt a more exact description of the characteristics of consciousness.

Consciousness is an all-pervasive mental experience, since it is found to be present as an accompaniment of all mental operations ranging from sense-perception to intellection and volition. As such, one would think that every psychologist should recognize consciousness as a most important factor in the study of the human mind and person. *Behaviorists*, however, ignore consciousness, if they do not deny its existence altogether. Man, according to their principles of psychology, must be studied in his external behavior exclusively. This position is extreme and is now, fortunately for psychology, practically abandoned.

Concept of Consciousness

Consciousness, being an ultimate datum of experience, admits of *no strict definition*, because it lies at the very root of all mental activity. It can, however, be pointed out and described. Consciousness is that state of the mind in which we find ourselves when we are awake, as contrasted with the state of our mind in dreamless sleep or in a coma or when under complete anesthesia. A simpler term for consciousness is *awareness*. We are 'conscious' of something when we are 'aware' of it, no matter how dimly or fleetingly. Again, we may say that we are conscious' of a thing or of a mental state when we notice its presence to mind. If we are 'unaware' of something and do 'not notice' its presence in any manner whatever, we are then said to be 'unconscious' of it. Consciousness is not a special cognitive power; it is simply the 'awareness' inherent in every act of sensory and intellectual cognition.

Consciousness has a *content*. In order to be conscious, we must be conscious *of something*. When we see or hear or taste or smell or feel something and 'know' or 'are aware' that we sense it here and now, then we are conscious. When we have a mental image of an object or experience and 'know or are aware of this image present within us, then we are conscious. When we think about something intellectually in the form of ideas, judgments, or argumentations and 'know or are aware of our thinking about it, then we are conscious. When we have feelings, emotions, or volitions and 'know or are aware that we have them, then we are conscious. The content of consciousness thus includes all the *mental acts* which are present in our normal waking state and of whose presence we are aware

— sense-perceptions, mental images, acts of the intellect, acts of the will, feelings, and emotions. It also includes the various *objects* toward which these acts are directed, as when we are aware not only of the act of seeing but also of the house that we see, not only of the anger we experience but also of the person with whom we are angry. Whatever attracts our attention in some way, whether it be an external object or an internal state of the mind, thereby enters our consciousness and belongs to the content of consciousness.

Field of Consciousness

Psychologists often speak of the *field of consciousness* and mean thereby the sum-total of all items present in the consciousness of an individual at any given moment. It expresses the range or area over which consciousness extends at a particular point of time, measured by the number of objects or mental states of which the mind is aware and by the degree of attention given to them.

Viewed in this manner, the total field of consciousness is divided into the *focus* of consciousness and the *margin, fringe, or periphery* of consciousness. The expressions are taken from the field of vision, because vision and consciousness are very similar in this respect.

Objects or experiences are said to be in the *focus* of consciousness when they are accorded the *maximal* amount of attention among all the objects or experiences present here and now in consciousness. It is a common fact, noticeable every hour of the day, that our attention shifts to

a considerable extent from one thing to another and appears in varying degrees of concentration. At any particular moment, some object or experience occupies our attention in a primary manner, so that it stands out before our conscious observance with exceptional distinctness and vividness; everything else is pushed into the dim background of attention for the time being. While watching, for instance, a long forward pass in a football game, our attention is directed primarily to the flight of the ball and to the pass receiver; we are only dimly aware of the actions of the majority of the other players at the moment. Similarly, when we are suffering from a sharp toothache, this intense pain forces itself upon our attention to such a degree that we are hardly capable of thinking of anything else. Such an object or experience occupies the 'focus' of the field of consciousness.

Objects or experiences which are not in the focus of consciousness but which are still *noticed to some degree*, along with the primary object of conscious attention, are said to belong to the *margin or fringe or periphery* of consciousness. Such objects or experiences occupy a place in the field of conscious attention similar to that of objects in the field of vision which throw their image on the peripheral regions of the retina. They are observed, but in a vague and blurred fashion:

they lack the distinctness and vividness of an object or experience in the focal position of awareness. Taking the examples mentioned in the preceding paragraph, while we are watching the flight of the football through the air, we are also aware of the roaring shout of the spectators, but

only in a secondary and coincidental manner; and while the sharp pang of the aching tooth is our main conscious concern, we still listen to the conversation carried on by those around us, even though only in a desultory and half-attentive manner.

As in vision, consciousness shades off from the maximal concentration of attention at the focus imperceptibly in diminishing degrees through the peripheral region, until it reaches a point where objects and experiences no longer make an impression and are lost to consciousness altogether. There is no fixed and clear line of demarkation in conscious attention. Sometimes an individual object or experience is so strongly placed in the focus of consciousness that we are practically unaware of anything else; at other times, especially when drowsy or very fatigued, the entire field of consciousness seems rather confused and chaotic. In any case, the states of consciousness occupying a position intermediate between maximal and zero attention is designated as the 'margin' or 'fringe' or 'periphery' of the field of consciousness.

Unconsciousness

Unconsciousness, as the term indicates, is the *absence of consciousness*.

The term 'unconscious' may be taken in an *objective* or *subjective* sense. Taken 'objectively,' something would be termed 'unconscious' in the sense that, by its very nature, it is devoid of the attribute of consciousness altogether and thus never becomes an object of awareness in our mental

life. Many processes occurring in the human organism are objectively unconscious. Chemical and purely physiological and neurological processes are of this type; they never enter consciousness, though we may become aware of their results.

Through the stimulation, for example, of the retina, of the optic nerve, and of the visual center of the cerebral cortex, we become conscious of the act and of the object of vision, but we are totally unconscious of the chemical, physiological, and neurological processes which precede and accompany vision. Similarly, we are totally unconscious of the many processes which take place in the metabolism of the body, in many reflex actions of the nervous system, in the storage and recall of memory images, etc. Without doubt, such processes influence our consciousness in diverse and profound ways; but the processes themselves never enter the field of consciousness directly. They are, by their very nature, objectively unconscious processes.

Taken 'subjectively,' something is 'unconscious' in the sense that it *actually*, as a mere matter of fact, does not enter our consciousness, though of itself it could. The human subject is simply not aware of the object or action under the existing conditions; but the nature of the object or action is such that, under other conditions, the mind could make it an object of its focal or peripheral attention. While I am writing, for instance, I may be unaware of the pressure of my forearm on the desk; it would be, however, a simple matter to direct my attention to this pressure and thereby bring it within the field of consciousness. Again, while in profound sleep, I am unconscious of the sensory

stimuli which affect my bodily organs; but when awake, these same stimuli give rise to conscious sense impressions. When, therefore, the mind is unconscious of objects or actions which could be consciously perceived, it is said to be in a state of 'subjective unconsciousness.'

Periods of unconsciousness, placed between periods of consciousness in our normal waking states, are facts beyond dispute and no psychologist denies them. Ordinary deep sleep is a period of unconsciousness. Many authors, however, are loath to admit that total and *absolute* unconsciousness of the mind ever occurs. The evidence, they say, is at best only negative, resting on the fact that in our normal waking state we cannot recall what has taken place in the mind during the period of so-called unconsciousness. The inability of recall is no convincing proof of absolute unconsciousness, because we know from experience that we are often unable to recall objects and experiences which were consciously perceived on a former occasion. More happens in the deep recesses of the mind than can be remembered while awake. There always remains, then, the possibility of some sort of conscious experience in dreamless sleep, coma, and other states of apparent unconsciousness, which never rises to the surface of conscious memory when we are awake. This argument, of course, is also negative. From the very nature of the case, positive proof for or against the fact of absolute unconsciousness is excluded.

Subconsciousness

A proof that unconsciousness is not so complete as is commonly supposed is found in what modern psychology calls *subconsciousness or subliminal consciousness*.

The term *subconscious* is used to designate certain mental items and processes which are apparently of the same nature as the normally conscious items and processes, yet of which the subject is not aware in the waking state. These items and processes are conceived as occurring 'beneath' or 'underneath' the ordinary waking consciousness; hence the terms 'subconscious' and 'subconsciousness.' It is as if, figuratively speaking, a 'threshold' (Lat., *limen*, threshold) divided and partitioned off the items and processes of the ordinary waking consciousness, of which we are aware when awake, from those other items and processes belonging also to the cognitive order, but of which we are unaware in the waking consciousness. For this reason, the subconsciousness is also termed the *subliminal* consciousness, while the ordinary waking consciousness is also termed the *supraliminal* consciousness.

In order to understand these terms properly, we must advert to a number of pertinent facts.

Consciousness, in general, means to have knowledge (to be aware) of what occurs within us. Since man's knowledge is of a double nature, he possesses a *double consciousness*: sensuous and intellectual.

Man's *sensuous* consciousness embraces everything of a sensory character, and this type of consciousness man has in common with the brutes. To the field of this sensuous consciousness belong the acts of sense-perception (sight,

hearing, taste, etc.), the images of the imagination and sense-memory, sensuous feelings, emotions, and appetitions. Man's *intellectual* consciousness is of a higher order. It comprises the rational acts of intellection and volition and the affective states based upon intellectual and volition; and it also comprises the sensory acts and states, in so far as these are reflexly cognized and made the objects of thought and will.

Both types of consciousness have a focus and a periphery in their field in the ordinary waking state. Whatever is perceived by this double consciousness in the ordinary waking state, whether focally or peripherally, belongs to the 'supraliminal' consciousness. Specifically, everything is included which has attracted our attention is some measure while awake and whatever can be recalled arbitrarily from memory.

There are, however, many items of experience which do not belong to the category just mentioned, but which, nevertheless, cannot be excluded from consciousness altogether. When in the ordinary waking state our attention is deeply engrossed by some object or experience, very many *faint impressions* are made on the mind; they go unnoticed at the time and do not enter our waking consciousness, but they are somehow registered and recorded. There can hardly be a doubt that practically every action of our bodily limbs and organs arouses nerve impulses of some kind which reach the brain along obscure and circuitous paths; they must leave impressions, no matter how weak, and these impressions, though

unperceived by the waking consciousness, cannot be ruled out entirely from the field of mental experience.

Again, due to the shifting and the natural limitation of attention, the periphery of our waking consciousness is filled with numberless fluctuating ideas, sensations, feelings, and so forth, which are but very dimly perceived for a moment and then pass into oblivion, never capable of being arbitrarily recalled in the future. It even happens that objects and experiences were distinctly perceived and reflexly cognized in our waking consciousness on a particular occasion; but they were objectively unimportant and too loosely connected with the vital facts of our existence to make a strong impression on our memory, and so they faded out and after a while joined the host of forgotten things. Yet they were present and left a record of their presence in our mind.

Such impressions are not lost entirely. Their vestiges remain and leave their collective mark on our mind and character, influencing us in diverse ways; at times they appear again in consciousness, unrecognized and unremembered.

This body of processes and experiences, '*split-off*' and *dissociated* from the content of the waking consciousness, belongs to the field of the *subliminal* consciousness (subconsciousness). It should be noted that much of what has been designated as 'subjectively unconscious is classed here as 'subconscious.' Specifically, subconsciousness comprises the processes and experiences which were not reflexly cognized and which were not perceived by the ordinary waking consciousness as having been present,

though they possess the general nature of mental items belonging to the field of consciousness; the faint, fleeting processes and experiences, noticed dimly in the marginal region of the waking consciousness for a moment and then forgotten, so that they are incapable of arbitrary recall; the processes and experiences which were reflexly and attentively cognized by the waking consciousness at some time or other, but faded from active memory in such a manner that they are beyond voluntary recall.

It is a peculiarity of our mental life that the mind in its subliminal (subconscious) states can and does perform *connected and consistent functions*, unknown to the ordinary waking consciousness. These 'split-off' and dissociated processes at times form a definite stream of consciousness, isolated from, and running parallel to, the stream of consciousness prevalent in our waking state, so that they may even seem to issue from a different mind or personality.

Here are some of the facts which, to all appearances, indicate the existence of a separate, subliminal stream of consciousness beneath the threshold of the ordinary waking consciousness.

While carrying on a conversation in an intelligent manner, *a second train of thought*, on an entirely different subject, may run through our mind and be brought to its logical conclusion. Or, while reading a paper or book, our attention is diverted to some other subject or occurrence; yet we find that we have continued to read. Our supraliminal consciousness cannot recall what we have read in this period of mental distraction, but the content of

our reading may suddenly come back to us later with clarity and precision.

Oftentimes we do our utmost to *recall* a certain name, person, fact, or mental operation; but all our efforts are to no avail. In despair, we turn our mind to something else, confident that the items cannot be recalled. Later, the forgotten items rise into our waking consciousness with startling abruptness. Upon investigation, we are unable to discover any association of ideas which can account for their appearance. The recall was made, not through any process known to our waking consciousness, but by some kind of subconscious process.

The *execution of problems*, unfinished in the waking state, is often carried out by the subconscious mind. Not infrequently a problem presents itself to us, and we experience considerable difficulty in marshaling our ideas to find the proper solution. The solution escapes us, and we put the problem aside. To our astonishment, the solution, ready-made and complete in detail, suddenly flashes into our consciousness at a time when we are thinking of something totally different. The secondary, subliminal consciousness has worked out the problem for the primary, supraliminal consciousness. In all probability, the inspirations of genius can be accounted for in this manner.

Far more striking and convincing are the experiments made in *automatic writing*. By 'automatic writing' psychologists understand script produced by a subject unknowingly and involuntarily. The phenomenon can be evoked quite readily in hypnotic trance, but in exceptional instances it also occurs in the ordinary waking state. The

procedure is somewhat as follows. The subject is made to read aloud a fascinating book or article, so as to engross his attention completely. A pen or pencil is placed in the hand of the subject, and the hand is screened off from the subject's view. The experimenter then asks a question to which the subject should write the answer at some length. While reading aloud, the subject's hand writes a fluent, intelligent, and consistent account. The subject's waking consciousness, totally occupied with reading, is unaware of the contents written by the hand. 'Automatic writing' is thus seen to result from the activity of the secondary or subliminal consciousness.

Hypnotism offers further evidence for the existence of subconscious processes unknown to the ordinary waking consciousness. What happens in deep hypnosis remains, as a rule, unavailable for recall when the hypnotized person returns to the normal state; in a subsequent hypnotic trance, however, the experiences of the former trance can be recalled. Furthermore, many items of mental experience, mysterious and unexplainable to the ordinary waking consciousness, can be traced in their origin and development by the subconsciousness during hypnosis. Hypnosis seems to open a hidden door to the secret workshop of the mind.

Coconsciousness

In recent years the term *coconsciousness* has come to the fore. Morton Prince¹ is mainly responsible for the rise and spread of the term and its meaning.

Prince divides the 'subconscious' into two distinct sections, namely, the 'coconscious' and the 'unconscious.'

The *coconscious*, according to his view, is any actual subconscious *idea or thought process* present in the human subject but unknown to him in his ordinary waking state. It is only when the term 'subconscious' is used to qualify 'ideas or 'thought processes' actively present beneath the threshold of the supraliminal or waking consciousness that the term 'subconscious' is equivalent to the term 'coconscious.'

The *unconscious* comprises two types of items. The one type consists of *inactive neural dispositions* (conserved dormant 'neurograms'), which are the vestiges of former sensations, etc., conserved in the nervous system, particularly the brain, after the sensations, etc., have ceased to be active and have left their traces as dormant 'neurograms.' The other type consists of *neural processes* (active functioning 'neurograms'), which come into existence when the dormant 'neurograms,' for some reason or other, are stimulated into becoming again an active process.² Both types of items, the inactive neural dispositions and the neural processes, are devoid of any quality of consciousness; hence the term 'unconscious.' The 'coconscious' and 'unconscious' have their place beneath the level of the waking consciousness and as such belong to the 'subconscious' as two species under a common genus.

According to Prince, then, the term 'unconscious' has a rather restricted meaning, quite at variance with the meaning commonly attached to the term. It applies exclusively to inactive and active neurograms, i.e., to

inactive neural dispositions and to neural processes. It does not, in itself, apply to metabolic and other dispositions and processes which are also devoid of consciousness. This restriction of the meaning, if intended, is unjustified. Furthermore, the inclusion of the 'unconscious' under the 'subconscious' as a species under its genus, seems a strange and unwarranted procedure. After all, the term 'subconscious,' as usually employed by psychologists, designates a certain form of *consciousness*, while the 'unconscious' is acknowledged to be devoid of any quality of consciousness. The use of accustomed terminology in such an unusual fashion can only lead to confusion.

As for the term 'coconscious,' it is appropriate enough. However, if we omit the 'unconscious' from the 'subconscious,' there appears to be little reason for making a distinction between 'coconscious' and 'subconscious.' Distinctions and terms should not be multiplied without necessity.

ALL THINGS CONSIDERED, IT SEEMS ADVISABLE TO MAKE ONLY THE following distinctions and divisions among the states and conditions affecting the human organism:

1. *Unconscious* (items not qualified by any attribute of consciousness, such as metabolic and purely neural items).
2. *Conscious*:
 - a) *Normal waking consciousness* (primary, supraliminal),

--b) *Subconsciousness* (secondary, subliminal).

Self-Consciousness

Self-consciousness is characteristic of man. It is the consciousness of his *self* or *Ego* as the subject and bearer of all the conditions and states affecting his being, particularly of consciousness itself.

Just as consciousness has a content, so it also has a subject or bearer, namely, the 'self' or 'Ego.' Whatever we may think of the ultimate nature of the 'self' or 'Ego,' introspection reveals the indisputable fact that it is the 'self' or 'Ego' to which all conscious phenomena are, in the last analysis, referred. To doubt this means to doubt the validity of the very foundations of all knowledge.

Consciousness is not a mere 'stream' of conscious states succeeding one another like flashes of light or like motion pictures on a screen. This analogy is convenient, but it is not the whole truth. Beneath these fleeting states of consciousness is the conscious self as the subject and bearer in which they exist and subsist; they are not independent items floating in some sort of mental vacuum.

'Self-consciousness' means that the mind (self, Ego) recognizes all mental states and activities as *its own*. Not only are these states and activities present, but *I myself*, by an act of reflex cognition, know that they are present and know that they belong to me as *modifications of myself*. Common speech is proof of this. We seldom say: 'Sight, hearing, pleasure, thought, volition, etc., are present.' We invariably say: '*I see, I hear, I experience pleasure, I think, I*

will, etc.' The subject and bearer is always mentioned together with the conscious state. We thus make a clear distinction between the conscious state and the self underlying it as the conscious agent. It is precisely this feature of our mental life which makes *introspection* possible and invests it with value as an instrument of knowledge in psychology. If there were no conscious self or Ego, we could not report on the presence or absence of a mental state.

I therefore not only know, but I know that I know; I not only have knowledge, but I have a knowledge of my knowledge; I not only am conscious, but I am conscious of my consciousness. By means of the reflex act of self-consciousness I become aware that I, the thinking and conscious subject, *apprehend myself concretely* in my mental acts and states. It is my *self-same Ego* which is active and passive, whether in the domain of sense or in the domain of intellect, and my Ego is *one, single individual*; there is no duality or multiplicity here, notwithstanding the radical difference between the acts and states themselves, between sensuous and intellectual consciousness. Even my consciousness is only a modification of my self or Ego, because I am conscious of *myself as conscious* in the same way that I am conscious of myself as seeing, hearing, thinking, and willing; I express both facts in an identical manner, namely, '*I hear a sound*' and '*I am conscious of myself.*'

The Ego is not consciousness; it is the *possessor* of *consciousness*. The Ego is not experience; it is the experient. And so, too, the Ego is not memory; it is the

bearer of memory. The act of remembering is a present act, but it always has a reference to past persons and events. I perceive with evidence that I, the Ego, who am conscious at this very moment, am the *self-identical* Ego who have had the 'past' experience recorded by my memory. I am writing at this moment; but I am also conscious that I was writing ten minutes ago, that I took a walk an hour ago, that I attended a meeting yesterday. Notwithstanding the fact that I was in a state of unconsciousness during my sleep last night, I am aware that 'I' am the self-identical 'Ego' who existed, worked, ate, wrote, perceived, and reasoned yesterday, a week before, a month ago, and through all the years down to my youth and childhood. The events belonged to me before, in the past; and my Ego preserved its self-identity, while they came and passed on. How could I remember them as 'mine,' as having happened in 'me,' if my Ego were not a *permanently abiding reality* in whom they occurred? My Ego is clearly perceived to be the *abiding subject* of these transitory states. Whatever may be the nature of the Ego, the data of my conscious states show plainly that my Ego is distinct from the conscious states themselves; the latter are only modifications of the permanent Ego, existing *in* and *by* and *through* my Ego as their agent-patient subject. So much is clear to me from an analysis of the data of memory and consciousness.

John Stuart Mill considered the mind to be nothing more than a *series* of conscious states which is aware of itself as a series. Such a view is in flat contradiction to the facts, as just pointed out. We make a clear distinction between the states and the self or Ego as the self-conscious bearer of the

states of consciousness. Besides, the series of conscious states of today, having begun after a period of unconsciousness during sleep, is totally different from the series of yesterday and of a year ago; how then could the Ego of today be conscious of the identity of itself with the Ego of yesterday and of a year ago, if the Ego were nothing more than a series conscious of itself as a series? It would definitely have to be conscious of itself as a different Ego entirely, because the series themselves are numerically and entitatively different.

The same objection applies to William James' concept of the Ego as a *stream* of consciousness in which each passing thought is itself the 'thinker' or 'Ego.' We may, of course, speak of the aggregate of successive conscious states as a 'stream.' This figure of speech is misleading. A 'stream' suggests unbroken continuity. The 'stream of consciousness,' however, possesses no unbroken continuity. On the contrary, the continuity is broken by every period of unconsciousness to which the human mind is subject, such as sleep, coma, anesthesia, etc. It should, then, be utterly impossible for memory to identify the Ego of one series or stream with that of a former series or stream. In fact, since the present passing thought is not identical with the immediately preceding thought, much less with the thought of yesterday or of a year or ten years ago, we should be conscious of as many 'thinkers' and 'Egos' as there are passing thoughts, not of an *abiding Ego* present as the bearer of the present and past thoughts through the years. Yet the identity of the Ego in the past and present is precisely what our consciousness reveals to us with

unmistakable clearness: the Ego which thinks today is the self-identical Ego which thought yesterday and all the days before. This fact is inexplicable, if the theory of James were correct. Finally, why should there be any reference of our conscious states to a single, permanently abiding Ego at all, if there were no such underlying Ego present? If only conscious states were present and a permanently abiding Ego as their subject were nonexistent, why should consciousness give testimony of the supposed existence of a nonexistent reality? There should, in that case, be merely a consciousness of *passing states*, but never of a *permanent Ego* as the bearer in which they exist and which they modify. We must, therefore, reject the theory of James and his followers.

Consciousness, then, reveals to us the existence of our self or Ego as the single, permanent, self-identical subject and bearer of all our states and experiences.

The Seat of Consciousness

Ever since F. J. Gall, G. Spurzheim, P. Flourens, P. Flechsig, and others, made their investigations into the problem of cerebral localization of sensory and motor activities, the problem of the *seat of consciousness* also received attention. It was evident that certain conditions affecting the nervous system also affected consciousness, at least the consciousness of the normal waking state. Some neurologists, therefore, concluded that the seat of consciousness must be located in the *brain*, the central organ of coordination for sensory and motor activities. Even

the ordinary man of the street feels that consciousness resides somehow "in the head."

The particular problem which confronted neurologists and psychologists was to decide whether the *entire brain* or a *definite portion* of the brain could be designated as the seat of consciousness. Opinions differed. In the course of time, however, certain facts began to throw some light on this complicated and perplexing question.

Some scientists believed that consciousness depended on the left cerebral hemisphere in right-handed persons and on the right cerebral hemisphere in left-handed persons. We now know that this view is erroneous. A number of cases are on record where the corresponding cerebral hemisphere had been extirpated, and no marked changes in consciousness or personality took place. Such cases have been reported by Dandy, Gardner, Rowe, Zollinger, and Kocher. The seat of consciousness, then, does not lie in any one of the two hemispheres as such.

Others identified mental life with the *frontal lobes* of the brain, either the right or the left or both. This view also proved to be false. Operations for the removal of one or the other frontal lobe have been performed, without serious impairment of the mental faculties. Ackerly reports the cases of the removal of both prefrontal lobes, and the patient retained normal intelligence.

Nor is the seat of consciousness in the *thalamus* or *hypothalamus*. Even extensive destruction of these important subcortical regions leaves consciousness essentially intact. Most remarkable in this respect, is the *Mittelhirnwesen* ('mid-brain creature') studied by Gamper

and reported by him in 1926. The child lacked a cerebrum, possessing only the mid-brain and the fragment of a thalamus. One would suppose that this unfortunate child must be devoid of all consciousness. However, it had alternating periods of sleeping and waking, and occasionally it smiled. The child, obviously, could not indicate whether or not it possessed consciousness in the accepted meaning of the term. But if sleeping and waking are, respectively, states of unconsciousness and of consciousness, then the conclusion is justified that the child did actually experience consciousness in some form. It would be erroneous to conclude from this case that the seat of consciousness is in the *mid-brain*, because the history of medicine records instances of considerable damage in this anatomical region without complete loss of mental activity.

Nor is the *medulla oblongata* the seat of consciousness. True, pressure in this region produces unconsciousness; but unconsciousness can be produced in many ways, independent of the medulla. To produce unconsciousness in a certain region is one thing, and to say that this particular region is the point center of consciousness is quite another thing. The very fact that the visual, olfactory, and auditory nerves do not terminate in the medulla but in the cerebrum, is reason enough to eliminate this anatomical structure from being the seat of consciousness, because visual, olfactory, and auditory perceptions most certainly are part and parcel of our conscious life.

There is, of course, a dependence of consciousness on the *nervous system*, because the nervous system is a system of channels which furnish the necessary materials for

sensory and intellectual activity. No definite portion of this system, however, can be singled out as the point center of consciousness. All we can say is that it is the *individual* who is conscious, with a dependence on the nervous system; but it is neither the brain nor the nervous system which, as such, is conscious.

The Function of Consciousness

Man is a unit being, an integral organism. All mental states, including consciousness, are states of the self or Ego. Man is not an isolated being in a world of isolated beings. The world is a co-ordinated whole, a true 'universe,' and man is a part of this co-ordinated whole.

As a part belonging to the world as a co-ordinated whole, man must be capable of making an *intelligent adjustment* to the world in which he lives. To achieve this adjustment, he possesses the equipment of his bodily limbs, his vegetative organs, his external and internal senses, his feelings and emotions, his intellect, and his will. He must be able to safeguard himself against harmful agencies and to perfect his own being, and it is through the proper use of these powers that he is able to do this. These powers are the necessary instrumentalities by means of which he can *perceive* and *interpret* the surrounding world. These perceptions and interpretations are recorded in the sensuous and intellectual memory, so that not only present impressions but also past experiences can be utilized to best advantage for the purpose of adjusting his conduct in accordance with the needs of his being.

Without *consciousness* man could not make this adjustment of his conduct. It is precisely because his perceptions and interpretations are 'conscious' that he is able to meet the conditions prevalent from moment to moment and turn them to his advantage. One need but think of what would happen to man, if he were in a continuous state of sleep or in a continuous coma, in order to understand the necessity of a normal waking consciousness. Even though we admit the importance of the influence of subconscious states on man's conduct, it is primarily through his waking consciousness that he has contact with the world at large and makes his adjustments to it.

It is, therefore, not difficult to state the *function* or *purpose* of consciousness in the economy of man's life. T. V. Moore has expressed its function and purpose, when he describes "normal consciousness as a state of the human mind, in which it can perceive and interpret its surroundings, and in which the past experience of the individual is fully available for the adjustment of the individual to the needs of the present moment."³ He goes on to explain that the phrase "fully available" must be taken in a relative sense, excluding pathological and abnormal conditions.

This description applies with equal force to the function and purpose of the *subconsciousness* or *co-consciousness*. Because of the natural limitations existing in the power of attention during ordinary waking consciousness, many impressions, too faint to attract attention, will be recorded and stored in the lower levels of the mind, forming a

secondary stream of consciousness and partly dissociated from the activity of the waking consciousness. These items are also subservient to the general welfare of the individual and assist in the shaping of his conduct.

Because of the tremendous importance of consciousness as a determining factor in human life, it is obvious that disorders of consciousness are particularly harmful to man in their effects.

Disorders of Consciousness

Disorders of consciousness arise either from organic causes, as epilepsy, or from *psychogenic* causes, as hysteria; in many instances both types of causes are present. When disorders are organic in character, the cause is always found to be an impairment or destruction of important nerve tissue due to lesions, internal hemorrhage, diseases, etc. When they are psychogenic in character, the cause is inevitably of a psychic nature, such as fears, anxieties, mental conflict, maladjustment to social conditions, and the like. Some people, for example, become blind through injury to the eyes, the optic nerve, or the visual center in the brain; others become functionally blind after passing through a severe emotional crisis.

Total loss of consciousness may result from poisons, and then we speak of 'coma'; or from head injuries, and this is 'concussion'; or from an improper distribution of blood in the brain, and then we have the condition known as 'swooning' or 'fainting.'

Partial loss of consciousness occurs in varying stages of depth and degrees of intensity. 'Stupor' is an intensive clouding of consciousness, characterized by a condition of marked unresponsiveness and usually accompanied by torpidity of perception, thought, and emotion. 'Confusion,' milder than stupor, is a mental state of clouded consciousness, in which the symptoms are an unstable attention, a poor perception of reality, a disorientation concerning time or place or person, and a more or less marked inability to act coherently. When accompanied by conditions of excitement and hallucination, confusion is termed 'delirium.' Some authors use the phrase 'twilight state' to designate 'confusion.'

Other disorders, involving partial loss of consciousness, are derealization, depersonalization, and amnestic fugues. In 'derealization' persons suffer from a disturbance of perception, so that the objects of the world have a sensory appearance quite different from that in their normal experience. Since interpretation, as a rule, remains unimpaired, derealization appears to be the result of some organic factor affecting the sensory nervous system. In 'depersonalization' patients are afflicted by a mental condition in which they experience a profound change in their own personality, so that their own actions, thoughts, and emotions appear to be those of an automaton or to belong to a totally different person. In some instances there is 'somatic doubling,' so that the person seems to possess two distinct bodies, to one of which he transfers whatever is disagreeable or painful in his experiences. In an 'amnestic fugue' or, as it is less properly called, 'ambulatory

automatism' the disorder of consciousness consists in a somewhat protracted condition characterized by wandering and other abnormal actions, followed by considerable loss of memory concerning this particular period. In these three states of partial loss of consciousness there is no 'splitting' of the personality of the subject.

In the following disorders of partial loss of consciousness, there occurs the phenomenon of so-called *split personality*. In this connection the word 'personality' is taken in the sense of 'character,' as the integrated group of acquired habits, emotional trends, behavior tendencies, temperament, etc., distinguishing one individual from another. It is a question, therefore, of the empirical personality, in so far as the self or Ego manifests itself in its mental states. By 'split personality' is meant an abnormal condition of mental dissociation in which the same human mind manifests alternately two or more very different characters or personalities.

This condition appears in a variety of forms. When it is a case of 'alternating personality,' there are two memory chains, one for each personality. As the personality changes, the respective memory chain comes to the foreground. In one type of alternating personality, one memory chain is continuous, while the other is interrupted; in another type, both chains are interrupted. Not only are there cases of double personality, but also cases of 'multiple personalities,' running in number from three to half a dozen and more. During these alternations only one personality is present at any particular time. If one memory chain is continuous and the other interrupted, the first personality remembers

everything done by the second, but the second does not remember what was done by the first; if both are interrupted, neither personality remembers what was done by the other. Ever since Morton Prince (1908, 1925) presented the case of Miss Beauchamp, psychologists also speak of 'co-conscious personalities,' in which two personalities are co-existent, the primary personality knowing at all times what the secondary personality is doing, but the secondary knowing nothing about the primary.

At times the changes in split personality are rather profound; at other times, more in the nature of changes of mood. When split personality has its origin in hysteria, a defense mechanism of the individual is always at work. Subconscious desires bring about a dissociation of memory items and form them into separate groups. In epileptic conditions, the dissociation is due to an organic cause, but the result is practically the same.

A number of psychologists and philosophers have built up a *metaphysical theory* on the facts of split personality. They claim there must be as many *minds* (selves, or Egos) in the individual as there are 'personalities.' This conclusion is Un warranted. The facts merely reveal a *dissociation* of memory material. While much of the memory material is available for voluntary recall to the normal consciousness, much of it is not. Under special conditions, the submerged, subconscious memory material may become dissociated into groups which, when utilized separately, give the appearance of a different personality. "After all," as Miss Beauchamp once remarked, "it is always myself."⁴

Psychoanalysis

Psychoanalysis is a method devised and developed by Sigmund Freud for the examination of the contents and mechanisms of an individual's mind, for the purpose of treating and curing mental disorders. He began his psychoanalytic therapy shortly before the turn of the century. C.G. Jung, A. Adler, A. Meyer, C. Baudouin, Franz Alexander, and others developed the principles and methods of psychoanalysis along divergent lines.

Freud bases his views on *three aspects* of mental life: the dynamic, the economical, and the topographical.

From the *dynamic* point of view, he considers all mental processes, except the reception of stimuli in sensation, to be the result of the interplay of *instincts*. There are two groups of instincts: the 'ego- instincts,' which aim at self-preservation; and the 'object-instincts,' which are directed toward external objects. Two fundamental latent instincts underlie these two groups: 'Eros' and the 'instinct for destruction.' The 'Eros' instinct drives toward ever closer union, and the manifestation of it is called by Freud *libido* or *sexuality*. The 'instinct for destruction,' as the name indicates, strives for the destruction of what is living. Instincts are always dynamic. Relative to one another, they sometimes cooperate, sometimes antagonize, sometimes compromise.

From the *economic* point of view, Freud contends that all ideas or images representing the instinctual forces have an 'affective charge,' measurable in definite quanta of energy. The discharge of this energy is regulated by the *pleasure-*

pain principle, so as to bring about a smooth functioning. Later, as the individual develops to adolescence and adulthood, the 'pleasure principle' is replaced to a great extent by the *reality-principle*; as a result of the operation of the 'reality-principle' pleasures of satisfaction are postponed and temporary feelings of pain are tolerated.

From the *topographical* or structural point of view, Freud distinguishes *three layers* or levels in the mental apparatus. 'The deepest and most primitive is the id. The 'id' is unconscious; it is also the storehouse of the instinctive impulses and of all memories which are inaccessible to normal consciousness. The next layer is the *ego*, the subconscious. The external world influences and modifies the 'ego,' and it is also developed through the activity of preformed instincts. The uppermost layer is the *super-ego*. The 'super-ego' exercises a dominating influence on the 'ego'; it contains the ideals, the moral notions, the conscious aims, the principles of art, science, and religion, the precepts of social convention, etc., which are the result of education and inhibit the instincts in their natural activities.

There is a *theoretical basis* to psychoanalysis. According to Freud, in order to understand the nature of neuroses, three things must be borne in mind: the condition of 'repression' and 'censorship'; the importance of the 'sexual instincts'; and the practical fact of 'transference' in the technique of psychoanalytic procedure.

Instincts are the mainsprings of action. They cannot be suppressed. The desires and tendencies emanating from them may be temporarily frustrated, through considerations of moral ideals, social conventions, and the

like. Frustration, however, induces tension, and, since gratification cannot be postponed indefinitely, mental and emotional conflicts arise which lead to substitutive gratifications replacing the natural gratifications of these instinctual desires and tendencies. The result is a neurosis.

The patient naturally tries to remove the disagreeable experiences of the mental conflict. He does this by endeavoring to *forget* them. The painful memories are pushed out of sight, so far as the waking consciousness is concerned, and thus these memories become buried in the dark recesses of the unconscious. They are, however, not dead, but always active; consequently, the conflict and the neurosis persists, working havoc in the patient's life.

To effect a cure, these destructive memories must again be brought to consciousness, analyzed, and finally resolved by the analyst. But here the mechanism of the mental apparatus presents an obstacle very difficult to overcome. At the threshold of consciousness is the 'ego,' which acts as a *censor* and seeks to hinder all tendencies which displease it from entering consciousness and influencing conduct. Such tendencies, submerged in the unconscious, are said to be 'repressed.' Hence the phenomenon of *repression*, found in all cases of neurosis. When the physician, in the course of his examination, comes close to these hidden memories and attempts to bring them to the surface of the patient's consciousness, he produces a mental *resistance* in the patient, because the patient does not want to remember them as the 'censor' seeks to block their entrance into consciousness. The 'censor' is unceasingly vigilant; but not so vigilant that the submerged memories cannot give

indications of their presence and character in devious ways. *Hypnotism* often discloses them. *Free association*, in the form of a detailed description of the patient's life history, frequently uncovers helpful clues. Mainly, however, indications of the conflict in past experiences come through dreams, because dreams are based on wish-fulfillment. The 'censor' permits these memories to pass in the form of dreams, but disguised and masked in *symbols* which need interpretation by an expert in order to be recognized for the memories which they represent.

The *sexual instincts* are the most potent and most important. For reasons of morality and social convention, however, their natural tendencies are the ones which are repressed the most.

It is in the field of repressed sexuality (*libido*) that substitutive gratification occurs; hence, neurotic symptoms are symptoms of *repressed sexuality* and are always libidinous in character. Since sexual life begins in earliest childhood, long before puberty, the psychoanalyst must look for the roots of neurosis far back in the earliest days of childhood.

Hypnosis, Freud soon discovered, is not necessary for the uncovering of former mental conflicts and their hidden memories. Free association in conversation and the expert interpretation of dreams suffice. Therein consists the technique of the Freudian psychoanalytic method.

In the course of this procedure the physician encounters what Freud calls *transference*. Patients, it seems, enter into an emotional relationship, both affective and hostile, with the psychoanalyst himself. There is really nothing strictly

personal about it. They merely 'transfer' their childhood relations to their parents, which is the basis for the original conflict, over to the physician, making him the substitute. Once the memories of the hidden conflict are revealed to the consciousness of the patient and are relived in the present, the irrationality of the grounds for the conflict are pointed out and explained by the analyst. When the patient perceives the explanation of the past conflict, the painful memories lose their effectiveness as psychogenic agencies of mental disorders, the mind is at rest, the transference ceases, and the cure is complete.

As a *therapeutic method* of curing psychogenic mental disorders, Freud's psychoanalysis can boast of remarkable success. As a *psychology*, it is based on theoretical assumptions of very questionable validity. Freud overemphasizes sexuality. He underestimates the importance of intellect and will in human conduct. His theory of the instincts and of the censorship of the 'ego' finds little support in experimental psychology. His underlying philosophy is materialistic and hedonistic, making religion, morality, and social life the natural causes of neurosis.⁵

On the other hand, psychoanalysis has demonstrated the influence of mind over body and body over mind, has stimulated a greater interest in the early educational care of the child, and has forcibly brought to the attention of a biologicistic psychology that mental treatment can cure a large group of bodily ailments.

The workings of the normal consciousness and of the subconscious are still very obscure. Little by little, however,

the veil is being lifted, enabling us to cast more penetrating glances into the depths of the human mind.

Summary of Chapter XVII

One of the foremost phenomena of mental life is consciousness.

1. *Concept of Consciousness.* A strict definition of consciousness cannot be made, because it is an ultimate datum of mental experience. It is the state of our mind in which we find ourselves when we are *awake*. It is the same as *awareness*.

Consciousness has a *content*. The content includes all mental acts of whose presence we are aware in our waking state and the objects toward which these acts are directed.

2. *Field of Consciousness.* It is the sum-total of all items present in the consciousness of an individual at any given moment. The field is divided into the focus, in which objects or experiences receive maximal attention, and the *margin, fringe, or periphery*, in which objects or experiences are still noticed to some degree.

3. *Unconsciousness.* It is the absence of consciousness. We distinguish between *objective* and *subjective* unconsciousness. Something is 'objectively' unconscious, when it is devoid of the attribute of consciousness altogether; it is 'subjectively' unconscious, when it actually does not enter consciousness, though of itself it could.

4. *Subconsciousness.* Those mental items and processes are 'subconscious,' which are apparently of the same nature as the normally conscious items and processes, but of which the subject is not aware in the waking state. This mental state is termed *subconsciousness or subliminal*

consciousness. The waking consciousness is also called supraliminal consciousness. Man has a sensuous and an intellectual consciousness.

Many items of experience, too faint to be noticed by the waking consciousness, are recorded in the subconsciousness; they are 'split off' and dissociated from the supraliminal consciousness.

Indications of the existence of subconsciousness are: double trains of thought; sudden recall of forgotten memories; the execution of unfinished problems; automatic writing; hypnotic phenomena.

5. *Co-consciousness*. By this is meant any actual subconscious *idea* or *thought process*, unknown to the human subject when awake.

6. *Self-consciousness*. It is man's consciousness of his *self* or *Ego* as the subject and bearer of all the conditions and states affecting his being, particularly of consciousness itself. Not only are mental states and activities present in consciousness, but I myself, by an act of reflex cognition, know that they are present and know that they belong to me as *modifications of myself*. Through memory I am aware that the Ego is a single, permanent reality, distinct from the mental states themselves; existing through the years, the Ego is perceived to be *self-identical* at all times.

7. *The Seat of Consciousness*. Neither the cerebral hemispheres, nor the frontal lobes, nor the thalamus, nor the hypothalamus, nor the medulla can be considered to be the seat of consciousness. It is the *individual* who is conscious, with a dependence on the nervous system.

8. *The Function of Consciousness.* The function and purpose of consciousness is to enable man to perceive and interpret his surroundings, to make his past experience available for adjustment to the needs of the present moment.

9. *Disorders of Consciousness.* Disorders arise from organic or psychogenic causes. They are of various kinds:

Total loss: coma, concussion, swooning.

Partial loss: stupor, confusion, derealization, depersonalization, amnestic fugue; these occur without 'splitting' of the personality. In the cases of 'split personality' we have an abnormal condition of dissociation in which the same human mind manifests alternately two or more very different characters or 'personalities.'

10. *Psychoanalysis.* It is a method devised for the examination of the contents and mechanisms of an individual's mind, for the purpose of treating and curing mental disorders.

Chapter 18

EXTRANORMAL MENTAL STATES

FROM THE DAWN OF RECORDED HISTORY UP TO THE PRESENT DAY, the claim has been persistently made that some persons are gifted with mysterious powers, outside and beyond the range of the normal capabilities. Instances of 'premonition,' 'clairvoyance,' 'telepathy,' 'trance,' 'hypnotism,' and the like, are cited in support of this claim.

These phenomena are termed *extra-normal*, because they do not occur with everybody or at all times. They are *not abnormal*, in the sense that there is anything, so far as is known, strictly pathological about them. Some of them are definitely *supernormal*, such as clairvoyance and telepathy; or so at least it would seem. Other phenomena, such as the mysterious workings of the hypnotic state, do not appear to be 'supernormal,' but they certainly do not belong to the 'normal' experiences of everyday life; they are, therefore, at least 'extra-normal.' The word 'extra-normal' can thus be used as a convenient term under which to group these exceptional experiences.

These extra-normal phenomena will be discussed under two main headings: *hypnotism* and *extra-sensory perception*.

Hypnotism

We can describe *hypnotism* or *hypnosis* as a trance-like nervous condition resembling sleep, induced by the suggestions and (or) manipulations of the operator ('hypnotist'), the hypnotized subject remaining in mental communication ('rapport') with the operator and responsive to his suggestions.

The hypnotic state is usually characterized by alterations of the character or 'personality' of the subject, together with changes of the functions of memory and of perception.

Hypnotism, except for the name, is nothing new. The trance state, so noticeable in the hypnotic condition, was known in antiquity. Pliny, Galen, and Aretaeus discussed the subject. Paracelsus attributed it to a force or fluid emanating from the stars, comparing it to the magnet and calling it *magnate*.

It remained for *Anton Mesmer* (1733—1815), a Viennese physician, to bring the phenomena into the focus of scientific inquiry. He supposed the cause to be a universally diffused fluid, set in motion by the will. He gave it the name *animal magnetism*, because he considered it to be analogous to that of mineral magnetism but peculiar to organisms or animal bodies. Different kinds of inanimate bodies, such as metals, crystals, and magnets, according to his view, also possessed this force or fluid, so that they could be used to induce and terminate the phenomena. In 1778 Mesmer came to Paris and publicized his views. The sick flocked to him in large numbers, and he effected numerous cures with his novel method. The French Academy

investigated the matter through a commission and attributed the phenomena to imagination or imitation. 'Magnetism' or *mesmerism*, as it came to be called, soon had a number of adherents, among them the Marquis de Puységur, who discovered the phenomena of somnambulism. Mesmerism dropped out of vogue during the French Revolution.

Abbé Faria, about 1814, revived hypnotism. A true pioneer of science, he discarded the theory of a 'magnetic fluid,' showing that the phenomena were attributable to the power of *suggestion*. Nothing, he maintained, comes from the operator, everything from the subject; at bottom, the magnetic trance is nothing more than a form of sleep, the condition often being induced by fixedness of look and cerebral fatigue; the phenomena are produced through the action of the subject's imagination in response to the suggestions of the operator. These acute observations aroused considerable interest among scientists for a time.

James Braid (1795—1860), of Manchester, took up the matter (1841). He became convinced that the phenomena were a result of a *mental concentration on a single idea*. Fixed gazing, the concentration on a real or imaginary object, and so on, produced what he called mono-ideism, while in the normal waking state man's attention is divided among a number of things. The fixed gaze, he contended, brought on a paralysis of the frontal brain, thereby producing trance and somnambulism; in this manner the subject lost the power of neutralizing the dominant idea and fell under the power of suggestion. Later on, Braid realized that the theory of mono-ideism was too narrow in

scope, because he noticed that several phenomena (psychic deafness and blindness, rigidity, anesthesia, etc.) could be present simultaneously. He called this trance condition 'neur-hypnotism' (nerve-sleep), and from his designation the modern term *hypnotism* derives its origin.

From this point on, hypnotism became an object of intense scientific study. Two schools of thought in France did much to bring hypnotism to the foreground through a heated controversy on the fundamental nature of hypnotism. These were the *Salpêtrière School of Paris*, headed by Charcot, and the *Nancy School*, represented by Liébeault, Beaunis, Bernheim, and Liegois.

Charcot (1825—1893) and the *Salpêtrière (Paris) School* explained hypnotism in terms of *nerve physiology*. Charcot made his experiments with patients afflicted with hysteria. To induce hypnosis, he made use of a bright light or a sudden sound; he also made the patient stare fixedly at some object. Correspondingly, he considered the inducing cause to be physical, not mental, and hypnosis itself due to a nervous or cerebral modification of the subject. Hypnosis, therefore, Charcot and his followers claimed, is a pathological condition, a neurosis, a form of hysteria; consequently, there is a profound difference between normal sleep and hypnotic trance. Since hypnosis is a condition induced by purely physical means, Charcot contended that a person might be hypnotized, as it were, unknown to himself.

Bernheim and the *Nancy School* took a diametrically opposite view. Hypnosis, according to this view, has but a single cause, and it is a *psychical* cause, namely, *suggestion*;

suggestion is the only essential factor. Everybody is suggestible; to suggest to a person to be more suggestible, that is neither more nor less than hypnotism. Consequently, no fundamental difference exists between normal and hypnotic sleep. The state of normal suggestibility is simply increased by the action of suggestion itself, because every idea has the tendency to actuate itself. Hypnotic phenomena are very similar in character to many normal acts; even under normal conditions we perform acts which are *automatic, involuntary, and unconscious*.

The controversy between these two schools attracted the attention of the entire scientific world. It gave a tremendous impetus to the experimental research into the phenomena in question and into the methods of inducing and controlling them. Many interesting facts were brought to light, so that our present knowledge of hypnotism is quite extensive.

The Phenomena of Hypnotism

The phenomena which occur in the hypnotic state are many and varied. Some are psychological, others physiological.

PSYCHOLOGICAL PHENOMENA

Consciousness. The hypnotic condition may be light or deep. Light hypnosis is, at times, hardly distinguishable from the normal waking state. There are many degrees and stages in hypnosis, shading imperceptibly from the nearly normal waking state to deep hypnosis. In deep hypnosis,

the subject is in a trance and apparently, though not actually, asleep. Generally speaking, the subject is, to a lesser or greater degree, *always conscious* in hypnosis. Even in deep hypnosis the subject hears the voice of the hypnotist and carries out suggestions. Hypnosis, therefore, can be said to be a mental state which lies between ordinary sleep and normal waking. The hypnotized person is more conscious than in sleep, but less conscious than in the waking state.

Suggestibility. Everybody is suggestible in some measure. We see someone yawn, and we also yawn; we hear an orchestra play a tune, and our feet tap the rhythm; we observe a person staring at a certain spot, and we involuntarily do the same: such and similar actions are the result of 'suggestion.' The inclination or tendency to carry out a suggestion is termed suggestibility.' In hypnosis this suggestibility is increased and heightened, so that the hypnotized person carries out the suggestions of the operator with greater facility and readiness than in the normal waking state.

Rapport. A mental alertness exists in the subject toward the suggestions given by the operator. When the subject is in a state of deep hypnosis, he will respond to the operator's suggestion, no matter how slight, whether it be expressed by word or sign. As a rule, the suggestion is carried out without opposition. At the same time, the subject is, to all appearance, totally oblivious of his surroundings, paying no attention to the presence or suggestions of other persons, unless ordered to do so by the operator. Provided rapport has been established through

definite suggestion, the subject will remain in mental contact with the operator, responsive to his voice, even after an interruption of hours or days. If, for any reason, this rapport is broken during deep hypnosis, the subject passes over into a state of normal sleep, to awaken later of his own accord, just as he would in ordinary sleep.

Memory. Memory is affected by hypnosis, but the change, if there is a change, depends on a number of factors — the personality of the subject, the kind of suggestion given by the operator, and the depth of the hypnotic state.

Sometimes memory remains *unchanged*, particularly in light hypnosis. The subject then remembers in hypnosis everything that has occurred in the waking state and also remembers everything in the waking state that has occurred in hypnosis. Furthermore, the operator can suggest that the subject shall remember in the waking state what has occurred in hypnosis.

During deep hypnosis, however, there ordinarily occurs a *change of memory*. In deep hypnosis the subject is able to recall the events of his normal waking life and also the events of former hypnoses; on waking, however, the events occurring in the hypnotic condition are forgotten, especially if posthypnotic amnesia has been suggested. It is a controverted point whether a subject in the waking state can recall, either by reflection or chance association, something which has occurred in deep hypnosis, if the operator has suggested complete amnesia. The trance of deep hypnosis, characterized by complete posthypnotic amnesia, is called 'somnambulism.'

Upon suggestion, the subject can be made to forget selected events of the normal waking life and also events of a former hypnotic state. This amnesia can again be abolished through counter-suggestion. For example, it may be suggested to a person who knows German that he be unable to speak it on awakening; he will not be able to use the language on returning to the normal waking state. In all probability, however, this condition will not be permanent, unless reinforced periodically by renewed suggestions. One must bear in mind, too, that the willingness of the subject is presupposed and required; a subject can always resist things disagreeable to himself and refuse to have items blotted out from memory.

Increased memory is a common phenomena associated with hypnosis. Many items can be recalled in the hypnotic state which are unavailable for memory in normal life. While the earliest remembered incidents of an individual's life history ordinarily date from about the sixth or fifth year, the subject, when hypnotized, is often able to remember events pertaining to the fourth and third year. All events are remembered with greater fullness of detail than is possible under normal circumstances. It was this fact which led the way to psychoanalysis. Memorizing is much easier in hypnosis than in the waking state. After a single reading, difficult prose passages or verses can be retained and, upon suggestion, be repeated later when out of hypnosis.

Post-hypnotic Suggestion. By 'post-hypnotic suggestion' is meant a suggestion given during hypnosis, but to be carried out by the subject after hypnosis has been terminated. The operator, for example, may suggest to the

subject an abhorrence for liquor or tobacco after awakening and, if the subject uses either, an attack of vomiting; after hypnosis is terminated, the suggestion will be carried out. Again, during hypnosis, a point of time may be specified in the normal waking state for a certain phenomenon to manifest itself; at the appointed time it will occur. The suggestion, for instance, may be given to the hypnotized subject that, one hour after being awakened, his leg will feel lame and he will walk with a limp for ten minutes; the lameness will appear at the specified time, and the subject, due to post-hypnotic amnesia, will be unable to account for the fact. Not all persons are post-hypnotically suggestible, but practically all subjects in deep hypnosis are capable of carrying out this type of suggestion.

Another very interesting and mysterious phenomena of hypnotism is that of *post-hypnotic appreciation of time*. In order that a certain act be performed at a specified future moment, it seems evident that some sort of time calculation must be made by the subject. Many experiments have been made involving time appreciation and time calculation. The subject was told, for example, to perform a simple act after 300, 450, 700, 1500, etc., minutes; post-hypnotic amnesia was suggested, and the subject awakened immediately. No clock or watch was allowed to be seen by the subject, so that the subject had no starting point for the calculation of time. The operator himself did not know at what time of the day or night the act would be due. In most cases the suggestion would be carried out correctly, though there was a deviation of a few minutes in some instances. Sometimes the subject resisted the impulse, because the

act seemed senseless and ridiculous; but the impulse itself was present at the appointed time. J. Milne Bramwell¹ made a series of 55 experiments with one subject, telling her to make a cross on a piece of paper with a pencil and write down the time of the writing without consulting a watch or clock. The time element varied, of course, in the different experiments. On one occasion, the subject was ordered to make the cross and write the time after 21,434 minutes. Forty-five experiments of the series were carried out successfully; in one experiment the performance occurred five minutes too soon; in the remainder, one to two minutes too soon. On being re-hypnotized and questioned as to the method of calculation employed, she informed him that at the time of the suggestion she made no calculation and did not remember the suggestion in the waking state, but that at a specified moment she felt an impulse to take paper and pencil and experienced the idea of making a cross and writing certain figures, without looking at a clock or watch while doing so. Other experimenters have encountered the same situation. The subjects do not seem to know just how they estimate and calculate the time.

Change of Personality. By means of suggestion, the hypnotist can modify the personality of the subject to a great extent. He can make the subject relive the developmental stages of his past life, so that the subject will think, speak, write, and act like a person of 5, of 10, of 15, of 20 years, and so on. Similarly, at the command of the hypnotist, he will assume the character of a general, a lawyer, a salesman, a preacher, a woman, a dog, a lion, etc., and do his utmost to play the role assigned to him. These

hypnotic 'personalities' may become so distinct and pronounced, that the one has apparently no knowledge of the other.

Automatic Writing. As a result of post-hypnotic suggestion, the subject in the waking state can be made to read aloud from a previously unknown book and simultaneously write out a discourse of some kind at the same time. The subject knows and remembers what was read, but has no waking knowledge of what was written. When re-hypnotized, the subject recalls the mental processes involved in the writing.

Physiological and Sensory Phenomena

The Muscular System. The *voluntary* muscles are affected by suggestion. The operator, through suggestion, can produce a marked increase in muscular power and activity. The subject can lift weights much heavier than he is capable of lifting under ordinary conditions. The operator can also suggest functional paralysis of the muscles. The entire body may be made rigid as a board, and this rigidity can be maintained for hours without apparent fatigue.

Even the *involuntary* muscles and the *vasomotor* system are affected by suggestion. The rate of respiration and of the pulse can be increased or decreased. Nose-bleeding has been obtained. Defecation, urination, perspiration, the shedding of tears, and other secretory functions, have been successfully suggested. It is claimed that blistering of the skin can at times be suggested.

Normal *sensibility* can be *increased* to a remarkable degree in hypnosis. One subject could read print reflected in the operator's eye. Attendants in mental hospitals have been hypnotized and their hearing sharpened, so that the slightest sound coming from the patients would be perceived, even though the attendants were asleep. Very minute differences in weight or temperature can be clearly distinguished. After a meal, hunger and thirst can be suggested, so that the subject will eat a second meal with relish.

Just as sensibility can be increased in hypnosis, so it can also be effectually *decreased, inhibited, and changed*. Blindness, color blindness, double vision, deafness, change or loss of taste and smell, can be produced temporarily. Hunger and thirst can be alleviated and even removed. If the operator suggests anesthesia, the subject loses the sensation of touch; if he suggests analgesia, the subject no longer experiences pain. In such cases, the subject will not notice the thrust of a needle or of a knife through his flesh. Surgeons have performed operations on hypnotized subjects; Esdaile excised a very large tumor from a man and amputated a woman's leg below the knee.

The production of *sensory hallucinations* in hypnotized persons is a common phenomenon. They can be made to see, hear, taste, smell, and feel practically anything the operator desires. The imagination produces images so vivid that to the subject they appear as real objects actually perceived. These hallucinations may be either positive or negative. If, for instance, the subject sees an article, and if the operator then suggests that a second article is placed in

front of the former, hiding it from view, the subject will see the imaginary article and will not see the real article; this effect is a case of 'positive' hallucination. Or, if the subject sees an article and sees a second article being placed behind the former, and if the operator then suggests the first article away, then the first article will (apparently) vanish, so that the subject sees the article hidden behind it; this effect is a case of 'negative' hallucination. Hallucinations can also be post-hypnotically suggested, so that the subject, upon awakening, will see an imaginary cow or hear an imaginary orchestra, etc.

When suggested by the operator, a subject will temporarily experience *feelings* (pleasure, displeasure) and *emotions* (fear, piety, anger, joy, disgust, etc.). Some types of *mental disorders* have been successfully treated by suggestion, particularly phobias; where complete cures have not been effected, improvement has often been obtained.

Criminal Acts and Hypnotism

Are hypnotized persons mere automatons, completely under the control of the hypnotist, so that they are irresistibly compelled to carry out his commands? If the hypnotist suggests a criminal act, such as theft, murder, arson, adultery, etc., *must the subject obey, or can the subject resist?* Liébault, Bernheim, and Beaunis, of the Nancy School, were convinced that subjects, while in the hypnotized condition, could be induced to commit crimes. Delbeouf, Bramwell, and most experimenters deny it.

In the course of time, extensive experiments have been made along these lines, and a number of facts have been established which have an important bearing on this problem.

Hypnotized persons are not mere automatons. The hypnotic state does not place them under the absolute control of the hypnotist. They do not lose the essential use of reason and will. They can and do resist suggestions; they can and do refuse to carry out orders. They act in this manner not only when the suggestions are morally offensive, but also when they are innocuous and indifferent. Many instances are on record where subjects have refused to obey out of sheer *whim* and *caprice*. Oftentimes subjects will not co-operate, although they are aware, as they themselves admit, that it is only an experiment, a 'laboratory crime'; it offends their *moral sense* to do something which they know is nothing more than an 'imaginary crime.'

It is true, of course, that subjects have been induced to perform 'laboratory crimes,' such as stabbing someone with a rubber or cardboard knife, putting poison (sugar, suggested as arsenic) in another's coffee, and so forth. These instances, however, prove nothing, because the experimenters were reputable men, and the subjects placed their trust in them, confident that a real crime would never be suggested.

Are we to conclude that no *real crimes* have ever been committed by subjects under the hypnotic influence of unscrupulous operators? It would indeed be rash to deny either the possibility or the fact of the commission of

genuine 'hypnotic' crimes. Forel, after an examination of the pertinent material, comes to the conclusion that normal persons can always resist criminal suggestions, but that the childish, the psychopathically inferior, and the ethically weak and defective person, lacking moral balance and resistance, can be induced to commit real crimes through suggestion. Schrenk-Notzing and others agree with him. Forel's opinion is, in all probability, the correct answer to the question. Virtuous persons cannot be compelled to commit, or to consent to, suggested crimes. It is not quite clear whether the operator, because he possesses their confidence, could break down their resistance by persuasion or false information. If, however, the criminal suggestion agrees with the principles, dispositions, and habits of the subject, it will probably be carried out.

Theories of Hypnotism

Leaving out of consideration the obscure opinions of the ancients and beginning with the views of Anton Mesmer, a number of theories have been advanced as an explanation of the *nature of hypnotism*.

Magnetism. Mesmer and his followers considered the cause of hypnotic phenomena to be *physical*, namely, 'animal magnetism,' 'magnetic or vital fluid,' 'od or odylic force.' Scientists have been unable to discover any such force or fluid. The theory is crude and primitive, and it is totally discredited.

Suggestion. Abbé Faria looked for the cause in *suggestion*, maintaining that everything comes from the

hypnotized subject, not from the operator. So far he was correct. The operator merely directs the course of events; the phenomena originate in and by the subject at all times. Whatever happens has its cause in the subject's own nature. Suggestion, however, is not really the 'cause' of hypnotic phenomena; it is merely the 'signal' which sets the cause in action.

Mono-Ideism. Braid's theory of mono-ideism points out the fact that there exists a considerable narrowing of consciousness in the hypnotized subject, and subsequent experiments have verified his contention. He was wrong, however, in restricting the concentration of consciousness to one single idea. He realized his error and later rejected mono-ideism, because it is possible to have more than a single hypnotic effect present at any given time. He advanced the understanding of hypnotism by stressing its *psychic character*.

The Salpêtrière School. According to Charcot and his followers, hypnosis is an artificially induced neurosis, and it can be produced only in persons suffering from *hysteria*. Since about eighty to ninety per cent of adults can be hypnotized, the vast majority of persons should be hysterical, which is not true. Soldiers, sailors, and students can readily be hypnotized, because of their habitual attitude of accepting commands (suggestions), and they are not hysterical. Charcot was also mistaken when he claimed that persons could be hypnotized by *purely physical means* and unknown to themselves. Hypnosis demands the co-operation of the subject, because hypnosis is primarily a

psychical affair and the subject is the principal agent in the production of all phenomena.

The Nancy School. Bernheim and his associates saw no real difference between *natural sleep* and the *artificial sleep* of hypnosis. A considerable difference, however, exists between the two states. Consciousness is responsive to the suggestions of the operator in hypnosis, but is not alert in natural sleep. Hypnosis lacks the haphazard character of dream states. Hypnosis tends to act out the suggestions of the operator externally, something rarely found in natural sleep. Bernheim also maintained that the hypnotized person is a mere *automaton*, without self-determination. The actions of the hypnotized subjects are, to a certain extent, automatic; but the subject is not thereby deprived of the power of self-determination, if he desires to use it. Hypnosis, the Nancy School asserts, is essentially *increased suggestibility*, and the increase is produced by suggestion itself. Increased suggestibility, however, is merely a symptom of hypnosis, not its essence. Suggestion and increased suggestibility do not explain the profound *physiological and psychical changes* which occur in hypnosis. Increased suggestibility seems to be rather the result than the cause of these changes. The real nature of hypnosis must lie deep down in the nervous and mental constitution of the subject.

The Subliminal Mind. F. W. Myers, William James, and many others sought the explanation of the mystery of hypnosis in the 'subliminal mind.' Most of these authors look upon the subliminal mind as a mind *distinct* from, and *independent* of, the normal, supraliminal mind, having

vastly more complex and accurate processes of mental activity than are found in the mind of the waking state. The subliminal mind is a fully developed 'self,' superior to the supraliminal self.

This theory is *inadequate*, because it fails to account for all facts.

Granting, for the sake of argument, the existence of such a secondary or subliminal mind as the agent of hypnotic phenomena, the *appreciation and calculation* of time in certain post-hypnotic experiments receives no proper explanation. As a rule, the subject, even when re-hypnotized, has no memory of the calculation and has *no knowledge* of how the calculation was made. In other words, the subliminal mind itself is unaware of how the phenomenon was produced. Hence, a third or fourth mind must be postulated. In as much as psychologists have distinguished as many as a dozen and more 'personalities' in one individual in various phases of hypnotic experience, consistency demands that we postulate the same number of subliminal minds or selves; but such a postulate seems unreasonable.

The distinction between these 'minds' or 'selves' is based on the distinction between *alternating consciousnesses* and *alternating memories*. The one consciousness is supposed to be altogether different from the other or others, and the one memory altogether different from the other or others. This difference, however, is not as great as is usually assumed. These consciousnesses and memories are not mutually exclusive, but overlap. As a matter of fact, a definite *bond of unity* runs through all the hypnotic

phenomena of an individual. The knowledge and use, for example, of *language* is preserved and remembered in all states and stages of hypnotic experience, particularly if the subject knows and uses but a single language. As a rule, too, the subject retains his general knowledge of persons, objects, localities, etc. Such facts are evidence for the *essential identity of memory* and *consciousness* in every individual. It takes more than changes of moods and alternating groups of memory items to constitute distinct minds and selves in a person.

Dissociation. Most modern psychologists find the cause of hypnotic phenomena in 'mental dissociation.' Joseph Jastrow² is representative of this group. Here is his line of thought.

Man's normal waking consciousness is characterized by the close and full association of his various faculties (senses, imagination, memory, intellect, will, etc.) and their activities. Normal experience is the result of three particular activities or 'privileges,' namely, incorporation, orientation, and initiative.

When we have a sense impression of an object and are aware of it, we give it a place among our conscious perceptions; this process is termed *incorporation*. We are conscious at the same time of the relative position of this object among the other objects of the physical world. Thereby we adjust ourselves consciously to the outside world; the resulting adjustment is *orientation*. Ordinarily, our mental experience is such that we control and direct our ideas, perceptions, imaginings, etc.; in other words, we have *initiative*. The joint, associated, normal functioning of

incorporation, orientation, and initiative constitutes our normal waking state. When any of these activities are interfered with, impaired, or absent, we speak of a *dissociation*. The effect of dissociation is a subnormal or abnormal mental state. Instances of subnormal states are sleep, profound distraction, dreams, etc.; instances of abnormal states are hysteria, somnambulism, intoxication, insanity, etc.

Impairment of the 'incorporative' activity makes us partially or totally unaware of our surroundings — *psychic anesthesia*. We observe this state in hypnosis. The subject actually sees, hears, and feels things; but due to suggestion, he excludes the visual, auditory, and tactual images from his conscious experience and treats them as if they did not exist. Double personality arises, when the mind abnormally concentrates its attention on one group of experiences, thereby failing to incorporate this group of experiences into the normal stream of consciousness.

Impairment of 'orientation' brings on a partial or total inability to distinguish between imagined and objective reality. A person so afflicted lacks the corrective influence of external impressions on the workings of the imagination and accepts the images of the imagination as objectively real, as it happens in dreams. *Hallucinations* result from impaired orientation.

Thus, in hypnosis, the suggestions of the operator, due to a restricted and narrowed consciousness, are not offset by corrective judgments based on external perception and consequently are taken for objective reality. When this impairment is profound, so that one group of memory

images is split off from the rest, there may arise the hallucination of distinct empirical 'selves' in the same individual, and then we speak of 'double personality.'

Impaired initiative, since it involves partial or total lack of personal control and direction, leads to *imperative impulse and enforced action*. A person with impaired initiative readily responds to an impulse imposed on the will by an outside agent. We observe this condition in hypnosis, where the operator's suggestions control and direct the actions of the subject. A marked impairment of initiative, together with an impairment of incorporation and orientation, is generally present in 'double personality.'

The impairment of one or the other or all of these human 'privileges' is present in all cases of mentally subnormal and abnormal conditions, ranging all the way from absentmindedness to permanent insanity.

The theory of dissociation has the advantage that it preserves the essential *unity and identity of the mind and self* and avoids the improbabilities of the subliminal mind theory mentioned above. It does not, however, give a complete explanation of the mystery of hypnosis. What happens in the nervous system, particularly in the cortical centers of the brain, when there is an impairment or disturbance of incorporation, orientation, and initiative? And how can the willingness of the subject and the suggestion of the operator produce such a profound impairment or disturbance? Therein lies precisely the mystery of hypnosis, and a mystery, it seems, it will always remain.

Among the various theories advanced in the course of the history of hypnotism, that of *mental dissociation* is the most promising. It agrees best with the findings of psychology in other fields of research.

The state of mind with the closest resemblance to hypnosis is the state of mind operative in *sleepwalking*. In sleepwalking (ordinary somnambulism), the mental images arouse the motor centers of the brain into carrying out bodily actions according to a fixed plan or idea (auto-suggestion). In hypnotic somnambulism, the images producing bodily action come from the suggestion of the operator (hetero-suggestion). The underlying mental mechanism is undoubtedly the same in both cases.

Extra-Sensory Perception

The problem of *extra-sensory perception* is a much-discussed question. 'Extra-sensory perception' is defined as a perception obtained through channels other than those of the known senses. Psychologists speak of the extra-sensory perception of *objective* events, i.e., knowledge of objects or occurrences not obtained from another mind, and of *subjective events*, i.e., knowledge of objects or occurrences obtained from another mind. The extra-sensory perception of objective events is termed clairvoyance, while the extra-sensory perception of subjective events is termed *telepathy*.

The distinction between clairvoyance and telepathy can be clarified by a simple illustration. A playing card, picked at random from a shuffled deck and no one having seen its face, is placed in an opaque envelope or box; the

clairvoyant person has the ability to name the card correctly, because he perceives the card as it is, although it is impossible to perceive it with the ordinary senses. A person thinks of a certain verse, without pronouncing a single syllable; the telepathic person, perhaps miles away, perceives what is going on in the other person's mind and mentions or writes down the verse correctly. In the first instance there is an extra-sensory perception of an external or 'objective' event (clairvoyance), and in the second instance an extra-sensory perception of a mental or 'subjective' event (telepathy).

Extra-sensory perception is such an extraordinary phenomenon that scientists, who as a matter of principle refuse to accept anything as a fact which cannot be verified by the senses in some form or other, derided its possibility. In the course of time, however, so many cases were recorded by reliable witnesses that the accumulated evidence could no longer be ignored. A number of eminent scientists thereupon founded the Society of Psychical Research in England in 1882. Prominent names are found on the roster of its membership; among them are Henry Sedgwick, the first president, A. J. Balfour, W. F. Barrett, Balfour Stewart, Edmund Gurney, Frederic W. H. Myers, Oliver Lodge, William Crookes, Lord Rayleigh, and Alfred Russell Wallace. Similar societies were established in America (1884) and other countries. These societies did heroic service in checking available material. The result of the investigation was a residue of fact which seemed to prove definitely the existence of clairvoyance and telepathy. After some time, the investigation was placed on an

experimental basis. Here, too, the result was positive. Some scientists became convinced, but very many were still skeptical.

THE DUKE EXPERIMENTS

In 1930 a group of psychologists of *Duke University*, inspired by William McDougall, head of the psychology department there, began a systematic experimental investigation of extra-sensory perception. These men were Helge Lundholm, Karl E. Zener, and Joseph B. Rhine. Their aim was to discover whether parapsychological ('unconventional,' extranormal) phenomena actually occur and to find an explanation for their occurrence. The laboratory experiments were to be conducted with strictly scientific precautions, so as to exclude both fraud and unconscious sensory perception.

The method selected was 'card calling.' Zehner devised a set of cards with symbols — a circle, a cross or plus sign, a rectangle, a star, and three wavy lines. A pack consisted of twenty-five such cards, each symbol appearing five times in the deck. These are the famous 'Zener' or 'ESP' ('extra-sensory perception') cards. Since each symbol appears five times in the deck of twenty-five cards, the average chance of the symbols being called correctly must be one in five or one fifth of the total. A score considerably beyond this average, especially when the experiments run into hundreds and thousands, must be adjudged 'significant'; persistent high scores would furnish scientific proof for the existence of extra-sensory perception.

The experiments begun in the Duke Parapsychology Laboratory are now being conducted in at least a score of other universities. The methods vary. The technique, however, is similar. Neither the subject nor the experimenter knows the order of the cards. The subject must call the top card; his call is recorded, the card is placed aside, and the next card is called and recorded. After all have been called, the cards are checked with the record, to see how many 'hits' have been made. Or, a sample card of each of the five suits is placed before the subject, and he must match them by placing the cards of the deck in front of the five key cards in such a manner that the suits agree; none of the cards of the deck are allowed to be turned face up until the entire deck has been called. Only then are the hits and misses checked. Or, the five key cards, one of each suit, are placed face down, no one knowing their order; the entire deck is placed face down before the subject and he must match the unknown key cards with the corresponding cards of the deck. Or, a screen having been set up between the subject and the experimenter, the subject is required to call the cards of the deck hidden from him by the screen or he must match them with the key cards placed in front of himself; in no case does either the subject or the experimenter know the sequence of the cards until the experiment is finished. Or, the entire deck, face down, is set before the subject and, without disturbing or touching the deck in any way, the subject must call each card down through the deck; after all the cards have been called, the hits and misses are checked. Such are some of the standard types of experiments made to determine the presence of

extrasensory perception. Mechanical shuffling devices are sometimes used, so that no personal idiosyncrasy in shuffling can give the subject any sensory cues.

Naturally, only those persons are used for experiments who show signs of extra-sensory perceptivity. Once they are chosen, however, they are made to go through hundreds and even thousands of trials. The results of these trials, whether favorable or unfavorable, are recorded in detail, checked and double-checked, and filed away for reference. Utmost precautions are taken to prevent error, loss, or tampering. In this way scientific accuracy is obtained. The very simplicity of the method reduces the number of extraneous factors, which might vitiate the result, to a negligible quantity and makes mathematical evaluation a relatively easy matter.

Clairvoyance and Telepathy

Ever since the para-psychological laboratory of Duke University began its research in 1930, the number of tests made there and in other places amounts to far more than 2,000,000. What are the conclusions to be drawn from these experiments in extra-sensory perception?

The card-calling experiments just described are tests for *clairvoyance*, provided no one knows the actual sequence of the cards beforehand. If somebody knows the sequence beforehand, the possibility cannot be eliminated that the subject was able to 'read the mind' of the person possessing this knowledge and discovered the sequence in this fashion; that would be telepathy, not clairvoyance. But if no one

knows the sequence, it is evident that the subject must 'read the cards themselves,' in order to know their sequence; and this would be clairvoyance.

At present there can hardly be a reasonable doubt that *clairvoyance is a scientifically demonstrated fact*. According to all the mathematical laws and calculations concerning probability, the results are significantly above the level of chance. In some instances the odds against the results having been obtained by chance run into the billions and even much higher.

Averages of 10 or more hits out of a possible 25 are not uncommon; a score of this kind is far beyond the expected chance results, particularly when one considers the fact that these averages cover perhaps hundreds of tests for the same subject. Scores for individual tests sometimes run as high as 15, 20, and more. In more than one case the subject performed the astounding feat of calling all 25 cards correctly; on one occasion a child 12 years of age called all cards correctly.

While most card-calling tests were made in a manner which would either prove or disprove the existence of clairvoyance, a certain amount of tests were made by Rhine and his associates to discover instances of *pure telepathy*. In the very nature of the matter, such tests are far more difficult to control scientifically than those of clairvoyance. In telepathy the subject must be able to read the mind or thought of the experimenter; hence, nothing can be used that exists in printed, written, or spoken form, otherwise clairvoyance would not be positively and definitely excluded from the test.

While the number of tests made concerning pure telepathy are relatively meager, those made gave *positive results*. The experimenter would arrange in his thoughts a sequence of symbols to his own liking, and the subject would be asked to name the sequence. In order to insure scientific accuracy, the experimenter and the subject would be placed in different rooms or buildings. The procedure was regulated by a stopwatch arrangement. At the appointed time, the subject had to call the sequence, and his calls were recorded. After the time for the test had elapsed, the experimenter wrote down the sequence he had in mind during the test. Thereupon the subject's calls were checked against this list for hits and misses. In one series of tests, with Miss Ownbey (a staff member of Duke) as 'sender' and Miss Bailey as 'receiver,' Miss Bailey made an average of 9.7 out of 25 in 450 trials, both being in separate rooms; she also made an average of 12.0 in 150 trials, both being in separate rooms, a distance of something like 30 feet away. On one occasion tests were made by Miss Ownbey as sender and Miss Turner as receiver over a distance of 250 miles. The daily tests called for a run of 25 calls, to be made at a specified time, with five-minute intervals between each call. Miss Turner made an average of over 17 correct calls out of a possible 25 during the three-day period of the tests. More tests were made. While she did not achieve the phenomenal success of the first tests, her over-all average was 10.1 for the entire series. Tests made by other psychological laboratories have substantiated the findings of the Duke experiments.

The Nature of Extra-Sensory Perception

Accepting clairvoyance and telepathy as factual occurrences demonstrated by scientific methods, what is their nature? The first question which must be answered is: Are they fundamentally sensory or extra-sensory?

For some reason or other, many critics simply cannot conceive of extra-sensory perception as possible and insist that *sensory cues*, imperceptible to ordinary persons or under normal circumstances convey the necessary information to the clairvoyant and telepathic subjects. They are supposed to be gifted with 'hyperesthesia,' or in plain words, with extreme sensitivity to minute visual, auditory, or tactual stimuli.

This theory, however, does not seem to cover the facts. So far as *visual cues* are concerned, they are, to all appearances, definitely excluded. No doubt, each card has peculiarities which, if known, might serve as a visual cue for the symbol printed upon it. The circumstances of the tests, however, make such cues useless. All decks are changed frequently; new decks are introduced continuously. The decks, in most tests, are screened, so that the subject cannot see them. Many subjects have their backs turned toward the cards; some walk back and forth in the room during the tests; others close their eyes; others lie on a couch at some distance from the cards, etc. Considering the properties of light, since light is essential for vision, it should be physically impossible for subjects to obtain visual cues, when they are separated from the cards by rooms, walls, and buildings, or when the cards are placed in sealed

opaque containers. Blind-from-birth subjects have made significant scores, even when the cards were placed in opaque envelopes behind screens. In the 'down-through' tests, where the subject must call all cards down through the entire screened deck before the check is made, the cards beneath the top card are invisible to the eye, so that visual cues are excluded. Under the conditions surrounding the tests in modern psychological laboratories, the precautions taken against the use of visual cues are so stringent, that the sense of sight cannot explain the phenomena of clairvoyance and telepathy in an adequate manner.

It has been suggested that unconscious whispering on the part of the experimenter might give the subject *auditory cues*, so that clairvoyance and telepathy are nothing more than cases of supersensitive hearing. This theory supposes that the experimenter possesses the information in advance of the test. In many modern card-calling experiments, however, no one, not even the experimenter, knows the actual sequence of the cards until each card of the entire deck has been called by the subject. Auditory cues are simply impossible under such test conditions. Hence, clairvoyance and telepathy cannot be explained by the sense of hearing.

Tactual cues are also excluded in many of the methods employed in the tests. The subject, as a rule, is not allowed to handle or even touch the cards. Oftentimes, new decks are used in successive tests, so that the subject cannot associate any peculiarities of individual cards with the respective symbols. In the 'down-through' test, the subject

cannot touch, even if permitted to do so, any card but the one on top of the deck. In distance tests tactual cues are entirely absent, because the subject is nowhere near the cards.

Olfactory or gustatory cues can hardly come into consideration at all, and no one advances a theory based on them.

Some critics speak of a 'sixth sense,' but no such sense has ever been discovered. It is possible, even probable, that clairvoyance and telepathy have a sensory basis of some sort. The real question, however, is: Can these phenomena be explained as the results of sensory stimuli affecting the *known, recognized senses*, such as sight, hearing, feeling, tasting, smelling, etc? The evidence is against such an explanation. All indications point to the 'extra-sensory' character of clairvoyance and telepathy.

That clairvoyance and telepathy are *extra-sensory* in the meaning defined, is borne out by a comparison of this type of perception with that experienced through the channels of the ordinary senses. *Organic structures* act as organs of sensation in ordinary perception. Perception thus involves a definite *localization* of the respective stimuli and their effects in the nervous system of the body. Nothing resembling organs and definite localization has been observed in extra-sensory perception. The subjects are unable to specify any particular organ of the body as the reception center of their extra-sensory impressions. They simply know or do not know what the symbols on the cards happen to be.

Another important difference is the *angle* or *position of the objects* for the two types of perception. It seems to make no difference in clairvoyance and telepathy whether the cards be held edgewise or broadside to the person of the subject, whether they be flat or folded, whether they be near or far away, whether they be placed openly in the presence of the subject or screened by walls, whether the symbols be large or minute, etc. Such factors, however, influence ordinary sense perception to a large degree.

Furthermore, none of the recognized senses are capable of perceiving directly what *thoughts* or *images* are present in another persons mind; visual or auditory signs are required. No such signs are required in telepathy. Distance, too, seems to be no effective barrier between mind and mind in telepathic communication.

Finally, science enumerates the various kinds of *energy* which are the stimuli for the ordinary senses: light energy for vision, sound energy for hearing, chemical energy for smell and taste, mechanical energy for pressure, etc. But science, so far at least, has been unable to point out what kind of energy, if any, is the causal agency involved in extra-sensory perception. No known energy seems to fit the facts of clairvoyance and telepathy. Radiant energy appears to be the necessary stimulus. X-rays, radio waves, gamma rays, etc., have been advanced as a possible cause for the phenomena in question. However, all these types of energy lose efficiency through distance and are affected by intervening objects, conditions which seems to have no appreciable influence on extra-sensory perception. Besides, no wave theory seems adequate as an explanation of how a

'thought' can be transferred from one mind to another, as occurs in telepathic messages. Then, too, if waves or rays are the efficient cause, how does it happen that the waves or rays emanating from the mind or brain of the sender, located perhaps a hundred miles away, are received by the subject, while those emanating from other persons much nearer are not received? To say that these minds are 'attuned' to each other, is a facile phrase, but it is merely an analogy and explains nothing. We may as well face the fact that the science of physics can contribute little to our understanding of the nature of extra-sensory perception.

IS THEN EXTRA-SENSORY PERCEPTION A PURELY *INTELLECTUAL operation*? It does not seem so.

There is, without question, a close relationship between the higher mental operations and extra-sensory perception.

Judgment, volition, attention, and mental concentration are required for good results in both types of activity. And yet it would seem that clairvoyance and telepathy belong essentially to the sensory order of cognition.

Practically all experiments in clairvoyance and telepathy have objects and images as the materials which form the basis of the tests. Both types of perception seem to meet with the greatest success, when the experimenter attempts to 'send' geometrical figures, words, melodies, etc. Apparently then, the imagination plays the dominant role in clairvoyant and telepathic perception.

Again, whatever lowers the efficiency of the higher centers of the *sensory nervous system*, interferes with

extra-sensory perception. Illness and fatigue bring about a decrease in the scoring averages. A dissociating drug, like alcohol or sodium amytal, does the same. On the other hand, a stimulant, like caffeine, increases perceptiveness, when applied to a subject affected by drowsiness or fatigue. These facts are indications that a good state of nervous integration is required for successful work in extra-sensory perception.

Experiments in *psychometry* corroborate the view that clairvoyance and telepathy are of the sensory order. In experiments of this kind, an object is placed in the hand of the subject. Sometimes the subject is blindfolded; sometimes the object is in an opaque container; sometimes the subject is allowed to see and handle the object. In any case, the psychometrizing subject gives the past history of this particular object. The interesting feature about the whole matter is the fact that this history comes to the subject in pictorial scenes of the *imagination*. These scenes, perhaps indistinct at first, become clear, and then fade out, other pertinent scenes following in succession. Psychometry is a variant of clairvoyance, but a clairvoyance that reaches into the past. R. Tischner has conducted a number of such experiments and claims that they are genuine. Others have made similar experiments with the same results. If genuine, they bear out the hypothesis that clairvoyance is sensory in nature. And since modern experimenters are convinced that both clairvoyance and telepathy derive their origin from the same fundamental faculty, the conclusion is logical that all extra-sensory perception is essentially sensory in nature and not purely intellectual. According to all

indications, it is the *imagination* which is directly involved in extra-sensory perception. The images present in another mind seem to rise up spontaneously in the imagination of the subject.

In that case, though, what sort of energy acts as the stimulus for extra-sensory perception? We do not know. Like the states of hypnosis, extra-sensory perception is a mystery of the human mind. The facts are there, but no theory so far has been able to give us anything like a fair understanding of the phenomena of these extra-normal mental states.

Summary of Chapter XVIII

Hypnotism and extra-sensory perception are extra-normal mental states.

1. *Hypnotism*. Hypnotism or hypnosis is a trance-like nervous condition resembling sleep, induced by the suggestions and (or) manipulations of the operator ('hypnotist'), the hypnotized subject remaining in mental communication ('rapport') with the operator and responsive to his suggestions.

The phenomena of hypnotism have been explored by Mesmer, Faria, Braid, the Salpêtrière School of Paris, the Nancy School, and by many other scientists.

2. The *Phenomena*. Some are psychological, others physiological.

Psychological Phenomena. Consciousness is narrowed, but always present. Suggestibility is increased. The subject is always in *rapport* with the operator. *Memory* undergoes a change, especially in deep hypnosis. Most subjects are able to carry out *post-hypnotic suggestions* involving the mysterious power of time appreciation. Hypnotism is often accompanied by a *change of 'personality.'* *Automatic writing* is a common phenomenon.

Physiological and Sensory Phenomena. The muscular system can be affected by suggestion. Normal sensibility can be increased, decreased, inhibited, and changed. *Hallucinations* can be produced.

Criminal Acts. Hypnotized persons are not automatons; they do not lose the essential use of reason and will. They

can and do resist suggestions. If, however, the criminal suggestion agrees with the principles, dispositions, and habits of the subject, a crime may, in all probability, be successfully suggested.

3. *Theories of Hypnotism.* A number of theories have been advanced in explanation of the nature of hypnotism.

Magnetism. Mesmer's theory of 'animal magnetism' as a physical force is crude; no such force has ever been discovered.

Suggestion. Faria maintained that the cause of hypnosis is suggestion. It is not so much the 'cause' which produces the phenomena as the 'signal' which sets the cause in action.

Mono-Ideism. This theory of Braid cannot account for the fact that a number of hypnotic effects can be present at the same time.

The Salpêtrière School. The theory is erroneous because the majority of adults are hypnotizable, but are not hysterical.

The Nancy School. Hypnosis is essentially *increased suggestibility* produced by suggestion. This theory does not explain the profound physiological and psychical changes which occur in hypnosis.

The Subliminal Mind. The advocates of this theory postulate a duality of minds in man. The subliminal mind is supposed to be the source of hypnotic phenomena. Since cases are known in which a dozen or more 'personalities' have occurred in hypnotic subjects, one must logically conclude that

there are the same number of 'minds' present; such a view, however, seems preposterous.

Dissociation. Most modern psychologists find the cause of hypnotic phenomena in mental dissociation. Impairment or absence of incorporation, orientation, or initiative produce dissociation; its effect is a subnormal or abnormal mental state. This theory seems to give the best explanation.

No theory explains the profound changes which occur in the nervous system, particularly in the cortical centers, during hypnosis.

4. *Extra-Sensory Perception.* We understand by this term a perception obtained through channels other than those of the known and recognized senses. *Clairvoyance* is the extrasensory perception of 'objective' events; telepathy, of 'subjective events.

5. *The Duke Experiments.* Since 1930, the Department of Psychology of Duke University has made a systematic and scientific attack on the problem of extra-sensory perception. The method selected was *card-calling*.

6. *Clairvoyance and Telepathy.* In clairvoyance the subject has an extra-sensory perception of *objects*; in telepathy, of *thoughts* or *images* present in another person's mind. The results obtained for both clairvoyance and telepathy were definitely positive.

7. *Nature of Extra-Sensory Perception.* Sensory cues, of whatever kind, seem ruled out as an explanation, due to the precautions taken in the tests. Extra-sensory perception

differs from normal sensory perception in a number of important points: it has no recognizable organ of reception; the angle or position of the objects has no appreciable influence; no conventional signs are required to perceive the thoughts or images of another mind; no energy known to science seems to be the causal agency.

Extra-sensory perception, to all appearances, belongs to the *sensory order of cognition*. Tests in clairvoyance and telepathy succeed best when objects or images are the materials used in the experiments. Whatever lowers or heightens the efficiency of the higher centers of the nervous system also lowers or heightens the scoring average in extra-sensory perception. Experiments in psychometry corroborate this view, because the subject sees the past history of the object in pictorial scenes of the imagination. The imagination, it seems, is the internal sense directly involved in extra-sensory perception.

As in the case of hypnosis, extra-sensory perception is an obscure process, a mystery of the human mind.

Chapter 19

THE VITAL PRINCIPLE

THE SCIENTIFIC PSYCHOLOGIST IS SATISFIED WHEN HE HAS obtained and has given a scientific description and explanation of the psychical process. The philosophic psychologist feels the necessity of delving into the implications of human processes and arriving thereby at an understanding of the *nature* of man.

Agere sequitur esse, 'action follows the being (nature),' is a sound axiom. As a being *is*, so it *does*. The nature of a being determines what kind of action a being can and will perform. In accordance with this principle, the action of a being is a *manifestation of its nature*. Hence, from the type of action performed by a being, we can legitimately conclude to the underlying nature which is the root of its action. If the actions of various beings are specifically the same, the natures of these beings must be specifically the same; if they are specifically diverse, the natures must be specifically diverse. No other conclusion is logical.

Man, as we have seen, combines within himself the vegetative processes of the plant, the sensory cognition and appetition of the brute animal, and the intellectual and volitional activities peculiar to himself. These types of action

assuredly reveal man's nature. In order, however, to arrive at a real understanding of man's nature, it will be necessary to understand organic life in general.

Nature of Organic Beings

In attempting to explain the ultimate nature of organisms, a number of fundamental theories have found approval in scientific and philosophic circles in *the* course of time. The modern theories date from the time of René Descartes who is mainly responsible for the mechanistic explanation of organic bodies.

In general, *biological* mechanism is the application of atomism to biology. *Extreme mechanism* teaches that '*matter and force*' suffice to explain all bodies and activities. According to this theory, bodies are masses of 'matter' consisting of indivisible, inert, and immutable atoms. 'Force' is nothing more than incessant local motion pushing the masses of matter around. All bodies are mere aggregates of atomic particles passively affected by motion; as such, they are incapable of efficient causality, because they possess no powers of physical activity in virtue of their own intrinsic constitution. There can be, therefore, no real distinction between animate and inanimate, organic and inorganic, bodies.

In the field of biology, atomism is called *micromerism* or *merism* (Gr., μέρος, a part; μικρός small). The organic body is conceived as an aggregate resulting from the additive summation of cells, chromosomes, and genes; these particles, in turn, are mere aggregates of molecules, atoms,

electrons, protons, neutrons, etc. Extreme mechanistic *merism*, then, seeks to explain the organism by 'breaking down' the organic body into its smallest parts and by reducing all its activities to simple mechanical motion. In consequence, the organic body is not an 'integrated unitary being' but an 'aggregate' or 'colony' of individually autonomous particles; its unity is more apparent than real. All that is required to obtain a complete organic body, is to put the single parts together; the sum of all the parts adds up to an 'organism.'

Few biologists and philosophers in our day defend this extreme mechanical *merism*. Though they adhere to the additive concept of *merism* as a basic theory, they admit the existence of mechanical, physical, and chemical 'forces in material particles, together with efficient causality resulting from these forces. They advocate, therefore, a mitigated biological mechanism.

In opposition to *merism* (or *micromerism*), we find the theory of *holism* (Gr., *όλος* total, whole). This 'totality-theory' considers the organic body to be primarily an 'organized unit,' an 'integrated whole,' and this unit or whole is more than the mere addition and summation of its constituent parts. Over and above the activities of the individual parts, the organism performs activities which characterize it as a 'unit' or 'totality' and which cannot be reduced to the activities of the individual atomic and subatomic particles which make up the general structure of the organic body. In other words, the living body is not a 'machine' but an 'organism.' A machine can be taken apart and put together again, because a machine is nothing more

than the sum of all its parts. An organism can also be broken down into its respective parts, but then it dies; the reconstruction of the parts into the whole, if that were possible, will never produce a living organism, because the organism is more than the sum of all its parts. Hence, the theory of holism is also called *organicism*.

Many biologists and philosophers demand *something distinctly vital* in the organism to account for the structural and functional unity of the organism as a whole. The mere forces of inanimate nature and the mere organization of material particles, taken alone by themselves, do not give an adequate explanation of the nature of the organism. This theory is called *vitalism*. Some vitalists find this 'vital' element in a special kind of qualitative force or energy which is immaterial; others consider it to be material, but different from the ordinary mechanical, physical, and chemical forces.

Vitalism is often holistic, combining the structural and functional unity of holism with some kind of vital factor. Some vitalists, however, are at the same time merists; they accept the fundamental tenet of merism that the organism is ultimately the sum of its constituent parts, but add a vital element or factor or principle to the atomic or subatomic particles. Similarly, a holist need not be a vitalist; the non-vitalistic holist accepts the structural and functional unity of the totality-theory, but he admits nothing 'vital' as distinct from the ordinary inanimate forces.

Finally, according to the general teaching of *scholastic philosophy*, which is both vitalistic and holistic in the general meaning of these terms, that which gives life to an

organism and distinguishes animate from inanimate beings is a *vital substantial principle*. Matter and the vital principle are incomplete part-substances which, in their intimate and compenetrating union, constitute the *unitary living substance*.

We observe that these main general theories of life crisscross and overlap due to the fact that the starting-point for nearly all of them is biological mechanism. The *main theses of biological mechanism* are, *first*, that the organism is but the sum of its parts, i.e., it is essentially meristic, and, *second*, only mechanical forces are present in the organism, and living and nonliving matter are essentially identical. Holists and vitalists oppose either the first or the second thesis or both; some vitalists oppose only the second thesis or only that part of the second thesis which denies the difference between animate and inanimate bodies. Hence, the confusion and overlapping of theories.

Meristic Biological Theories

In general, we may divide the modern biological theories into *two main groups*, those advocating a form of merism and those advocating a form of *holism*. Each of these will be either *vitalistic* or *anti-vitalistic*.

Merism has its roots in the doctrine of atomism, materialism, and mechanism. These doctrines were in vogue among a number of Latin and Greek philosophers in ancient times and exerted their influence on modern biological theories.

Anti-vitalistic (Mechanistic) Merism

The first modern mechanist of importance was *Descartes* (1596—1650). His theory was a mixture of divergent views. The essence of all bodies, including organic bodies, is pure extension; this concept is mechanistic. Plant and animal bodies are not living; they are body-machines pure and simple.

External physical stimuli travel through these bodies by means of certain *spiritus animales* (animal humors or vapors), and the body movements result therefrom. Man's body is also a machine; but the spiritual soul is attached to it in the pineal gland at the base of the brain, and the body moves through stimuli or impulses received from the soul. The body itself has no life, nor is it an organized, integral whole vitalized by the soul; the soul alone really lives, is conscious, and has knowledge. Descartes, therefore, is a dualist, but also an antivitalistic, anti-holistic mechanist. P. Gassendi (1592—1655), J. A. Borelli (1608— 1679), H. Boerhave (1668—1738), and F. Hoffman (1660—1742) held similar views.

The *French empiricists* of the eighteenth century were entirely atomistic, materialistic, and mechanistic in their interpretation of life and living beings. Representatives of this group are J. de la Mettrie (1709—1755), P. H. d'Holbach (1723—1789), and P. J. Gabanis (1757—1808).

Toward the end of the eighteenth and in the beginning of the nineteenth century, vitalism came to the foreground. It seemed evident to many biologists that a radical difference existed between inorganic and organic bodies. On the other

hand, *chemistry* was placed on a sound scientific basis about the same time, and the mechanistic theory of life received a new impetus. Many biologists opposed the concept of 'vital force' and 'vital energy' and maintained that the general *physico-chemical forces* suffice as an explanation of the phenomena of life, even though a complete account of all organic processes cannot as yet be given. Among the group of scientists who upheld this general mechanistic view are J. C. Reil (1759—1813), J. Berzelius (1779—1848), F. Magendie (1785—1855), and C. Bernard (1794—1867).

The next period is that of *materialistic evolutionism*, brought on by Darwin's theory of general evolution. Extreme mechanism of a thoroughgoing materialistic type were propounded by T. H. Huxley (1825—1895), F. Büchner (1824—1899), J. Moleschott (1822—1893), K. Vogt (1817—1895), E. Haeckel (1834—1919), and many others.

Present-day biologists are more conservative in their views on the nature of organic life. Many of them, however, when given to theoretical discussions, advocate a *physico-chemical* interpretation of vital processes. They may admit that physical and chemical forces are inherent in matter and that some sort of 'efficient causality' exists in nature, but the general explanation advanced is that of a summative mechanistic merism.

Many biologists of our time recognize the fact that the *unity of the organism* is something unique and cannot be adequately accounted for by ordinary physico-chemical forces. They postulate the existence of certain *chemical units* which direct the organization of matter into an

organic whole and control its activities. The machine-concept, however, still prevails. Various names have been given to such hypothetical units as producers of 'life.' Among them we find the 'biogens' of Verworn, the 'idioblasts' of Hertwig, the 'biophorids' of Weismann, the 'pangenes' of de Vries, the 'organogenetic substances' of Wilson and Rable, and 'bioblasts' of Altmann, and the 'mitochondria' of Benda. At present, the tendency among such biologists is to identify these chemical life-producing units with the genes as the active agents of heredity.

C. Lloyd Morgan's theory of emergent evolution finds favor with a large number of modern philosophers. In the course of evolutionary progress, the theory states, some types of forces or beings arise or 'emerge' which are not the mere resultants of pre-existing forces; they are something new and unpredictable. Among these unpredictable 'emergents' are life and mind. 'Life' is thus conceived as a novel quality emerging from a special arrangement of nonliving matter, when the latter has arrived at a certain level of organization. The active forces, however, are still the ordinary physico-chemical forces operating in a fortuitous and mechanistic fashion, so that there is no essential difference between organic and inorganic bodies. Morgan's theory, therefore is a *moderate mechanism*, because it accepts no principle of vital activity distinct from material forces.

Vitalistic Merism

Vitalists all admit that organisms contain a *certain vital plus-something* which distinguishes organisms radically from inorganic bodies. Consequently, they attack the mechanistic position, maintained in the anti-vitalistic theories given above, which sees the difference between living and nonliving bodies to be a difference only of degree and not of kind. Meristic vitalists postulate some *special kind* of 'vital force,' 'vital energy,' or animate matter, to account for this difference; but they still cling to the concept that organisms are *meristic* in their constitution, i.e., they are the result of a mere additive summation of very small parts.

Old Vitalism assumed the existence of *vital energies* in the organism which do not belong to the order of mechanical, physical, and chemical forces of inorganic nature. 'Vital energy or 'biotic force' is responsible for the phenomena of irritability, sensibility, co-ordination and co-adaptability of living function and structure. It regulates and controls the physico-chemical forces active in the organic body; in many instances it opposes the action of these forces, whenever the latter tend to work against the welfare of the organism. The first to stress this vitalistic viewpoint in consistent fashion was A. Haller (1707—1777), although W. Harvey (1578—1657) had already postulated 'vital spirits' as operating in the medium of the blood.

Best known is the *School of Montpellier* as representative of Old Vitalism. According to M. Bichat (1771—1802), this vital or biotic force is immaterial and therefore not subject to physical laws. It acts in opposition to material force. The material forces active in the physical

world tend to disrupt and destroy the organism; the vital forces active in the organism oppose the destructive tendency of these material forces and tend to keep the organism alive. The theory is crystallized in the definition of life given by Bichat as 'the sum total of the forces that resist death.' This type of vitalism is ultra — spiritualistic.

Others have different views about the nature of this vital energy or force. J. B. van Helmont (1577—1644) calls it *archaeus*; C. F. Wolff (1733—1794), *vis essentialis*, 'essential force'; J. F. Blumenbach (1752—1840), *Bildungstrieb*, 'formative power.

Neovitalism, which arose in the latter half of the nineteenth century, differs from Old Vitalism mainly in this, that it considers vital energies to be subject to the general law of the conservation of energy.

J. Reinke, for example, maintains the difference between the organism and the machine and attempts to account for this difference by the presence of certain 'dominant forces or 'life dominants' which are immanent in living matter. Nevertheless, the meristic concept prevails. D. E. Cope and O. Lodge held similar views.

Some biologists claim that the vital forces existing in every type of organism are conscious, psychic factors; these conscious factors are present in every living cell. This theory is called psycho-vitalism; it is also meristic in character. Among the defenders of this theory or of a similar theory we find A. Pauly, R. H. Francé, G. Bunge, R. Neumeister, P. Jean, A. Wagner, E. Rignano, S. Butler, J. Ward, S. Eldridge, and others.

All these views, whether anti-vitalistic or vitalistic, are fundamentally meristic; that is to say, they consider the organism to be the result of nothing more than a *morphological aggregate* of cells, atoms, and subatomic particles and a *physiological summation* of partial processes. At most, the defenders of the meristic concept of organic life admit that efficient causality is at work, denying altogether the existence of anything like intrinsic purposiveness (finality, teleology) in the structure and function of organisms.

Holistic Biological Theories

Holists oppose the atomistic, meristic concept of organisms. Observation and experiment, they say, force us to admit that the organism is primarily and fundamentally a *whole, a unit, a totality*. The various parts of an organism are interdependent, and the organism as a whole dominates and directs the parts both structurally and functionally.

Most modern biologists are content to accept the wholeness of the organism as a scientific empirical fact and leave the matter rest at that. The philosopher has no quarrel with these scientists for restricting their discussions to empirical data. Many biologists, however, attempt an explanation of the unity manifested by the organism and thereby essay a solution of the nature of the unitary organism; they then leave the field of empirical science and become philosophers.

Philosophic holism, like philosophic merism, appears in two types, anti-vitalistic and vitalistic.

Anti-vitalistic Holism

Foremost among the advocates of anti-vitalistic holism stand the present-day *Gestaltists*, as represented by W. Kóhler. Kóhler and his followers look upon the organism as a Gestalt, a unitary being, which is dominated as a whole or totality by the pattern or configuration producing a harmonious interrelation of parts and functions, so that the whole is more than the mere sum of all of the structures and functions. In this contention the Gestaltists are undoubtedly correct. Nevertheless, according to these authors, there is no essential difference between a physical Gestalt, such as a system of electrical condensers with its resulting electrical field, and an organic Gestalt, such as is found in a plant, an animal, or a man. The same forces being operative in physical and organic unitary systems, inorganic and organic matter is essentially the same. Hence, this theory is mechanistic and anti-vitalistic; intrinsic finality is excluded from the organism. Somewhat similar views are held by M. Heidenhain, T. Haering, B. Fischer, H. Pxribam, and others. They are mechanistic holists.

Some holists, while rejecting the meristic concept of organic beings, find the explanation for the unity, individuality, and totality of the organism in the *subjective attitude* of our reason. Strictly speaking, our reason is constrained by its own subjective laws to view the organism as a purposive whole, but in reality the organism is devoid of all immanent finality; in its ultimate objective nature, the organism is conceived in mechanistic fashion. Advocates of

this view, though with individual differences, are M. Hartmann, H. J. Jordan, A. Meyer, and others.

It is an odd fact that these philosophic scientists recognize, on empirical grounds, the necessity of a holistic interpretation of the organism and yet refuse to accept some sort of principle or intrinsic factor to account for the 'whole-making tendency' observed in every organic being. They fail to see that a mechanistic explanation must inevitably end in merism.

VITALISTIC HOLISM

Vitalistic holism, as a general theory, stands in opposition to the mechanistic and meristic concept of organic life. It maintains the *specific difference between inorganic and organic beings* and seeks to explain the unity and wholeness of the organism by means of a *unifying vital factor or principle* distinct from the physico-chemical forces operating in the organic body. However, authors differ among themselves as to the nature of this vital factor or principle, and this difference gives rise to divergent theories.

J. S. Haldane must be classed among the vitalistic holists, but he seems to place the difference between the natural wholes, as found in inorganic and organic bodies, more in the attitude of the reasoning subject than in the bodies themselves.

Far more important is the theory of *Hans Driesch*. He was forced to relinquish the mechanistic viewpoint through his experimental studies on embryonic development. He

observed, when a newly-segmented egg of a sea urchin was halved, that each half developed into a complete individual half the size of a normal sea urchin. Reversely, when eggs were fused together, a single individual resulted from the fusion. Normally, of course, each half of the egg would develop into one half of the body; and each single egg would develop into a complete individual. The half-egg, however, and the fused egg possess the 'prospective potentiality' of forming the complete individual. Prospective potentiality is totally at variance with the machine-theory of the organism, because no machine, when halved, and no two machines, when united, ever show the least tendency to develop into a single machine. There exists a *purposive tendency* in the organism which far exceeds the inherent powers of inorganic matter and physico-chemical forces. No meristic summation of parts and processes can explain this fact. A distinct *vital principle* is required as a 'whole-making causal factor.'

Driesch calls this principle the *entelechy*, a term taken over by him from Aristotle; he uses the term, however, in an entirely new (and unwarranted) meaning. This entelechy, according to Driesch, has a reference to space, but does not exist in space; it is non-spatial, non-mechanical, and non-physical. Matter, in his view, is in no sense whatever the foundation of life. Life comes into the organism through the entelechy; the entelechy is non-material and supra-material in character. This Drieschian entelechy, then, does not combine with matter to constitute a unitary substance and nature, but is a non-spatial and supra-material something which controls the physico-chemical forces of inanimate

matter in the organism; organic matter is itself not 'living.' We have here a view which closely resembles Plato's horse and rider and Descartes' body-machine and soul.

In Driesch's theory, the entelechy is the formative agent which is responsible for the structural organization of matter. It is an operational principle; with Aristotle, it is primarily an entitative principle, the 'substantial form' or 'soul.' Besides the entelechy, Driesch accepted a directive principle, the *psychoid*, an organic factor which directs all vital processes according to specific needs of the particular organism and utilizes the physico-chemical energies of nature for the purposes inherent in the organism. Because of this *excessive dualism* in Driesch's theory, his entelechian vitalism fails to account for the evident unity and the individuality observed in organisms.

R. Woltereck calls the principle of unity the 'reactionnorm.' Similar to the entelechy of Driesch, it is an immaterial principle, and it possesses, even in the case of plants, fundamental psychic powers of knowing and willing.

According to J. von Uexküll, each cell is autonomous, a distinct unit for itself, a 'nerve-person.' Since the purposiveness of the organism is 'immaterial' and each cell is autonomous, the organism consists of matter and a number of vital immaterial principles.

A number of modern biologists call the principle of *unity hormé* (urge, drive), postulating its existence because of the purposive developmental evolution found in organisms. P. T. Nunn, W. McDougall, and C. von Monakov, among others, propounded the hormic theory of organic life.

The *élan vital* or 'life force' of H. Bergson is of a similar nature. It passes in creative evolution from one generation of living beings to another. This life force creates all species of living beings in the process of its evolution. All matter is thus endowed with an impetus of life.

These vitalistic theories represent a *functional* concept of organic life and as such fall short of a complete and adequate interpretation of organisms as unitary natures.

A number of biologists in the course of the history of biological science have demanded a vital principle which is an *objective immanent principle* as the factor responsible for the immanent purposiveness (finality, teleology) present in the structure and function of organic bodies. They are holistic vitalists who approach the hylomorphic theory of Aristotle and the scholastics in many points.

Among the older biologists belonging to this class are J. Stahl (1660—1734), C. Bonnet (1720—1793), and J. P. Muller (1801—1859). In our day, the immanence theory' is proposed by von Bertalanffy, A. von Gurwitch, P. Weiss, J. Schaxel, A. Putter, and K. Sapper.

Aristotelian-scholastic hylomorphism (Gr. *ύλη* matter, and *μορφή*, form), as a general theory of organic bodies, is vitalistic and holistic. It envisions the organism as follows. Every organism is a *unitary material substance*. This substance is composed ultimately of two incomplete substances or substantial part-principles, namely, *primordial matter* and the *vital principle*. The vital principle is also termed the substantial form or soul. Both part-principles are complementary to each other; together they constitute the *complete substance* of the plant or animal or

man. Primordial or prime matter is the *passive, determinable* factor, capable of being made into any type of specific body; it is the universal stuff of which all bodies, inorganic and organic, are made. The vital principle (substantial form, soul) is the *active, determining* factor in the organic body; it is the life-giving, organizing principle which 'informs' matter and builds it into the living body of a *specific type* of organism, for example, into an oak or a rose, into a dog or a snail, or into a man. Hence, all vital phenomena, present in any species of organism, proceed primarily from the vital principle. The real, fundamental *subject*, however, of all vital phenomena is neither the matter alone nor the vital principle alone, but the *substantial composite* of matter and vital principle. Both are united together in the most intimate union, thereby forming a single substance or *nature* which is the ultimate constitution of the organism and from which all structural developments and vital operations proceed. This 'nature' of the organism possesses an immanent tendency or purposiveness, typical of each species and particular for each individual, and it utilizes the physico-chemical forces present in the elements of the organic body to realize the inherent goal toward which it tends in virtue of its constitution. In as much as this theory is animistic (Lat., *anima*, soul), it is properly termed *vitalistic animism*.

Facts and Conclusions

In evaluating the facts of organic life, as revealed in biological research, we must not be swayed by any

preconceived scientific or philosophic theory. The facts must speak for themselves, and our conclusions must be based on these facts.

Perhaps the best way to arrive at a solution of the nature of organic life will be to examine the main theses of biological mechanism in the light of the discovered facts. There are, it will be remembered, two main theses; *first*, the organism is meristic, i.e., it is but the sum of its constituent parts; *second*, only mechanical (or physico-chemical) forces are present in the organism, and living and nonliving matter are essentially identical. The second thesis, it should be noted, consists of two parts.

IS THE ORGANISM MERISTIC?

Merism advocates the *machine theory* of the organic body. The summation of all the parts (subatomic particles, atoms, molecules, tissues, organs, etc.) accounts for all the structural and functional phenomena of what we call 'life.' There is nothing more to an organism than an aggregation of these parts and processes. This concept of the organism is *erroneous*.

The organism is *holistic* in its nature. A mere summation and aggregation would be similar to a heap of sand or a pile of bricks. Even a machine cannot be explained on the meristic basis of a summation of different pieces of metal. Consider the facts.

One of the most remarkable phenomena of the organism is its all-pervasive *unity of being*, manifested by the marvelous *co-adaptation of structure* and activity. Each

single cell possesses an intricately complicated structure. Some features of this structure are common to all cells, namely, the cytoplasm and the nucleus. So, too, every cell has functions which are the same as those of every other cell, namely, assimilation and dissimilation, growth and division. And yet, cells also possess individual and specific peculiarities, so that cells differ greatly among themselves. In multicellular organisms the cells group themselves into various kinds of tissues and organs; and these tissues and organs perform activities distinctively their own, over and above the general functions of their cells as the biological units of life. Again, cells, tissues, and organs group themselves into the higher unity of the *organism as an individual being functioning as a whole*.

The single cells, tissues, and organs are endowed with a certain *autonomy and individuality*. Each cell, as we know, has its own cycle of proper functions, the result of the activities of its various structural parts. In plants, the roots, trunk, bark, leaves, and blossoms have separate functions, so that each part is a unit in its own right. In animals, the bones, muscles, skin, glands, afferent and efferent nerves, sensory organs, and the brain manifest autonomy and individuality of structure and function; the stomach, for example, digests, the muscle contracts, the salivary gland secretes, the eye sees, the tongue tastes, etc. Yet all these types of apparatuses, notwithstanding their distinctive structures and functions, are not isolated and independent, but *interconnected and interdependent* as parts of the organism as a whole; and this interrelationship of whole and part constitutes the 'organization' of the organism.

Everything in the organism conspires toward the co-adaptation of all parts in the construction of the organism as a supreme unit. The autonomy and individuality of the cells, tissues, and organs is only *relative*, both in structure and in function.

The supreme law which governs the structure and functions of cells, tissues, and organs is the *need*, the *exigency*, of the type of organism of which they are the subsidiary parts. What kind of food material shall be digested and assimilated, depends entirely on the nature of the organism; the same kind of grass will be transformed into the flesh of a cow, a horse, a sheep, or an elephant, according to the needs of the animal that eats it. How far the reciprocal relationship of all parts of an organism reaches, can be seen from the fact that an expert zoologist can deduce, with a fair degree of certainty, the complete organism from a single typical organ or part. As an illustration, Milne-Edwards deduces the characteristics of a carnivorous mammal from its teeth. The teeth are such that the animal can eat flesh meat. The entire digestive apparatus must be of such a character and arrangement that flesh meat can be digested and assimilated; it will, therefore, deviate considerably from the structure of the digestive apparatus found in herbivorous mammals. In order to obtain flesh meat, the carnivorous animal must be able to capture its prey; hence, its muscular apparatus must be powerful and capable of a rapid expenditure of energy, so that the animal can be swift and sure in its movements. To fulfill this requirement, it must possess a skeletal arrangement with appropriate leverage in the

limbs. Swift movement demands a quick combustion of energy-providing substances in the body; quick combustion is possible only with a large supply of oxygen; a large supply of oxygen, in turn, presupposes deep inhalation of air and large areas of lung surface. In order that the oxygen can reach the muscles in ample quantity for quick combustion, the circulatory apparatus must permit the blood to travel rapidly through the entire system; the arteries, veins, and heart must be constructed accordingly. Then, too, a carnivorous mammal must be able to locate its prey at a distance; this requires acute senses of sight, hearing, and smell. Once the animal overtakes its prey, it must kill it; hence, it will have either strong legs with sharp claws, or strong jaws with sharp teeth, or both. The entire body, therefore, is built according to the requirements of the animal's being, all parts being *mutually dependent and harmoniously interrelated*.

The organism thus manifests an unmistakable morphological and physiological unity, *individuality, and totality*. The organism is primary; the structures and functions are secondary. The organism exists *for itself*; the structures and functions exist *for the organism*. The organism acts as a whole; the structures and functions are *subservient* parts of the whole. It follows, therefore, that merism is a false theory.

ARE ONLY MECHANICAL OR PHYSICO-CHEMICAL FORCES PRESENT?

We will leave out of consideration the theory that purely mechanical forces alone are present in the organism; no

one seriously defends this theory any more.

Some exponents of vitalism, both meristic and holistic, postulate the existence of *biotic or vital forces*, distinct from the physico-chemical forces of inanimate bodies, as present and operative in organisms. This vital force is assumed to be non-material in nature and operation, and it is through this 'vital force' that organisms are truly 'living.' The assumption of these ultra-spiritualistic vitalists is *unwarranted* and *erroneous*.

It is one of the triumphs of the biological research methods to have proved that the chemical reactions occurring in the cells, organs, and tissues of organisms are of the same *material kind* as those occurring outside the organisms in inorganic bodies. The heat generated in organic bodies is the result of an oxidation process which is the same as that occurring in any test tube or furnace. The electricity present in nerve action is plain electricity and can be measured by a galvanometer. All forces operating in the organism are material forces. In no instances has science been able to discover any kind of biotic energy or force distinct from the ordinary material physico-chemical forces and energies.

It is true, of course, that organic compounds are made in and by the organism, which the inorganic elements, of their own accord, never make. But this fact does not prove that 'vital forces' are at work; it merely proves that a totally different principle operates in the organism, utilizing the ordinary forces for its own purposes and in its own way. Laboratory technicians have succeeded in forcing the elements to unite in the formation of compounds which are

identical with organic compounds. We need but mention synthetic rubber, synthetic alcohol, synthetic perfume, synthetic urea, vitamins, hormones, etc.; the number of such synthetic organic compounds runs into the thousands, and the number is increasing day by day. These technicians use the ordinary inorganic forces to bring about such compounds. It is, then, a logical conclusion to assume that the same material forces, and not 'vital forces,' are at work in organisms.

We must agree, therefore, with the biological mechanists that only physico-chemical forces are operative in organisms. We do not agree, however, that biological mechanism is the true interpretation of the nature of the organism. Mechanism depends on the truth of its argument that physico-chemical forces *alone* account for *all* the phenomena of organic life. If so, then, of course, there is no essential distinction between living and nonliving bodies.

ARE LIVING AND NONLIVING MATTER ESSENTIALLY IDENTICAL?

Again, we must consider the facts. According to the tenets of biological mechanism, the ordinary physico-chemical forces, operating as *material efficient causes*, suffice to produce all 'vital' activities; there is no purposiveness (finality, teleology) present in the structures and functions of any organism. We contend that the biological facts contradict this basic assumption.

While it is true that the forces operative in organisms are the same as the material forces operative in inorganic beings, their *manner of operation* is radically different in

living and nonliving matter. Among inorganic substances, action is always *transient* (or *transitive*) in character. Transient action is the action in virtue of which one being influences and changes another being. The energies of light, heat, electricity, magnetism, physical impact, gravity, etc., are such that the goal of their influence is *outside* their efficient causality; they tend to change *other* bodies. A heated body tends to raise the temperature of a colder body; an electrified body tends to charge a neutral body; a body in motion tends to impart motion to the body with which it comes in contact; sodium and chlorine tend to change each other and form a salt; and so forth. Such action is always 'transient.'

On the other hand, the inherent tendency of all *vital* activity within an organism is *the organism's own development and perfection*. All vital activity originates in the organism, remains in the organism, is carried out by the organism, and has as its natural goal the well-being of the organism itself. Hence, vital organic action is rightly termed *immanent*. (Lat., *manere* in, to remain, reside in.) No matter how much the vegetative, sensory, and rational processes may differ, they are characterized by 'immanence.' Immanence or spontaneity of vital action proceeds from the *inner constitution* of the organism which reacts as a *whole* to outside agencies. Life is essentially self-perfection through self-development.

Why this radical difference between the actions of living and nonliving bodies? Immanence of action demands an adequate explanation. The only explanation the mechanists can logically offer is the constitution of the atoms and

molecules which form the organic body. These atoms and molecules, however, are forever the same, and so, too, are their physicochemical forces. Consequently, the manner of operation of these forces should also remain forever the same, whether they are operative in organic or inorganic bodies. Hence, the manner of operation of material forces should always be 'transient' and never 'immanent.' But vital action is 'immanent.' Biological mechanism, therefore, cannot explain the immanence of vital action. There must be, then, something 'vital' in the organism which makes the physico-chemical forces perform immanent actions.

Besides, *organic compounds* are the result of the *natural tendencies* operating within the organism. The inorganic elements have no natural tendency to produce such compounds. Outside the organism, the elements combine according to the general laws of affinity. Under these conditions, the elements tend to form rigid combinations with a stable equilibrium; the proteins and other organic compounds, however, are extremely complex and in an unstable *colloidal* state. That the principle operating in the formation of organic compounds is different from that operating in the formation of inorganic compounds, can be seen after the *death* of plants, animals, and men. The organisms decay, and the organic compounds dissolve, reverting again to the status of ordinary inorganic compounds and elements. If organisms and organic compounds were the effects of elements and their physicochemical forces alone, and not of some higher principle utilizing them, no sufficient reason can be assigned why such organic compounds should not continue

indefinitely in existence, even after 'death,' somewhat after the manner of a crystal. The fact of synthetic compounds is no argument in favor of the mechanistic theory. Synthetic compounds are *forced products*, made by technicians under laboratory conditions; we might stress the parallel by saying that the organisms, too, must have a technician in their laboratory, namely, a vital principle which forces the elements to enter into organic combinations against their normal tendencies.

One of the fundamental tenets of mechanism is the *denial of final causes* and purposiveness in organisms; *only efficient causes* are at work. This contention is easily disproved. Man is an organism. Our own consciousness is witness to the fact that *we act for a purpose* and do many things in order to *realize a future goal*. Practically all our social, commercial, educational, and industrial acts are done 'for a definite purpose.' We set a goal, realizable in the future, and then go about selecting and applying the means to make the goal an actuality. The goal is 'that for the sake of which' something is done, and to strive toward the realization of a goal is 'finality' or 'purposiveness.' Animals also display purposiveness, as when a cat pounces on a mouse, when a dog pursues a rabbit, when a bird builds its nest, when a bee builds its honeycomb, and so on.

Every organism is characterized by an *inherent natural purposiveness*. 'Ends' and 'purposes' permeate the structures and activities present in the organism. This inherent natural purposiveness follows a double course: the realization of the well-being of the individual and the preservation of the species.

That the realization of the well-being of the individual dominates the entire life history of an organism, should be evident to any unprejudiced observer. It manifests itself from the first to the last moment of the organism's existence. Consider the *organism's embryonic development*. The ovum and the sperm cell prepare themselves for fertilization by ejecting one half of the normal number of chromosomes, so that the normal number will again be restored through the fusion of the ovum and the sperm cell. If this halving were not done, each succeeding generation would have double the number of chromosomes found in the cells of the organisms of the foregoing generation; after a series of reproductions, the number of chromosomes would be so large, that the organism could no longer survive. Hence, the purposiveness of the maturation division. Once the parent cells have fused, the fertilized ovum begins to develop itself, *by its own innate power*, into a full-grown organism. This development, however, is not the result of a fortuitous concurrence of chance factors; it is the result of a definite and precise plan, carried out in a definite and precise *manner*. The fertilized ovum develops into a *specific type* of being. The original embryonic cell of an oak develops only into an oak; that of a cat, only into a cat; that of a man, only into a man. The various tissues and organs are formed, long before they can be of any possible use to the organism — legs, wings, nerves, stomach, eyes, heart, etc.; they are built for the *future*. And if it should happen, as it occasionally does, that the first two embryonic cells are split apart, the two cells do not develop into two half-organisms,

but each cell develops into a complete individual of that particular type; the entire structural plan of the organism is simply doubled and carried separately to completion. This prospective potentiality of the germ cell is one of the most remarkable features of embryonic life. It is as if one were to cut a machine in half, and each half-machine would then proceed to shape itself into an exact duplicate of the original machine. The purposiveness of the entire process of embryonic development is as apparent as that of an architect in planning and erecting a house, but with this difference: the house of the organism is built *by itself* from a single 'magic brick,' as Alexis Carrel so aptly puts it, which gradually fashions itself into kitchen, plumbing, windows, walls, rooms, telephone, and a million other items.

That the well-being of the individual also controls the *mature life* of the organism as an 'end' and 'goal' to be achieved, can be seen in the fact that it tends to *preserve its identity of being* under all circumstances. It adapts itself to its surroundings, fights off injurious agencies, repairs the damage done to its tissues, assimilates proper food and rejects unsuitable material, seeks pleasure and avoids pain. To perform these functions, the organism has the necessary equipment in its own body, furnished by itself.

The *preservation of the species* is another fundamental natural end or goal inherent in the organism. Whatever may be the type of plant or animal, the organism eventually arrives at a stage in its existence when it tends to reproduce itself by bringing forth an individual similar to itself. The method of reproduction varies, but reproduction itself is universal and is eminently purposive. Whether the

method of generation be asexual or sexual, there is perhaps no greater marvel in the world, viewed from a purely organic standpoint, than the wonderful arrangement of structure and function for the purpose in view. In bisexual generation the individuals of the species are grouped into two sexes, male and female. The generative organs of each sex, taken singly as male and female organs, have no meaning and significance for the individual possessing them. It is only in relation to each other, though in different individuals, that they have meaning and significance. Their inherent natural purpose, however, is unmistakable. The organs are made to complement each other, and so are the individuals possessing them. Each type of generative organ is insufficient of itself for reproduction; in conjunction with each other they achieve their obvious purpose — the generation of a new individual and the preservation of the species. Mating, gestation, care of the young, and so forth, are all subservient to this supreme purpose of organic life. A more patent and universal illustration of inherent natural purposiveness could hardly be found.

Action flows from a principle of action. Since the action of organisms is beyond the natural capabilities of ordinary atoms and their physico-chemical forces, vital action must flow from a *vital principle*. Vitalism, therefore, is the correct theory of organic life, and it must be a *holistic vitalism*.

There are various theories of holistic vitalism. Which one should be adopted? We claim that the theory of vitalistic animism is the one which gives the best explanation of all the facts.

Vitalistic Animism

The *cardinal points* of vitalistic animism (Lat., *anima*, soul) are these: Every organism consists of two ultimate constitutive substantial principles, matter and the vital principle, which are united together into a complete substance and nature. These points must now be established.

One of the ultimate constitutive principles of every organism, including man, is matter. 'Matter' is the basic stuff of which all bodies are composed.

Whatever we may think about the ultimate nature of 'matter,'¹ it should be obvious that every *organism consists of matter* and that matter is an ultimate constituent of the organic body. All organisms — plants, animals, and men — are 'spatial,' both as to the structures and their functions; the forces active in organisms are 'material' forces and as such are rooted in matter. Every biologist, whether mechanistic, meristic, holistic, or vitalistic, concedes this. Hence, matter is an ultimate constitutive principle in the nature of the organism.

Vitalistic animism, however, contends that we must also accept a second, equally important, constitutive principle in organisms, distinct from matter, namely, the vital principle. Without a distinct *vital principle*, co-equal with matter, the phenomena of life cannot receive an adequate explanation.

No effect can be greater than its cause, otherwise something would exist without a sufficient reason for its existence. Now, the activities and phenomena of organic life *exceed the inherent causality of inorganic substances*. One

cannot, by the wildest flight of fancy, conceive of sensory and intellectual knowledge, consciousness, and appetitive behavior, as phenomena directly resulting from the actions and reactions of atom complexes considered as such. Even the colloidal state of protoplasmic material and the formation of organic compounds cannot be adequately accounted for on the basis of ordinary chemical affinity between elements; much less the processes of nutrition and reproduction. The inherent natural purposiveness of organisms, in virtue of which they plan and build for future use, is a qualitative factor far beyond the capabilities of mere atoms and their aggregates. Above all, the dynamic unity of the organism as a whole, with complete subordination and co-adaptation of all structures and activities for the well-being of the individual and the preservation of the species, is something so unique, that it cannot receive its ultimate explanation in the grouping of billions of inanimate atoms fortuitously thrown together by the ordinary chemical, physical, and mechanical forces into an accidental chance product. Such an explanation would do violence to all the laws of reason.

Nor can the explanation be found in the *environment*. The circumstances of the environment are frequently very diverse, but the organisms preserve the identity of the individual and of the species intact. And where the environment is the same, we observe a great diversity of organic species living side by side. Hence, the conditions of organization are not the result of environment.

Since inanimate matter is incompetent to produce the marvelous effects observed in organic life, we must reduce

these effects to a causality distinct from the causality of matter and its forces. Organisms, it is true, consist of matter; and that is why matter must be considered as a constitutive principle of organic life. The matter present in organic bodies, however, is *organized* and *living*, and matter as such is incapable of producing this effect; hence, besides matter, we must postulate a distinct *vital principle*, from which the phenomena peculiar to living matter proceed, as a second constitutive principle of organic life.

Both constituent principles are *mutually irreducible*. There can be no question of this so far as concerns matter. The matter or basic stuff present in the atoms and elements exists in them prior to their entrance into the organism; matter, therefore, cannot be reduced to the vital principle. On its part, the vital principle cannot be reduced to the matter present in the atoms and elements. If it were reducible to matter, the vital phenomena themselves would be nothing more than manifestations of atoms and elements and their natural inanimate forces; mere atoms and elements, however, cannot adequately account for vital phenomena. Hence, the vital principle must be a reality distinct from matter and as such not reducible to it. It follows, then, that both matter and the vital principle are *ultimate; in their own line* as constituents of the organism.

Matter and the vital principle must be *substantial* principles. They are the constituent principles of the organism, and each organism is a substance. A substance is a being existing in and for itself and does not exist in another as in a subject. Such being the type of existence which the organism possesses, its ultimate constituent

principles must also be substantial, because every being is what it is through its ultimate constituent principles. If matter and the vital principle were not 'substantial' principles, the organism resulting from them could not be a 'substance.'

While matter and the vital principle are substantial and mutually irreducible, they cannot be said to be complete substances; on the contrary, they are *incomplete substances*. A substantial principle is said to be an 'incomplete' substance, when it must be united with a second substantial principle in order to constitute a complete individual being. Neither principle suffices of its own accord to constitute the complete individual being; but each principle is an intrinsic co-principle complementing the other, so that in their union they constitute the complete individual being. Every plant and animal and man is a complete individual being and as such a 'complete substance,' because it exists in itself and for itself and needs no other being or principle to complete it as a substance. If both matter and the vital principle were 'complete substances,' the organism would be a double-substance, a being consisting of two 'complete substances.' Under such circumstances, the two 'complete substances' would merely be allocated in juxtaposition along parallel lines without ever coalescing to form a single individual being or substance. Now, every organism, whether a plant, animal, or man, is a *unitary substance functioning as a whole*; it is not a double being consisting of a material substance and of a vital substance conjoined in some sort of harmonious relationship, but a *single substance* which is at one and the

same time *both material and vital*. No other view will account for the fact that the organism is a dynamic unit of vital action. Hence, matter and the vital principle, though substantial, cannot be 'complete substances,' but must be 'incomplete substances' or 'substantial co-principles' which, through a most intimate union, coalesce to constitute the organism as a single, individual, 'complete substance.' In consequence of this union, matter ceases to be inanimate and becomes truly vitalized; the result is *living matter* capable of the functions of life.

The organism is thus seen to be a *composite substance*, and the component ultimate realities are matter and the vital principle. Matter is the determinable, vivifiable reality, while the vital principle is the determining, vivifying reality. Matter is compenetrated by the vital principle and is transformed into living matter. When the vital principle vanishes from the organism, death supervenes, and the atoms and elements again return to the lifeless condition of inanimate substances through decay and decomposition. In its *ultimate constitution*, therefore, every organism is a single but *composite substance consisting of matter and a vital principle*.

This exposition of the cardinal points of vitalistic animism enables us to understand the characteristic phenomena of organic life. That an organism is a 'material' being, is due to the fact that *matter* is an essential constituent, because matter exists in the atoms and elements as the ultimate basic stuff of which they are made and which they carry into the structure of the organism when they become an integral part of it. Because matter enters into the organic

composite, the forces operative in the organism are the ordinary chemical, physical, and mechanical forces present everywhere in the world. The processes of vegetative, sensory, and intellectual 'life,' however, considered precisely as such, are superior to the forces and activities normally present in matter and must be attributed to a principle fundamentally and essentially distinct from matter, namely, to the *vital principle*. It is because of the presence of a vital principle in organisms that matter and its material forces are capable of forming organic compounds in a colloidal state and of being the bearers of vital activities far beyond their natural capacities. And it is because of the essential differences in vital principles that plants, animals, and men represent different *levels of life* and that there are so many *distinct species* among the plants and animals. As regards 'matter,' they are all alike; but as regards their 'vital principles,' they are specifically different types of organisms, because the vital principles differ specifically among themselves. Without matter, there would be no 'organisms,' but spiritual beings. Without the vital principle, there would be no 'living matter,' but inanimate chemical substances. Without the specific differences between vital principles, there would be no 'specific types' of organisms, but only a single species.

We therefore define the *organism* as a substance consisting of *matter animated by a vital principle*.

The Plant Soul

In common parlance, the vital principle is referred to as the *soul*. In accordance with this usage, it is customary to speak of a 'plant soul,' an 'animal soul,' and a 'human soul.'

One of the essential attributes of the plant soul is its *unicity*. By the unicity of the plant soul we mean that each plant has but a *single* soul as the animating principle of the entire organism. Unicity follows as a logical consequence from the nature of the plant as a unitary substance. All structures and activities of the plant serve to promote the well-being of the organism as a whole. The plant acts as a dynamic unit throughout its life. Hence, the soul, the principle of all vital phenomena in the plant, must be one, not two or many.

Since the soul of the plant is singular, it is actually undivided. It is not, however, indivisible like a spiritual entity. On the contrary, the plant soul is *indirectly divisible* and therefore *potentially multiple*. There is ample evidence for this statement in facts. A cell can be cut into pieces, and each piece, provided it contain a portion of the nucleus, will rebuild itself into a complete cell and continue to live. The slips of many plants, for example, of the geranium, the willow, etc., will grow roots and develop into normal plants. The explanation seems simple enough. The plant soul, though one and undivided, is potentially divisible and multiple. Once the division of the plant body is made, the soul is also divided with it and accompanies the divided parts; each animated part then continues to function as a whole plant. There is no need for assuming that a new soul is generated in the separated parts. When a shoot from an apple tree is grafted onto a pear tree, the shoot of the apple

tree becomes one with the pear tree, but it lives as a parasite, merely using the sap furnished by the roots and stem of the pear tree; two souls are present in the same tree, one an apple-tree soul and the other a pear-tree soul, each functioning in its respective part of the tree as a whole.

The plant soul is *material*, in the sense that it is *totally immersed in matter and intrinsically dependent on matter*. We cannot, of course, perceive the plant soul itself. In passing a judgment on the inner nature of the plant soul, we must conclude from its activities to its essence. Now, there is nothing in the activities of the plant to indicate immateriality.

Everything about the plant is on a material plane, both as regards structure and activity. If the plant soul were immaterial, a mere division of the matter (body) of the plant should not result in two living plants; one part might remain living, but the other part should be dead. It is true that one cannot make a division of the more highly organized plants, so that both parts remain living after the division. Nevertheless, plants are plants, essentially alike in nature, no matter to what particular species they belong. Hence, the fact that such a division, with both parts remaining alive after the division, cannot be made on all plants, is no valid objection against the argument. We must conclude, therefore, that the plant soul is essentially material.

The Animal Soul

When we speak here of the 'animal soul,' we restrict our remarks to the soul of the brute animal, not to man.

Like the plant soul, the animal soul is a *single soul* animating each individual animal. Each insect, bird, fish, mammal, etc., is an individual being acting as a unit of structure and activity. There cannot be two souls in the animal, one controlling the vegetative structures and activities as a vegetative soul and the other controlling the sensory structures and activities as a sentient soul.

While it is true that some organs and functions of the animal are characteristically vegetative and others characteristically sensory, there is no absolute line of demarkation separating the one type from the other, so that two distinct souls, one vegetative and the other sentient, would be demanded. All tissues and organs, whether they belong to the vegetative or sensory system, derive their origin from one and the same parent cell. From the very beginning of embryonic development, the plan of a *vegetative-sensory* organism prevails. Both types of organs and tissues, vegetative and sensory, are fashioned from the same cells and in the same process. Throughout the life history of the animal the formation, growth, and repair of the sensory system is carried out by the vegetative processes of the animal; *vice versa*, the requirements of the vegetative system, such as the procurement of proper food, etc., are taken care of by the sensory activities and instinctive actions of the animal. In this manner, all structures and activities collaborate conjointly and harmoniously toward the realization of the vegetative and sensory life of the animal as a unitary organism. This

complete unity of being demands a single vital principle or soul.

It should be obvious that the *animal is specifically superior* to the plant. Cognition and appetite exceed in perfection anything found in the activities of the plant. Hence, the animal soul is superior to the plant soul. Since, then, there can be but a single soul in the animal, the conclusion is inevitable that the animal soul is a vital principle which, together with matter as a co-principle, is the active principle for both vegetative and sensory functions, so that the capacities of the lower vegetative soul are contained in the superior animal soul. All structures and activities, vegetative as well as sensory, have as their ultimate goal and purpose the well-being of the animal as a single, unitary organism. If it is difficult at times, especially among the lower forms of life, to distinguish accurately between animals and plants, that is due to the limitations of our knowledge; organisms capable of sensory perception are animals, not plants, no matter how primitive in organization they may happen to be, and as such must have a sentient soul.

Like the plant soul, the animal soul is one and undivided, but *indirectly divisible* and *potentially multiple*. Some animals, for instance, the hydra and others, can be divided into sections, each section then developing into a complete individual of the same species. By dividing the body of the animal, the soul is also divided, though indirectly, and multiplied. In technical phrasing, the soul is said to be indivisible *per se* (as such, directly, in so far as its own being is specifically concerned), but divisible *per accidens*

(incidentally, indirectly, in so far as the body of which it is the animating principle is concerned); what is primarily and directly divided is the whole body, and the soul is incidentally and indirectly divided with it.

Furthermore, like the plant soul, the animal soul is *totally immersed in matter and intrinsically dependent on matter*; consequently, it must be said to be material in its essence. All sensory organs and functions are spatial and material in character; even the higher senses of imagination and memory deal only with images that are based on quantitative extension in some form. Not a single activity of the animal is in any manner free from matter and material conditions. We have no reason, therefore, to attribute immateriality to the animal soul. This will become clearer when we analyze the rational activities of man.

It is imperative to view the question of the plant and animal soul from the angle of their relationship to the organism as a whole. It cannot be stressed too much that it is the *complete organism*, the individual plant and individual animal, which is generated, lives, and dies, and not the matter and soul as such. Matter and soul (vital principle) exist solely for the organism of which they are the constitutive principles. When a new plant or animal is generated, the soul is evoked out of the potentiality of matter through the agency of the generating cause (the parent organism or organisms). When a plant or animal dies, its soul simply perishes and is reduced to the potentiality of matter. The plant and animal souls, therefore, do not survive the death of the organism; they are *not immortal*.

Philosophic Concept of Life

Though 'life' is a readily distinguishable natural phenomenon, it has always been found to be difficult to define. Many definitions have been offered by savants, but most of them are unsatisfactory in one respect or another. These definitions are usually restricted to organic life and as such fail to define *life in general*.

The true definition of 'life' must express that distinctive attribute which is essential to every type of vital activity, whether it be vegetative, sensory, rational, or divine. We must not overlook the fact that 'life' is also predicated of *God and His activities*, and that primarily and in an infinite manner. The definition of life, therefore, must exclude everything which would be inapplicable to the life of God and must include the distinctive attribute which characterizes essentially all 'life,' creatural and divine. Obviously, then, since God is not an organic being, the definition, in order to be adequate, cannot be based solely on the vital activities of organic beings, such as plants, animals, and men. And yet, organic beings possess true 'life,' so the definition must apply to them as well as to God. Similarly, since the life of organisms involves qualitative and quantitative 'change,' while the life of God involves no change at all, the definition of 'life' must neither include nor exclude change, but must express that mark of vital activity which is compatible with both the presence and absence of change.

Our analysis of organic life has shown that there is one distinctive attribute common to the activities of vegetant,

sentient, and rational organisms, and that is *immanence*. 'Immanent action' distinguishes the vital activity of organic beings from the 'transitive action' of inorganic, nonliving beings. Now, the life of God is also characterized by 'immanence of action.' All the activities of God have their origin, permanence, and goal in the being of God, because they are identical with His divine substance. Hence, 'immanence of action' is the essential attribute common to the life of organic creatures and of God; and it is the *only essential attribute* common to every type of life.

Consequently, *life is immanent action*. And a living being is one endowed with immanence of action. Such is the definition of life and of living beings given by Aristotle and St. Thomas Aquinas centuries ago.

What has been said about organic life and the vital principle, should assist us in understanding man and his soul.

Summary of Chapter XIX

The philosophic psychologist endeavors to arrive at an understanding of man's nature through a study of vital activities.

1. *Nature of Organic Beings.* The theory of merism contends that the organic body is an aggregate resulting from the additive summation of its smallest parts. The theory of *holism* views the organic body as an integrated whole which in its totality is more than the sum of its parts. The theory of *vitalism* sees something distinctly vital in the organism and demands a vital element or factor or principle to account for the 'life' of the organism. Merism may be vitalistic or antivitalistic; holism may be vitalistic or anti-vitalistic.

2. *Meristic Biological Theories.* Merism occurs in two types, anti-vitalistic and vitalistic. *Anti-vitalistic merism* advocates the view that the organic body is a machine actuated solely by physico-chemical or mechanical forces. Vitalistic merism postulates some special kind of 'vital force,' 'vital energy,' or animate matter to account for the difference between organic and inorganic bodies.

3. *Holistic Biological Theories.* Holism opposes the atomistic, meristic concept of the organism. It is either anti-vitalistic or vitalistic. *Anti-vitalistic holism* admits that organisms are integrated wholes functioning as units, but does not see any essential difference between inorganic and organic bodies. *Vitalistic holism* maintains the specific difference between inorganic and organic bodies and seeks

to explain the unity and wholeness of the organism by means of a unifying vital factor or principle distinct from the physico-chemical forces operating in the organic body.

4. *Facts and Conclusions.* Biological mechanism is based on two main theses: first, the organism is meristic; second, only mechanical or physico-chemical forces are present in the organism, and living and nonliving matter are essentially identical.

The first thesis is false. The facts show that there exists in the organism an all-pervasive unity of being; the structures and functions are interconnected and interdependent; the law governing structure and function is the need, the exigency, of the organism. The organism is a morphological and physiological unit and individual acting as a whole. *Holism*, not merism, is characteristic of the organism.

The *first* part of the second thesis is correct. Science has discovered no 'vital force' or 'biotic energy' distinct from the ordinary physico-chemical forces.

The *second* part of the second thesis is false. There exists an *essential difference* between inorganic and organic bodies. The action of inorganic bodies is always 'transient,' that of organic bodies is immanent.' Organic compounds are the result of the natural tendencies operating within the organism, while inorganic elements show no tendencies to form such compounds. Vital activity is characterized by an inherent natural purposiveness, as can be seen in the realization of the well-being of the individual and in the preservation of the species. Such conditions demand a vital principle.

Holistic vitalism, therefore, is the correct theory of organic life.

5. *Vitalistic Animism*. The theory of vitalistic animism gives the best account of the nature of the organism. Its cardinal points are these: Every organism consists of two ultimate constitutive principles, matter and the vital principle, which are united together into a complete substance and nature.

Matter is one of the ultimate constitutive principles of the organic body, because the organism consists of material atoms and utilizes material forces.

Besides matter, and distinct from it, the *vital principle* is an ultimate constitutive principle of the organic body, because the activities and phenomena of organic life exceed the inherent causality of inorganic substances. They must proceed from a principle different from matter and its forces.

Matter and the vital principle are *mutually irreducible*.

Both are *substantial* principles, because the result of their Union is a substance. Both, however, are *incomplete substances*; neither suffices to constitute the complete individual being. If both were 'complete' substances, the organic body would be a double-substance and it could not be a unitary substance functioning as a whole.

In its ultimate constitution, therefore, every organism is a *composite substance consisting of matter and a vital principle or soul*.

6. *The Plant Soul*. It is singular and actually undivided, but it is indirectly divisible and potentially multiple. It is

material, in the sense that it is totally immersed in matter and intrinsically dependent on matter.

7. *The Animal Soul*. It, too, is singular and actually undivided, but indirectly divisible and potentially multiple. Since cognition and appetite are functions superior to the vegetative functions of the plant, the animal is specifically superior to the plant. The animal soul is also material, because sensory organs and functions are spatial and material. Being material, neither the plant nor the animal soul can be said to be immortal; they perish with the death of the organism.

8. *The Philosophic Concept of Life*. The true definition of 'life' must express that distinctive attribute which is essential to every type of vital activity, creatural and divine. This attribute is 'immanence of action.' Hence, *life is immanent action*.

In the present context we are not concerned so much with the existence of 'matter' as with the nature of a 'vital principle' distinct from matter.

Chapter 20

THE SOUL OF MAN

FOR MANY BIOLOGISTS AND PSYCHOLOGISTS THE TERM 'SOUL' HAS a bad taste. They either deny the existence of a soul in man or ignore its presence. At best, they contend; the soul is an intangible reality which cannot be perceived by introspection or subjected to scientific investigation by means of laboratory experiments. Hence, in their opinion the soul, if it exists at all, is a negligible factor in psychological experience and can very well be left out of consideration.

The philosopher disagrees with this superficial attitude. It makes a tremendous difference in our concept and understanding of 'the whole man,' if he has or has not a soul. If he has no soul, our understanding of man is beset with a thousand difficulties and is made practically impossible. If he has a soul, the mystery concerning man's vegetative, sensory, and intellectual life, and also the mystery concerning his origin and destiny, can be cleared up, at least within the limits of human knowledge.

Man an Integral Organism

Descartes was mistaken, when he proposed the doctrine that an organic body, including that of man, was a 'machine' composed of atoms and acting solely with the movements of atoms. As we have already pointed out, the mechanistic view fails to explain the main phenomena of organic structure and function observed in every type of living being. The vegetant and sentient organisms are of an order differing essentially from inorganic substances. Organisms demand a vital principle or soul.

Man, too, is an organism, and he is an *integral organism*.

Like the plant, he has vegetative organs and functions; like the brute animal, he has sensory organs and functions; and, exclusively typical of himself, he has the rational activities of intellection and volition. Contrary to the theory of Descartes, however, man is not a double-substance, consisting of a material substance (the body) and a spiritual substance (the rational soul), but a single, unitary substance, an integral organism. As in the case of the brute animal, his vegetative and sensory structures and activities are not split apart, so that they must be referred to distinct vital principles; they co-operate in perfect harmony, and one set is dependent on the other in being and in operation, so that it is evident that both sets of structures and activities must be referred to *one and the same vital principle*. Man, therefore, so far as his vegetant and sentient life is concerned, has a *vital principle or soul* which is vegetant-sentient.

Then what about man's *rational activities*, intellection and volition? Are they reducible to sensory activities? They are not. They are of a higher order and as such must derive

their origin from a higher principle. An ordinary vegetant or sentient soul cannot give issuance to the products of intellection and volition; otherwise it would be necessary to admit that a cause could produce something superior to its own capabilities. The rational activities of man demand a principle superior to the vegetant and sentient soul, a *rational vital principle*.

Apparently, rationality introduces an ultra-dualistic division in man, similar to that of Descartes. Such a division, however, would be contrary to the nature of man as an integral organism. Man is not a double- being, vegetant-sentient and rational, but a single *vegetant-sentient-rational being*. Our entire discussion of man's being throughout this book emphasized this important fact. There is no absolute cleavage between rational life and vegetant-sentient life in man; they are interrelated in many ways. Bodily health and illness affect intellection and volition. Emotions, as we know from personal experience, exert a profound influence on thinking and willing. Sensory perceptions and images are the necessary starting point for the formation of ideas by means of intellectual abstraction, according to the well-known axiom that 'nothing is in the intellect which was not first in the senses.' On their part, intellect and will to a very great extent guide and control the senses in their operations, especially imagination and memory. Ideas are clothed in the habiliments of sensory images and words. The intellect can think of material things and sense qualities, but not without a previous presentation by the senses; if a certain sense is missing from birth, as in a person born blind, the intellect is incapable of forming ideas

of the things or qualities which are normally perceived by this sense. The will desires goods which pertain to the vegetative and sensory order as well as those which pertain to the rational order. The will controls the members of the body through the voluntary or striped muscles. This mutual influence of activities would be impossible, if there were an absolute cleavage between the vegetant-sentient principle and the rational principle in man. The vegetant-sentient part of man's being could not influence the rational part, nor could the rational part influence the vegetant-sentient part; each part would be restricted to its own specific sphere of action. As it is, there exists a most intimate relationship of mutual influence between the two parts, with the result that man is indeed an integral organism, a single, complete, unitary being.

Consciousness also bears witness to this fact. The pronoun *I* expresses the personal, rational part of man; that much is clear. Much more, however, is referred to the *I* or *Ego* than purely intellectual and volitional acts and states. Statements like the following are very frequently made: 'I have grown in height and increased in weight; I have a good digestion; I feel cold; I have a stomach-ache; I see a house across the street; I hear the radio playing a symphony; I am imagining the scenes of my home town; I remember the friend I met last week; I have an idea of a perfect circle; I desire to be virtuous; I love God.' Such statements are not made in a figurative sense; they are intended as expressions of literal facts. Factually, therefore, vegetative, sensory, and rational acts and conditions are referred to the self-same Ego without restriction or

discrimination, as vital activities of *one identical organism*. The same organism digests, senses, and thinks. The reference of all functions to the Ego would be inexplicable, if man were not an integral organism; and man would not be an integral organism, if the vegetant-sentient activities proceed from a vegetant-sentient principle and the rational activities from a rational principle, both of which are fundamentally distinct realities.

The conclusion to be drawn is evident. There are not two vital principles or souls present in man, one vegetant-sentient and the other rational. Nor has man a body (matter) animated by a vegetant-sentient soul, like the brute animal, to which a rational principle is somehow attached. Man is a *rational animal*, and the rational principle with its intellect and will is an integral part of his nature. Being an integral organism, functioning throughout as a dynamic unit, man can have but a single soul. This soul is not only endowed with the powers of vegetancy and sentiency, but also with the powers of rationality. Hence, the soul of man is a *single rational soul* which includes the lower functional capabilities of the vegetant soul as found in the plant and of the sentient soul as found in the brute.

In scholastic terminology, the vital principle or soul is said to be the *substantial form* of the living body. The 'substantial form' is defined as 'the determining principle which, by uniting with the matter which it actuates, constitutes a complete substance of a definite species.' Man, of course, is a specific type of being, different from inanimate chemicals and from plants and brute animals. Matter, the material coefficient of the organism, is not the

principle which brings about the specific differences existing in these types of being, because matter, due to the metabolic processes going on in the organism, is subject to continuous change, while the organism preserves its *specific identity* throughout all material change. The vital principle, or soul, or substantial form, therefore, is the determinant responsible for the placing of an organism in a definite species. Hence, the *rational soul* is the 'substantial form' of the human organism, because it is precisely through his rationality that man belongs to the 'human species' as distinct from that of plants and brutes.

A number of terms have now been used to designate the specific determinant of organisms — 'vital principle,' 'soul,' 'entelechy,' and 'substantial form.' Fundamentally, they all mean the same thing, because they represent the same essential determining reality. The rational soul is the *ultimate ground or source* of all vegetative, sensory, and rational life in the human organism, making man to be precisely 'man.'

If we wish to *define* the *human soul*, we can define it as the *vital principle of the human organism, or as the substantial form of the human body*. Aristotle defines the soul as "the first act [first grade of actuality, form — Author] of a natural body possessed potentially of life."¹ These are technical definitions, couched in philosophical language. In a descriptive manner, we can define the human soul as the *ultimate principle in man in virtue of which he lives, senses, thinks, and wills*.

The Spirituality of Man's Soul

Spirituality is the same as *immateriality*. Something is said to be 'material' for one of two reasons: it is either composed of matter as an ultimate constituent of its essence; or, though not composed of matter itself, it is intrinsically dependent on matter, so that it cannot exist and act except in conjunction with matter. Reversing the concept, a thing is 'immaterial' or 'spiritual,' if it is *neither composed of matter nor intrinsically dependent on matter*.

Every subatomic particle, every chemical element and compound, and every organism is material, because matter is an essential constituent of their being; they are composed ultimately of matter. Man, therefore, considered in his entirety as an integral organism, is a 'material being.' Plant and animal souls are not composed of matter itself, because they are co-principles *with* matter and are conjoined *with* matter to constitute the ultimate nature and substance of the organic body; but these souls, as we have seen, are totally immersed in matter and intrinsically dependent on matter, so that they cannot exist and act except in conjunction with matter. Hence, plant and animal souls are essentially 'material' realities.

Man's soul, however, is *essentially immaterial and spiritual*. Man's soul is *not composed of matter*, because, like the plant and animal soul, it is a co-principle *with* matter as an ultimate constituent of the human organism. It can, therefore, only be a question of whether or not the soul is 'intrinsically dependent' on matter in its essence and operation. If the human soul is material, that is to say, if it is

intrinsically dependent on matter, then it must conform absolutely to the capabilities and conditions of material forces and energies. Its operations could never transcend these capabilities and conditions, *not even in a single instance*, because these forces and energies would be the immediate causes of the operations as effects, and no effect can transcend the level of its cause. Hence, if it can be shown that the operations of the human soul actually *transcend matter* and its capabilities and energies, then the essence of the human soul must be intrinsically independent of matter and as such immaterial and spiritual. This conclusion follows necessarily from the principle: As the essence, so the operation, and as the operation, so the essence. We claim that *some* operations of the human soul plainly transcend matter and the capabilities and conditions of material forces and energies.

Thinking and Energy. If the soul of man is material in nature, then thinking is a material operation. Thinking must then be some sort of sensory function, on a par with seeing, hearing, imagining, and so forth. Being material, there should be a consumption and transformation of material energy in every act of thinking, because such an act would involve metabolic changes in the nerve tissues which serve as the material substrate for sensory function. The evidence, however, is entirely against such a view. Thinking, so far as scientists have been able to discover, does *not increase metabolism nor consume energy*. In this regard, Alexis Carrel states: "Intellectual work, strange to say, does not increase metabolism. It seems to require no energy, or to consume a quantity of it too small to be detected by our

present techniques. It is, indeed, an astonishing fact that human thought, which has transformed the surface of the earth, destroyed and built nations, discovered new universes in the immensity of the sidereal spaces, is elaborated without demanding a measurable amount of energy. The mightiest effort of our intelligence has incomparably less effect on metabolism than the contraction of the biceps when this muscle lifts a weight of a few grams. The ambition of Caesar, the meditation of Newton, the inspiration of Beethoven, the passionate contemplation of Pasteur, did not modify the chemical exchanges of these great men as much as a few bacteria or a slight stimulation of the thyroid gland would easily have done.”² Provided these scientific findings are correct, they prove that thinking, precisely as such, is not a material process but an immaterial operation. Whatever minute metabolic changes might occur, could be attributed to the formation of images which normally accompany all acts of thinking.

Intellection and Sensation. It is a common experience that the senses, after strong stimulation, are incapable of registering the impressions of weaker stimuli for a certain period of time. A loud report makes the ear insensible to faint sounds; a glance into the sun blinds the eye for a while to ordinary rays; a strong odor affects the sense of smell to such a degree that a weak fragrance remains unperceived until a certain time has elapsed. All senses act in this manner. The reason is simple. Nerve action is subject to the law of assimilation and dissimulation, because energy is consumed in nerve action, and energy is produced by

means of a chemical breakdown of the material of nerve tissue. The stronger the stimulus, the stronger the nerve action; the result is, that an amount of energy greater than usual is expended. Before the sense organ can respond to weaker stimuli, this expended energy must be restored by a counter-process of assimilation, and it takes a certain amount of time for the metabolism of the nerve tissue to bring the organ up to its former level of efficiency.

The character of intellection is radically different. When the intellect is occupied with ideas and truths of great clarity, sublimity, and magnitude, its understanding of ideas and truths of inferior scope and importance is not impeded. On the contrary, the insight into major truths facilitates the simultaneous insight into minor truths; no lapse of time is required for the intellect to pass from the one type to the other. Yet, if intellection were a material process, intrinsically dependent on material nerve tissues and organic structures, metabolic changes would of necessity occur, and a certain amount of assimilation would have to take place, before the intellect would be capable of perceiving ideas and truths of lesser clarity, sublimity, and magnitude. The character of intellection thus plainly indicates that intellection is of an order different from sensation and is *exempt from the conditions of materiality*. Intellection is, therefore, an immaterial operation. Aristotle³ already called attention to this fact and used it as evidence of the essential difference between intellect and sense.

Of course, man being an integral organism, the intellect and its operations are not completely isolated from

concomitant sensory processes. 'Mental fatigue' results from muscular tension which is usually present when lively interest is aroused.

Universal Ideas. Man acquires his intellectual knowledge of the world and its objects through the mental process of 'abstraction' from sensory images, and these images are derived from impressions made on the sense organs and the brain. Sense objects are material objects, and sense organs are material organs; both are, therefore, affected by the conditions of materiality. Every material object in the world is a concrete individual object, determinately circumscribed and particularized as to quantity, quality, space, and time. What I perceive with a sense, for instance with sight, is always a 'this' and 'that,' an individual object which is affected by a determinate quantity (a certain size, weight, age, etc.), which possesses definite qualities (a certain color, warmth, energy, etc.), and which exists in a determinate place (in the sky, on the ground, in New York, etc.) and at a determinate time (now, today, yesterday, etc.). For example, if I perceive a dog, it is always an individual dog; and this individual dog is particularized as to size, weight, age (quantity), as to breed, sex, color (quality), as to his whereabouts (place), and as to when he exists and is perceived (time). Sense impressions and images, therefore, are concerned solely with *individual objects in particularized material conditions*.

Intellectual knowledge consists of universal ideas. Universals are representations of *class natures*, and as such apply to the whole class as a class and to each individual belonging to the class. They are divested of all

particularizing determinations of quantity, quality, space, and time. My idea of 'animal,' for example, is that of a 'sentient organism.' It is a *generic* idea, not the image of an individual animal; it applies to all animals as a class, because all are included in the idea 'sentient organism,' and also to each individual animal belonging to this class, because each one is a 'sentient organism.' It thus includes all individuals and types of dogs, cows, eagles, sharks, men, etc., without any consideration of the particularizing determinations found in them as individuals. Universal ideas, therefore, are *not material sensory images*. No material image of an 'animal' can include within itself at one and the same time the representations of a dog, cow, eagle, shark, ant, snail, and man, as the idea of an 'animal' does. Only individual animals exist in nature, and our sense impressions and images can represent only individuals, not a genus. Universal ideas, since they represent class natures divested of material conditions, must be immaterial. As a consequence, the intellect which elaborates universal ideas through abstraction from sensory images must also be immaterial. If the intellect were intrinsically dependent on a material organ, it could not surmount the conditions of materiality inherent in sensations and images, and universal ideas would be impossible. The fact that we have universal ideas proves that the intellect is an immaterial power, intrinsically independent of matter.

Ideas With Supra-Sensuous Content. Images are sensory representations of material objects and qualities; as such they are material in nature. If ideas are not spiritual, they also are nothing more than sensory representations; and in

that case, they cannot represent supra-sensuous realities, because the effect cannot be of a nature superior to its cause. We have, however, numerous ideas which represent supra-sensuous realities. Such are the ideas of 'justice,' 'law,' 'freedom,' 'truth,' 'possibility,' 'immortality,' 'spirituality,' 'soul,' 'God,' and a host of others. The contents of these and similar ideas are not representations of physical objects and qualities which can affect a sense organ with their stimuli. They cannot, therefore, be perceived in a sensory manner. But if ideas were essentially sensory and material in nature, then it would be impossible for us to have ideas of these supra-sensuous and spiritual realities. Our intellect could not think of such realities, because it would be a material power absolutely restricted to the representations of material things. We do, however, think of them, form ideas of them, speak and write of them. Whether the contents of such ideas are actualities or not, is beside the question. The important thing, though, is the fact that our intellect in its ideas is capable of *transcending matter and material realities*; and only a power which itself transcends matter and material realities is capable of such an act. Hence, the intellect must be intrinsically independent of matter, i.e., spiritual.

The Intellect and the Future. Sense organs are here-and-now instruments of sensory knowledge, dependent on the stimuli which proceed from objects at a specified time from a specified place. The composite image of the synthetic or central sense, elaborated from sensations, is similarly characterized. The imagination is less restricted, since it can combine various elements of present and past

sense impressions and images into new images. The imagination, however, is dependent on the synthetic or central sense for its materials. In some form or other, therefore, all senses are restricted in their operations to materials furnished by objects existing in the present or which have existed in the past. The future is barred to the senses; the sensory powers cannot elaborate images of future events, because future events cannot send stimuli to the sense organs existing in the present, otherwise a non-existent cause would produce an effect.

If the intellect, like the senses, were essentially dependent on the material organism in its operations, it would also be a here-and-now instrument of knowledge and could neither have ideas of the future nor predict future events. The fact is plain, however, that we have ideas of the future and actually predict future events. Scientists, in their experiments, know before-hand what results will follow from the combination of conditions which they place. Astronomers predict eclipses of the sun and moon for hundreds and thousands of years in advance of their occurrence. The senses, being material powers dependent on present material stimuli, cannot have a knowledge of the future. The intellect, therefore, cannot be a material power, but must be intrinsically independent of matter and of material conditions in its operation; it is a supra-sensuous, immaterial, spiritual power.

C. T. Ladd does not hesitate to write: "With no mere figure of speech we are compelled to say, every mind thus *transcends* completely, not only the powers of the cerebral mechanism by springing into another order of phenomena,

but also the very existence, as it were, of that mechanism by passing into regions of space, time, causality, and ideality, of various kinds, where the terms that apply to the existence and activity of the cerebral centers have absolutely no meaning whatever. For example, the human mind anticipates the future and predicts, on a basis of experience in the past, the occurrences which *will* be but are not now. Into this future, which is itself the product of its own imagining and thinking, it projects its own continued and yet characteristically altered existence, as well as the continued similar existence of things. But the existence of the brain, and of its particular forms of nerve commotion, is never other than a purely here-and-now existence. This physical existence is, therefore, transcended in an absolute way by every such activity of the mind."⁴

Volition. An appetitive power can only desire something proportionate to its own nature. An appetitive power, immersed in materiality and essentially dependent on a brain or organ, cannot be influenced by, or strive for, anything except a concrete physical good. The brute animal, for instance, seeks only that which is good for its physical well-being. Man, however, is often influenced in his volition by goods which are decidedly *supra-physical* and *supra-sensuous*. Food, drink, pleasure, physical well-being, etc., are sensuous goods which affect the sensuous appetency, because they are concrete realities which affect the senses. Immaterial goods, however, like justice, righteousness, altruism, patriotism, charity, duty, love of God, etc., at times contravene our sensual desires and demand the sacrifice of sensuous goods and even of life

itself; yet they not only influence the will, but are goods for which the will actively strives. The soldier in war willingly goes without food and drink, sacrifices many natural pleasures, and even deliberately gives up his life, thus acting in opposition to every instinct and desire of his sensuous nature, for the sake of an *ideal* — the defense of his country's sacred honor and right. The martyr, too, undergoes horrible pain and suffering and gladly lays down his life, for the sake of his religious convictions and for the love of God. In doing these things, man's will *transcends all sensuous desires and sensuous goods*. Such attitudes are possible only on the supposition that the will is a supra-sensuous, immaterial appetency.

Furthermore, the will is *free in its choice*. Material realities are subject to physical determinism. When all the conditions required for an occurrence are present, the material cause must act, and the effect must follow. Material agencies are simply constituted that way; they have no choice in the matter. It is on the basis of this law that scientists are able to forecast the actions of material beings. Man's will, on the other hand, is intrinsically undetermined. Even when all the conditions required for action are posited, the will can *determine itself* to act or not to act, to act this way or that way. Such a power, contrary to all the properties of material agencies, cannot itself be material, but must be immaterial and spiritual.

So far as these arguments for the immateriality and spirituality of the human soul are concerned, it makes no difference whether we accept the soul as the direct and sole subject of thinking and willing, or whether we refer

thinking to the intellect as a power and willing to the will as a power, with the soul as the ultimate subject of these two powers. In the first case, the acts of thinking and will *modify the soul directly*; and, since these acts are immaterial and spiritual, the acting subject, which is the soul, must also be immaterial and spiritual. The argument is based on the evident principle that the effect cannot be superior to the producing cause. In the second case, according to the same principle, the powers of the intellect and will must be immaterial and spiritual. These powers, however, are agencies of the soul, residing in the soul as in their *ultimate subject*; and, since the powers are immaterial and spiritual, the agent soul must also be immaterial and spiritual, because these powers receive their being and existence from the soul and cannot be superior in nature to it.

We do not, of course, perceive the soul and we do not perceive its spirituality. We can only conclude from the nature of the acts to the nature of the acting subject. According to all the laws of reason, this conclusion is legitimate. From the spirituality of the acts of intellection and volition, we are, therefore, necessitated to draw the logical conclusion that the *human soul is spiritual in its nature and substance*.

The Simplicity of the Soul

By *simplicity* we understand that positive property in virtue of which the essence of a being is not composed of distinct and distinguishable parts or principles. An extended body

has unity of being, but it is composed of *integrant*, or *quantitative*, parts into which it can be divided. A yardstick can be sawed into inch-lengths; the limbs of the human body can be severed from the trunk. These parts are integrant, or quantitative. The original body is undivided, but divisible; since it is composed of internal parts, actual division separates one part from the other. Living bodies are also composed of *essential*, or *constitutive*, parts or principles, namely, matter and soul. In the living body, these parts or principles are united and undivided; however, being essentially distinct realities, a division separates them. Such a division occurs when the living body dies; matter and soul are then divided and separated. Every material being, therefore, whether organic or inorganic, is composed of quantitative or constitutive parts or of both and as such is capable of being divided into these component parts. On the other hand, a simple essence is composed neither of integrant, quantitative parts nor of essential, constitutive principles; due to the perfection of its being, extension and composition are absent. Hence, a simple essence is not only one and undivided, but one and indivisible. A being which is so perfect that it is not composed of integrant, quantitative parts, is said to possess *quantitative simplicity*; one that is not composed of essential, constitutive parts or principles, is said to possess *essential simplicity*. Our definition of 'simplicity' is thus seen to be negative in form but positive in content; 'simplicity' is a perfection, not a deficiency.

THE HUMAN SOUL IS SIMPLE IN ITS ESSENCE, EXCLUDING BOTH THE composition of integrant, quantitative parts and the composition of essential, constitutive principles.

That the human soul has *essential simplicity*, follows from its spirituality. The composition in question involves the union of matter and soul as the two constitutive principles necessary to form the living body of man. Man, as an integral organism, consists of matter and the soul. The soul, however, considered for and by itself, does not consist of matter; it is immaterial and spiritual, and it is, together *with* matter, an ultimate constituent of the human body. Hence, it is not itself composed of matter and another vital principle, but is the vital principle alone. Consequently, the human soul possesses essential simplicity.

The human soul also possesses quantitative simplicity. Only a material being, a body, has integrant, quantitative parts, because it is matter which gives to a body extension and, with it, parts beside parts. An immaterial being, since it is devoid of matter, has no quantitative parts. The human soul, however, is immaterial and spiritual. Hence, it is not composed of integrant, quantitative parts and, therefore, possesses quantitative simplicity.

A CONSIDERATION OF THE ACTS OF THE INTELLECT AND OF SELF-reflection proves the same point.

Take the act of *judgment*. In the act of judgment the intellect compares two ideas and expresses their agreement or disagreement among themselves. In the statement 'The rose is red,' there are two distinct ideas,

namely, 'rose' and 'red.' We compare the two ideas in our mind by analyzing the attributes contained in 'rose' and 'red'; we are consciously aware that quality 'red' is actually present in the object 'rose.' After perceiving the factual agreement between the two ideas, we make the mental assertion that 'The rose is red.' An indivisible intellect is required to perform this operation. If the intellect (or the soul, which amounts to the same thing, because the soul is the root-principle of the intellect) consisted of parts, then the idea 'rose' would be apprehended by one part and the idea 'red' by another part; or, both ideas 'rose' and 'red' would be apprehended by each part. In the first alternative, one part would know about the 'rose' and the other about 'red,' but there would be no single subject to make the comparison and form the judgment combining the two ideas into a statement of agreement. In the second alternative, each part would make the same comparison and form the same judgment; the result would be double ideas, a double judgment, and a double assertion of agreement, but no unitary judgment. Since the intellect makes the mental synthesis of a unitary judgment, it cannot consist of parts, but is simple in essence.

H. Lotze recognized the force of this argument and its consequences. "Any comparison of two ideas, which ends by our finding their contents like or unlike, presupposes the absolutely indivisible unity of that which compares them; it must be one and the same thing which first forms the idea of a, and then that of b, and which at the same time is conscious of the nature and extent of the difference between them. Then again the various acts of comparing

ideas and referring them to one another are themselves in turn reciprocally related; and this relation brings a new activity of comparison to consciousness. And so our whole inner world of thoughts is built up, not as a mere collection of manifold ideas existing with or after one another, but as a work in which these individual members are held together and arranged by the relating activity of this single pervading principle. This is what we mean by the *Unity of Consciousness*. It is this we regard as sufficient ground for assuming an indivisible soul.”⁵

The act of *self-reflection* is unique. Man’s intellect is the soul of man in so far as it knows intellectually. Man’s soul not only has intellectual acts, but it knows that it has intellectual acts and recognizes itself in its acts. The Ego or *I* is the subject of its intellectual acts and is conscious of itself in these acts; it thinks of itself, and thereby it makes itself the *object* of its own thinking. When judgment is made that ‘I am I, or ‘I am myself,’ the Ego is both *subject and object* of its intellectual act, agent and patient, the being knowing and the being known, the thing thinking and the thing thought. In self- reflection, a complete reversal or return of a thing upon itself takes place, so that the agent makes itself the patient or recipient of its own cognitive activity. A being consisting of parts cannot perform such a feat. It is possible for one part to influence another part, and it is possible for one part to bend over another part; but it is impossible for the parts to make themselves the object of their own action, or for the single parts to turn completely upon themselves. The hand, for example, cannot grasp itself, nor can it grasp its own grasping; the eye

cannot see itself, nor can it see its own seeing; the ear cannot hear itself, nor can it hear its own hearing. Only an indivisible entity can perform the remarkable feat of making itself the object of its own percipient act, as the intellect (soul) does in self-reflection. Hence the soul is a simple entity.

Extrinsic Dependence

Although it has been established that the human soul is spiritual and simple in its essence, neither consisting of matter nor intrinsically dependent on it, the soul is not entirely independent of matter in all its operations.

The intellect demands the *active co-operation of the sense organs* in the formation of ideas. Man is an integral organism, and the intellect derives the materials for its ideas from the senses, because ideas are formed through the process of abstraction from sensory images. Ideas, as we have seen, are not innate. Ideas are not mere refinements of images, as the sensationalists assert; nor do they arise solely out of the depths of the soul itself, as the ultra-spiritualists claim. Ideas are indeed the spiritual products of the spiritual intellect, but the intellect must dip into the reservoir of sense images and draw their 'intelligible content' out of them; only in this manner can man, so long as the soul is the vital principle of the body, fashion ideas. Hence, disturbances and distortions on the sensory level, as psychiatry proves, bring on disturbances and distortions on the intellectual level. Sensory images are more than 'conditions' of thought. They are, as D. Card.

Mercier, points out, *instrumental causes*; or, as St. Thomas puts it, images are to the intellect as color is to sight.”⁶ In other words, the intellect is dependent on the senses for the ‘object’ of its ideas. The intellect (and, therefore, the soul) is thus subjectively and intrinsically independent of the organism in its existence, but *objectively* and *extrinsically* dependent on the organism for the exercise of its abstracting ability.

The activities of vegetancy and sentiency are of a different nature. Since they are ‘vital’ activities, they have their primary source in the soul as the vital principle of the human organism. They are, however, ‘organic’ functions, and their real subject is not the soul alone, but the *organic compound* of matter and soul. The soul, therefore, taken by and for itself, is not capable of performing vegetative and sensory activities; it can perform them only in conjunction with matter as a co-principle of operation. So far, then, as *these activities* are concerned, the soul is intrinsically dependent on matter.

The Locus of the Soul

By the *locus* of the soul we mean the ‘place’ or ‘seat’ where the soul resides in the human organism. Descartes, it will be recalled, considered the pineal gland to be the ‘locus’ of the soul. Others have placed it in the blood, the heart, or in some unspecified portion of the brain. Such views are uncritical and philosophically untenable.

THE SOUL IS IN THE ENTIRE ORGANISM AND IN EVERY LIVING PART of it.

The ubiquitous presence of the soul in the body follows from the very nature of the soul as the *vital principle* of the organism. Life has its primary source, not in matter, but in the vital principle or soul. Unless matter is animated by the soul, it is lifeless matter, incapable of any vital activity whatsoever; only in conjunction with the animating soul does matter become a partner in vital activities. Since there can be no life without the soul, *wherever life is, there the soul must be present*. Life, however, manifests itself as vegetancy, sentiency, and rationality in man. Consequently in every part of the organism, where any of these activities occur, the soul must be present as the primary active principle of life.

The cell is the biological unit of life. It performs the essential functions of vegetative life, namely, nutrition and reproduction. Furthermore, the entire cell-body is an organic structure, which, throughout its entirety, is actively engaged in the process of metabolism and generation. Hence the soul, as the vital principle, must be present *in every cell throughout its entire structure*. And since the entire human organism consists of cells, the soul must be present throughout the entire body.

This fact reveals an interesting feature of the soul. The soul has no parts. Hence, it cannot exist in one part of the body according to one part of its being and in another part of the body according to another part of its being. As a spiritual, simple, indivisible reality, *it must be entire wherever it is*. Consequently, it is entire in the smallest

living portion of the organism and also entire in the total living organism. We cannot, of course, imagine this sort of presence, because we are acquainted only with the extended presence of material bodies; but we must bear in mind that thought, not imagination, must be our guide in philosophical problems. A spiritual essence is not circumscribed by the limitations of tri-dimensional extension, because it has no quantity or mass, and it would be utterly inappropriate to conceive of the soul's presence in the organism after the manner of a quantified body. The presence of the spiritual soul in the human organism is technically termed a *definitive or non-quantitative presence*, in virtue of which the soul exercises its life-giving power ubiquitously in the whole body and in every living part of it.

The soul is present everywhere in the organism according to its entire essence, but it does *not exercise all its powers everywhere*. If a certain bodily structure or organ is designed exclusively for a particular vital function, then it is there that the soul exercises this function, and nowhere else. The soul, therefore, exercises its cognitive sensory powers only in the sense organs, afferent nerves, and brain, and exercises its motor powers only in the brain, efferent nerves, and muscles; in other words, the soul as the vital principle of sentiency exercises its sentient powers only in and through the nervous system. Intellectual and volitional operations, being spiritual and simple in nature, are exercised exclusively by the soul itself as the rational principle and therefore occur nowhere but *in the soul*. In as much, however, as these operations are objectively and

extrinsically dependent on the functions of the brain for the supply of necessary images from which to abstract ideas, one may say that thinking and willing take place in the head' or 'in the brain,' so long as one does not understand these phrases too literally. Intellection and volition are not localized in any brain centers like sight, hearing, taste, and the other senses. Hence, it is only in a very broad meaning that one may use the phrase 'The brain is the organ of thought.' Philosophically speaking, thought is not directly connected with any bodily organ at all, not even with the brain.

An intriguing problem arises out of the relation of the spiritual soul to matter in the human body. Since the soul is one and indivisible, and since the organism is undoubtedly a unitary substance, does it follow that the body of man possesses an unbroken *continuity*? Discontinuity in the body seems to involve division in the simple, indivisible soul. There can, however, be no doubt that the body of man, in its entirety, is not a *continuous substance* in the strict sense of the term. The blood is an organic substance, and it is replete with hemoglobin corpuscles and leucocytes; their existence and activity must be ascribed primarily to the action of the vital principle, the soul. The blood, however, is a fluid coursing uninterruptedly through the arteries and veins, and as such it is at best only *contiguous* with the walls of the arteries, veins, heart, and the rest of the bodily substance; yet it must, together with all other parts of the body, be 'informed' and vivified by the soul. The soul, therefore, can be present in discontinuous parts without sacrificing its indivisibility. An analogy for this type of

presence is found in the presence of God's spiritual substance throughout the discontinuous parts of the world. The 'how' of such a presence is a mystery, but the fact itself is beyond dispute.

Man and Brute

The difference between man and brute is fundamentally *the difference between their souls*. Is this difference relative or absolute, accidental or essential? In many quarters there has been a persistent endeavor to eliminate any essential difference between the two, either by humanizing the brute or by brutalizing man.

Our discussion so far has brought out the point that the soul of man is endowed with powers and activities which are rational and as such superior to the powers and activities of sentiency. If there is no essential difference between man and brute, then the soul of the brute must also be rational. Now, no soul can be perceived directly; we can know it only by drawing an inference from its activities to its nature. In our own case, we have the advantage of an introspective analysis of our own mental operations. This advantage is absent in the case of the brute. We cannot analyze the brute's mental operations by any direct method. We must draw our conclusions as to the brute's rationality or irrationality from its external behavior.

On the basis of its behavior, we claim that *the brute manifests no rationality*.

The Absence of Progress. If brutes, like men, had the rational power of an intellect, then we have the right to

expect that they would have made use of it as men have. They would then possess essentially the same nature and live in the same general environment and the same causes and conditions should, by analogy, have produced the same results. Now man, because he has an intellect, perceives the *abstract relationship between end and means* and understands that the same end can be reached by a variety of means. Realizing this, man is not satisfied with producing a desired result in a single, uniformly constant manner, but invents various *devices* and *techniques* to use and save energy and to increase efficiency by improved methods. Therein lies the secret of human progress.

Nothing of the sort is ever observed in the brute's behavior. Even when the brute is in daily contact with the inventive genius of man, it manifests *no tendency to learn* to do things man does, although it exhibits native curiosity in many ways. The brute has never invented a single device, although the materials are ever present and within easy reach. When archeologists find a piece of clumsily carved stone and geologists discover a primitively chipped flint, they unhesitatingly ascribe it to man, not to the brute, convinced that the simplest of tools and manufactured articles are beyond the mental capacity of the brute, because the brute cannot comprehend the relation of means to end involved in the construction of any sort of implement. Brutes can and do learn in some measure by actual experience, and occasionally incidents occur which seemingly reflect intellectual insight; but, as M. Maher sagely remarks: "The few trivial instances cited here and there of some animal seizing a club or other rude

implement that fell in its way, only establish the more clearly the enormous chasm which separates the brute from the rational being.”⁷

Very many of the actions performed by brutes are marvelously complex and purposive, revealing an eminent adaptation of means to specific ends. Such actions, however, are *not learned and devised*, but are the result of an inborn instinct. They show the invariable, stereotyped routine of an almost machine-like perfection, *without variation and improvement* of procedure acquired in the course of time; and the brute makes no attempt at variation and improvement, except in such a minor degree that the change can easily be explained on the basis of immediate perception of sensory relations. So far back as the knowledge of man goes, each species of animal, with the sole exception of man, reacts to his environment in practically an identical manner. Bees and ants, for example, retain the same mode of living wherever they are. Each type of insect, fish, bird, reptile, and mammal constructs its home, seeks its food, cares for its young, and in general lives, as it has always done in the past. Not even the apes and monkeys, notwithstanding their morphological similarity to man and reputed intelligence, have been able to devise and make a simple cutting tool or a wooden shelter.

If the mind of the brutes were truly intellectual, like that of man, then why is their behavior so confined to the level of the senses and of the instincts? Why would the brutes not change their methods, modify their manner of living, invent mechanical contrivances, and show progress in every

direction? Man does, and the brutes, if truly intellectual, should also do it. They would have the capability, and they should also exhibit its use. Many of their actions, if really the outcome of intellectual insight, reveal a mind superior to man's. Then why the lack of progress? No valid reason can be given for this lack of progress, if they are capable of progress. The only valid reason that can be found as an explanation for this universal fact is this: *Instinct takes the place of reason*. Brutes have no reasoning powers, and hence no genuine progress is possible. Yet the individual and the race must be protected and perpetuated; and so they are endowed with strong and ingenious instincts, innate and ineradicable, to supply the deficiency of intellectual insight in the purposiveness of their actions.

The Absence of Language. Language is a system of conventional signs expressive of ideas. Sounds, gestures, written and printed symbols are used by man as the media of language, in order to express the meaning of ideas present in one mind and to communicate them to another. Some signs or symbols are 'natural.' Laughter is a natural sign of exhilaration, weeping and sobbing a natural sign of pain or grief, romping a natural sign of general well-being, depressed lethargy a natural sign of ill health, singing a natural sign of joy, snarling lips and a fighting pose a natural sign of anger. Similar attitudes are observed among the brutes, because every emotion tends to express itself in bodily form.

Language, however, is a system of *conventional* signs. Sounds, gestures, written and printed symbols are arbitrarily chosen by mutual agreement ('convention') to

express ideas. Languages are made; they are an artificial product. The natural signs of emotions are the result of a spontaneous outburst and are more or less the same at all times and with all persons; for this reason it is usually easy to interpret their general import. Languages, since they are the invention of a rational mind, differ from race to race and from nation to nation, with regard to grammar, pronunciation, writing, and printing. One need but glance at a polyglot dictionary or listen to the speech of diverse national or racial groups, in order to observe the conventional and artificial character of languages. The ideas are the same, but their expressions in languages are totally different. Languages, therefore, must be *learned* before they can be understood, both as to single words and as to grammatical construction. Even the learning of words will not suffice; one must know the ideas which the words are supposed to represent. Languages are really codes of nonsense syllables made to make sense by filling their otherwise empty forms with the intellectual content of ideas. It takes intellect to devise languages, and it takes intellect to understand and speak them.

Language is a *universal accomplishment* of man. Even the uneducated savage has a language, because he has a rational mind. As new ideas arise, new words are formed to express them. A living language is thus a fluid thing, constantly in a process of formation and modification. It changes with the progress and culture of the people who use it.

Brutes possess no *language*. They give vent to their feelings and emotions through the medium of natural cries

and bodily attitudes; but they have, so far as we can judge from their behavior, no systems of conventional signs which serve as a means of communicating their experiences from one mind to another. If they were actually endowed with an intellect, no valid reason can be assigned why they should not have devised some sort of code, even if it were only a code of clots and dashes. It might not be easy for us to decipher the code, but it would be relatively easy for us to recognize the fact that a code is being used and that it has an intellectual meaning. Most species of animal are not devoid of the necessary physical apparatus required for using a system of conventional signs. The dog's bark, the cow's moo, the horse's whinny, the crow's caw, the woodpecker's tattoo, and similar natural accomplishments, lend themselves admirably for use as languages. The vocalization abilities of the parrot are outstanding, for the parrot can memorize and speak words and entire sentences with astonishing fidelity. Practically every animal could scratch symbols or picture-drawings on the ground, to represent ideas and communicate messages.

If brutes possessed a rational mind, why this astounding *absence of language in every form* in the entire animal kingdom? The advisability and the occasion for language are certainly present; the physical ability is not lacking for the required invention of the necessary conventional symbols. Yet not even the parrot attempts to use its ability of imitating speech for the purpose of expressing its own ideas. All we observe are natural signs expressive of natural feelings and emotions. It is inconceivable that intelligent animals would not use their intellectual powers to invent

some form of language among themselves which would be recognizable as such. And it is also inconceivable that domestic pets would not, if they could, express their ideas and sentiments to their human masters. The reason why brutes have no language can only be: *They have no idea to express*. Where ideas are lacking, there can be no language.

Some advocates of animal intellectuality put forth the claim that brutes speak a language of their own, so that they understand one another. They adduce as evidence the melodies of birds, warning cries, mating calls, the whining of the young clamoring for food, and so on. The facts are admitted, but the interpretation of the facts is of very doubtful validity. The conditions expressed by these sounds and bodily attitudes are of a purely sensory nature, and the expressions themselves are *natural signs*, not conventional and arbitrarily invented symbols. These expressions are on a level with the natural signs found among humans, especially infants. The human infant also cries out in pain and fright, gurgles and coos in pleasure and comfort, and otherwise gives expression to his emotional states; but there is nothing intellectual about such natural manifestations, because the infant does not use his latent intellectual powers at this stage of existence. An older child, when injured, will weep and cry out "That hurts !" Weeping is a natural sign; the cry "That hurts!" is language. Man expresses his mental condition with both types of signs; the brute, only in the form of natural signs which demand no intellect to apprehend their significance. The human infant, as it advances in age, learns to speak, because it has an

intellect. The brute, however, never goes beyond the level of natural calls and attitudes. The reason must be that it simply *has no intellect* which would enable it to use language as a medium of expression.

The Absence of Intellectual Insight. To test the relative intelligence of man and brute, much experimental research has been made in recent decades. Many types of animals were used for the purpose, among them monkeys, orangutans, chimpanzees, cats, rats, dogs, raccoons, etc. Representative of the group of experimenters are E. L. Thorndike, J. A. Bierens de Haan, P. E. Fields, L. Verlaine, H. G. Wyatt, N. R. F. Maier, G. Révész, G. W. Hartmann, A. A. Campbell, R. M. Yerkes, H. W. Nissen, T. L. McCulloch, H. A. Fjeld, W. Köhler, W. N. Kellogg, L. A. Kellogg, J. B. Wolfe, S. D. Shirley Spragg, and others.

A study of the results of these experiments shows that animals possess a synthetic sense and are capable of sensory analysis and synthesis. They have the power of *sensory abstraction*, selecting a predominant sensory item to the exclusion of others. But they are *incapable of intellectual abstraction* based upon the formulation of a general principle applicable to a number of similar things. Children readily grasp the logical relationship of part and whole, genus and species, general law and particular instance, etc., and they solve problems accordingly with true intellectual insight. Animals, however, solve problems on a sensory basis, but not when intellectual insight into logical relation is required. Where *deduction* is demanded, even in its simplest form, animals invariably fail. Animals cannot grasp an abstract 'principle' and work out a

problem in accordance with the principle. If, for example, eight boxes are placed in a row, and food is placed in the first one for the first experiment, then in the second one for the second experiment, in the third for the third experiment, and so on through the series, the principle to be deduced and learned is that one must always choose the box next in line to the box which contained the food in the preceding experiment. The principle is simple, but animals never make the deduction; they always choose by the trial-and-error method. *They cannot reason.*

From their behavior, therefore, we must conclude that animals do not possess a rational soul.

MAN IS AN INTEGRAL ORGANISM, CONSISTING OF MATTER AND soul. His soul is spiritual and simple. It is entire in the entire body and entire in every living portion of the body. The brute soul is not rational. Hence, there is an essential difference between man and brute.

Summary of Chapter XX

To have a proper understanding of 'the whole man,' it is necessary to understand the nature of man's soul.

1. *Man an Integral Organism.* Man is a single, unitary substance, an integral organism. His vegetative and sensory structures and activities co-operate in perfect harmony, and one set is dependent on the other in being and operation; hence, both sets of structures and activities must be referred to one and the same vital principle or *soul*.

Man's rational activities, being of an order higher than vegetancy and sentiency, demand a *rational soul*. There exists a most intimate relationship of mutual influence between the vegetant-sentient part and the rational part of man's nature: he is a vegetant-sentient-rational' being, a single, complete, integral organism. Hence, he has but a single soul.

Man's *consciousness* is also witness to the fact that vegetative, sensory, and rational acts and conditions are referred to the self same Ego, as vital activities of one identical organism. Man, therefore, is 'a rational animal.' His soul is a *single rational soul*, capable of performing vegetative, sensory, and rational activities.

The human soul can be defined as 'the vital principle of the human organism'; or, as 'the substantial form of the human body'; or as 'the first act of a rational body possessed potentially of life'; or, as 'the ultimate principle in man in virtue of which he lives, senses, thinks and wills.'

2. *The Spirituality of Man's Soul.* Spirituality or immateriality is that property in virtue of which a thing is neither composed of matter nor intrinsically dependent on matter. Man's soul is *spiritual* and *immaterial*.

It is not composed of matter, because it is a co-principle *with* matter as an ultimate constituent of the human organism. It is also *intrinsically independent* of matter, because its operations transcend matter.

Thinking and Energy. If the soul is material, then thinking is a material operation and must consume energy, involving metabolic changes. To all appearances, however, thinking does not consume energy.

Intellection and Sensation. In sensation, the stronger the stimulation and nerve action, the more time it takes for the senses to register the impressions of subsequent weaker stimuli. With the intellect, the insight into truths of great clarity, sublimity, and magnitude facilitates the simultaneous insight into minor truths. The reason must be that intellection is not dependent on material nerve tissues and organic structures subject to metabolic changes and loss of material energy. Intellection, therefore, is *exempt from the conditions of materiality*.

Universal ideas. A material object is an 'individual' object, determinately circumscribed and particularized as to quantity, quality, space, and time. Sense impressions and images are characterized in the same manner. Man's intellect

has universal ideas which represent *class-natures* divested of all particularizing determinations of quantity, quality, space, and time. Universal ideas, therefore, are not material, sensory images, but are *immaterial representations* of things.

Ideas with Supra-Sensuous Content. Man has ideas which represent supra-sensuous realities, such as 'justice,' 'law,' 'truth,' 'God,' etc. If the intellect were a material power, it would be absolutely restricted to the representation of material things, and such ideas would be impossible.

The Intellect and the Future. Future events, being as yet non-existent, cannot possibly influence a present material power; the senses, therefore, cannot image future events, because the stimuli are absent. We have, however, ideas of the future and predict future occurrences in advance. Hence, the intellect transcends all material conditions of knowledge.

Volition. A material appetitive power cannot be influenced by, or strive for, anything except a concrete physical good. The will, however, is often influenced by, and strives for, goods which are decidedly *supra-physical and supra-sensuous*, transcending all sensuous desires and sensuous goods for the sake of an ideal. The will is also free in its choice, determining itself in its action, while material realities are subject to a physical determinism.

We must conclude, then, that the soul, the ultimate subject of intellection and volition, is neither composed of matter nor intrinsically dependent on matter.

3. *The Simplicity of the Soul.* By 'simplicity' we understand that positive property in virtue of which the essence of a being is not composed of distinct and distinguishable parts or principles. An extended body is composed of *integrant*, or *quantitative*, parts into which it can be divided. Living bodies are composed of essential, or constitutive, principles, namely, matter and soul. The human soul is *simple in its essence*, possessing both 'essential' and 'quantitative' simplicity.

Essential Simplicity. Since the soul is spiritual and immaterial, matter is excluded from its essence.

Quantitative Simplicity. The soul possesses no quantitative parts, because only a material and extended body has such parts.

The act of *judgment* expresses the agreement or disagreement of two ideas among themselves. An *indivisible* intellect is required to make a judgment. If the intellect consisted of parts, then the one idea would be apprehended by one part and the other idea by another part, or both ideas would be apprehended by each part. In the first alternative, there would be no single subject to make the comparison and combine the two ideas into a statement of agreement or disagreement; in the second alternative, we would have double ideas and double judgments, but no

unitary judgment. Since the intellect makes the mental synthesis of a unitary judgment, it cannot consist of parts.

In the act of *self-reflection*, the Ego knows itself; the intellect makes its own thinking the object of its own thought. The Ego is both *subject* and *object* of its intellectual act. Such an act is a complete reversal of a thing upon itself, something impossible to a being consisting of parts. Hence, the intellect, and the soul, is a simple and indivisible entity.

4. *Extrinsic Dependence*. The intellect derives the materials for its ideas from the senses, because ideas are formed through the process of abstraction from sensory images. Hence, though the intellect and its operations are spiritual, the intellect is *objectively* and *extrinsically* dependent on the organism for the exercise of its abstracting ability.

5. *The Locus of the Soul*. By the 'locus' we mean the 'place' where the soul is situated in the body. The soul is entire in the *entire organism* and in *every living part* of it.

The soul is the vital, or life-giving, principle of the human organism. Hence, wherever life is, there the soul must be present. Every cell and every structural part of the cell is vitally active in the functions of vegetative life; and the entire body consists of living cells. The soul, therefore, must be present in the entire organism as a whole and in every living part of it. Since the soul is a simple essence devoid of parts, it must be entire wherever it is; hence, it must be entire in the smallest living portion of the organism and also entire in the total living organism. This type of presence is termed *definitive* or *non-quantitative*.

6. *Man and Brute*. On the basis of its behavior, the brute manifests no rationality. Evidence is found in the absence of *progress, language, and intellectual insight* throughout brute behavior. Instinct takes the place of reason.

Man, therefore, differs from the brute not only in degree, but in *nature* and *essence*.

Chapter 21

THE HUMAN PERSON

MAN IS AN ORGANISM. LIKE EVERY OTHER ORGANISM, THERE ARE numerous aspects to the nature of man, and each aspect gives rise to special problems. Some of these problems are comparatively simple, others are deep and perplexing. It was necessary to treat of these many phases of man's being in piecemeal fashion. Such a division of material, however, is merely methodological; in reality, man is not an aggregate of separate parts, like the various parts of a machine which a deft hand can take apart and piece together again. Eventually, the philosopher must reverse his methodological procedure and seek to synthesize into the integrated whole of the *human person* what he was compelled to treat separately for reasons of convenience and clarity.

The complete synthesis of the various aspects of man's being into the higher unity of the human person has proved to be a grave difficulty for modern psychologists.

Many aspects of man's being are 'physical' and belong to his 'body'; others are 'psychical' and belong to his 'mind.' Integrating these two large groups of items constitutes the *body-mind problem* so prominent in modern psychology.

Then, too, man consists of matter and a vital principle or, according to the usage of common language, of 'body' and 'soul.' Their relationship constitutes the age-old *body-soul problem*. Again, everything in man, 'body and mind' and 'body and soul,' is referred to the 'Ego' or 'self.' Thereby the body-mind problem and the body-soul problem merge in the modern *Ego-problem*.

And since man is a 'person,' an attempt at a complete synthesis becomes the *problem of the human person*.

The Empirical Ego

When we speak of the *empirical Ego*, we mean the 'Ego' or 'self' as it is revealed to each individual in his own *internal experience* in the introspective act of self-consciousness (Chap. 17). Usually the empirical Ego is observed by the individual in the performance of some *action*. It may be a bodily action, as when I pay attention to manipulating a tool, to humming a tune, to pronouncing words, etc.; or it may be a mental action, as when I consciously read a book, solve a problem in arithmetic, write an essay, etc. It is in this manner that I perceive my 'self' or 'Ego' concretely in action.

In a similar way, I become conscious of my 'self' or 'Ego' in certain states which affect me more or less passively. I am aware, for example, that something has struck me, that I feel the cold wind, that I have a pain or headache, etc. Here also it is through introspective self-reflection that I become conscious of my 'Ego' as the passive subject in which these states occur.

Mainly, I become aware of my 'self' or 'Ego' when I consciously exert myself, either physically or mentally, as when I push my physical powers to the limit of endurance or resist a pleasurable allurements for the sake of duty and conscience. This *concomitant awareness* of my 'self' or 'Ego' in a personal action or affecting state is *an immediate datum of my internal experience*.

I am not, however, aware of my 'self' or 'Ego' at all times, but only when my attention is focused inwardly. When my attention is focused outwardly, as when I witness a stage play or an exciting game, I may be so absorbed in what is taking place before me as to forget my 'self' or 'Ego' for the time being. Attention to external happenings is *inspection*; attention to internal happenings is *introspection*.

The 'empirical Ego,' therefore, is the 'self' or 'Ego' as observed at *any present moment* in a here-and-now experience.

The Historical Ego

The *historical Ego* is the 'Ego' or 'self' of an individual as he perceives it through *memory* of his life's experiences from the present down through the past. Every individual has a history of past experiences. The traces of these experiences are stored away in the mind and are, to a greater or lesser degree, capable of recall at the present moment. Since these experiences belonged to the 'self' or 'Ego' as to their subject, the part which the 'self' or 'Ego' played in these experiences is also capable of recall. Hence, the 'Ego' itself has a history, peculiar to each individual.

The knowledge of my 'historical Ego,' since it is based on my memory of my past experiences, is of necessity subject to all the vicissitudes and vagaries of my memory. While many events have been forgotten and are perhaps permanently beyond recall, I am usually able to remember the principal experiences of my childhood, youth, and adulthood. All such experiences pertain to my 'historical Ego.'

Viewed in retrospect, the 'historical Ego' may undergo a considerable *change* in the course of time, as the pattern of life changes. Success and failure, education and environment, influence a person in remarkable ways. We are sometimes compelled to confess: 'I have changed greatly since the days of my youth.' This change can also occur through a change in *memory itself*. Injury and illness may bring about a state of dissociation in the memory content (Chap. 9). We then observe the mental phenomenon of a 'changing personality.'

The 'historical Ego' in each individual has its beginning with the first instance of the knowledge of his own 'self' some time in *childhood*. The knowledge of the 'self' or 'Ego' is not innate; it is acquired. The prenatal life of the child is mainly vegetative. After birth, the child accumulates sense impressions and develops an acquaintance with his own body and with surrounding objects. After a few years, the child suddenly becomes aware of his own 'self' as a person set apart from other persons and things; he has reached selfhood. From that moment on he has a knowledge of his 'empirical Ego,' using the terms 'I' and 'me'; that moment is also the starting point of his 'historical Ego.' From the data

obtained in this manner man forms his *abstract concept* of the 'self' or 'Ego.'

It should be evident that the 'empirical Ego' is very meager in content and the 'historical Ego' very rich in content.

The Metaphysical Ego

From the data of the empirical and historical Ego it must be possible to draw certain definite conclusions concerning the *constitution and nature of the human Ego*. The Ego, considered in its constitution and nature, is termed the *metaphysical Ego*. The philosopher is interested in this deeper problem of the Ego.

That such a problem exists and clamors for a solution, is beyond question. Just what is this 'Ego' or 'I' or 'self' of which man is forever speaking?

Does the Ego belong to the mind, or does the mind belong to the Ego? The *mind* is generally understood to be the ultimate principle or, as others prefer to view it, the sum-total of all the powers, processes, and states found in the sensory and rational life of man. That mind and Ego are inseparably connected, is conceded by all psychologists and philosophers. Man becomes conscious of his Ego or self through a cognitive act of the mind; man, however, performs 'mental' functions in childhood before he is conscious of his Ego or self. It would seem, then, that the mind is prior to the Ego, so that the Ego is only a phase or part or state of the mind. On the other hand, after man has learned to pay attention to the workings of his mind

through introspection, he invariably refers the mind to his Ego or self, convinced that *the mind belongs to the Ego* as a part to the whole. We thus say: '*I have a mind.*' And we also say: 'My sight; my imagination; my memory; *my mind.*' Such phrases are universal, used by all persons and at all times. They plainly indicate that all mental states and the very mind itself belong to the Ego, so that the Ego or self is their *subject* and *possessor*. The Ego, therefore, is more basic and ultimate than the mind itself.

We observe a similar relationship between the 'soul' and the Ego.' We frequently say, for instance: 'I have a soul; *my soul.*' Here, too, the soul is referred to the Ego as something more basic and ultimate than the soul itself. *The soul*, like the mind, *belongs to the Ego*, and the Ego is considered as its subject and possessor. The Ego, therefore, is neither the mind nor the soul, but something deeper and more fundamental in man.

There is something still more puzzling about the Ego or self. The material, corporeal part of man's being is also referred to the Ego. We say, for instance: 'I have hands and feet and a torso, *I have a body*; my nerves, my bones, my body.' The body, therefore, and everything pertaining to it, *belongs to the Ego* as to its subject and possessor.

Thus the material and mental, the physical and the psychical, body and mind, in a word, *man's entire being*, is conceived by us as belonging to the Ego or self as to its subject and possessor.

Considered from another angle, to what is the Ego or self referred? Viewed introspectively, and judging from the expressions used by all men, *the Ego is never referred to*

any deeper reality in man. Occasionally, when a person becomes very philosophical, he may say: 'I am myself.' Since 'I' and 'self' mean the same thing, such a statement is equivalent to saying that 'I am I' and expresses a reflexive judgment of identity between 'I' and 'self'; the Ego is simply the Ego. The Ego, I, or self is the *ultimate reality* in man to which everything in man belongs, while the Ego itself does not belong to some more fundamental reality. Everything is united and unified in the Ego, and the Ego unites and unifies everything in man. Therein lies the profound *problem of the human Ego*. How can the Ego embrace within itself such disparate and, one is almost inclined to say, contradictory realities and attributes as are found in body and mind? What is the Ego in its final analysis? Is it the body, or is it the mind? If the body, then what about the mind? Man certainly has a mind. If the mind, then what about the body? He also has a body. Or, is the Ego both body and mind? But how can that be possible, since both are such totally different kinds of being? Contradictory attributes seem to exist in one and the same Ego.

Man is, in many respects, like a jigsaw puzzle. The physiologists have succeeded in putting a large number of pieces together, and the picture obtained is that of a 'body.' The psychologists have also succeeded in putting a large number of pieces together, and their picture is that of a 'mind.' Neither picture, however, is really complete, because both major portions are supposed to be fitted together into the *higher synthesis of the Ego*, so as to form the composite picture of 'the whole man.' Yet the two major portions of the complete picture, namely, body and mind

synthesized in the Ego, do not seem to match. Philosophers, by and large, find it extremely difficult to effect the synthesis.

The problem is, without doubt, not an easy one to solve. Many solutions have been offered. The best way to arrive at the correct solution will be to view the problem in its historical setting.

The Problem in History

The ancient philosophers knew nothing of an 'Ego problem.' For them the 'body-mind problem' was mainly a 'body-soul problem.' However, since the modern problem of the human Ego has its roots in the age-old problem of body and soul, it will be necessary to go back as far as Grecian philosophy.

Plato, as we have seen (Chap. 13), maintained an *ultra-dualism* of body and soul (mind). The body is a material substance, and the soul is a spiritual substance; the two substances form a dynamic unit, but not a substantial unit. The relationship between the human spirit and its body is that of a rider and his horse, of a helmsman and his ship. This theory has already been refuted.

Aristotle, the greatest scientist and philosopher among the ancients, rejected this ultra-dualism of Plato as contrary to all evidence. He synthesized body and mind (Chap. 14, 19) by assuming that the soul of man is the formal, organizing, animating principle of primal matter. Matter and soul are two incomplete substances or substantial co-principles, and their union results in a single, *unitary*

substance, namely, the human organism. While safeguarding body and mind (soul) as distinct realities, he gives a neat explanation of their synthesis into one substance.

In *medieval times*, under the guidance of *St. Albert the Great*, *St. Thomas Aquinas*, and other great masters, aristotelianism developed into a new and powerful system of philosophy. It received the name of scholasticism. Aristotle's doctrine on the nature of man as a composite substance of body and soul became one of the principal teachings of aristotelian-scholastic philosophy.

Toward the end of the Middle Ages, a period of philosophic stagnation set in. Originality of thought gave way to vain subtleties and sterile commentaries on the books of the masters. Scholasticism fell into disrepute, especially after the advent of the Renaissance and the introduction of more precise scientific methods in the solution of the problems of physics. Eventually, the genuine doctrines of the great medieval philosophers were practically forgotten by the thinkers of the rising new era.

MODERN PHILOSOPHY HAS ITS ORIGIN IN THE TEACHINGS OF *RENÉ Descartes* (1596—1650). He broke completely with the philosophy of Aristotle and St. Thomas and attempted to place philosophy upon an entirely new basis (Chap. 13). He defended an *ultra-dualism* of body and soul in man. Regarding man's body, he advocated a *mechanistic atomism*; regarding man's soul, an *ultra-spiritualism*. Man's ideas are potentially innate, not derived from sense data

through intellectual abstraction. Here were the seeds of the subsequent theories of *materialism and idealism*.¹ Since man's mind can know only its own internal states, his theory of knowledge terminated in *subjectivism*, the theory which plagues practically all modern philosophy. Descartes placed a gap between body and mind; bodily events and mental events were closed systems without intercommunication. It has become the main endeavor of modern philosophy, outside neo-scholastic circles, to find a bridge to span this gap. The gravity of the problem was obvious. Granted the assumption that body and soul (mind) were two complete substances merely in conjunction, how could the body influence the mind, and how could the mind derive any knowledge of the world through the body?

Arnold Geulincx (1625—1669) went a step farther. He denied all activity to creatural beings, reserving all activity to God. It is God who produces every kind of activity in the universe. In order to explain the apparent influence existing between body and mind, he compared them to *two clocks* synchronized so perfectly that both indicate the same hours. The two clocks do not influence each other; both are constructed by the same Divine Workman and have His will imposed upon them to work with perfect timing. Thus, when we have the will to speak, the tongue is simultaneously set in motion, but the will has no influence over the movements of the tongue. The theory that God, on the occasion of certain conditions, produces all activity in his creatures, is called *occasionalism*. Geulincx thought that his theory overcame Descartes' ultra-dualistic difficulties by simply denying all activity to both body and mind. He failed

to see that the theory is contradicted by the testimony of our *consciousness*, which is witness to the evident fact that we are the causal agents of our own acts. His theory denies *free will* and destroys the foundations of morality, making God solely responsible for every good and evil human act.

Nicholas Malebranche (1638—1715) also accepted Descartes' ultra-dualism. He was an *ontologist*, defending a modified occasionalism. According to his theory, man acquires his knowledge from the contemplation of the divine Ideas of God. Similar views were held by *Rosmini* and *Gioberti*. The theory has been refuted elsewhere (Chap. 13).

Gottfried W. Leibnitz (1646—1716) proposed the curious doctrine of monadism (Chap. 13). He recognized no interaction between the mental and the material. Every material entity, however, has also a mental side; this doctrine is called *pan-psychism*. God has established a perfect harmony between the material and mental, so that, like the two clocks of Geulincx, material and mental activities follow parallel lines throughout. His theory of 'pre-established harmony,' therefore, is a form of *psycho-physical parallelism*.

Baruch Spinoza (1632—1677) sought a different solution for the cartesian dilemma. He defined 'substance' as something the concept of which needs no other thing from which it should be formed. Such a definition can apply only to God, because God alone is a substance the concept of which involves no other concept or thing. Spinoza accepted the implication of this definition: there is but *one substance*, and that substance is *God*. Hence, everything that exists is a

modification of the divine substance, and that includes everything material and extended and everything spiritual and unextended. The divine nature, therefore, has as *essential attributes extension and thought*. As extension, the divine substance unfolds itself into the physical world; as thought, it unfolds itself into the human minds. The human mind is a mode or manifestation of the divine intellect. When, therefore, man's mind has an idea, it is really God who has this idea in the human mind, because He constitutes the essence of the human mind. And since the extended world and the unextended mind are one in the substance of God, it follows that the order and connection of ideas is identical with the order and connection of things. Viewed this way, the theory is a *psycho-physical parallelism* with its roots in a *pantheistic monism*. It is 'pantheism,' because everything is God, and God is everything. It is 'monism,' because there is only one kind of ultimate reality or substance in existence to which all things, physical and mental, are reduced; in Spinoza's system this reality is God.

There are a number of reasons which compel us to reject Spinoza's theory. God is, as Spinoza admitted, infinite. The objects in the universe and the human minds are finite; finiteness, as we know, is an attribute at least of our own body and mind. God, then, must be both *infinite* and *finite* simultaneously — a contradiction in terms. Again, if our mind is a part of God's intellect and if God's substance constitutes the essence of our mind, we should be *conscious of our identity with God*; we are, however, not conscious of this identity. Furthermore, since man is an unfolding of God's substance, all human actions are really God's actions,

and God is the responsible agent of all human *misdeeds* and *crimes*; but in that case God would not possess infinite perfection. Finally, the world consists of a *multiplicity* of objects and human beings. If we are certain of anything, we are certain that we are identical with ourselves and distinct from other things and other human beings; our consciousness does not include the consciousness of other minds, although speech assures us of the existence of other minds and physical contact assures us of the existence of other bodies. This testimony of our consciousness is either true or false. If true, then a multiplicity of things exists, and they do not form one ultimate substance, because something cannot be a single substance and a multiplicity of substances at the same time. If false, the foundation of all knowledge is destroyed, because knowledge rests ultimately on consciousness as the last court of appeal; the outcome is complete skepticism. The entire system of Spinoza is a deduction from his *definition of substance*. This definition is *arbitrary* in the extreme and rests solely on Spinoza's personal statements. It leads to contradictions and impossibilities which are a plain *reductio ad absurdum*. These contradictions and impossibilities should have warned Spinoza that his original definition must be *false*, because erroneous conclusions presuppose faulty premises.

In England the trend of philosophy was toward empiricism and sensationalism. *Empiricism* is the doctrine that all human knowledge is derived from the data of particular states of consciousness, so that experience is the exclusive source and criterion of all knowledge. *Sensationalism*, which is almost synonymous with

empiricism, is the doctrine which assumes that all human knowledge originates solely in sensation and that all intellectual cognitions are ultimately nothing more than complex and elaborated products of sense impressions and their reproduced images. In both theories intellectual knowledge is only a refined form of sensory knowledge and not of a kind essentially superior to sensory knowledge. A *sentient* nature, therefore, suffices to explain all human knowledge, and a spiritual intellect or soul is a superfluous entity. The empiricist and sensationalist theory has its origin in the teachings of Locke.

John Locke (1632—1704) was an *empiricist*. He considered 'ideas' to be the sole object of thinking, and by 'ideas' he understood 'phantasms' (sense images) and 'notions' (concepts). By wiping out the distinction between sense images and concepts, he led the way directly to *sensationalism* and *materialism*. By asserting that our internal mental states ('ideas') are the sole objects of thought, he excluded from our knowledge all *things* of the physical world, as they are in themselves, except by a mediate inference from our ideas. His teaching leads to *subjectivism* and *idealism*.

Locke was unjustified in identifying sensory phantasms and intellectual concepts under the common term 'idea,' because ideas (Chap. 20) are abstract, universal, and spiritual in nature, while sense impressions and images are always concrete, particular, and material. Hence, although Locke rejected Descartes' theory of innate ideas, he did not succeed in overcoming the cartesian ultra-dualism of body

and mind, because he could not explain how a knowledge of the material world could get into the mind.

George Berkeley (1685—1753) accepted Locke's dictum that the mind can perceive nothing but its own internal states. Locke maintained that a world of material substance actually exists, though its existence is a matter of inference only. Berkeley refused to follow Locke. Since we can know nothing but our internal states, to *be* is to be *perceived* (*esse est percipi*), and we have no right to conclude to the existence of an extra-mental world of inert corporeal substances. The only substances which exist are God and minds, i.e., spiritual substances; even the human body does not exist, except as a perception. Berkeley advocated *spiritualistic idealism and mentalism*, the theory that nothing exists but the spiritual mind.

Berkeley's theory solves the cartesian body-mind problem through the expedient of denying the existence of bodies and all material reality. The solution is entirely too simple. One cannot get rid of the human body and of the world by means of a mere denial. We are as certain of the existence of our body as we are of our own self, and the body is as much a part of our being as is the mind.

David Hume (1711—1776) adopted the empirical phenomenalism of Locke, maintaining that we can have knowledge only of our internal states. He agreed with Berkeley that we have no right to accept the existence of material substance. He even *denied the existence of all substance*. He formulated his argument in the oft-quoted passage: "I would fain ask those philosophers, who found so much of their reasonings on the distinction of substance

and accident, and imagine we have clear ideas of each, whether the idea of substance be derived from the impressions of sensations or reflection? [These are the sole data of our knowledge, according to Hume. — Author. See Chap. 13] If it be conveyed to us by our senses, I ask, which of them; and after what manner? If it be perceived by the eyes, it must be a color; if by the ears, a sound; if by the palate, a taste; and so of the other senses. But I believe none will assert, that substance is either a color, sound, or taste. The idea of substance must therefore be derived from an impression of reflection, if it really exists. But the impressions of reflection resolve themselves into our passions and emotions; none of which can possibly represent a substance. We have therefore no idea of substance, distinct from that of a collection of particular qualities, nor have we any other meaning when we talk or reason concerning it.”² And thus all substances are argued out of existence, leaving nothing but phenomena. Hume became the protagonist of *pan-phenomenalism*, the theory in which everything is reduced to mental states.

Since there is no substantial reality underlying the transitory mental states, Hume contended that man is “but a bundle or collection of different perceptions, which succeed each other with an inconceivable rapidity, and are in perpetual *flux* and movement.”³ We have, then, *no personal mind and Ego* as the subject of mental phenomena. There are thoughts, but there is no thinker who thinks the thoughts. We should not say ‘*I think*,’ but ‘*it thinks*.’ Here we have the psychology of the impersonal mind, and the ‘mind,’ if we speak of it at all, is not distinct

from the passing internal states. It is like movement without anything that is moving.

Locke and Hume had many followers. Chief among them are James Mill, J. S. Mill, A. Bain, J. Sully, H. Spencer, T. Ribot, H. Tame, E. Condillac, and the founder of positivism, A. Comte. They differ among themselves in many respects, but they all adhere to the general doctrine of empiricism and sensationalist phenomenalism.

Immanuel Kant (1724—1804), sought to offset Hume's skepticism and re-vindicate the validity of human knowledge (Chap. 13). He arrived at the conclusion that we can know only *phenomena* (appearances), not *noumena* (things-in-themselves, as they are in reality). Among the items of phenomenal knowledge, acquired through introspection, is the *empirical Ego*. The 'idea' of the Ego, however, is an innate, *a priori* form of reason, pertaining solely to phenomena, and tells us nothing of what the 'Ego' is as a thing-in-itself. Similarly, 'substances' is an innate, *a priori* category, and all 'categories' have only a subjective, regulating function in ordering our thoughts, without any objective value in the world of things. Hence, when we think of the soul or Ego as a 'substance' possessing actual simplicity, unity, and spirituality, we harbor an illusion, because we then confuse the real order with the mental order. There is, of course, a *pure, noumenal Ego* beyond the phenomenal Ego of which we are aware in our consciousness, but we can never attain to a knowledge of its reality; we can know only the phenomenal Ego, and such knowledge is a mere mental construction.

Kant's general theory has been subjected to a critical evaluation in connection with the origin of our ideas (Chap. 13). Here we wish to stress the point that, if Kant's theory were correct, he could not even know of the existence of the 'pure Ego,' much less tell us anything about it. In psychology, we are interested in the 'Ego' as given in our conscious experience and not in some hypothetical 'pure Ego' conceived by Kant; otherwise *psychology is an illusory science* devoid of all value for life, because everything we can discover about our body, mind, soul, and Ego would tell us nothing of what these things are in themselves as objects of reality. Kant's theory is a form of *rationalistic idealism*, although he is a hypothetical dualist postulating the existence of an external world. He failed to overcome Descartes' antithesis between mind and matter; the mind remains imprisoned in its conscious states and can know nothing of the external world and non-Ego objects. His followers developed his ideas into a stark absolutism.

Johann Fichte (1762—1814) contended that thought cannot be derived from being, but being must be derived from thought; thought, therefore, is the ultimate and only reality, and the laws of thought are the laws of being. And since all thought is contained in consciousness, there is no other reality but conscious Ego; hence, all reality is unified in the Ego. The Ego, of course, does not mean merely human consciousness, but the universal consciousness of the Absolute or God. Fichte assumes the existence of an infinite Ego which first posits itself, then posits a limited non-Ego (the world), and finally posits a limited Ego (the human

mind or Ego) in opposition to the limited non-Ego. Fichte defends *pan-Egoism*.

Friedrich Schelling (1775—1854) viewed the universe as divided into two great actualities — nature and spirit (real and ideal, object and subject, matter and self, thing and mind). In reality, however, these opposites are originally and essentially identified in the *Absolute* or *infinite*, so that they are but two phases in the evolution of the ultimate reality which is the Absolute. Hence, his doctrine is termed the *identity theory*.

Georg W. Hegel (1770—1831) also identified all things in the Absolute. But with him the Absolute is pure *Thought* or *Idea*. It evolves by means of a *purely rational and logical process of thought* into the ideal and real, into subject and object, into spirit and nature, into mind and matter. The Absolute is incessantly in a process of dialectic evolution, so that all being is thought realized. His system is *idealistic monism* driven to its highest peak; it is the one-ness of all things in the Absolute.

Idealistic monism, which seeks to eliminate the difference between the physical and the psychical by reducing them to the identity of one ultimate reality or Absolute, exerted a great influence on modern thinkers. Among those who followed this line of thought are A. Schopenhauer, E. von Hartmann, T. Green, F. Bradley, J. Gaird, E. Gaird, B. Grace, G. Gentile, and many others.

Disgusted with the brilliant obscurities of Kant and the idealists, others sought to bring the problem of man out of the clouds back to earth. Instead of following Descartes in the spiritualistic side of his ultra- dualism of human nature,

they swung to the opposite extreme and chose the atomistic-mechanistic side pertaining to man's body. In opposition to the idealists who reduced the physical to the mental, they reversed the procedure and *reduced the mental completely to the physical*. The result was a *materialistic* monism which admits but a single ultimate reality, namely, matter.

Materialism, being a form of monism, is a metaphysical identity theory, because everything in man is identified with matter and material energy. What we call the 'psychical,' such as sensation, perception, memory, intellection, etc., is regarded by materialism as a *function or property* of organized matter, essentially of the same nature as any other physiological function of the human body. There is nothing in mental facts but movements of material particles; they are obscure manifestations of material energies and as such do not transcend matter and its conditions. *No interaction* exists between body and mind, for the simple reason that 'mind' is a mere abstraction; the only reality that exists is the body composed of atoms and molecules in organization. Mental life is identified with neural action. At best, some materialists admit that consciousness is an accompaniment or by-product of neural processes, determined by them but exerting no influence upon them, so that consciousness is but an 'epiphenomenon' of matter, matter being the real phenomenon. This doctrine is the theory of *epiphenomenalism*. By ignoring the specific character of psychical events and conditions, the materialists arrive at

an easy solution of the problem of mind and body and of the human Ego.

Chief among these pseudo-philosophers were P. J. Gabanis, J. La Mettrie, L. Feuerbach, C. Vogt, L. Büchner, and E. Haeckel. Theirs was a very crude sort of materialism. Cabanis, for example, maintained that the brain secretes thought as the liver secretes bile.

Ever since experimental psychology has investigated mental phenomena with scientific thoroughness and precision, it has become increasingly clear to psychologists that the crude materialism of men like Moleschott, Buchner, and Haeckel is a failure. Nevertheless, many prominent experimentalists, due to the materialistic trend of the times in which they received their education and training, were loath to accept the idea of a spiritual soul informing the body as the principle of unification for body and mind. Generally speaking, they prefer some kind of *psycho-physical parallelism*.

Gustav J. Fechner (1801—1887) maintains that body and soul (physical and psychical) are not essentially different realities; at bottom, they are a single reality with *two aspects*. When I look at myself, I find that I am a conscious mental being; that is the 'psychical aspect' of myself as a man. When an outsider looks at me, I am a material being, because he cannot intuit my mental states; that is the 'physical aspect' of myself as a man. In so far as Fechner considers the physical and psychical to be merely two aspects of one and the same ultimate reality, his view is termed the *double-aspect theory*; and in so far as he postulates a single ultimate reality which is both physical

and psychical, depending on the point of view one takes, his psycho-physical parallelism is an *identity theory*.

Wilhelm Wundt (1832—1920) was a psycho-physical parallelist. In his 'ideal-realism' he takes a stand midway between idealism and realism; as a scientist he leaned toward realism, and as a follower of Kant he could not free himself from idealism. Wundt denies the existence of all substance: "The contents of psychological experience should be regarded as an *interconnection of processes*. This concept of process excludes the attribution of an objective and more or less permanent character to the content of psychical experience. Psychical facts are *occurrences*, not objects."⁴ Since the mind is conceived as a sum-total of psychical events, there is, in his view, no such thing as a permanent, substantial mind or Ego as the carrier of these mental states. The concept of 'mind-substance' has no value except to satisfy "a mythological and metaphysical need."⁵ The mind is simply act, actuality. All we have is a manifold of interrelated occurrences, an inner (psychical) and an outer (physical) experience. Wundt's psycho-physical theory is, therefore, also termed the *theory of actuality*. Wundt considered the will to be the real Ego.

Many modern psychologists have adopted the theory of psycho-physical parallelism as best suited to the temper of the scientific investigator. Man is, as Huxley puts it, a 'conscious automaton.' Defenders of this *conscious automaton-theory* are, among others, Hodgson and Spalding. Many also, especially evolutionists, defend some sort of atomistic *mind-dust* or *mind-stuff theory*, as proposed by W. K. Clifford and H. Spencer, according to

which an atom of consciousness or mind is attached to every atom of matter in the universe, both developing together in the evolution of beings, including man. As the material atoms, in the course of eons, massed themselves together to form the bodies of plants, animals, and men, so also the mind-atoms massed themselves together to form the more developed and refined minds of conscious animals and men. According to this view, all matter has the quality and potency of life and mind, and the 'mind' of man is a mere affair of psychic summation. The theory that all atoms of matter originally possess life is *atomistic hylozoism*; it is also a form of *pan-psychism*, since everything existing is conceived as fundamentally psychic or mental in nature.

William James (1842—1910), the eminent American psychologist, took a peculiar stand in this problem. He admitted frankly the reasonableness of the scholastic doctrine of the *soul*. "To posit a soul influenced in some mysterious way by the brain-states and responding to them by conscious affections of its own, seems to me the line of least logical resistance, so far as we yet have attained."⁶ In order, however to remain "positivistic and non-metaphysical," he considered an *empirical parallelism* to be the wisest course.

We have already seen (Chap. 17) that James viewed man's conscious life as a 'stream' of internal states *without a substantial Ego* as their subject. He followed in the footsteps of Hume and Wundt. For him, "the passing thought itself is the only *verifiable* thinker,"⁷ and he can find no rational use for the concept of 'substance' or of a 'substantial soul.' James was fully aware of the

consciousness of the 'identity of self' extending over gaps of unconsciousness, as evidenced by memory. How did he overcome the difficulty?

He compared the passing mental states to a herd of cattle, branded with the brand of the owner, who is the 'Ego' or 'self.' "How would it be," he writes, "if the Thought, the present judging Thought, instead of being in any way substantially or transcendently identical with the former owner of the past self, merely inherited his 'title,' and thus stood as his legal representative now? . . . We can imagine a long succession of herdsmen coming rapidly into possession of the same cattle by transmission of an original title by bequest. May not the 'title' of a collective self be passed from one Thought to another in some analogous way? . . . Each later Thought, knowing and including thus the Thoughts which went before, is the final receptacle — and appropriating them is the final owner — of all they contain and own. Each Thought is thus born an owner, and dies owned, transmitting whatever it realized as its Self to its own later proprietor."⁸ In this manner, James believed, he could safeguard the identity of the self or Ego without having recourse to a 'substantial' Ego or soul.

James' analogy is ingenious. The only trouble with it is, that it does not fit the case; he places the cart before the horse. In our mental life, the internal states are transient, while the Ego or self is consciously observed to be permanent; the herd of cattle (which is supposed to represent our passing internal states) is permanent, while the herdsmen (who are supposed to represent the permanent Ego or self) are transient. The roles are actually

the reverse of what they should be. In a succession of heirs to a particular piece of property (here, the herd), certainly *no heir feels himself to be identical with every other heir in the line of succession*, simply because he has succeeded to the title formerly held by the other proprietors. In the case of man, however, *the present Ego feels itself to be the one identical Ego throughout the years*. If James' analogy were correct, the present Thought or Ego could never feel itself identical with the preceding Thoughts or Egos, because they are in reality not the same any more than the succeeding heirs and owners are the same. It is always dangerous to build an important theory on an analogy. Facts should govern a theory; and the facts point very definitely to the identity and permanence of the Ego as the possessor of the transient mental states as they succeed one another. James did not prove his case; if anything, he proved that a substantial Ego is a necessary requirement for the proper explanation of our mental life.

In our *present time* there are a number of distinctive movements and counter-movements in the psychological field. *Functionalism* considers the mental processes as the functions of the organism in its adaptation to, and control of, environment; it is the psychology of William James, J. Dewey, G. T. Ladd, and the pragmatic school of thought. *Structuralism* is an 'atomistic' psychology which analyzes mental states into component sensations, images, and feelings; E. B. Titchener and his followers are representative of this type of psychology. *Gestaltism* or *configurationalism* stresses the tendency of the mind to view things as formed 'wholes' rather than as isolated items of

experience; among its advocates are W. Köhler, K. Koffka, and very many others. *Behaviorism* seeks to explain the mental in plain physiological terms of stimulus-response reactions, without taking consciousness and introspection into account; J. Watson, A. P. Weiss, and others defend this view. *Reflexological psychology* identifies mental life with neural reflexes; V. M. Bekhterev, K. N. Kornilov, A. L. Schniermann, and other Russian followers of Marxist materialism are expounders of this system. Psychoanalysis, as a psychology, explains mental life as the result of instinctive drives working in the lower levels of the mind. Then there is also the *hormic* psychology of W. McDougall which emphasizes the goal-seeking tendencies of organisms, and the *factor* psychology of C. Spearman, which seeks to determine the general and special abilities by means of correlation coefficients.

As a general policy, modern psychologists strive to remain within the limits of a 'scientific' treatment of their subject matter, disclaiming any sort of 'metaphysical' explanation of the nature of man and the relation of body and mind. The majority accept a *psycho-physical parallelism* of physical and mental events in man as a methodological convenience. As a rule, however, they make occasional commitments about the ultimate nature of man, because their basic ideas of body and mind are rooted in metaphysical concepts and theories; psychologists, therefore, often become, in unguarded moments, metaphysicians. Some individuals subscribe to panpsychism; others, to materialistic monism; others to idealistic monism; others to pantheistic monism; others, to

strict parallelism, without attempting to define their position in any more definite manner. It is perhaps safe to say that the general trend of modern psychologists is toward some form of materialism.

The *reflexological* psychology of the Russian School is avowedly a materialistic monism. Behaviorism is materialistic. *Gestaltism*, though it contains elements of a sound psychology, does not rise above the fundamental tenets of materialism, because the chief exponents of the theory find the ultimate explanation of the whole-making tendency of the mind in the conditions of the brain. The *structuralism* of Titchener is materialistic. *Psychoanalysis*, as conceived by Freud, is also basically materialistic. *Functionalism* favors dualism and interactionism. The *hormic* psychology of McDougall is interactionistic and animistic, based upon a metaphysical dualism.

And thus we see how the ultra-dualism of Descartes, by destroying the essential unity of man's nature and placing body and mind in a position of antagonism toward each other, has brought on a deplorable confusion of psychological systems. He made a real *interaction* between body and mind impossible, and it has been the endeavor of subsequent thinkers to bridge the gap between these two realities in man.

Digest of Theories

After reviewing the historical development of the body-mind problem, which is also the problem of the human Ego and the human person, it is not difficult to summarize the

various views and theories into a few *broad systems*. Starting with Descartes' ultra-dualism, which everybody seemed to accept without question, the following main solutions have been offered as a metaphysical explanation of man's nature.

Man has a *body*; man also has a *mind*. Whatever pertains to the body is physical; whatever pertains to the mind is psychical. The physical and the psychical, body and mind, have attributes and activities which are diametrically opposed to one another. The material and the mental are mutually irreducible, because the material is spatial while the mental is non-spatial; hence, they cannot reside in, nor be the product of, a single principle. Body and mind, therefore, since they have nothing in common, cannot interact upon each other; it is impossible for the mind causally to influence the body or for the body causally to influence the mind. Yet, such an interaction apparently occurs continuously. We must, then, accept a *double series of events*, one physical, belonging to the body, the other psychical, belonging to the mind. Each series is independent of the other, but running parallel to it, giving the impression of interaction. The result of this line of thought is the theory of rigid *psycho-physical parallelism* in a metaphysical sense.

Other thinkers were dissatisfied with this theory. It presupposes a *division* in man which is contrary to all experience. Man is not a double being, but a single being. If man were really a double being consisting of two irreducible parts, each part possessing an independent series of events without mutual interaction, one cannot

explain the perfect synchronization or timing that exists between the physical and psychical series. Such a parallelism is inconceivable. The body-mind problem can only be solved by maintaining that body and mind are not distinct and separate entities, but fundamentally a single reality. In other words, there exists an *identity* of body and mind; their distinctness is merely apparent. These thinkers defend the *identity theory*.

Even when maintaining the identity of body and mind, the problem is not solved thereby. This disparity between body and mind still remains. One must either reduce the body to the mind, leaving the mind as the sole remaining reality; or, one must reduce the mind to the body, leaving the body as the sole remaining reality. The psychical must absorb the physical, or the physical must absorb the psychical.

To some philosophers it seemed evident that man is conscious, senses, thinks, and wills. The *mental*, therefore, is *real*. The existence of the mind must be maintained under all circumstances, because one cannot deny the existence of psychical experiences as a part of man's life. Consequently, the physical, the material, the body, must be identified with the mind. The mind, then, is the *only reality*; the physical, the material, the body, exist solely in the mind as a percept or idea. At the most, matter and the physical world can be nothing more than manifestations or modes of mind. This form of the identity theory is characterized as *idealistic monism*.

There is, however, also a reverse side to the identity theory. Other philosophers are convinced that man is a

bodily being existing in time and space, with all the attributes and properties of matter. If we are certain of anything, we are certain that we are material organisms. The *material*, therefore, is *real*. Hence, the mental, the psychical, the mind, must be reduced to the reality of matter. Matter is, at bottom, the only reality, and the mental is fundamentally identical with the physical. The identity theory thus becomes *materialistic monism*.

Others take a metaphysical short-cut across all difficulties of explaining the union of body and mind by assuming that *all matter is living and endowed with mind*; or, as some prefer it, all bodies consist ultimately of some neutral stuff which is the substrate of both matter and mind. One need not wonder, then, that man possesses the attributes of a body and a mind in conjunction. These philosophers advocate *pan-psychism*.

It is seldom, however, that any of these basic systems are accepted in their pure form. Most psychologists and philosophers mix the principles of the one with that of another. They may be parallelists from one standpoint and idealistic or materialistic monists or pan-psychists from another; even a pantheistic monist may be a parallelist. Others adhere strictly to an idealistic or materialistic monism; the former admit nothing but mind and mental states, the latter nothing but matter and material states. Although psycho-physical parallelism really should exclude all interaction between psychical and physical events, yet some thinkers believe in interaction. Some believe that body and mind (soul) are distinct substances; others believe in one of the two as a substance; and others deny the

substantiality of both body and mind. There is no unity of doctrine; everything is confusion.

Strictly speaking, every type of monism should be opposed to the dualistic concept of psycho-physical parallelism. Some monists, however, are parallelists, as our historical survey has shown. Under the heading of *parallelism* we find grouped together the most diversified theories — interactionism, pre-established harmony, occasionalism, sensationalism, the identity theory, the double-aspect theory, the actuality theory, automatism, the mind-dust and mind-stuff theory, epiphenomenalism, pan-psychism. Yet some of these theories are also fundamentally monistic.

Critique of Theories

Some individual theories and views have been submitted to criticism in previous chapters. Here, the pure basic systems, as outlined above, will be evaluated.

PSYCHO-PHYSICAL PARALLELISM

The theory presupposes the ultra-dualistic opposition between matter and mind, between the physical and psychical, as propounded by those who deny the possibility of interaction between these supposedly antagonistic realities.

This denial is based mainly on the argument that such an interaction would be contrary to the *Law of the Conservation of Energy*, as H. Höffding contends, in as

much as the total amount of energy in the physical universe would be decreased or increased by the causal action of the physical on the psychical or of the psychical on the physical. As was pointed out in connection with free-will activity (Chap. 16), the validity of this argument is very doubtful. Furthermore, there is good evidence to show that intellectual (and volitional) activities do not consume physical energy (Chap. 20), so that there would be no infringement on the law. The main point, however, is that all evidence of our daily life definitely establishes the fact of a *mutual influence between the physical and psychical events* in man, irrespective of the postulates of any theory. The physical conditions of the body influence our sensations, imagination, memory, intellect, emotions, and will; there can be, for instance, no sensations without physical stimuli. Reverse, emotions have physical resonances in the body; and the will, as consciousness testifies, does control the movements of our bodily members throughout our waking state. The testimony of consciousness is so clear on this score and the mass of experiential evidence so overwhelming, that an unprejudiced observer cannot doubt the facts.

Parallelism rests on a *false assumption*. It places an *excessive division* between the body and mind of man, as if the two were completely separated entities. Such a division does not exist. Man is, as we have proved, a unitary, integral organism in which the physical, vegetative, sensory, and rational activities are fused into a single harmonious whole. The ultimate nature of man, therefore, must be a dynamic and entitative unit and not the extrinsic union of ultra-

dualistic entities. It follows, that Descartes' and the parallelists' concept of the nature of man is an assumption which is erroneous in its foundation. The facts are true; the theory of parallelism is wrong.

IDEALISTIC MONISM

Every type of idealistic monism, whether it be spiritualistic (Berkeley), phenomenistic (Hume, Bain, etc.), or absolutistic (Fichte, etc.), takes it for granted that, as Descartes proposed, we can know nothing but our own *internal mental states*. The body, the physical objects, the material universe — all have no existence except in so far as they are present in our perceptions and thoughts. At bottom, then, everything is mental; the mind alone exists, and matter is identified with mind. In this way, idealists claim to reduce ultra-dualism and parallelism to unity and the difficulty of the body-mind problem in man is overcome. The theory, however, is fallacious.

Idealism, for one thing, is contrary to the sound teachings and experimental findings of the *natural sciences*. Every natural science — physics, chemistry, geology, astronomy, biology, physiology, and all the rest — is based on the actual existence of *material bodies* endowed with spatial attributes and physical energy independent of the mind and its conscious contents. True, we cannot *know* that they exist unless we have a conscious percept or idea of them, but it does not follow that they have existence *only in knowledge*. Experimental psychology shows how our sensations are dependent on *external stimuli* for their

origin and specificity; it also proves that *nerves* and a *brain*, which are material realities, are required for the transformation of the stimulus excitation into conscious perception. Without the body, there can be no reception of stimuli; without the mind, there can be no knowledge of the objects transmitting the stimuli.

If nothing exists but the non-spatial mind and its ideas, then our knowledge should absolutely be *restricted to the mind and its ideas*. But then it should be utterly impossible to have any perceptions and ideas of such nonexistent things as brains, nerves, bodily organs, houses, automobiles, cities, and countries. Yet we are as certain of these material things as we are of our mind and its conscious states. Our emotions and feelings are accompanied by definite bodily changes, as we know from the findings of experimental psychology; these facts are not the result of sheer imagination. When idealists speak as scientists and psychologists, they invariably speak of sensations and perceptions as if they possessed a *bodily character*; it is only when confronted with the difficulty of explaining the reciprocal action of body and mind that they seek to evade the difficulty by denying the existence of matter and material bodies. Man has both a body and a mind, and we are conscious of both; we have no more right to deny the existence of the one than of the other.

We are conscious of being *passively influenced* by extra-mental objects. When I close my eyes and imagine a parade, I know that I am the agent producing these images; but when I watch a parade passing by, I am passive and do not myself determine what images I shall or shall not receive.

Such a situation could not arise, if the production of sensations, perceptions, and ideas were solely dependent on the mind and its operation.

Idealism is inadequate, because it leaves out of account the *body*, which is just as much a part of man as his mind.

MATERIALISTIC MONISM

Little need be said here in refutation of materialistic monism. If nothing exists but matter and material energy, then everything in man must be able to be interpreted strictly in *terms of matter and material energy*. However, not even the ordinary phenomena of sensation admit of such an interpretation. The sensation of 'blue,' for example, is something totally different from the physical stimulus of a definite frequency of light waves striking the retina; and the sensation of 'pain' has no similarity to the piercing of the skin by a needle point. *Cognition* and *consciousness* cannot be explained in terms of atomic oscillations of brain substance. *Ideas* (Chap. 12) are abstract and universal, while everything material is concrete and particular. *Intellection* (Chap. 20) is spiritual and intrinsically independent of material conditions; it cannot, therefore, be reduced to material activity.

Materialism accounts for the body, but it does not account for the mind. Yet the mind is as much a part of man as his body. The theory is inadequate, because it fails to give an explanation of the 'whole man.' Like idealism, it is an oversimplified system which evades the real issue by denying the existence of an essential part of man's nature.

PAN-PSYCHISM

Pan-psychism assumes, in one form or other, that everything material is also mental; in other words, every body is fundamentally endowed with life and mind. This assumption is gratuitously made and is contrary to the verdict of the *natural sciences*. The sciences make a clean-cut distinction between living and nonliving bodies, and they base this distinction on essential differences in *structure* and *operation*. Nonliving beings (Chap. 19) are characterized by 'transitive' action, living beings by 'immanent' action. There is not a shred of evidence for maintaining that the electron, proton, and atom have life and mind. The metaphysical necessity of overcoming the cartesian ultra-dualism of mind and matter prompted the formation of the theory; the theory, however, is contrary to all known facts.

SCHOLASTIC ANIMISM

The prodigious confusion of philosophical and psychological systems of the three preceding centuries stems logically from the *ultra-dualism of Descartes*. It is the clearest proof that Descartes' assumptions must be wrong, because this confusion furnishes a complete *reductio ad absurdum*: when the conclusion is so disastrous, the premises must inevitably be false. Wherein did Descartes err?

His error consisted in splitting man's nature into two antagonistic substances, body and spirit. He conceived the body as a mechanistic aggregate of atoms and the spirit as the sole seat of all mental states. A psycho-physical parallelism was unavoidable, and he thereby made a metaphysical explanation of man's unitary nature impossible. The result is seen in the fruitless attempt of most modern philosophers to restore the evident factual unity of man as an *integral organism* capable of both bodily and mental activities.

Descartes made his initial mistake in rejecting the traditional teaching of man's nature as embodied in scholastic anthropology. Here was the correct doctrine, but Descartes misunderstood it. In rejecting it, he led subsequent thinkers into a quagmire of errors. To remedy this desperate situation, we must return to the fundamental doctrine of the scholastics. We have shown the correctness of their views in a lengthy discussion (Chaps. 19, 20) on vitalistic animism.

In vitalistic animism we find the *solution* of all the difficulties involved in the various systems mentioned above. Parallelism stresses the difference between the physical and the mental, but finds no means of combining them into the higher unity of the human Ego. Animism preserves the difference between the physical and the psychical, because the primary source of the physical is matter and the primary source of the psychical is the soul; but the real subject of both is neither matter nor the soul, but the Ego which is the composite unitary substance resulting from the substantial union of matter and soul.

Idealism stresses the mental, but finds no place for the material side of man's nature; it reduces the physical to the psychical, thereby doing violence to man's physico-psychical nature. Animism does justice to the psychical side of man's nature, but it also safeguards the physical as an equally important part of man's being. Materialism emphasizes the physical, but it eliminates the psychical which is present in man's nature. Animism also accounts for the physical side of man's nature, but it safeguards the psychical as being equally essential to man. Pan-psychism is correct in maintaining that in man matter is living matter, but it goes contrary to all evidence when it asserts that all matter in the world is endowed with life and mind. Animism agrees with the sciences in distinguishing between living and nonliving matter, and it also agrees with biology and psychology in asserting that man's nature is both physical and psychical, material and mental. While Descartes' theory of man is an ultra-dualistic conception, based on the dissociation of man's nature into two distinct and separate complete substances, body and spirit, the theory of vitalistic animism is a *moderate dualism*, based upon the real distinction of matter and soul as part-substances, combined into the metaphysical unity of a single nature by means of a substantial integration.

Animism, therefore, contains whatever there is of truth in parallelism, idealism, materialism, and pan-psychism, while avoiding the errors of extremism found in each and all of them. The animism of aristotelian-scholastic philosophy alone accounts for all the facts and phases of man's complete nature.

The Human Person

What, then, is the human *Ego*? Whatever in man is bodily and mental, physical and psychical, material and spiritual, is referred by the Ego to itself: *I* weigh one hundred fifty pounds, *I* see a house, *I* think, *I* will. The physical and the psychical represent 'the whole man.' The *Ego*, therefore, is *the whole man*. Body and soul are integrated into one thing, the whole man, the Ego. The Ego, therefore, is not the body, not the soul, not the intellect, not the will, not consciousness, not life. All these things 'belong' to the Ego as constituting 'the whole man.'

The Ego is a *substance*. A 'substance' is an individual being whose nature it is to exist in itself and not in another as in a subject. A being whose nature it is to exist, not in itself, but in another as in a subject, is called, in philosophical terminology, an 'accident.' Accidents are modifications and modes of substance. Shape, color, motion, thought, feelings, etc., are modifications of some ultimate reality; they do not exist in and for themselves, but exist in the substance which they modify. Man, considered as a totality, is a self-contained being with a naturally independent existence of its own; man, therefore, is a 'substance.' And since the Ego is the whole man, the ultimate reality which possesses everything pertaining to man's being, it is evident that the Ego is substantial and not merely accidental.

The Ego (man) is a *person*. The term 'person' is never applied to a chemical being, to a plant, or to a brute animal; no one calls a piece of carbon, a tree, or a horse, a 'person.'

Since man alone, among all material beings and organisms, is called a 'person,' what specifically constitutes man a 'person'? It is not 'materiality,' because chemicals, plants, and brutes are material. It is not 'life,' because plants and brutes are living. It is not 'sentiency,' because brutes are sentient. It must be that which distinguishes man from all these types of being, and that is 'rationality,' 'intellectuality.' Boethius⁹ has given us the following definition of a 'person': *naturae rationalis individua substantia* — an individual substance of a rational nature. A 'person' is, therefore, an *individual, complete, subsistent, rational (intellectual) substance*.¹⁰ A moment's consideration will reveal the fact that the human Ego, or whole man, is indeed a substance which is individual and complete and subsistent and rational. Consequently, the human Ego, or man in his totality, is a 'person.'

We must make an exact distinction between 'personality' in this *metaphysical* sense and 'personality' in a *psychological* sense. Psychologists, when they use the term, mean the sum-total of human functions and capacities, traits and aptitudes, and this concept is akin to 'character.' The unity of 'personality' in this psychological meaning is a *functional* unity, and this functional unity may at times be impaired or destroyed, as we notice it in 'split personality,' 'dual personality,' and so on. 'Personality' in the philosophical or metaphysical sense is the essential mark of man's nature as a 'rational animal' and is never subject to change, because the essential constitution of man's being from the moment of conception to the moment of death remains the same. In other words, man is and remains at all

times a 'person,' namely, an individual, complete, subsistent, rational substance, irrespective of what happens to the functional unity of his mental states and operations.

The human being, the human Ego, is a person. As a person, man is a substance consisting of two really distinct substantial co-principles, soul and matter. The soul is the animating principle and therefore the primary principle (in conjunction with matter) of the *vital* attributes and activities of vegetancy and sentiency. The soul, however, is spiritual in essence and as such the sole agent (though with an extrinsic dependence on matter) of the spiritual activities of intellect and will. Matter is the principle (in conjunction with the soul) which accounts for all the *physical* attributes and activities in man's nature. Man is a unique being, the fusion of spirit and matter compounded into a single substance and organism. He is in all truth a *microcosm*, uniting within his person the essential realities of chemical elements, living plants, sentient animals, and spiritual intelligences.

How can spirit and matter be so intimately linked together that they constitute a single substance, nature, Ego, person? The *fact*, from all that has been said, is demonstrated beyond reasonable doubt; the *manner* of this union will never be clearly understood. We explain the union of spirit and matter in man by saying that the spirit is the *soul* of the body, the 'vital principle' or 'substantial form' or 'entelechy' of matter. Such terminology may not clarify the 'manner' of their union to any great extent, but it is a philosophical explanation which at least avoids the difficulties inherent in parallelism and monism and is in

accord with all the material, sensory, and spiritual phenomena observed to be present in man. T. V. Moore's remarks are classic. "Since Infinite Power cannot make a square circle, neither can it make the essentially non-thinking and lifeless matter, while it remains non-thinking and lifeless, at the same time think and live. But it is possible for living matter to live by a principle of life inherent within it; it is possible for a sensory organism to have sensations by means of sense organs vitalized by a living soul; it is possible for man to be a living being with sense organs capable of being acted on by the energies of matter in the outside world, because these same sense organs are themselves material, but not lifeless matter, and live by the soul that vivifies the body. It is possible for this same living soul, which is a principle of life, vivifying the body and animating the sense organs, to be conscious of the way in which its sense organs are affected, and to think about those revelations of the world outside, which come to it through the sense organs, by powers which are in no way the activity of bodily organs, though they can interpret the data derived from bodily organs, and so understand and interpret the world outside by non-sensual and spiritual concepts."¹¹ No other theory can explain all the pertinent facts so clearly and completely.

MAN IS THE *ULTIMATE GROUND AND AGENT* OF EVERYTHING THAT occurs within the realm of his being. Whatever pertains to his being in any manner whatsoever must, in its final analysis, be referred to his *person* and *Ego* and not to any

particular part or power. Man is material and spatial. Man is composed of a matter and a spiritual soul, and is an organism. Man assimilates food and reproduces himself. Man has a nervous system and sense organs. Man sees, hears, tastes, smells, has the sense of touch, and feels pain. Man synthesizes the sense data, imagines, remembers, and performs instinctive actions. Man strives for sensuous good, avoids sensuous evil, and experiences various emotions. Man forms ideas, judgments, and processes of reasoning. Man exercises free will and desires spiritual values. Man is conceived, lives, and dies. The immediate principles of functions are powers or faculties, but the ultimate agent is *man*, the *person*, the *Ego*.

There are a thousand-and-one aspects to man's being, but they are all just so many phases of one ultimate substantial reality, the human person, expressing itself in multitudinous ways.

Summary of Chapter XXI

We must now synthesize the various aspects of man's being into the unity of 'the whole man.'

1. *The Empirical Ego*. It is the self or Ego as observed at any present moment in a here-and-now experience.

2. *The Historical Ego*. It is the self or Ego of an individual as he perceives it through memory of his life's experiences from the present down through the past.

3. *The Metaphysical Ego*. It is the self or Ego considered in its constitution and nature. Everything in man is referred ultimately to the Ego: mind, soul, body, and all bodily and mental states and activities. The Ego, however, is never referred to anything else in man; it is the *ultimate reality* in man. How can such diverse realities be referred to the same Ego, since 'body' and 'mind' seem to possess such antithetical attributes? The attempt to bridge the gap between 'body' and 'mind' has given rise to many theories.

4. *The Problem in History*. Plato maintained a theory of ultra-dualism; body and spirit are complete substances. *Aristotle* maintained that matter and soul are incomplete substances united together into a single substance. *Medieval* philosophers followed Aristotle.

Modern philosophy begins with *Descartes* who placed an antithetical *ultra-dualism* between body and spirit; he conceived both as complete substances. Man's mind can know only its internal states. *Geulincx* advocated occasionalism and *Malebranche* ontologism. *Leibnitz* proposed his monadology, a theory of pan-psychism and

psycho-physical parallelism. *Spinoza* was a pantheistic monist. *Locke* was an empiricist who confused concepts and phantasms. *Berkeley* maintained a spiritualistic idealism. *Hume* denied the existence of all substances; his theory is pan-phenomenalism. *Kant* proposed a rationalistic idealism, which was developed by *Fichte*, *Schelling*, and *Hegel* into the idealistic monism of absolutism. Other philosophers went to the opposite extreme and defended a materialistic monism.

Fechner propounded the parallelistic view of the double-aspect theory. Wundt developed the actuality theory, Huxley the conscious automaton theory, Clifford the mind-dust theory.

W. James advocated an empirical parallelism, denying the substantiality of the soul and making the passing thought the 'thinker' or Ego.

The present-day theories of psychology mostly advocate psycho-physical parallelism, and the general trend is still materialistic.

5. *Digest of Theories*. All views can be reduced to the following general metaphysical theories: psycho-physical parallelism, idealistic monism, materialistic monism, and pan-psychism.

6. *Critique of Theories*. *Psycho-physical parallelism* cannot explain the evident relationship and mutual influence of the psychical and physical in man. *Idealistic monism* is contrary to the natural sciences which maintain the existence of material bodies; it cannot explain the facts pertaining to the human body. Materialistic monism cannot explain man's mental life, as manifested in sensation,

cognition, consciousness, ideas, and intellection. *Pan-psychism* runs counter to the findings of the natural sciences, which make a clean-cut distinction between living and nonliving bodies based on structure and operation.

7. *Scholastic Animism*. It is the doctrine that organisms consist of *matter* and *soul* as two incomplete substances united together into a single, composite substance. This unitary substance is the subject of all activities and states in man, physical as well as mental. It is the only theory which accounts for all the facts and phases of man's complete nature.

8. *The Human Person*. The human Ego is the *whole man*. The Ego, the whole man, is a 'substance' and a 'person.' The soul is the animating principle of matter and therefore the primary principle (in conjunction with matter) of the vital attributes and activities of vegetancy and sentiency; it is spiritual in essence and as such the sole agent of intellection and free will. Matter is the principle (in conjunction with the soul) which accounts for all the physical attributes and activities in man. The whole man is thus satisfactorily explained.

Chapter 22

THE ORIGIN OF MAN

OUR INVESTIGATION INTO THE NATURE OF MAN HAS SHOWN THAT he is a unitary but composite substance. Man consists of a material substance, taken from the ordinary elements, and a spiritual form or entelechy. The spirit of man is the animating principle of the material substrate, transforming the latter into organized, living matter; the human spirit, therefore, is the soul or psyche of the human organism, so that soul and matter are fused together into a single integral organism. Vegetative and sensory functions proceed from the organic compound as from a single principle of action or nature; they are intrinsically material vital functions. The rational activities of intellection and volition, being spiritual, proceed from the soul alone, but with an extrinsic dependence on the senses and the nervous system. Such is the constitution of 'the whole man.'

The next important philosophical question relative to man's being is the problem of the *origin of man*. The problem before us is the *ultimate origin of man*. And since man consists of a body and a spiritual soul, the question resolves itself into the double problem of the ultimate origin of man's *body* and *man's soul*.

The Origin of Life

Before going into the question of man's origin, it will be necessary to investigate the *origin of life in general*.

It is the unanimous verdict of the geologists that living beings did not always exist on our globe. There were long ages in the history of the earth, in the early period of its development, when it was in a fiery-molten state. No organism, as we know it, could possibly have existed under such circumstances. Later, after considerable cooling, the upper mass of the earth solidified into a crust, forming a suitable habitat for organisms. Eventually, the organisms appeared on the earth; their fossil remains can be traced far down in the sedimentary deposits.

HOW DID LIFE ORIGINATE ON EARTH?

Did life originate through the extra-mundane causality of *God*? If so, there are two possibilities to consider. He could have made the entire organism, matter and soul, without using any pre-existing material whatsoever in its production. Such a total production out of nothing would be *direct creation*. Or, He could have used the matter already existing on the earth and transformed it into a living being; in doing so, He would be the primary cause in the production of life, while utilizing the agencies of creatural beings as secondary causes. This type of production is *mediate creation*.

On the other hand, many scientists and philosophers are reluctant about appealing to any extra-mundane, divine

causality. Some take this position on the general principle that an appeal to divine agency must be avoided in all natural events, except as a final recourse; only when natural agencies are evidently incapable of accounting for the origin of life, would it be permissible to invoke the Creator as the cause of life on the earth. Materialistic monists, of course, approach the question from an entirely different angle. Since, in their view, there is no God and since matter and material forces are the sole agencies at work in the world, they must explain the origin of life as an emergence from matter alone.

This theory, which defends the origination of life from nonliving matter, through forces which are indigenous to matter itself, is termed *abiogenesis*. In our day, the theory of abiogenesis is also called the *theory of absolute emergence*.

Abiogenesis

Biology informs us that living beings, under present conditions, originate from other living beings of the same type. Generation may be sexual or asexual, both among plants and animals, but some form of generative reproduction is necessary. Reproduction, however, does not settle the question of the origin of the first organism which appeared on our globe.

Formerly, the defenders of abiogenesis thought they had good evidence for the origination of life out of nonliving matter in the instances of so-called *spontaneous generation*. Up to the end of the seventeenth century even scientifically

minded men believed that certain low types of animals were generated 'spontaneously,' i.e., abiogenetically. Worms were supposed to develop out of putrid flesh; frogs, it was thought, were produced from the mud of ponds through the action of the sun's rays; insects, and even rats and mice, were believed to originate without the generative action of living beings. Aristotle, St. Thomas Aquinas, and the medieval Schoolmen generally, taught spontaneous generation in such cases. Lack of scientific training and instruments were responsible for such views.

At present, no scientist would dare defend spontaneous generation on *scientific* grounds.

In 1668 Redi made a scientific experiment in the city of Florence. In midsummer, he placed two pieces of meat side by side, one covered with gauze, the other exposed to the free air. The latter alone developed maggots, because the flies could deposit their eggs on it.

Thereupon the defenders of spontaneous generation adduced other instances which seemed to exclude definitely any form of generation proper, since one never found eggs. Some organisms live in inaccessible places within animals, for example, in the peritoneum of rabbits, inside the muscles of pigs, in the brain of sheep, in the intestines of men and animals. Soon, however, it was proved that these organisms were reproduced through normal generation and then changed their habitation by entering into the system of other animals.

Driven back almost to surrender, the advocates of spontaneous generation received new courage when the high-powered microscope revealed organisms so minute

that they seemed to be a transition stage between matter and organic life. Vegetable and animal infusions, when exposed to the air, were seen to contain innumerable little organisms for whose origin one found no generative cause. Hence, these 'infusoria' were considered to be the product of spontaneous generation. Tyndall, however, did much to disprove this contention.

The epoch-making experiments of *Louis Pasteur*, begun in 1860, exploded the theory of spontaneous generation beyond recovery. The genius of Pasteur, through a life-time period of experimentation, established beyond the shadow of a doubt that germs can originate only from germs. Against the claims of Pouchet, Musset, and Joly, Pasteur proved that putrifiable matter of any kind whatever, if sterile and properly protected against contamination from germs present in the surrounding media, such as the air, will never produce living beings. Although nothing was known at the time about such germs except their bare existence, the classic experiments of Pasteur convinced the scientific world that spontaneous generation never actually occurs.¹ Later, as microscopy became perfected, the lowly bacteria and protozoa were seen to reproduce their kind by means of division, a definite proof of Pasteur's original contention.

In 1905, John Butler Burke claimed to have discovered a case of abiogenesis. His experiments seemed to show that *radioactive substances* acting on gelatin media produced 'bacteria-like' cells, containing a nucleus, and that these cells grew and finally subdivided. But Sir William Ramsay, the famous investigator of radium, showed that the

emanation of the radium decomposes the water in the bouillon into oxygen and hydrogen and coagulates the albumin. Hence, little bubbles of gas are formed, surrounded by a covering of coagulated albumin. As more gas is produced, the bubbles increase in size, so as to give the appearance of very small growing organisms. Burke had also noticed that the new-born organism melted away in the water. Ramsay supplied the explanation: the water gradually removed the gelatin from the 'cell walls,' the gases escaped, and the bubbles collapsed. The phenomenon was thus seen to be nothing more than an ordinary chemical, lifeless process.

In our own day, the discovery of *viruses* and *bacteriophages* has brought the question of abiogenesis again into the foreground. It is not known whether they are true organisms or chemical substances. Perhaps the electron microscope will determine their exact nature. If they turn out to be true organisms, the probabilities will not favor spontaneous generation.

Historically, the formula of the Law of Biogenesis has undergone the following development:

William Harvey (1651): *Omne vivum ex ovo*; every living being originates from an egg.

Francesco Redi (1698): *Omne vivum ex vivo*; every living being originates from a living being.

Rudolf Virchow (1855): *Omnis cellula ex cellula*; every cell originates from a cell.

Walter Flemming (1882): *Omnis nucleus ex nucleo*; every nucleus originates from a nucleus.

Theodor Boveri (1903): *Omne chromosoma ex chromosomate*; every chromosome originates from a chromosome.

All observations and experiments, therefore, have confirmed that organized substance originates only from organized substance. Hence, so far as science is concerned, *spontaneous generation (abiogenesis) never occurs*.

Helmholtz, Van Tiegham, Lord Kelvin, Arrhenius, and others have advanced the theory that life might have originated on earth through life-germs carried by *meteorites* from some other stellar body; or, the germs could possibly have *floated across* the intervening space and landed on the earth. This arbitrary assumption merely defers the question without solving it. How did life originate on these stars? They, too, were at one time in a fiery-molten state. Meteorites melt through friction on contact with the atmosphere of the earth, and the heat would kill all germs; the absence of heat and moisture in interstellar space would freeze the germs and desiccate them. Becquerel placed germs in a vacuum with a temperature of liquid air, thus approximately reproducing the conditions of interstellar space. The result, after exposing the germs to ultraviolet rays, which are so abundant in interstellar space, was the death of all germs. Hence, all life-germs would have died in transit. The theory is hardly worthy of serious consideration, but it reveals the desperate extremity in which the theory of abiogenesis has been placed.

When, therefore, certain scientists and philosophers maintain that abiogenesis must have occurred in the

bygone ages of the earth's development, their assertion no longer rests on scientific proof. Abiogenesis is thus advanced as a *postulate* of science and philosophy. But a postulate is the assumption of something as true which is either so self-evident that it needs no proof or which must be accepted as true because it is the only rational and logical explanation of a fact which is obvious to us and of which we have certainty, although we cannot verify the assumption by direct demonstration.

From what has been discovered by science concerning the fact of abiogenesis, it is clear that abiogenesis is not a self-evident postulate; every bit of evidence is against its actual occurrence. Nor can it be said to be the only rational and logical explanation of the origin of life. Only on the supposition that a Supreme Being does not exist, would abiogenesis, or the absolute emergence of life in virtue of the forces inherent in matter, be a necessary postulate. Is the existence of a Supreme Being inconsistent with reason and logic? If not, then abiogenesis is not the only rational and logical explanation of the origin of life.

THE PRINCIPLE OF CAUSALITY IS THE FOUNDATION OF ALL SCIENCE and philosophy. Reason and logic, according to this principle, demand that there be a *proper proportion between cause and effect*. The effect can never be actually greater than what is virtually contained in the cause, otherwise a part of the effect would be without an adequate cause and as such could never come into existence. It is true, that organisms consist of material elements in their

structure and utilize material forces in their vital functions. But the *intrinsic purposiveness* of organic structure and function and the *spontaneity* and *immanence* of action, as manifested in metabolism and reproduction, far exceed the capabilities of matter and material forces taken by themselves. The simplest forms of plant and animal life, bacteria and protozoa, are so superior to inorganic elements and compounds, that even confirmed materialists are now forced to admit that they belong to different levels of being.

There is no need to restate the proofs that, besides matter and material forces, a *vital principle* or *soul* is required in plants and animals (Chap. 19). Unless we wish to make the gratuitous assumption that all matter is living, the arrival of the organism on earth involves the arrival of something *totally new and superior*, namely, the vital principle or soul. The soul cannot be accounted for on the basis of mere matter and material force. Hence, it must be accounted for by some cause *outside of matter itself*; and, since the cause must be at least equal to the effect, this extra-material cause must itself be endowed with life. That the complicated structure and purposive function of even the lowest unicellular organism could be the result of haphazard chance-factors, *without intelligent planning*, would indeed be a greater miracle than creation. It is not sufficient for the first organic being to arise somehow through a fortuitous concurrence of atoms; this first organic being must have arisen completely endowed with cytoplasm, nucleus, chromosomes, and genes, and with the *perfect mechanism of the process of reproduction*. If this

were not so, *no reproduction could occur*, and there would be no offspring, no second generation; life would become extinct with the very first organism, and there would be no life today. Yet there are no grounds for supposing that the first organism, arising from unintelligent matter and itself unintelligent, could have the power of reproducing future generations and transmit this power in perfect condition to its offspring. Reproductive power has a purpose for the future, but it is of no advantage for the reproducing individual organism. Such a purpose for the future implies intelligence, but this intelligence does not lie in the speck of living substance which we call 'organized matter.' Neither does the intelligence in question reside in the inorganic elements. Hence, there must have been an *Intelligent Cause*, distinct from matter and the material world, which produced life on our globe. Any other supposition is against logic and reason.

The statement of W. Branca, the well-known scientist, is as true today as when he uttered it in 1910: "Whoever accepts spontaneous generation [abiogenesis] here on earth, thereby believes that two diametrically opposed Laws of Nature have equal value. The first states: Life can originate only through Life. The second states: Life originates also or at least has originated in the past out of non-life. *The first law is proved by billions of facts*, and it is true without any doubt. The second, however, has until the present *never been proved by a single fact*. Both Laws of Nature contradict each other diametrically."²

Since, therefore, science cannot prove abiogenesis either by observation and experiment or by logical principle

and deduction, abiogenesis is not a postulate of science but of *materialistic philosophy*. But a postulate which is based neither on reason and logic nor on the approved findings of science, is no real postulate at all; it is nothing more than a subterfuge designed to bolster a bankrupt philosophy of the origin of life.

Direct Creation

It is not within the province of psychology to prove the existence of an extra-mundane Supreme Being; the proof for the existence of a personal God, all-intelligent and all-powerful, belongs to the philosophical department of theodicy. In this connection, we are entitled to accept His existence, particularly in view of the fact that the origin of life must be attributed to an intelligent cause distinct from all matter and material force. It will not be amiss, however, to quote the following statement of a modern scientist, C. C. Hurst: "At present it seems to be generally agreed that the material universe is finite and not infinite in space and time. If the material universe is finite in time, the matter of which it is composed must have had a beginning. In the strictest sense a beginning implies creation and creation involves a Creator. That is as far as modern science will take us."³

Granting, then, the existence of God, the question arises as to how He produced the first living being on earth. Was it by means of a *direct creation*? By direct creation we understand the production of a new reality *in its total being from nothingness*, so that no pre-existing entity contributes anything at all to the making of the new reality except the

Creator and His creative power. Applying this concept to the origination of the first organism, it means that no material substance of any kind was used by the Creator in the production of the organism; the complete organism, both as to its matter and vital principle (soul), was produced directly by the creative act out of nothing and then placed readymade on earth.

It is obvious that a direct creation of this sort *could* have occurred. God in His omnipotence can create anything which does not involve a contradiction in terms. That no intrinsic contradiction exists in an organism, is evident from the very fact that organisms actually exist. Hence, a direct creation of the first organism is *possible*. It would, however, be a fallacy to conclude from possibility to actuality; because something 'can be,' does not prove that it 'actually is.'

In all probability, a direct creation, in the sense defined, did not take place. We must bear in mind that the body of all organisms is composed of the ordinary elements found everywhere on earth and in the physical universe. Consequently, there was *no need* to create the bodily elements of the first organism out of nothing. As R. E. Brennan remarks: "No builder would go to the trouble and expense of bringing in a whole new array of materials if he already had all that was necessary for the construction of his building."⁴ While the argument is not strictly cogent, it has enough force to make the theory of a direct creation of the total being of the first organism highly improbable.

Mediate Creation

How, then, did God produce the first organism? Life could not originate through an absolute emergence solely from matter and its indigenous forces. In some manner the creative causality of God was necessary for the production of the first organism, even though He used the pre-existing elements of the earth, because the *vital principle* or *soul* is by its very nature *superior to matter and material forces*. The vital principle or soul, therefore, demands the causality of God for its production, at least for the first organism.

Did the first vital principle or soul come into existence through direct creation on the part of God? Again, it *could* have; there can be no question of the *possibility*. On the other hand, the vital principle or soul of the plant and animal, as we have seen (Chap. 19), is essentially *material* in nature, being intrinsically dependent on matter in its entity and existence; it is, in aristotelian-scholastic terminology, *educed* out of the potentiality of matter. Hence, a direct creation from nothingness is not required. All that would be required for the appearance of life and for the production of the first organism is the original *fiat* of God ordering and disposing matter and material agencies in a purposive fashion, so that at a given time and place the first organic vital principle or soul, the conditions being favorable, would emerge out of the hidden potentialities of matter. Life would thus emerge spontaneously, but in virtue of an *inherent tendency* placed in bodies from the beginning by the Creator. God would be the primary cause

of the origination of life, with the agency of bodies as a secondary and instrumental cause.

If we wish to call this form of production a 'creation,' it could be called a *mediate* or *derivative creation*. The term *relative or restricted emergence* is perhaps a better designation.

According to the 'law of parsimony,' one should ordinarily accept a theory which provides the smallest amount of assumptions in reasoning and employs an economy of means for the realization of an end. The animation of pre-existing matter seems to conform to this law. Hence, mediate or derivative creation (relative or restricted emergence) appears to have been the method of production used by the Creator in the origination of organic life. The theory is, to say the least, very probable.

Organic Evolution

In a broad sense, *organic evolution* is understood to be the theory according to which the various species and types of animals and plants derive their origin, not through distinct and separate creative acts of God, but through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws. The theory maintains that the higher forms of animals and plants developed genetically from the lower, so that all species and types are the descendants of a very few simple organisms, perhaps even of a single one. The general trend of evolution has been from the simple and homogeneous to

the complex and heterogeneous. Hence, the organic descent of all animals and plants should be viewed as representing a 'genealogical tree,' the various branches exhibiting manifold degrees and stages of divergence from the parent stock acquired in the course of time.

Most scientists advocate a *monophyletic* evolution, so that all organisms derive their descent from a single primitive organic cell; at least, they say, all plants evolved from an original plant and all animals from an original animal. Others advocate a *polyphyletic* evolution; according to this view, there are several independent pedigrees of plants and animals, representing distinct natural species, each of which has its own point of departure from which the evolutionary process started.

As for the *evidence* for evolution, the theory is based on a number of observations and deductions pertaining to various fields of science.

Paleontology, the science which treats of the life of past geological periods, shows the phylogeny and relationships of organisms and seeks to determine their age and chronology in the history of the earth. The story of life is contained in the fossils found in the superimposed strata of rock deposits of the earth's crust. The fossil remains are a record of the various species of animals and plants through the ages. From this record it is proved that animals (for example, trilobites) and plants (for example, algae) existed side by side in the earliest (Cambrian) formation. Some of the types are highly specialized forms of life. Generally speaking, the trend is from more primitive forms to more complex structures; the mammals, for instance, appear

rather late. In some cases, there has been a deterioration of organic structure. Scientists find in this *progressive succession* a potent argument for organic evolution.

Scientists point to the *morphological* and *physiological similarity* of organic types as another general argument in favor of the evolutionary theory. There are certain structures which are fundamentally similar, though they belong to different species and genera. Thus, the hand of man, considered structurally, bears a remarkable resemblance to the paws of lions and mice, to the hoofs of cows and horses, to the wings of birds and bats, to the fins of fishes, and to the flippers of seals and whales, etc. The spinal column of vertebrates is, of course, similar in all these types of animals. The structure of plants is very much alike. The most important feature of morphological similarity, universal throughout the plant and animal kingdoms, is the cell, the basic unit of biological structure and function; it is fundamentally the same in every type of organism. Such similarity in structure, evolutionists claim, shows genetic descent and a common origin.

Ontogeny, the life history of the individual organism, is also adduced as evidence. Accepting E. Haeckel's 'biogenetic law,' evolutionists see in the ontogeny of the individual in its embryonic stage a recapitulation of the phylogeny of the race. As an example, they refer to the whalebone whale. As an adult, this whale has only dental plates, but in its foetal life it has teeth; in former ages, as paleontology reveals, it had teeth also in its adult life. The flounders, and similar fishes, have their two eyes on top of the head, because they swim in horizontal fashion, with one

side of their body close to the ground; but when hatched, they have one eye on each side of the head, like ordinary fishes, and the one eye gradually moves over until it is near the other. Many such instances are known to science. Even man, they say, shows gill-pouches in his prenatal development, reminiscent of his phylogenetic relationship with the fishes. All that is required, in order to establish organic evolution on a sound scientific basis, is the extension of this biogenetic principle to all organisms.

There are other arguments, but these are broadest in scope and most fundamental in significance. It is the *cumulative force* of the various pieces of evidence upon which evolutionists rely to prove their case. While the outline just given is extremely brief, it indicates the line of thought which underlies the evolutionary theory.

HISTORICALLY, THE FIRST SERIOUS ATTEMPT TO EXPLAIN THE ORIGIN of the various species through genetic descent was made by *Jean de Lamarck* (1809) who accounted for all specific changes through the use and disuse of bodily organs. *Geoffroy Saint-Hilaire* (1828) sought the explanation more in the influence of the environment. *Herbert Spencer* (1852) stressed the 'survival of the fittest.'

The extraordinary work of *Charles Darwin* (1859), as expounded in his *Origin of Species*, made organic evolution acceptable to the scientific world. His famous 'principle of natural selection,' enabling the fittest to survive in the struggle for existence, seemed to supply the universal factor for changing one species into another in a practically

mechanical way according to a purely natural law of development. All animals conform to a general type, but individuals possess slight variations. Such variations, gradually accumulated, are transmitted through heredity. Some of these variations are bound to give their possessors an advantage over their competitors in the struggle for existence, because the former are more fit. The result will be that the fit will survive, while the unfit and the less fit will perish. This preservation of advantageous variations and the rejection of injurious variations, is what Darwin meant by 'natural selection.' Through countless generations, succeeding one another over vast periods of time, the constant addition of small variations will eventually produce types so divergent from the original parent stock that new species arise. Such was Darwin's theory.

Hugo De Vries defended the theory of mutation, according to which important variations occurred suddenly, so that the offspring differed from the parent in well-marked characters. *August Weismann* (1893) opposed the view that acquired characters could be transmitted by heredity and based evolution on natural selection affecting the germ plasm. *Hans Driesch* (1894) invoked his quasi-intelligent entelechy to account for evolutionary development. *Lloyd Morgan* advocates an *emergent evolution*, in which unpredictable new levels of organic beings arise. Other theories have also been advanced.

According to the modern biological concepts of genetics, based on the laws of heredity discovered by the Augustinian Abbot *Gregor I. Mendel* (1822—1884) in 1866, the genes

and chromosomes are the main factors in evolution. Four different vital processes contribute to the origin of new species: the mutation of genes, the transmutation of chromosomes, the mixing of genes and chromosomes through sex reproduction, and the progressive adaptation of their product to the manifold conditions of the environment.

The authors of these theories of evolution usually disclaim anything like *purposiveness* in the process of development. Modern biologists, however, in explaining evolution, use terms which savor strongly of 'purposiveness,' although they are very loath to admit it outright. The recent trend to teleological concepts, i.e., that there is a *tendency* in evolutionary processes to develop higher organisms, is represented by such scientists as L. J. Henderson, Jennings, Vialleton, Coghill, Agar, Goldschmidt, T. H. Morgan, Wheeler, and others.

In opposition to organic evolution is the *theory of permanence or fixity*. It maintains the stability of organic species, acknowledging only minor variations within the framework of the specific type. The theory presupposes that every single species received its existence through a creative act of God. The systematic arrangement and plan of organisms, based on their structural similarity, is merely an *ideal unity*, founded on the unity of the plan conceived and executed by the Creator of the universe. Up to the time of Darwin, this theory was the only one held by scientists and people in general. They observed no transformation of one species into another. The fact that hybrids of different species could not propagate, at least not indefinitely,

seemed to preclude the possibility of all species having a common genetic origin.

EVOLUTION OR PERMANENCE?

Strictly speaking, the problem of evolution or permanence is a *scientific problem*. If we grant the existence of God as the Author of nature and of life, either theory is tenable. It is evident that God could have created the various species of animals and plants directly. He could also have implanted in the first organism the tendency to develop into increasingly higher forms of life under the influence of internal and external developmental factors. There is nothing contradictory in either theory. Which plan was actually carried out, would be difficult to ascertain.

St. Thomas Aquinas and scholastics in general have always maintained the principle that, if something can be explained through the agencies of creatural causality, one should not have recourse to divine power. It has also been the consistent teaching of St. Thomas⁵ that a planned hierarchy exists in nature, so that there is a *tendency* for elements to lead to compounds, for compounds to lead to vegetant beings, for vegetant beings to lead to sentient beings, and for sentient beings to lead to man, who is the end and the aim of all development. While St. Thomas was not an evolutionist in the modern sense of the term, because he was unacquainted with the data of the modern problem of evolution, his general metaphysical teaching about the world and about spontaneous generation could very well be harmonized with the theory of evolution,

provided this evolution be conceived as being inaugurated by God according to a purposive plan. The rest would be left to the agency of natural causes.

The theory of evolution is not, in itself, irreligious and atheistic; but the scientists and philosophers are often irreligious and atheistic. The theory does not, in all probability, run counter to Christian principles and belief⁶ or to the scriptural account in the Book of Genesis. A number of the early Christian philosophers maintained that creation was a single act of God set at the beginning of the world. All further developments occurred through natural agencies. If scientists can prove conclusively that evolution is a fact, then a fact it is.

HAS SCIENCE *PROVED THE FACT OF EVOLUTION*?

The answer is definitely in the negative, as every reputable scientist admits. At best, it is a very plausible theory, but nothing more than a 'theory', the dogmatic claims of certain pseudo-scientific magazine writers notwithstanding. Let us evaluate briefly the evidence.

Paleontology is a static, fossilized record; it must be interpreted to be understood, because it does not explain itself. It is a record of the *succession* of organic forms; succession, however, does not necessarily mean descent. *Post hoc, ergo propter hoc*, is a fallacious piece of reasoning. The white man came after the Indian in North America, but he did not on that account descend from the Indian. The succession of forms can be explained either by creation or evolution. Natural descent, therefore, would

have to be established on other grounds than mere succession in time.

In *morphological* and *physiological similarity* the argument for evolution is based on *analogy*, and such an argument may easily be false, as every scientist and philosopher knows only too well. Similarity does not necessarily involve genetic descent. The camel and the llama are similar in many respects, but neither is the direct descendant of the other. Similarity *could*, without doubt, be due to phylogenesis and evolution; but it could just as well be the result of creation according to a plan of similarity.

The argument from *ontogeny* and *embryology* is a favorite with many evolutionists. This argument for general evolution, however, is not at all stringent. Articulate animals, such as insects, have their central nervous system on the ventral side of their body, while the vertebrates have theirs on the dorsal side. Now, the embryo of a vertebrate does not begin to develop its central nervous system on the ventral side and then gradually change it over to the dorsal side; the vertebrate's central nervous system is developed from the start on the dorsal side, contrary to the so-called 'biogenetic principle' that the embryonic development of the individual is a recapitulation of the history of the race. And it must be borne in mind that the invertebrates and the vertebrates are the two great divisions of the animal kingdom. Since the vertebrates are supposed to be the descendants of the invertebrates, no sound reason can be given why the former, if the biogenetic principle were correct, does not recapitulate the race history of the latter. That vertebrates and invertebrates start from a single cell

and develop their embryonic body gradually is due to the fact that all embryonic body development proceeds from the 'general' to the 'special.'

It is necessary to stress a few *important facts* in connection with the theory of a general organic evolution. There is absolutely no evidence for the descent of *animals from plants*, or of plants from animals. Thousands of species and hundreds of genera appear *suddenly* and *without transition* in the geological record at various periods, and there is no evidence that they descended genetically from preexisting types; all intermediate types are missing. Many types appear immediately as *highly specialized forms* of organisms; no pre-existing simple and primitive types exist from which they should have evolved, as might be expected. Of course, the geological record is, without question, fragmentary; but the burden of the proof for evolution rests upon the shoulders of the evolutionists.

These critical remarks *do not disprove evolution*. As a matter of fact, *partial evolution* seems a fairly established fact. *Eric Wasmann* has made out a good case for the *Dinarda* forms, a type of beetle. One might also cite the case of the horse, the whale, the elephant, and some others, as evolutionary in character. But such instances are a far cry from a proof for evolution in general. Nevertheless, the cumulative evidence makes the theory of general evolution a fascinatingly plausible and, perhaps, even a *probable theory* which cannot be lightly discarded. Man appeared so late on the globe and his span of historical knowledge is so short and piecemeal that a conclusive proof or disproof of

the theory of evolution, whether general or partial, is practically impossible.

Much can be said for and against evolution. A mechanical evolution does not satisfy the philosopher. A purposive evolution, deriving its inherent tendencies from an Intelligent Creator, should be acceptable to all. Since the causal influence of God is necessary for the origin of life, as we have shown, it is reasonable to suppose that He would put the proper dispositions and tendencies in the original organisms, so that they would develop along definite lines into different species. This view is based, of course, on the supposition that He decided on an evolutionary development of species. The direct creation and permanence of all species is not required. Partial creation and partial evolution might be the answer, but it seems a half-hearted position. What method brought about the divergence of species among plants and animals, facts alone can determine, and the facts are obscured. The problem is still very debatable.

Origin of Man's Body

Not long ago it was almost a dogma among a large class of scientists that man is a direct *descendant of the apes*. All that seemed necessary for definite proof of this contention was the existence of fossil 'missing links' connecting man and ape. For a time the search for these links was carried on with feverish activity. At present, the view that man is a direct descendant of the ape has been relegated to the limbo of discarded theories. The theory now prevalent is

that man and ape represent collateral lines of descent from a generalized common stock, known as the *Dryopithecus*, which is thought to have existed about ten million years ago.

Man is a newcomer on earth. Some of the fossil skeletal remains of ancient man date back to the *glacial epoch* of the Pleistocene Age, the geological age immediately preceding our own. It is customary to speak of four glacial epochs, though some geologists admit only two. There is no uniformity in the calculation of the lengths of these glacial epochs; depending on the methods of calculation, the time that man has existed on earth is variously estimated as being anywhere between twenty thousand and one million years. Even were no skeletal remains ever discovered, the presence of *flaked flint tools* is a sure indication that man existed in an early glacial period. Such tools of undoubtedly human manufacture are found in the deposits of the *Middle Pleistocene*. The eoliths (ancient chipped stones) of the Lower Pleistocene may have a natural and not human origin.

The *fossil remains* of prehistoric man are rather few. Leaving out of consideration the skull top of *Pithecanthropus erectus* of Trinil, Java, about whose simian or human nature scientists disagree, probably the oldest known human skull is that of the *Piltdown man*,⁷ found at Piltdown manor in Sussex, England, by William Dawson and Sir Arthur S. Woodward in 1912. The deposit of gravel, it appears, might possibly belong to an early Pleistocene period. Only parts of the fragmentary skull remain, and reconstruction was difficult. About a yard away from where

the skull had been, the greater part of a jaw was found, but it is impossible to determine whether this jaw belonged to this particular skull. The jaw, it is claimed, is rather 'simian' in character, but the skull, oddly enough, except for the thickness of the bones, is essentially modern in type. The brain capacity of this individual is figured at approximately 1,350 cubic centimeters, practically the same as that of many living persons. Such a large brain capacity was rather disconcerting to evolutionists, who loved to picture primitive man as always having large supra-orbital ridges, a low, receding forehead, a small cranial capacity, etc. It sounds almost like a complaint, when Alfred S. Romer, a confirmed believer in the evolution of man, writes: "To the type of skull . . . with the great brow ridges, retreating forehead, etc., the term paleoanthropic, 'ancient human,' may be usefully applied. At the end of the Pleistocene appears our own species, *Homo sapiens*, with new human' or neanthropic characteristics — the brow ridges reduced, the forehead high, the skull contours rounded. It is frequently assumed that neanthropic modern man has ascended through a long series of paleoanthropic ancestors. But in the Piltdown skull we have one of the oldest of human known fossils — a form probably considerably older than the paleoanthropic Java and Peking men — and yet the skull here is already of a typical modern neanthropic type!"⁸

The *Peking man*, or *Sinanthropus*, was discovered near Peking, China, in 1929. Various skull fragments, belonging to individuals of both sexes and to young and old, were found. All skulls are incomplete, but together they give a

fairly accurate picture of the skull formation. The supra-orbital ridges are pronounced, the forehead is low and receding, the skull is narrow and long. The jaw is chinless, as in all ancient men, but essentially human. The Peking man used tools and fire. The animal skeletons present indicate the period as *Middle Pleistocene*. The brain capacities reported are given as 915, 1,050, 1,100, and 1,200 cubic centimeters.

There are other fossil remains of ancient man — the *Solo* man, the *Rhodesian* man, the *Heidelberg* jaw, the *Swanscombe* skull fragment, the *Galley Hill* skeleton. They are, apparently, more recent than the Piltdown and Peking remains. In the earlier part of the last glaciation, there lived the *Neanderthal* race, of which a number of variants existed, distributed over Europe and western Asia. The men of this race had strong brow bridges, low foreheads, and prognathous jaws, similar to the Peking man. The *Cro-Magnon* race, of the Upper Pleistocene and last glacial period, was a type of tall, well-built individuals, with long heads and high foreheads, and a chinless jaw. They were an artistic race, as their implements and cave paintings reveal. The brain capacity of the skull sometimes exceeds that of modern individuals.

Modern man, of whom we are the descendants, seems to have migrated into Europe from Asia or Africa. Nothing is known as to how or where or when the human sub-races (white, negroid, mongoloid, etc.) originated. This much, however, is certain: All human beings, no matter what their color or structural differences may be, are true men. They intermarry, and their offspring is not sterile but fertile. We

can, therefore, draw the conclusion that prehistoric man was also a true human being, like ourselves. Here and there we find living men whose skull structure resembles an ancient type, but they are not less 'human' on that account. What, then, are we to think of the question of the *evolution of man*?

Theoretically, viewed from a purely scientific and philosophic standpoint, the hypothesis of human evolution through brute ancestry, at least so far as man's body is concerned, could be maintained, *provided the general* evolution of all organic species from a primitive stock is established as a *fact*. After all, man is a mammal among mammals. His bodily structure and organs are patterned on the general plan of the vertebrate animals. *If* a universal evolution has actually occurred, it would be but natural to include man in the general scheme, because evolution, with its driving force of intrinsic purposiveness and direction, would then have been planned by God in the creation of the first organisms. We must, therefore, state that the evolution of man's body *could, per se*, have been included in the general scheme of the evolutionary process of all organisms. Evolution would be a fair *working hypothesis*, because it makes little difference whether God created man directly or used the indirect method of evolution. Man in either case, would be a creature of God.

Evaluating the *existing evidence*, we find it to be extremely meager. The lack of factual evidence, which makes the theory of general evolution so inconclusive, is even more pronounced in the past history of man. Millions of years, if the calculation is correct, in an enormous gap to

span, and there is *no evidence* of the existence of *intermediate forms* linking man to the proposed and supposed ancestral stock. In no other field of scientific research would scientists dream of rearing so stupendous an edifice upon so precarious a foundation as they feel inclined to do in the case of the 'descent of man.' It is amusing and at times irritating, to read their statements on man's 'unquestionable descent' in the face of this absence of factual evidence.

Origin of Man's Soul

Whatever may be the ultimate verdict of science and philosophy concerning the origin of man's body, whether through organic evolution or through a special act of divine intervention, *man's soul is not the product of evolution.*

Materialistic evolutionists, since they deny the existence of a Creator, have no choice in the matter; they must maintain, at the expense of reason and logic, that life evolved out of lifeless matter, that consciousness evolved out of unconscious atoms, and that the total man evolved out of brute animals. We have demonstrated (Chap. 20) that man's soul is a *spiritual entity* endowed with the spiritual powers of intellect and will. As such, the soul transcends matter and material conditions. Matter is essentially quantitative, and so are its energies. Its causality is restricted to the material order. Unless we wish to see the entire edifice of science and philosophy crumble into dust, we must uphold the validity and inviolability of the Principle of Causality and maintain that no cause can produce an

effect superior to itself. The effect, before being produced, must be contained virtually in the nature and power of its producing cause; this conclusion follows from the self-evident principle that a thing cannot give what it does not possess. Since matter and material energies do not possess spirituality, because that would be a contradiction in terms, they cannot produce a spiritual being. Man's soul, however, is a spiritual entity, devoid of quantitative parts. Hence, matter and material energies cannot produce the human soul. Plants and animals are organisms, material systems; even plant and animal souls are material in essence, completely immersed in matter and intrinsically dependent on matter in entity and operation. Consequently, neither the matter nor the soul of plants and animals could give rise to the existence of the human soul. Therefore, whether we view the human soul as originating by means of an *absolute emergence* from lifeless matter directly, or through a *generative process* on the part of plants and animals, or through the *transmutation* of a plant or animal soul into a human soul, the effect would exceed the capabilities of the cause. In no case can the spiritual and simple soul of man originate from material beings or through material agencies, whether inorganic or organic.

Pantheists identify the soul with God. The Stoics considered the human soul to be a *particle* of the divine substance. St. Augustine fought this view, He pointed out that, under this supposition, the substance of God would be subject to error and deception and would undergo many kinds of accidental changes; the substance of God, however, being infinitely perfect, is unchangeable in every respect.

Other pantheists, especially in our era, look at the human soul as an *emanation* or *mode* of the divine substance passing through a process of development according to intrinsically necessary laws. The soul is considered a form or modification of God's substance. God's substance, however, as will be seen in theodicy, is an infinitely simple, unchangeable, spiritual, and perfect substance, without accidents or modes of any kind. Hence, the soul as an emanation or mode of the divine substance is a contradiction and therefore impossible.

The theory of *traducianism* or *generationism* sought to explain the origin of the individual human soul as the product of *parental generation*. *Corporeal traducianism* maintained that the material semen of the parents produced the entire child, body and soul; Tertullian and Apollinaris defended this view. *Spiritual* traducianism was the theory that a spiritual semen passed from the soul of the parents to the child in the moment of conception and thereby generated the spiritual soul of the child; St. Augustine upheld this opinion for a time. The former theory is erroneous, because a material generation of the spiritual soul would violate the Principle of Causality. The second theory is erroneous, because the soul of the parents, being spiritual and simple, cannot transmit a part of its substance to the child; besides, the soul of the child would consist of a part of the father's soul and a part of the mother's soul, and thus its essential unity, simplicity, and indivisibility would be destroyed.

THE SOUL CANNOT BE PRODUCED OUT OF A PRE-EXISTING MATERIAL or spiritual subject.

Since the human soul is spiritual in nature, it does not consist of matter nor is it intrinsically dependent on matter. Hence, it can not be produced out of matter as out of a preexisting subject. Nor can it be produced out of a spiritual substance, because a spiritual substance, since it is simple in essence and does not consist of parts, cannot give away a part which could be used for the production of the new soul. Hence, the human soul cannot be produced out of any spiritual substance as out of a pre-existing subject. Anything, however, which is brought from non-existence to existence without being derived from a pre-existing subject, is produced *completely out of nothing*. Such a production is termed creation in the strictest sense of the term. Creatures cannot 'create' things in this way; their total activity is restricted to influencing and changing existing beings. It follows that only an extra-creatural and extra-mundane cause can create the individual human soul, and that cause is God. Hence, every individual human soul is *created by God*. This doctrine is termed *creationism*.

The *objection* is made that, in the event of such a creation, parents are parents of their child in name only; they would not usher into this life a being of the same nature as themselves, but only a human body. The objection is valid only under the supposition that the soul and body form merely an accidental unit. Soul and matter, however, form a *single substance*, an *integral organism*. God, it is true, is the author of the soul through a creative act. But the formation of *the whole man* is also the work of the

parents, because their generative act is the determining factor of the origin of the child; through their generative act it is brought about that God creates the soul and unites it substantially to matter, so that the *total effect* is a *human being* similar to their own nature.

Time of the Soul's Origin

At what particular time is the individual soul created? Were all souls created in the *beginning of time* and then united singly to their respective bodies? Or is the individual soul created at the moment of its *union with matter*?

Plato contended that the human spirits (souls) *pre-existed* in a noumenal world before being united with a body.

Origenes also believed in the pre-existence of souls. *No solid grounds* exist for such a belief. The soul must have been either active or inactive in its state of pre-existence. If inactive, there could have been no purpose to such an existence, and it is inconceivable that God would have created the soul for a purposeless existence. If *active*, the total lack of memory concerning events in our previous existence remains inexplicable. One might say that the union with the body brought on the loss of memory. But why should this happen? The soul being spiritual, its intellectual memory is spiritual and should not be affected by matter. Could the loss of memory be a punishment for some crime committed by the soul in its former state? Hardly, for how could the soul expiate its crime in this life, if it knows nothing of the crime? Furthermore, our present life would

be a condition of deterioration for the soul. In that case, however, the union of body and soul would not be natural (though it is); and one cannot understand why the instinct of self-preservation should be so strong in us and why we should shrink from the separation of body and soul. If anything, we should naturally welcome death, so as to be relieved from the state of punishment; such, however, as we know only too well, is not our attitude toward death. Preexistence, therefore, must be rejected.

There remains, then, the view that the human soul is created by God at *the moment of its union with matter*. This view alone is reasonable. The soul is a spiritual entity, but it is also the *vital* principle or substantial form of the body. Body and soul (matter and spirit) constitute a single nature and substance. The soul receives its entitative perfection in animating matter so as to form an integral organism; therein lies the natural purpose of its existence. When separated from the body, many of its natural operations, namely, vegetative and sensory functions, are impossible. Hence, since the soul has its natural existence only in conjunction with matter, thereby constituting the 'rational animal' which is the true 'human being,' it receives its existence when the human organism comes into existence.

Is the human soul created at *the moment of conception*, that is, at the moment when the male sperm cell unites with the female ovum? The question is controversial and highly speculative. *St. Thomas Aquinas*⁹ held that the rational soul is not present in the earliest stages of the embryo's development. In his view, the paternal semen first disposes the maternal substance into organized matter; then a

vegetative vital principle or soul is educed out of this organized matter, so that the human embryo at this stage is a vegetant organism; after the vegetative principle has developed and disposed this body for the reception of a sentient vital principle or soul, the sentient soul replaces the vegetative soul, so that the organized foetus is now capable of vegetative and sensory functions. When, under the progressive influence of the sentient soul, the foetal body is sufficiently organized and proximately disposed for the reception of the spiritual rational soul, the rational soul is created in the body, replacing the sentient soul and taking over all functions.

Duns Scotus differed with St. Thomas on this question. He would not admit a temporal succession of vital principles in the foetus. After the initial preparation of matter by the parents, and after the foetal body had developed sufficiently and was disposed to receive the vital principle, the rational soul is infused by God. In his view, no vegetative and sentient vital principles, distinct from the spiritual soul itself, are present in the human foetus before the creation of the spiritual soul. All vital functions, therefore, are performed by the rational soul, and not by any other.

Both St. Thomas and *Duns Scotus* have had a considerable following. D. Card. Mercier, one of the most prominent of modern scholastics, preferred the opinion of St. Thomas, although few accept his opinion in our day.

The *prevailing view* is that the soul is created and infused into the body at the moment of *conception*. Here is the argument. Since the rational soul contains within itself the capabilities of vegetative and sentient souls and

performs the triple functions of vegetancy, sentiency, and rationality in the human body at a later stage of its existence, no genuine reason can be adduced why the same spiritual soul should not be present from the very *beginning*, first performing vegetative functions, then sensory functions, and finally rational functions, depending on the developmental stage of the organism. In the prenatal life of the child, the vegetative development must prepare the organism for sentient life, and then the sensory development must prepare the organism for rational life. It is, therefore, only natural that sentiency should follow vegetancy, and rationality follow sentiency; but there is no need to postulate distinct vital principles in each of these successive stages of organic development. After all, it is the *same* body that is being developed, and it is a *human* body, not first a plant body and then a brute body. It is very difficult to grasp how a mere vegetative soul should fashion a 'sentient' body, and how a sentient soul should fashion a 'human' body; a development of this kind, since it tends toward a higher level of being, seems to exceed their intrinsic capabilities. But one can readily understand that a 'human' soul would be capable of fashioning the foetus into a 'human' body through the intermediate vegetative and sensory stages of organic development, because it is the purpose of the human soul to develop a 'human' body. Since, however, the development of the human body begins at the moment of conception, when the paternal sperm cell and the maternal ovum unite in fertilization, it is reasonable to suppose that the *organizing principle*, the spiritual vital principle or soul, be present at and from that very moment.

That the human soul does not need to exercise its triple functions immediately and at all times, is proved by the fact that the rational activities of intellection and volition are in abeyance until some time after birth. Yet it is universally conceded that the human infant at birth possesses a rational soul, so that up to the point of the awakening of reason the soul exercises only vegetative and sensory functions. According to the 'law of parsimony,' therefore, no stringent reason can be assigned why the rational soul should not be present from the moment of conception, beginning its organization of the human body at that time. The position here taken, though not capable of direct proof, is undoubtedly logical.

Life thus originated in this world through the causative action of the Creator; abiogenesis, according to the evidence of science, never occurs. Organic evolution is a probable theory, but its factual occurrence has not been definitely proved. The descent of man from brute ancestry is, on purely scientific and philosophic grounds, a tenable but doubtful theory. The spiritual soul of man is created. The exact moment of the creation of the individual human soul is not known with certainty; it would seem, however, that it is created at the moment of conception. That is as far as philosophy can lead us.

Summary of Chapter XXII

The problem to be investigated is the ultimate origin of man's *body* and *soul*.

1. *The Origin of Life*. Life did not always exist on the earth. Theoretically, there are two possibilities to be considered. Life could have originated either through an act of creation or through abiogenesis (absolute emergence).

2. *A biogenesis*. Abiogenesis, or spontaneous generation, is the origination of living beings from nonliving matter through forces which are indigenous to matter itself. A common opinion formerly, it has been definitely *disproved by science*. Living substances can originate only from living substance. The principle of causality precludes the possibility of a vital principle or soul originating from matter through material forces alone, because the effect would be greater than the cause.

3. *Direct Creation*. Life owes its existence to the action of the Creator. *Direct* creation, the production of a new reality in its total being from nothingness, could have been the cause of life; but there was *no need* of creating the elements of the first organic body, because these elements were already at hand.

4. *Mediate Creation*. Since the bodily elements are material, and since the plant and animal souls are educed out of the potentiality of matter, a mediate or *derivative creation* (relative or restricted emergence) would suffice for the origination of the first living organism. This method

of production seems to have been the one used by the Creator.

5. *Organic Evolution*. 'Organic evolution' is the theory that the various species and types of animals and plants derive their origin, not through distinct creative acts of God, but through *development* from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws. Evolution may be considered as monophyletic or polyphyletic.

The *evidence* for evolution is found mainly in the *fossil remains* present in the rock deposits of former geological periods, in the morphological and physiological *similarity* of organic types, and in the *ontogeny* and *embryology* of existing types. The various *factors* of evolution, as stressed by different authors, have given rise to a number of evolutionary theories.

The theory of *permanence* or *fixity* is in opposition to evolution and maintains that every species is fixed, having come into existence through a creative act of God.

6. *Evolution or Permanence?* Both evolution and special creation are acceptable theories. The *fact of evolution* has not been definitely proved by scientific research, but it is a *probable theory*, provided evolution be purposive. God, having created the first organisms, could have put the proper *dispositions* and *tendencies* in the first organisms, so that they would develop along definite lines into different species. From a scientific and philosophic standpoint, it is unnecessary to postulate special creation for the various species.

7. *Origin of Man's Body.* Man existed in the glacial epochs of the Pleistocene Age. A number of skeletal remains of ancient man have been found, chief among them being the Piltdown man, the Peking man, the Rhodesian man, the Neanderthal man, and the Cro-Magnon man. This evidence is very meager, if used as a proof that man descended from a stock which is common to ape and man. As a *working hypothesis*, the descent of man through evolution, if we exempt man's soul, is tenable, but the fact itself has not been proved.

8. *Origin of Man's Soul.* Man's soul is *not the product of evolution*. Since it is a *spiritual* entity, the Principle of Causality precludes the possibility that it could have evolved out of the material body or the material soul of animals or plants. It cannot be a *particle or emanation or mode* of the substance of God, as pantheism asserts, because God's substance is infinitely perfect and unchangeable. Nor can it be the product of corporeal or spiritual generation, as *traducianism (generationism)* claims; the material semen could not produce a spiritual soul, and the souls of the parents, being simple and indivisible, could not emit a spiritual semen.

Since, therefore, there is no material or spiritual subject from which man's spiritual soul could have been made, the soul must be produced completely out of nothing. A total production is called *creation*.

9. *Time of the Soul's Origin.* The theory of the pre-existence of human souls must be rejected. We have no memory of a previous existence. The theory is a gratuitous assumption.

The soul is created at the moment of its union with matter. The soul, being the animating principle of the human organism, has its natural existence only in conjunction with matter; consequently, it receives its existence when the human organism comes into existence. In all probability the soul is created at the *moment of conception*, because it is a 'human' body that is fashioned from the beginning.

Chapter 23

THE DESTINY OF MAN

ALL ORGANISMS — PLANT, ANIMAL, AND MAN — OWE THEIR ultimate origin to God. Man is neither altogether animal, nor altogether rational. Animality and rationality are fused into a single substantial synthesis; man is in all truth a *rational animal*. So far as his physical being is concerned, he is akin to the mammalian vertebrates; so far as his spiritual soul is concerned, he is made in the image and likeness of God.

It is unthinkable that the all-wise Creator would make a purposeless being. In creating man's soul and giving man existence, God gave a purpose to man's being. The fulfillment of that purpose is *man's destiny*.

What is man's destiny? Can it be specified more exactly? To know his destiny is obviously an important matter for the individual and for mankind in general, since man's knowledge of his destiny will impart *meaning, value, and direction* to his life; without this knowledge, man will either live the life of a brute or wander about in a senseless maze of aimless endeavors. To be worthy of his dignity as a human person, man must discover his true place in the universe and then work diligently and conscientiously

toward the fulfilment of whatever immediate and ultimate purpose God has set for his being.

The Rhythm of Growth

In a normal span of life, the individual human being passes, biologically and mentally, through a number of *natural periods*. There is a rhythm of growth for the whole man in the progress of his individual life. A. Willwoll very aptly likens these progressive periods to a symphony unfolding itself according to an inner law of art.

The *first phase* comprises *prenatal life* and *childhood*. Prenatal life builds the fundamental bodily structures and establishes the relationships of parts to parts and of all parts to the organism as a whole. It is in this stage that heredity is mostly at work. After birth the child receives and correlates the manifold impressions of sense. External and internal senses work together and develop harmoniously. The child learns to speak, becomes conscious of self, and after a number of years its reasoning powers are awakened. *Childhood* extends from birth to the age of puberty.

The *second phase* of man's growth begins with the completion of puberty. It is the period of adolescence. The body undergoes a profound biological change, preparing the boy and girl for fatherhood and motherhood. It is also the period in which the higher mental powers reach out to maturity. The individual becomes more serious-minded and strives to find his proper place in society by fitting himself

for a definite vocation, so as to have an independent existence of his own.

The *third phase* sets in around the turn of the third decade. As a rule, the individual in these years of *middle age* attains the highest point of physical efficiency. The specific direction of his life's course is now set. Even though mental maturity does not follow bodily maturity as an effect upon a cause, there is a close relationship between the two, so that experience and achievement, in very many instances at least, reach their peak in these years.

The *fourth phase* begins with the changing years, when a person is about forty-five or fifty. Biologically, this is a period of gradual decline; the bodily mechanism has passed its zenith of maturity and slows down in efficiency. By contrast, due to the consolidation of the accumulated store of experience and knowledge, many persons, especially professional people, achieve their greatest mental vigor in this period.

The *fifth and last phase*, setting in with the sixth decade or thereabouts, is the period of final decline. Life obtains a leisurely aspect of rest and retrospect. Old age, with its retarded metabolism and with its infirmities, creeps over the bodily system. The sensory and mental faculties lose their keenness and alertness, and the mind turns more and more to events of the past. Occasionally, however, some individual seems to rise above the deterioration of the organic powers and attains the highest point of mental perfection in old age. Eventually, though, senility and general decrepitude mark the ruins of a once vigorous personality, until death steps in and ends the individual's

earthly existence. The rhythm of growth has run through its cycle, and the symphony of life is ended in a whisper and a sigh.

Life is thus never at a standstill. Man is in a continuous stage of transition, from the moment of conception to the moment of death. Biologically, his development and decline proceed according to the inexorable laws of nature, even though the inevitable end be not hastened by unavoidable disease and avoidable neglect. Mentally and intellectually, his development and decline are governed far more by individual initiative and effort.

Man and the World

It would be a very grave mistake to consider man as an individual in isolation. According to the cartesian tradition, carried on by the empiricism of Locke and Hume and by the idealism of Kant and his followers, man's mind is forever chained within the prison of its own ideas and subjective states. Other things and objects either have no existence in their own right, or they cannot be effectively known as they exist in themselves. It is the fundamental error of all modern philosophy and psychology, that they attempt to derive the existence of the world from our subjective ideas, instead of deriving our ideas of the world from the objective things and objects existing in the world.

The world exists prior to man, and man is a part of the world. The earth is man's home and workshop. The earth influences him, and he influences the earth.

There is no question that *geographical conditions* exert a profound influence on man's body and mind. It makes a difference whether he lives in the mountains or on the plains; in the tropical, or the temperate, or the arctic zone; in the steaming jungles or on the coast; in an arid or a fertile region; in an area of moderate or extreme changes in temperature. In the tropics, if food is abundant, the heat makes man indolent and sluggish; his culture, as a rule, does not reach a high level. In the arctic, climatic conditions are so severe and the battle for subsistence so hard, that man has no time for anything but the mere acquisition of food and shelter; he finds few opportunities for the things of the mind and of the spirit. It is in the temperate zone that man thrives best, both from a bodily and a mental point of view. The climate is stimulating, the seasonal changes tend to toughen the body, the labor involved in making a living is neither too hard nor too easy, and all conditions serve as an incentive to man to develop new methods of technique to conquer the earth, to establish an appropriate culture, and to give play to the higher mental powers in various forms of art and science.

The earth is not a paradise. Difficulties beset man at every step on his way through the lands. He can fulfill his destiny only through *work*. But man has an intellect and will, setting him apart from all other creatures of the universe, and with these superior powers he fashions the creative tools to master the earth wherever he chooses to roam and live. Nature thus becomes man's servant. The impress of his genius is seen everywhere.

Some authors, with a facetious turn of mind, speak of man as a worm crawling on a pebble, the earth, as a speck of life floating aimlessly through the immeasurable vastness of the universe. The idea is puerile. As if the greatness of a thing should be measured in terms of physical size and linear dimensions!

Man's body stands at the half-way mark between the mass of the infinitesimal electron and the mass of the most ponderous star; he is the *pivotal point of the universe*. Comprising within his organic body subatomic particles, the chief elements, and all that is best in plants and animals, he is the *supreme representative of the universe*. His spiritual soul, with its penetrating intellect and conquering will enables him to pierce the veil of phenomena and uncover the hidden essences and laws, so that he is the natural *interpreter of the universe*. One single spiritual concept far outweighs the huge massiveness of an entire world of mere matter. One single spiritual soul has a greater value and a nobler destiny than a million solar systems and a billion galaxies of blindly whirling stars. In the spirituality of his soul, he is the *crown of the universe*. With his feet he is rooted in matter; but his soul reaches out beyond the uttermost boundaries of matter and space.

Man and Other Minds

Man is not a solitary, isolated being. There are other human beings in this world. The individual cannot fulfill his destiny by himself; he needs the assistance of other minds. How

does he contact these *other minds*? How does he know what takes place in the minds of other persons?

The bridge which spans the gap between one mind and another must have a *sensory* component and an *intellectual* component. Man does not know directly what another mind is thinking about; hence, the indirect path of the senses must be used in communication between one mind and another. Sense knowledge alone, however, is not in itself sufficient. A system of sensory expressions must be devised, and these expressions must be symbols of ideas; only in this manner can the ideas present in one mind be communicated to another mind. *Language* fulfills these conditions.

The accumulated knowledge of millions of individuals and of thousands of generations is made available for everybody through the medium of spoken and written language. The wisdom of the ages becomes the property of individuals through language. It is not necessary for each individual to relearn everything through personal experience and observation. Whether transmitted by word of mouth or preserved in writing and print, the intellectual, emotional, religious, and moral experiences of other minds can be assimilated by each individual, according to his capacity and inclination, for his personal development.

Man and Society

Man, it is often stated, is a *social animal*. Though an individual human being, he must fulfill his destiny as an integral member of the *community of men*.

A *society* is a permanent union of a number of persons in fellowship and co-operation for a common purpose of benefit to all. There are two kinds of society, conventional and natural. A conventional society is one founded by a group of persons from free choice, for the attainment of some purpose specifically agreed upon. Examples of this type of society are political parties, labor unions, study clubs, commercial associations, athletic organizations, student fraternities. They satisfy the desires and needs of a certain class of individuals who band together for a common purpose by means of mutual agreement or 'convention.' A *natural* society is one which is established by men in general under a mandate of the 'natural law,' the law inherent in them as human beings. There is in man the *natural aptitude, inclination, and need* for a permanent union and companionship with his fellowmen, so that he cannot escape membership in this kind of society without doing violence to his human nature and running the serious risk of frustrating the purpose of his existence. Man is not born perfect; but he is born with a perfectible nature. It is his right and duty to perfect his nature; he cannot perfect his nature, however, except in a stable union with others throughout the course of his life. There are three natural societies among men, domestic society or the family, civil society or the state, and religious society or the church.

That man has the natural 'aptitude' for membership in such societies, can be seen from the fact that he is gifted with speech. Speech enables men to communicate with one another, to exchange ideas, and to make known their needs and achievements; they can, therefore, give mutual

assistance and work for the common good of all concerned. That he has the natural propensity' to combine his efforts with others, is also evident; he dislikes prolonged solitude and isolation, he seeks companionship, and he feels the necessity of consulting others for the solution of important problems. That he has the natural need' of association with his fellowmen, is all too obvious; he simply cannot receive life and grow to the full status of his bodily, mental, and spiritual maturity except in community with others within the framework of such natural societies. To be a member of these social organizations is, therefore, a requirement of his *nature* as a human being.

Membership in the community does not entail depersonalization of the individual. The individual possesses *inalienable rights*, flowing from his nature as a rational person, and these rights are never lost or forfeited by belonging to a society. Society respects and safeguards the rights of the individual, because its fundamental purpose is to work for the welfare of all members through mutual co-operation and the pooling of resources for the benefit of all in the fullest measure obtainable. The individual, however, also has *social duties* toward the other members of the community. If he is to receive the services of others for his own benefit, he must give his services for the benefit of the others. Society makes its contribution to his personal development, and he in turn must make his personal contribution toward the furtherance of the interests of society. Community life is thus grounded on the principle of *mutual benefit* and *mutual service*, because of the natural limitations and needs of man as an individual who must

work out his destiny by developing all his powers, so far as possible, to their full capacity. Natural societies are, therefore, a mandate of the natural law. In its final analysis, of course, the binding force of the natural law is derived from the will of the Creator who made man to be what he is.

Man and Domestic Society

The *fountainhead* of social life lies in the union of man and woman in *marriage*. Biologically and mentally, the two sexes are complementary to each other. Perfect equality between the sexes never has existed and never will, due to their natural difference of position in the divinely ordained scheme of life. The man is the breadwinner, the worker, the explorer, the inventor, the scientist, the governor. Woman is essentially the homemaker and mother of the race who gives, nurtures, forms, and rears the new life. Masculinity and femininity are emotionally opposites and attract each other instinctively. Love and the sex urge prompt the man and the woman to enter into the most fundamental union of human society — marriage. Here the 'I' becomes the 'We' of society.

In marriage the purpose of their sex reaches its fulfillment in the procreation of a new human being similar to themselves — the child. The child is the concrete embodiment of their marital love. The parents now submerge their individual interests and their interests as husband and wife into the higher and more unselfish love of both for their child. The child and its interests enjoy a primacy. The presence of the child brings about an

extension of the community life of husband and wife into that of father, mother and child. There now exists the family.

The *family* is the *basic unit of human society*, because the family is the source of life for all members of the human race and the primary institution for the bodily, mental, moral, and social development of man from birth to maturity. Man has the natural aptitude, propensity, and need to enter into the bond of marriage and establish a family; hence, the family is a natural society dictated by natural law. The single individual is not obligated to establish and rear a family; the obligation is incumbent upon mankind as a race, because the purpose of the law is the perpetuation of the race as such, and mankind as a whole does not fail to fulfill this obligation.

Authority in the family is divided between both parents, since both share in the giving of life and are responsible for the welfare of the children they beget. Due to their difference of position in the heart of the family, the father is the authoritative head of the family, while the mother is primarily concerned with the upbringing and education of the children. The relationship of parenthood confers upon father and mother certain rights, and involves specific duties, toward their children. On the other hand, children, both as individual human beings and as members of the family, enjoy the rights of proper sustenance and training; but they also have the duties of respect, obedience, and, when necessary, support of their parents. The family, in its very essence, is the fundamental form of human society.

Man and Civil Society

Just as man is by natural law a member of domestic society or the family, so he is also a member of *civil society* or the state. The state is an extension of the family. The family is prior to the state. The state results from the combination and organization of a number of families into a social union for the furtherance of their mutual welfare.

Man has the natural aptitude, propensity, and need to establish the broader social unit of the state, and hence the formation of the state is a mandate of the natural law. The state is a *natural society* and as such lies within the order ordained and willed by the Creator for the greater benefit of mankind. Neither the individuals nor the families are, as a rule, capable of acquiring and supplying everything needed for the maximal welfare of all. Resources are limited, and so are opportunities and capabilities. Dangers threaten from all sides, and the individuals and families are incapable of coping with them adequately. It is necessary, therefore, for individuals and families to form groups, communities, cities, tribal organizations, and national governments for mutual assistance and protection. Thus does the *state* or *commonwealth*, namely, a body of people occupying a definite territory and politically organized under a stable government, come into existence as a natural society. The particular form of government is of minor importance.

The state, since it is the outgrowth and extension of the family, must protect the inherent and inalienable rights of the family, because the family is the basic unit of society.

The rights of the family have a primacy over the rights of the state. The rights of the family are not derived from the state, but existed before the state could even be established. Hence, the doctrine of the *absolutism* of the state is radically wrong. The intrinsic goal of all man's social activity is the satisfaction and completion of his natural powers, so as to insure *temporal happiness*. It is, therefore, the duty of the state to assist man in the realization of this supreme goal of earthly existence. It follows that the state does not possess arbitrary powers of government over its subjects, but must be guided by the essential purpose of all government in relation to its constituent groups, families, and individuals, namely, the common weal in accordance with the destiny of man. Hence, the state must establish and maintain *peace* and *order* throughout its domain, upholding all natural and legal rights and compelling the fulfillment of all civic duties on the part of its members. It must also, so far as possible and feasible, place within the hands of its members the opportunities and means of a full bodily, mental, and moral development. To achieve its mission, authority must be vested in an individual or representative body, together with the power necessary to enforce the laws for the benefit of all.

Man and Religious Society

Man is by nature not only a domestic and political, but also a *religious being*. Man is specifically what he is through his rational, spiritual soul. Whatever we may think of the origin of his body, his soul owes its total being and origin to the

direct creative act of God. Everything man is and has, he is and has through the loving kindness of his Creator. The bond between man and God, therefore, is infinitely more intimate than the bond between child and parent.

Here we have the ultimate foundation of the *equality of all men* and the ultimate source of the inalienable rights of all men to *life, liberty*, and the *pursuit of happiness*. Man is a creature of God, made in His image and likeness, irrespective of sex, color, or race. The concept of a 'super-race' is an insult to man and God.

The very nature of man demands that he recognize his creature-ship and dependence on the Creator. This relationship implies reverence, adoration, and homage; expressed externally, reverence, adoration, and homage assume the form of a religious rite. Man, therefore, has the natural obligation to *worship* his Creator, so that religious worship is incumbent on man as a dictate of the *natural law* of his being.

First and primarily, the *individual* has the obligation of worship. Since, however, he is by nature a social being, he has the aptitude, propensity, and need to fulfill the obligation of worship in his social union with others in a public manner. In other words, not only the individual but *society* must worship God. In accordance with this dictate of natural law, we find that all peoples have exercised their duty of worship through religious rites as a social group and even as a state. In virtue of his very being, then, man has the right and the duty to worship God as a member of a religious organization or society, either in conjunction with the state or apart from it.

Viewed from the standpoint of reason and philosophy, we must say that man is by nature impelled to be a member of domestic, civil, and religious society.

Man and Morality

Man is born not only into the physical and social order, but also into the *moral order*. Unlike brute behavior, human conduct is characterized by the quality of *right* and *wrong*. By 'human conduct' we understand those actions of the human persons which are controlled by the free will; these are qualified by the attribute of morality, in so far as they conform or do not conform to the norms and principles governing right living.

All men at all times have recognized the fact that free human actions are 'good' or 'bad,' 'right' or 'wrong.' It is not a question of whether certain actions are efficient or inefficient, expedient or inexpedient, pleasant or unpleasant, convenient or inconvenient; irrespective of such considerations, they are deemed to be good or bad *in themselves*. All agree that what is good 'ought to be,' while what is bad 'ought not to be.' The 'good' should be loved and striven for the 'bad' should be abhorred and avoided. Who does what is 'right,' deserves praise; who does what is 'wrong,' deserves blame and punishment. This attitude is fundamental and universal.

Man feels under *obligation* to do what is good and avoid what is bad. He stands *under* the law of morality, not above it. There is an absolute and immutable element in morality which binds man's will in all deliberate, free acts and

imposes itself upon him as an authoritative command. Kant terms this command the 'categorical imperative.' Whence the authoritativeness of this command?

Consider the *basic principles of morality*. They are general in character, but specific in intent. Such principles are: 'Do what is right, and avoid what is evil; reverence and worship the Supreme Being and do His will; do unto others as you would have others do unto you; respect your fellow man's person and property; you must not steal; you must not lie; esteem and obey your parents and lawful superiors and show them gratitude; murder and adultery are wrong and must be punished, etc.' It is obvious that such and similar moral precepts are not based on pleasure or external restraint or the limitation of physical capability. The moral principles just enumerated often run counter to natural inclination, impulse, and pleasure. Even when no restraining external force is present, man feels the obligation to carry out these precepts. The physical capability of performing a prohibited act may be unimpaired, but the sense of obligation still remains. The obligation to abide by the moral precepts, therefore, is not of man's own making, because man, of his own accord, would not impose such onerous duties upon himself.

We must conclude that morality is a *law* imposed on man by his own *rational nature*. Man is distinguished from the brute by the rationality of his intellect and the morality of his free will. Because man is a rational being, he is also a moral being. Man will lead a moral life, if his free actions are in harmony with his rational nature. Man's rational nature is thus the proximate ground of human morality. The

ultimate ground lies in the will of the Creator who has endowed man with a rational nature. Brutes, not possessing rationality, have their behavior regulated by irresistible drives and impulses. Man, possessing intellect and will, must freely choose to regulate his conduct by practical principles and judgments, so that his conduct will be in conformity with his rational nature by free choice. Morality, therefore, is a *natural law* based upon an intellectually perceived obligation, not upon physical or physiological constraint. Man *can* violate the moral law, but he *should* obey it.

By the very fact that man is endowed by the Creator with the power and use of reason, he soon learns to make the necessary and practical judgments that some acts are in harmony with his rational nature, and therefore 'good' and 'right,' while other acts are in opposition to the fundamental character of his rational nature, and therefore 'bad' and 'wrong.' The practical judgment which applies the moral law to our own acts, informing us whether a particular act is in agreement or disagreement with the moral law, is called *conscience*. Conscience is an act of reason which interprets the moral law and demands obedience to the law. It is 'God's voice,' to use an apt figure of speech, telling man what to do and what not to do, if he would follow God's will. Conscience is the supreme arbiter in moral life, and its commands must be obeyed.

What is the *purpose* of conscience and morality? To make us live a life worthy of our dignity as rational beings and to make us like to God who created us. The *whole man*, not a mere part of his nature, must be taken as the norm and

criterion of morality. Man is an individual being, with sensual and intellectual potentialities; he is also a social and a religious being. Whatever befits him in these various capacities and helps to develop them in their proper order, is morally good. Man's nature gives him a definite *scale of values* to guide him in right living. St. Thomas Aquinas marks off the scale of values in clear and concise terms: "There are certain activities naturally suited to man, and these activities are in themselves right and not merely by positive law... It is natural to man to be a social being. Those things, therefore, naturally befit man without which the maintenance of human society would be impossible... The use of lower creatures to meet the need of human life is a natural property of man. Now there is a certain measure in which the use of aforesaid creatures is helpful to human life. If this measure is transgressed, as in the disorderly taking of food, it results in harm to man and is inappropriate. In the natural order, man's body is for his soul, and the lower powers of the soul for reason. It is therefore naturally right for man so to manage his body and lower faculties of his soul so that the good of reason may be helped... To every man those things are befitting, whereby he tends to his natural end; and the contraries are naturally unbefitting. But God is the end to which man is ordained by nature. Those things therefore are naturally right, whereby man is led to the knowledge and love of God."¹ It is, then, the purpose of conscience and morality to make man acquainted with what is befitting to his rational nature and to oblige him to seek the various values in their proper order; and man has the duty to follow the dictates of

conscience and morality. Otherwise he cannot fulfill his destiny as a human being.

What is the *end* and *goal* of the moral order for the *individual*? It is the perfection of the 'whole man'; and this perfection entails *happiness*. The end and goal of all man's activities is his personal happiness. Whoever fulfills his moral obligations faithfully, is bound to obtain happiness; and whoever refuses to submit to the moral order, must reach a state of final unhappiness. St. Thomas expounds this point with his usual clarity: "Wherever there exists a well-regulated order of ends, it is necessary that this established order lead to an end; anything which separates itself from that order, at the same time separates itself from its end. God has ordained a certain order for human acts in as far as their end is concerned, and this end is happiness. It follows, therefore, assuming this order to be solidly established, that those who follow its dictates will obtain their end, happiness; in other words, they will be rewarded; and those who disturb this order by the commission of sin will not obtain their end, happiness; in other words, they will be punished."²

Morality involves *sanctions*. A 'sanction' is a reward given for the observance of a law and a punishment meted out for the violation of a law. Sanctions are necessary to make the law effective. If there were no punishment for evil doers and no reward for the observers of the law, right order would end in chaos, the self-denial of the virtuous would be useless, and the wicked would be triumphant. Justice thus demands sanctions. Furthermore, the frailty of man needs a stimulus for the performance of duty and a

deterrent which serves to curb his inclination and will to do wrong. The legal sanctions of the state are insufficient for the purpose, because the state has control only over external actions, and many violations of the moral law never become known. The sanctions of the moral law must come from the *author* of the moral law; since God is the Supreme Lawgiver, He must have attached the necessary sanctions Himself. God alone knows the secrets of the human will, and He alone can reward the just and punish the unjust in adequate measure. Now, happiness is the natural reward of the good, and misery the natural punishment of the evil. God, therefore, in His justice will see to it that the good receive their reward and the wicked their punishment.

Man *cannot escape the law* of morality. He may sidestep the duties of domestic and civil society by isolating himself from the rest of mankind, living by himself in some inaccessible place. But he cannot escape from himself and from God; he carries the moral law and his conscience with him wherever he goes. Hence, he cannot escape from the sanctions of the moral law.

And yet, is it true that the observance of the moral law brings happiness to the good and the violation of it brings unhappiness to the wicked? We are here face to face with a profound problem.

Survival After Death

Death is the cessation of life in an organism. When vital functions cease in an organism, without the possibility of the resuscitation of these functions, the organism is 'dead.'

Since vital functions have their existence primarily from the vital principle or soul, death supervenes upon an organism when the soul of plant, animal, or man is no longer capable of animating the material substrate with which it is substantially conjoined as the vitalizing 'form.'

Death may occur in one of two ways: *dissolution or annihilation* of the organism. 'Dissolution' takes place, when matter and form are separated. The elements of the organic compounds then revert to the inanimate status of ordinary chemical elements and enter into new combinations according to the laws of chemical affinity. In 'annihilation' the total organism (matter and form, body and soul) is reduced to complete nothingness, so that no vestige of the organism remains in existence.

Man, of course, dies. His vital functions as an organism cease. Man, however, considered as an organism, is *not annihilated* in death. The material elements of his body remain in existence in the corpse, just as they do in the case of plants and animals. Man, therefore, dies by means of a dissolution of the substantial bond between body and soul (matter and form). The body disintegrates after death.

What happens to the *soul*? Does it also disintegrate? Does it cease to exist, when man, as an organism, ceases to exist? Or, does it survive the death of the organism as a whole and exist for itself? The answer to these questions is of surpassing importance for each individual human being. If the soul ceases to exist with the death of the organism, man's destiny is completed in his span of earthly life; if the soul survives the death of the organism, his destiny receives its fulfillment after death.

SURVIVAL AFTER DEATH IS POSSIBLE.

Whether the human soul can survive the death of the organism, depends on two factors: the intrinsic essence of the soul itself and its relation to the body with which it forms one nature.

Of itself and in virtue of its essence, the soul cannot be destroyed through death except on the supposition that it were composed of quantitative or entitative parts. A *composite* being can, by its very nature, be dissolved into its constituent parts and thus lose its identity through dissolution and disintegration, either through the power of an outside agent or through internal weakness. Conversely, what is not composed of quantitative or entitative parts, cannot be dissolved and so destroyed. Now, the soul is not composed of any parts whatsoever, because it is a *spiritual* and *simple essence*. Hence, in virtue of its essence, it cannot be destroyed. The death of the organism, therefore, does not entail the destruction of the soul.

In virtue of its *relation to the body*, the survival of the human soul would be naturally impossible, if the soul were completely immersed in matter and would thus be *intrinsically dependent* on matter for its existence and operations. It was, however, proved before (Chap. 20) that the human soul, unlike the plant and animal soul, is a subsistent spiritual entity, *intrinsically independent* of matter in its essence and only extrinsically dependent on the senses for the object of its intellectual knowledge. Vegetation and sensation are organic functions, but

intellection and volition are spiritual activities essentially devoid of materiality. Hence, so far as its essence and rational activities are concerned, the dissolution of the organism does not necessarily involve the destruction of the soul. The human soul, therefore, being a spirit, can survive the death of the organism and carry on an independent existence of its own.

In such a disembodied existence after the death of the organism, the soul would not, of course, be capable of vegetative and sensory functions, because these require material structures and organs. The *rational activities* of intellection and volition, however, would remain intact in this after-death existence; they are not organic functions, but reside in the spiritual soul alone. The intellectual memory of past experiences would be carried over into the new life. Elaboration of previously acquired knowledge would also be possible, and no legitimate reason can be advanced against the acquisition of new knowledge, because the soul now has the mode of existence of a pure spirit and no longer needs the co-operation of the senses. The will, too, following the intellect, must be unhampered in its activities.

SURVIVAL AFTER DEATH IS MORALLY CERTAIN.

It has been the *universal conviction* of mankind that the human soul survives the death of the body.

Ethnology has supplied a practically complete proof of this conviction. There is a considerable difference of belief as to the kind of life the soul will lead after death; but of the

fact of survival itself there is a universal conviction throughout the world.

A universal fact of this sort demands a *universal cause* as an explanation. It is useless to assign ignorance, prejudice, or deception as the cause; these are not universal in character. The only adequate cause, co-extensive with man himself through all types of culture, is the *rational intellect* of man which finds itself constrained to accept the survival after death as a *necessary truth*.

But on what is this judgment based? On the *moral nature* of man. Man is subject to the moral law. This law, to be effective, must be enforced by sanctions, reward or punishment. In this earthly life, however, reward and punishment are not of such a nature that they are adequate for the purpose intended. The good are by no means always rewarded in proportion to their virtues, nor the evil punished according to their misdeeds. Occasionally, virtue is a source of happiness, and vice a source of misery. In general, however, pleasure and pain, comfort and discomfort, wealth and poverty, honor and disgrace, enjoyment and self-denial, happiness and misery, are not meted out to the good and evil according to their just deserts, as the divine sanctions would demand.

The best proof for the inadequacy of the moral sanctions in this life is found in those instances where a person voluntarily *sacrifices his life* in supreme devotion to the moral law. Many maidens have died in defense of their chastity; many persons have been martyred for the sake of God and their conscience; many heroes have given their life in the charitable effort to save others; many soldiers have

fought until death because of their sublime sense of duty. If the soul did not survive death, where is the sanction, the reward, for a magnificent moral deed magnificently done? Such actions, which we prize and praise so highly, would be utterly useless and foolish.

It is unthinkable that God, who is *infinitely just*, would permit such deeds of supreme devotion to the moral law to go un-rewarded, particularly when man, out of love of God and His law, sacrifices his highest earthly possession, namely, his life. Since the sanctions of the moral law are of divine origin, and since the reward for good and the punishment for evil are not adequate in this life, we must conclude that the soul will survive the death of the organism and receive its just dues in the life to come. Without this balancing of the scales on the part of eternal justice in the soul's life after death, the entire moral order would be a delusion and a mockery, and man would be the most deplorable of all God's creatures. God is infinitely good and infinitely just; He will therefore, reward the virtuous and punish the wicked in adequate measure. Hence, the survival of the human soul after death is certain.

There is another point which must be considered. God does not create a thing without a purpose to its being; and the *purpose* of a being is revealed by the kind of essence which God has given it. Now, the essence of man's soul is spiritual, incorruptible, indestructible; by nature it can and should survive the death of the organism. Creatural powers cannot touch the essence of the soul; they are as incapable of annihilating it as they are of creating it. Only God can create and annihilate the spiritual soul of man. The very

fact, however, that God created the soul as a spiritual and naturally incorruptible essence, capable of surviving the dissolution of the body, shows that it was His *purpose* that the soul should live on after death. Since the purposes of God are infallible in their power of execution, He had the intention that the soul should not cease to exist with the cessation of life in the human organism. Of course, God *could* annihilate any of His creatures; He gives existence, and He can also take away existence. No creature has an indisputable and absolute right to existence. God, however, is not fickle and capricious. If He chose freely to create the soul of man as a spiritual and incorruptible essence, so that by its very nature it is capable of survival after death, we are justified in drawing the conclusion that it is His *will* that the soul survive. The spiritual essence of the soul, together with the necessity of adequate sanctions for the observance of the moral law, makes the actual survival after death not only a probability but a certainty.

Spiritism and Survival

Spiritism (or, as the adherents of the cult term it, *spiritualism*) makes the claim to have furnished empirical proof of the continued existence of the human soul after death. Many disembodied souls, spiritists maintain, not only can, but actually do, establish contact with the living in various ways. The chief manner in which the souls of the dead communicate with the living is through certain psychic persons. Such a specially gifted person is called a *medium or sensitive*.

Spirit communications are usually received in a seance, a meeting held in a more or less darkened room. The medium goes into a trance, and the spirit makes use of the bodily organs of the medium to produce 'manifestations.' Such manifestations are manifold in character; some are physical, others psychical.

Among the *physical phenomena* attributed to discarnate souls in mediumistic seances, the following are the most outstanding. Heavy bodies are moved with contact, but there is no mechanical exertion involved in the movement. Heavy bodies are moved without contact. Objects and human beings are lifted off the floor and remain suspended in mid-air without visible support. Articles move about from place to place without contact. Bodies change their weight, even when subjected to laboratory conditions. 'Raps' or percussive sounds are heard and are used as a means of intelligent communication. 'Spirit-lights,' resembling the luminosity of glow worms, appear and travel about the room. Phantom forms and faces 'materialize' and are visible to those present; these phantom shapes are said to be developed from ectoplasm, a psychic substance obtained from the body of the medium.

The *psychical phenomena* attributed to the spirit intelligences are equally remarkable. One is automatic writing concerning subjects with which the medium is totally unfamiliar. Then there is the writing done with the planchette or ouija-board, an instrument similar to a miniature table with three legs, one of which is a pencil or pen. Clairvoyance, telepathy, and psychometry also occur quite frequently. A medium of mediocre education and

intellectuality may speak brilliantly on very abstruse and strange topics or in an archaic language. Detailed facts of historical events, long forgotten, are brought to light and verified through subsequent research.

The phenomena are startling. Numerous scientific bodies have investigated the occurrences happening in the seance room. In many instances fraud has been detected. It would be rash, however, to ascribe everything to deception; some mediums are apparently above reproach. Eminent scientists and investigators have become convinced that many phenomena are genuine. Among them are Sir William Crookes, Alfred Russel Wallace, W. F. Barrett, Sir Oliver Lodge, Henry Sidgwick, F. W. H. Myers, Charles Richet, Fred. H. Van Eeden, R. Hodgson, J. H. Hyslop, William James, Gustav T. Fechner, Frederick Bligh Bond, Hans Driesch, and others. They have arrived at the conclusion that 'intelligences are at work and manifest themselves to the living.

Are these extraneous intelligences the discarnate souls of persons who formerly lived on earth? The 'spirits' frequently make this claim in spiritistic seances and adduce evidence in support of their claim. That these intelligences are discarnate human souls is the central dogma of the religious cult of spiritism (spiritualism). In evaluating this main doctrine of spiritism as *empirical evidence for the survival of the human soul after death*, we must bear the following facts in mind.

First, the spiritistic practices of the ordinary seance room, as honest observers admit, are permeated by *fraud* and *trickery*. Since even the best of the famous mediums

have occasionally been caught in the perpetration of fraud, the entire evidence of spiritism is of doubtful validity.

Second, the chief objection against the spiritistic hypothesis lies in the impossibility of establishing *spirit identity*. To be acceptable, spiritism must prove beyond reasonable doubt that the communicating intelligence is really identical with the soul of a former person. Though claims of identity are frequently made by the 'spirits,' and though investigators have done everything possible to establish identity, indubitable and conclusive evidence of spirit identity has never been proved in a single case even under most favorable conditions. Ignorance and deception on the part of the 'spirits' have frustrated every attempt to establish identity. The case of Stainton-Moses, one of the best mediums, is illuminating. His principal spirit controls gave their names as 'Imperator,' 'Rector,' and 'Doctor.' Before he died, Stainton-Moses obtained the supposedly real earth names of his controls and communicated these names to a single living person, F. W. H. Myers. After his death, a 'spirit' communicating through Mrs. Piper, another famous medium, claimed to be the soul of Stainton-Moses. It was suggested to the alleged spirit of Stainton-Moses that he reveal the three names given by him before his death to Myers, in order to establish an indubitable case of identity. After considerable delay and evasion, the control revealed three names. Not one of them had the least resemblance to the original names given by Stainton-Moses to Myers. Myers himself attempted to establish identity in his own case. Shortly before his death he gave a sealed message to Sir Oliver Lodge. Lodge placed the sealed letter in a bank

vault. Soon after Myers' death, messages were received from all parts of the world, purporting to come from the spirit of Myers. After a few months, the message of Myers was taken from the vault and opened in the presence of official witnesses. None of the communications sent in bore the remotest resemblance to Myers' original message. The test ended in dismal failure, as did every other test ever made.

Whatever may be the nature of the intelligences operating in seances, we must conclude that spiritism does not furnish empirical proof of the survival of the human soul after death. The arguments for survival still rest, so far as philosophy is concerned, on the rational grounds adduced by speculative reason.

Immortality of the Soul

So far we have shown that man's soul will actually survive the death of the human organism and pass over to a new life after death. How long will this life of the soul last? Will it eventually come to an end? Will it last forever? Is the soul immortal?

By *immortality* is meant *endless duration of life*. The soul has a beginning to its existence, because it is created. Must it also have an end to its existence in the future life? If not, then it is immortal. Of itself, the human soul, since it is a spiritual and therefore a naturally incorruptible and indestructible essence, *can* live forever. Absolutely speaking, God *could* terminate its existence through annihilation. Consequently, the question resolves itself into

this: *Will* God annihilate the soul at some point in the future or leave it exist forever? The philosopher must attempt to answer this question, not by an appeal to Christian revelation, but on the grounds of reason. On the *grounds of reason* alone, we must draw the following conclusion:

THE SOUL WILL LIVE WITHOUT END; IT IS IMMORTAL.

Every individual living being seeks existence according to its nature. In beings endowed with knowledge, this seeking of existence and its preservation takes the form of a *natural desire* of the appetency, because knowledge precedes and produces desire. When something is known to be a 'good,' it is desired as such; and existence and its preservation is such a 'good.' The brutes apprehend existence and its preservation as a here-and-now 'good' and strive for it in that manner; their natural desire for existence and its preservation does not range beyond the present moment into the future. The intellect, however, apprehends *existence as such*. Existence conceived in this manner is simply pure duration extending endlessly into the future without limitations of time and space. The intellect, furthermore, apprehends this endless existence as a supremely valuable and desirable 'good.' The human will, then, following the lead of the intellect, naturally desires this endless existence, because it is the nature of the will to desire what the intellect proposes to it as a 'good' eminently suited to man's being and life. This desire for endless existence, therefore, flows from the very nature of man; it is a *natural desire*, the result of man's rational constitution.

Such a natural desire cannot be futile, because God does not create a futile thing; but it would be futile, if it were incapable of realization.

Hence, this desire for endless existence is capable of realization and will be realized.

Another important point. Man has a *craving for perfect happiness*. This craving is universal and irresistible. It is *universal*. The craving for perfect happiness is the root of all man's striving; it underlies all the tendencies and urges of sensuous and rational appetency. It is at the bottom of the desire for power, for wealth, for honor, for pleasure, for comfort, for achievement, for sex love, for all the efforts expended in domestic and civil society. Art and science, industry and commerce, international rivalry and treaties, war and peace, morality and religion — all are inextricably tied up with man's insatiable craving for happiness. It begins with the infant's cry for food, endures through the years of youth and mature age, and flickers in the centenarian's feeble clutch at the thinning thread of life. Wherever man goes and whatever he does, everything in his being is an expression of this craving. And this craving for happiness is *irresistible*. It is not a matter of free choice on the part of man's free will. The will *must* desire what is proposed by the intellect as a perfect 'good,' and perfect happiness is such a 'good.' To strive for the realization of perfect happiness is simply the dictate of the *nature* of rational appetency. No human person can rid himself of this craving. It is only with a 'good' of limited value that man has freedom of choice; in its striving for perfect happiness the will is determined by the law of inexorable necessity.

Deliberate violation of the moral law and blasphemous disrespect toward God may seem in opposition to this principle; nevertheless, a person exhibiting such conduct prizes his own will more than that of the Supreme Being and thinks he can find happiness in this kind of self-assertion and pride, notwithstanding the punishment which may follow. Even the act of suicide of a frustrated person is nothing else than an attempted escape from misery for the sake of a negative happiness in death and in possible extinction. The universality and irresistibility of man's craving for perfect happiness can only be explained on the supposition that it is a part of man's nature.

Such a *natural* craving, universal and irresistible in character, demands that the perfect happiness, toward which it is directed, *exist and be attainable*; and this happiness must be of *endless* duration. Why? For various reasons.

Contrary to the contentions of materialists and extreme mechanists, we live in a *rational teleological world*. This world is a world of order, not of irrational chance. Even the atom is a miniature world of orderly arrangement. The biological sciences, in particular, disclose more and more the marvelous reciprocal relationship which exists between organic structure and function and between the organism and its environment. When a biologist discovers an organ in a living being of any kind, it is a foregone conclusion that this organ has a definite function to perform in the cycle of the organism's life. He is so certain of this fact that he sets himself the task to find out the purpose and object of this function and the conditions under which it operates. If he

discovers a 'rudimentary organ,' which now seems useless, he immediately draws the conclusion that this rudimentary organ either had a specific function in the past history of the organism or that it is in the evolutionary stage of becoming a useful organ in the future. He never judges such an organ to be an accidental, useless excrescence on the organic body. In fact, the existence of rudimentary organs is one of the main arguments used as proof for the theory of evolution.

Applying this principle of universal teleology or purposiveness to man's desire for endless existence and craving for perfect happiness, it is obvious that man must be *able to attain* endless existence and perfect happiness. Should man, the highest and noblest creature in the universe, alone be frustrated in his nature? If the digestive apparatus has the natural aptitude to assimilate food and actually does assimilate it, and if the nervous system has the natural aptitude to receive sense impressions and does actually receive them, then the human soul, since it has the natural aptitude for endless existence and perfect happiness, must be capable of actually attaining immortality and perfect happiness. Otherwise the constitution of his nature would be meaningless, and the natural tendencies of his innermost being would be purposeless. It is contrary to reason to suppose that the universal purposiveness of the world would reach its highest peak in man and then suddenly stop and end in a contradiction.

Again, God is the *Creator of all beings* through an act either of direct or derivative creation. He gave to each being its specific nature with all its powers and tendencies.

Since God is infinitely *wise*, He would not have given man a soul which is naturally indestructible and therefore immortal, without making it also possible for his soul actually to be immortal. Nor would He have placed in the soul of man the irresistible craving for perfect happiness, if He never intended to place this perfect happiness within his grasp. God is also infinitely *just*; but it does not seem consonant with infinite justice to give man a rational nature which is filled with an unquenchable desire for endless existence which will never be fulfilled and with an irresistible craving for perfect happiness which can never be attained. God's wisdom and justice, therefore, demand immortality for the human soul.

Finally, the very *concept of perfect happiness*, which man craves with every fiber of his being, demands immortality. Perfect happiness involves the complete realization and satisfaction of the natural tendencies of man's spiritual soul after death. Now, if this happiness were not endless in duration, one of *three possibilities* would of necessity occur. Either the soul, while living its new life after death, would be aware of the eventual termination of its happiness; or it would be unaware of its termination, in such a manner that its ignorance is invincible; or, its ignorance would not be invincible, so that it could arrive at a knowledge of the actual or probable termination of its happiness. In the first case, there could be no perfect happiness; the mere fact of being aware of its termination would haunt the soul during every moment of its existence, and so its happiness would never be perfect, because it knows it will lose it some time. In the second case, this

invincible ignorance would be an evil which precludes perfect happiness; besides, such an ignorance could only prevail under the unthinkable supposition that God would deliberately blind the soul to its real condition and permanently deceive it. In the third case, knowledge or doubt as to the actual or possible termination of its happiness would, as in the first case, destroy perfect happiness from the very beginning of its knowledge or doubt. Hence, the happiness of the soul in its life after death, in order to be perfect, would have to be endless in duration, or there is no possibility of perfect happiness at all. And yet, as we have shown, perfect happiness must not only be possible but actual. Consequently, this happiness must be endless in duration, and the soul must be able to enjoy it endlessly, knowing that it is endless. In other words, the soul is *immortal*.

The argument based on perfect happiness applies only to those who have followed the moral law and have died in the friendship and love of God, because they alone merit the eternal reward of perfect happiness. Whether those who have flouted the moral law and have died in wickedness should suffer an immortal life of punishment, is, viewed from a purely philosophical standpoint, not so clear. They certainly do not deserve eventual perfect happiness, because they have voluntarily separated themselves from the Author of perfect happiness. Since their death in wickedness is of their own choosing, it would be *reasonable* to conclude that God will leave them eternally in this state of wickedness and consequent punishment.

Some thinkers advance the doctrine of *metempsychosis*. Metempsychosis, or reincarnation, is the teaching that human souls at death transmigrate into another body or succession of bodies, whether of a brute or a man, for the purpose of purification or gradual perfection. If such were the truth, souls should remember the experiences of their former incarnation. The assertions of a few persons notwithstanding, man is not conscious that his soul has ever transmigrated from one body to another. Metempsychosis contains this grain of truth that the wicked must suffer punishment in the life to come; but the doctrine itself is without a shred of proof.

In as much as the soul of the wicked is naturally indestructible and immortal, the same as the soul of the just, reason is justified in assuming that it will also lead an immortal life, but in eternal separation from God. The thought is terrifying indeed. We must, however, bear in mind that God gives all men the same nature, with the same fundamental powers and tendencies, with the same calling for endless perfect happiness, and with the same opportunities to work out their destiny. The *destiny of all man*, as intended by the Creator, is *immortality with perfect happiness*. If the just fulfill this intended destiny, it is because, through free choice, they loved God and observed His moral law; if the unjust fail to fulfill this intended destiny, it is because, also through free choice, they ignored God and deliberately violated His moral law. Whatever befalls them in the life to come, the blame is theirs and theirs only. So much is certain: God cannot be ignored or offended with impunity. The sanctions of the moral law

would become ineffective, if man could persistently disregard the moral law and yet attain perfect happiness or annihilation after a while.

We must, therefore, conclude that the soul after the death of the organism will enter upon an endless life. The soul of man, then, is truly immortal.

The Restoration of Man

What about the human body (matter)? Should not the *whole man* (body and soul, matter and form) be the bearer of immortal life in the world to come? Why should it be necessary for man to pass through the grim tragedy of death before entering upon immortal life? *Why death at all?* Is not the soul alone an incomplete substance in the new life, so that it is a sort of truncated being deprived of its natural counterpart, and would not this condition entail an *incomplete happiness*, at least on the part of the just who have fulfilled their natural destiny? These are pertinent questions.

We will consider the last question first. It is true that the soul alone is an incomplete substance and that the body is its natural counterpart. *Here on earth* the soul is destined to be the substantial form and animating principle of the body. The body, united substantially with the soul into one nature, has the natural purpose of being the *bridge of communication* between the spirit of man and the physical world; it supplies the sensory materials necessary for the formation of intellectual knowledge. As such, therefore, it acts very much in the nature of an 'instrument' for the

spiritual soul. It could very well be that the body is no longer required in the new life of the soul's immortality. If this is the correct view, the soul would have *two forms of natural existence*, one with the body in its earthly life and the other without the body in its immortal life after death. In that case, the soul would not be a truncated being after death, nor would its happiness be incomplete: This solution, however, does not seem to be rationally satisfying. After all, man is by nature an *organism* of which the body is an integral substantial part. But then again, why death at all? Philosophy stands here before an apparent contradiction or at least before a mystery.

Christian faith gives a solution. Mankind in its present situation is a *fallen race*. It has sinned, and sin has tainted man's nature. Man's intellect is darkened, his will is weakened, and the flesh is in rebellion against the spirit; the result is ignorance in spiritual matters, difficulty in observing the moral law, and proclivity toward sensual excesses. And 'the wages of sin is death.' Even the just, in the vast majority of instances, shrink from death. There should have been no death; death and organic dissolution is a punishment for sin. The human organism, however, will eventually be restored, for there will be a *resurrection of the body*, and the body will again be *reunited to the soul*. The body had its share in the performance of virtue and in the practice of vice, so it also shall share in the happiness of the just and in the misery of the wicked in the life to come. Philosophy, basing its conclusion on the findings of reason alone, can neither prove nor disprove this doctrine. The doctrine, however, explains many things in the life of the

individual and in the history of the human race which are very obscure and puzzling. As for the final restoration of the total man in the resurrection of the body some time after death, it is in eminent accord with the *logic of nature and reason*. Since the soul is by its very nature the substantial form or entelechy of the body, it has the natural exigency to be united to the matter of which it is intended to be the form. Hence, a final restoration of 'the whole man' is at least probable. We must, from the standpoint of philosophy and psychology, leave it rest at that.

AND SO WE COME TO THE END.

Psychology is the philosophical study of life of the whole man.

Man's body consists of physical elements, but these elements are compounded together into a living being, an organism. This organism consists of various types of structures. Some of these structures perform functions relating to nutrition and reproduction; man is a 'vegetant' being. Other structures perform functions relating to sensory perception; man is a 'sentient' being. Over and above these functions, man has the 'rational' activities of intellect and free will. Man is a *single vegetant-sentient-rational substance*, an integral organism, a unitary nature. Vital activity demands a vital principle, an animating substantial form, a soul. Man, therefore, is a single substance composed of matter and form, *body and soul*. This soul of man is spiritual and simple and comes into existence through an act of divine creation. The whole man

belongs to the physical, the social, the religious, and the moral order — a veritable microcosm. Man must die, but his soul is created for immortality.

Man has a *glorious destiny*. God did not make man to live for a few years on this spinning planet and then doom him to death and extinction. The life on this earth is only a period of probation. Here man must become worthy of the perfect happiness which is intended for him in the endless existence of an immortal life. C. P. Bruehl has expressed this thought beautifully: “On account of the unlimited reach of his rational power, the object to give man perfect happiness must itself be limitless. It must be the fullness of truth, goodness, beauty, and every conceivable perfection. This is God, who is the plenitude of being. In Him unalloyed happiness can be found. It will be found in communion and fellowship with the Supreme Being, who is not impersonal but a personal Self and will be to us Father and Friend. With Him and all the good, man will live in a blessed community in which eternal harmony prevails and into which no disturbing shadow can fall, because it is centered on Him who is the source of all good, infinite, changeless, and everlasting. Perfect happiness will be ours when God, for whom we are made, becomes for us all in all.”³

Summary of Chapter XXIII

God gave a purpose to man's being; the fulfillment of that purpose is man's *destiny*.

1. *The Rhythm of Growth*. Biologically and mentally, man passes through a number of *natural periods* in his development: prenatal life and childhood; adolescence; middle age; gradual decline after about forty-five or fifty years; the last phase, old age, after about sixty years until death. Mental maturity is slower than biological maturity.

2. *Man and the World*. The earth is man's home and workshop. Geographical conditions exert a profound influence on man's body and mind. Man is the pivotal point, the representative, the interpreter, and the crown of the universe.

3. *Man and Other Minds*. Man contacts other minds through the medium of language.

4. *Man and Society*. Man is an integral member of the community of men, of *society*. He has the natural *aptitude*, propensity, and *need* for a permanent union and companionship with his fellowmen in three great natural societies: domestic society, civil society, and religious society.

5. *Man and Domestic Society*. The fountainhead of social life is marriage. Marriage develops into the *family* which is the basic unit of human society.

6. *Man and Civil Society*. The *state* is the extension of the family. The essential purpose of the state is the common weal of all individuals, families, and communities.

7. *Man and Religious Society.* Man is also by nature a *religious* being, because he owes everything he is and has to his Creator. As an individual and as a member of society, he has the obligation of worship.

8. *Man and Morality.* Human conduct is characterized by the quality of *right* and *wrong*. Man has the obligation to do what is good and avoid what is wrong. Morality is a law imposed on man by his own rational nature as its proximate ground and in the *will of God* as its ultimate ground. *Conscience* is an act of reason which interprets the moral law and demands obedience to the law. The end and goal of the moral law for the individual is the perfection of the 'whole man, and this perfection entails *happiness*. In order that the moral law be effective, God must have attached sanctions to it, i.e., reward and punishment.

9. *Survival After Death.* Death may occur either through dissolution or annihilation. Man is not annihilated in death, because the corpse with its material elements remains after death. Does the *soul* survive the death of the human organism?

Survival is *possible*. In virtue of its essence, the soul is not subject to dissolution, because it is a *spiritual* and *simple* substance. It need not pass out of existence in virtue of its *relation to the body*, because it is intrinsically independent of matter.

Survival is *certain*. It has been a *universal conviction* of mankind that the soul survives the death of the body; such a conviction must be a necessary truth, the natural expression of man's rational intellect. This conviction is based on the *moral nature* of man. The sanctions of the

moral law do not find their fulfillment in this life; hence, the moral sanctions must be applied in a life after death. Survival is necessary, particularly in the case where man gives his life in the performance of duty. God, who is infinitely just, would not permit such devotion to go unrewarded; there must, therefore, be a life for the soul after the death of the organism. Besides, the *essence* of a thing bespeaks its purpose of existence. Since the soul was made by God as naturally indestructible, it must live after death.

10. *Spiritism and Survival*. Spiritism makes the claim to have furnished empirical proof of the continued existence of the human soul after death. There are two main objections against this claim. For one thing, the *fraud* and *trickery* which permeates spiritistic practices makes the evidence doubtful. Furthermore, all attempts to establish *spirit identity* have ended in failure.

11. *Immortality of the Soul*. Man has the *natural desire* for an endless duration of life, because the intellect apprehends 'existence as such' which is *pure duration*. Such a natural desire cannot be futile. Man also has a *craving for perfect happiness*, and this craving is universal and irresistible; as such it is the dictate of the nature of rational appetency, and perfect happiness must therefore exist and be attainable. Perfect happiness, however, demands immortality.

The world is a rational, *teleological* world in which every natural power has its proper function. Man's natural desire for endless existence and perfect happiness must, therefore, be capable of fulfillment. God is infinitely *wise*

and *just*; hence, lie would not implant in man's nature such a desire and craving, if He did not intend that it should be fulfilled. The very *concept* of perfect happiness demands immortality, because it would not be 'perfect' if it were not endless in duration. Consequently, the soul of man is immortal.

12. *The Restoration of Man*. It is in eminent accord with the logic of nature and reason that there will be a resurrection of the body, so that the 'whole man' will eventually be restored.

GLOSSARY

Note: In the case of qualified words, look for the word or noun qualified. For example: in looking for *Scientific Psychology*, see *Psychology, Scientific*.

ABIOTENESIS. The origination of life from nonliving matter, through forces which are indigenous to matter; spontaneous generation.

ABSTRACTION. The intellectual process in which, through an act of selective attention, we leave out of consideration one or more aspects of a complex total object so as to attend to some other aspect or aspects of this object.

ABSTRACTION, GENERALIZING. That form of abstraction in which we separate mentally, through an act of selective attention, items which are common to a number of individual objects from those items in which these objects differ and then arrange the objects having the common items into a class as a unit.

ABSTRACTION, ISOLATING. That form of abstraction in which we mentally separate, through selective attention, a particular feature from the subject in which it exists.

ACTION, REFLEX. An act performed automatically and involuntarily, as a response to a stimulus, by a partial mechanism of the nervous system.

ACTUALITY, THEORY OF. The theory that the mind is the sum-total of psychical events, there being no permanent mind or Ego as the carrier of these mental states.

AFTERIMAGES. Sensations occurring after the stimuli causing them have ceased.

ANABOLISM. The synthesis of living protoplasm by which nutritive materials are absorbed and changed into the living substance of the cell.

ANIMISM, VITALISTIC. The vitalistic, holistic theory which maintains that every organism consists of two ultimate constitutive substantial principles, matter and the vital principle (soul), which are united into a complete substance and nature.

ANNIHILATION. The reduction of the total being to complete nothingness.

ANTI-CONSOLIDATION. The theory of retroactive inhibition which maintains that intense mental activity of any kind, following a period of learning, hinders the original memory traces from going through their normal phase of consolidation.

APPETENCY. The tendency of one thing toward another.

APPETENCY, CONCUPISCIBLE. The propensity to enjoy a good.

APPETENCY, IRASCIBLE. The propensity to fight an evil.

APPETENCY, RATIONAL. The will.

APPETENCY, SENSUOUS. The power in virtue of which a sentient being tends toward a consciously apprehended

sensuous good and away from a consciously apprehended sensuous evil.

ASSIMILATION. See Anabolism.

ASSOCIATION. The reproduction of related phantasms.

ASSOCIATION, LAWS OF. The principles which condition the reproduction of a related set of phantasms.

ASSOCIATIONISM. The theory that simple ideas are derived from the senses and that mental development proceeds entirely and exclusively through the combination of sensory elements according to the Laws of Association.

ATTENTION: The direction of the cognitive process toward an object, an activity, or a thought.

AUTOMATISM, AMBULATORY. See Fugue, Amnestic.

BEHAVIORISM. The doctrine that psychology should restrict itself exclusively to observations and concepts relating to behavior.

CEREBRUM. The large brain which is the final enlargement and amplification of the Spinal cord and brain stem.

CLAIRVOYANCE. The extra-sensory perception of objective events.

COCONSCIOUS. Any actual subconscious idea or thought process unknown to the human subject in his ordinary waking state.

COCONSCIOUSNESS. That form of consciousness which is characterized by any actual subconscious idea or thought process unknown to the human subject in his ordinary waking state.

COLOR BLINDNESS. The partial or total inability to distinguish or recognize chromatic colors.

COLOR CONTRAST. The difference in the appearance of colors brought about by the stimulation of adjacent sets of rods and cones in the retina.

CONSCIOUSNESS. A state of the mind in which we are aware of our experiences.

CONSCIOUSNESS, SENSORY. The awareness of sensations and of the sense qualities present in the sensations.

CONSCIOUSNESS, SUBLIMINAL. See Subconsciousness.

CONSCIOUSNESS, SUPRALIMINAL. Normal waking consciousness. See Consciousness.

CONTROL, VOLUNTARY. The control which the will exercises over the powers and actions of the human organism.

CREATION, DERIVATIVE. See Creation, Mediate.

CREATION, DIRECT. The production of a new reality in its total being from nothingness, so that no pre-existing entity contributes anything at all to the making of the new reality except the Creator and His creative power.

CREATION, MEDIATE. The spontaneous emergence of life from non-living matter in virtue of an inherent tendency placed in matter from the beginning by the Creator.

CRITICISM, TRANSCENDENTAL. The theory of Kant and his followers that the universality and necessity of scientific knowledge is derived from certain a priori forms innate to the human mind.

DEDUCTION. The legitimate inference from the more general to the less general, from a law or principle to a particular instance falling under the law or principle.

DELUSION. A mental disorder which manifests itself in a misinterpretation of the general state of affairs, characterized by a false belief or judgment regarding the self.

DEPERSONALIZATION. An abnormal state of consciousness in which a person experiences a profound change in his own personality, so that his own actions, thoughts, and emotions appear to be those of an automaton or to belong to a totally different person.

DEREALIZATION. An abnormal state of consciousness in which a person suffers from a disturbance of perception, so that the objects of the world have a sensory appearance quite different from that in his normal experience.

DESIRE. The longing aroused by the conscious representation of an absent good.

DETERMINISM. In the problem of free will, the doctrine that the will is determined by the antecedent psychical and physical conditions and causes to act as it does.

DEUTERANOPIA. Green blindness.

DICHROMATISM. Partial color blindness.

DISASSIMILATION. See Katabolism.

DISSOCIATION. The splitting of the consciousness into disunited parts.

DOUBLE-ASPECT THEORY. The theory that the physical and the psychical are merely two aspects of one and the same ultimate reality.

ECTOPLASM. A hypothetical psychic substance, derived from the body of the medium and supposedly used by spirits in the phenomena of materialization.

EGO, EMPIRICAL. The self or Ego as observed at any present moment in a here-and-now experience.

EGO, HISTORICAL. The self or Ego of an individual as he perceives it through memory of his life's experiences from the present down through the past.

EGO, METAPHYSICAL. The self or Ego considered in its constitution and nature.

EIDETIC. A person capable of producing eidetic imagery. See Imagery, Eidetic.

EIDETIKER. See Eidetic.

ELAN VITAL. Original life force.

EMERGENCE, ABSOLUTE. See Abiogenesis.

EMERGENCE, RELATIVE. See Creation, Mediate.

EMERGENCE, RESTRICTED. See Creation, Mediate.

EMOTION. An affective mental state of the animal organism, following the cognition of an object or situation, characterized by strong feeling, by an impulse to action, and by physiological changes in bodily function.

EMPIRICISM. In the problem of the perception of visual space, it is the theory which claims that our perceptions of space are entirely and exclusively a matter of experiential education; opposed to 'nativism.'

EMPIRICISM. The doctrine that all human knowledge is derived from the data of particular states of consciousness, so that experience is the exclusive source and criterion of all knowledge.

ENTELECHY. In Driesch's vitalistic holism, the formative agent, non-spatial and supra-material, which is responsible for the structural organization of matter in the organism; it is an operational principle. In Aristotle's vitalistic holism, it is the substantial form or soul which unites with primary matter to constitute the unitary substance of the organic body; it is primarily an entitative principle.

EPIPHENOMENALISM. The theory that consciousness is an accompaniment or by-product of neural processes, determined by them but exerting no influence upon them, so that it is but an 'epiphenomenon' of matter, matter being the real phenomenon.

EVIL. The unsuitability of something for a natural tendency or appetency; the privation of a required good.

EVOLUTION, EMERGENT. The theory that nature is the product of evolution in such a manner that entirely new and unpredictable properties originate through synthesis and thereby form new and higher levels of reality.

EVOLUTION, ORGANIC. The theory according to which the various species and types of animals and plants derive their origin, not through distinct and separate creative acts of God, but through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws.

EVOLUTION, PURPOSIVE. The doctrine that the Supreme Intelligence (God) endowed nature with a purpose and with the necessary principles of action to realize this purpose through evolution.

FEELING. An elementary affective state characterized by pleasantness or unpleasantness.

FIXITY. THEORY OF. See Permanence, Theory of.

FORM, SUBSTANTIAL. The determining principle which, by uniting with the matter which it actuates, constitutes a complete substance of a definite species.

FREE WILL. The ability of the will, all conditions for action being present, to decide whether to act or not act and whether to act in this manner or in that manner.

FREEDOM. In the widest sense, the absence of external coercion or restraint which hinders an appetency from expressing itself in external action; in the strict sense, the absence of intrinsic necessity or determination in the performance of an act.

FREEDOM OF CHOICE. See Freedom of Indifference.

FREEDOM OF CONTRADICTION. See Freedom of Exercise.

FREEDOM OF CONTRARIETY. The freedom of the will to choose between a moral good and a moral evil.

FREEDOM OF EXERCISE. The freedom of the will between acting and not acting; freedom of contradiction.

FREEDOM OF INDIFFERENCE. The freedom of the will in so far as it is subjectively indifferent in the presence of conflicting motives; freedom of choice.

FREEDOM OF SPECIFICATION. The freedom of the will to choose between one object and another object and therefore also between one act of the will and another act of the will.

FUGUE, AMNESTIC. An abnormal state of consciousness consisting in a somewhat protracted condition

characterized by wandering and other abnormal actions, followed by considerable loss of memory concerning this particular period.

FUNCTIONALISM. The doctrine which considers the mental processes as the functions of the organism in its adaptation to, and control of, environment.

GAMETE. Sex or germ cell; spermatozoon and ovum.

GENERATION, SPONTANEOUS. See Abiogenesis.

GENERATIONISM. See Traducianism.

GESTALT. Form, shape, configuration; as used in psychology, it is the theory that there are wholes, the behavior of which is not determined by that of their individual elements, but where the part-processes are themselves determined by the intrinsic nature of the whole.

GESTALTISM. The psychological theory of Gestalt. See Gestalt.

GOOD. That which is suitable in Some manner for the striving subject.

GOOD, ABSOLUTE. Anything suitable to a being itself, irrespective of other beings.

GOOD, APPARENT. Something which is judged to be good for a being, but which actually is not good for it.

GOOD, DELECTABLE. A relative good which gives pleasure and enjoyment to another.

GOOD, DISINTERESTED. Any good considered merely as giving perfection, irrespective of any pleasure derived through its acquisition or from its possession.

GOOD, MORAL. A thing or act which has everything demanded of it by the moral law.

GOOD, OBJECTIVE. Anything that is a good in itself.

GOOD, ONTOLOGICAL. What is good in its very entity or reality.

GOOD, PHYSICAL. A good that satisfies the demand of the nature of a being.

GOOD, REAL. Something which is judged to be a good for a being, and which actually is good for that particular being.

GOOD, RELATIVE. Anything suitable to another being.

GOOD, SUBJECTIVE. The actual possession of an objective good.

GOOD, USEFUL. A relative good which is desired as a means to acquire perfection or pleasure.

GOODNESS. The suitability of a thing to a natural tendency or appetency.

HALLUCINATION. An abnormal mental state in which a person has subjective perceptual experiences which lack relevant stimuli.

HEARING. The sense by which the vibrations of certain media acting upon the ear become known as sounds.

HOLISM. The 'totality-theory' which considers the organic body to be primarily an organized unit, an integrated whole, and this unit or whole is more than the mere addition and summation of its constituent parts.

HYLOMORPHISM, ARISTOTELIAN-SCHOLASTIC. The theory that the unitary substance of the organic body is composed ultimately of two incomplete substances or substantial part-principles, namely, primordial matter and the vital principle (substantial form, soul).

HYLOZOISM. The theory that all atoms of matter originally possess life.

HYPNOSIS. A trance-like nervous condition resembling sleep, induced by the suggestions and (or) manipulations of the operator ('hypnotist'), the hypnotized subject remaining in mental communication ('rapport') with the operator and responsive to his suggestions.

HYPNOTISM. See Hypnosis.

IDEA. The intellectual representation of a thing.

IDEALISM. In general, the doctrine which holds that the being of things is conditioned by their being known; consciousness is constitutive of its objects; the being of sensible things is simply their being sensed, and their true characters are their sensed characters; the world we know is the world of our perceptual content; the mind cannot transcend its own internal, conscious states.

IDENTITY-THEORY. The theory that the physical and the psychical are at bottom identical realities.

IDEOGENY. The formation or genesis of ideas.

IMAGE, EXPRESSED INTELLIGIBLE. The essential elements of a thing, abstracted from the phantasm by the agent intellect, gathered together by the potential intellect into a definition or abstract representation; the 'idea' or 'concept' of a thing.

IMAGE, EXPRESSED SENSIBLE. The completed sensory cognitional image representing the sensed thing in the sentient subject; phantasm, formed by the synthetic sense.

IMAGE, FORMAL INTELLIGIBLE. See Image, Expressed Intelligible.

IMAGE, FORMAL SENSIBLE. See Image, Expressed Sensible.

IMAGE, IMPRESSED INTELLIGIBLE. The cognitional image of a thing, abstracted from the phantasm by the agent intellect, which is the vital determination of the intellect to the act of understanding, to the intellectual perception of the quiddity of the thing represented in the phantasm.

IMAGE, IMPRESSED SENSIBLE, In the genesis of ideas, the sensation arousing the synthetic sense into action by its presence; the rudimentary cognitional image of the sensations.

IMAGERY, EIDETIC. Images of unusual clarity and vividness which are faithful reproductions of the original sensory experiences.

IMAGINATION. The power to form mental images or phantasms of perceived objects, together with the ability to reproduce these images or phantasms even in the absence of the perceived objects.

IMAGINATION, CONSERVATORY. The imagination in so far as it conserves the images or phantasms of previous sensations and perceptions.

IMAGINATION, CONSTRUCTIVE. The imagination, in so far as it has the power to unite phantasms which, in this particular combination, have never been experienced by the subject.

IMAGINATION, REPRODUCTIVE. The imagination, in so far as it has the power of forming phantasms of objects and events which have been previously perceived.

IMMATERIALITY. See Spirituality.

IMMORTALITY. Endless duration of life.

INDETERMINISM. See Libertarianism.

INDUCTION. The legitimate inference of universal laws from individual cases.

INFERENCE. A reasoning process in which, from truths known, we conclude to a truth previously unknown.

INHIBITION, RETROACTIVE. The tendency of mental activity to impair the recall of memorized material, if this activity is placed between the time of learning and the time of recall.

INNATISM. As a theory of the nature of instinct, the doctrine that the intrinsic factors of instinct are inherited and therefore innate; not learned, at least not fundamentally and ultimately, by experience.

INSTINCT. An innate disposition which determines the organism to perceive (to pay attention to) any object of a certain class, and to experience in its presence a certain emotional excitement and an impulse to action which find expression in a specific mode of behavior in relation to that object.

INTELLECT, AGENT. The power or capability which actively modifies itself so as to represent within itself in an abstract manner what is concretely represented in the phantasm.

INTELLECT, POTENTIAL. The power or capacity to express the essence of the represented thing in an 'idea' or 'concept.'

INTELLECTION. Rational cognition.

INTELLIGENCE, ANIMAL. The capacity to improve upon native tendency in the light of past experience.

INTERFERENCE, OR TRANSFER. The theory of retroactive inhibition which maintains that the original and interpolated activities intermingle, so that the two sets of memory traces become a single mixed set with subsequent confusion of recall results, or that the traces of the original material are used with the traces of the interpolated material and become modified thereby.

INTROSPECTION. The method of studying mental phenomena by means of the internal observation of experience on the part of the individual person.

IRRITABILITY. The property of living matter of responding to changes in the environment (such changes are called 'stimuli') by change in shape, production or cessation of movement, or other activities of their organs or parts.

JUDGMENT. The pronouncement of agreement or disagreement between two ideas.

KARTOKINESIS. See Mitosis.

KATABOLISM. The destruction of protoplasmic material in the course of vital processes.

LIBERTARIANISM. In the problem of free will, the doctrine that the will, no matter what the strength of the conflicting motives or the nature of the antecedent external and internal conditions may be, is not determined to act by necessity.

LIBIDO. In psychoanalysis, the instinct of Eros or sexuality.

LIFE. Immanent action.

MAGNETISM, ANIMAL. An obsolete name for hypnosis. See Hypnosis.

MATERIALISM. In general, the doctrine which finds the ultimate solution of all phenomena, physical and psychical, in the nature and activity of universal matter or force.

MATTER, PRIMARY. An incomplete corporeal substance, undetermined but determinable, capable of receiving any kind of substantial form.

MATURATION DIVISION. The cell division characteristic of gametes, preparatory to fertilization.

MECHANISM, BIOLOGICAL. Mechanism, i.e., atomism, as applied to organic nature.

MEMORY. The power to recall past objects and states of consciousness and recognize them as having been present in former experiences.

MENTALISM. The theory that nothing exists but the spiritual mind.

MERISM. The doctrine that the organic body is nothing more than an aggregate resulting from the additive summation of cells, chromosomes, and genes; the latter, in turn, are mere aggregates of molecules, atoms, electrons, etc.

MESMERISM. See Hypnosis.

METABOLISM. The processes in plant and animal cells involved in the construction and destruction of living tissue during the course of the activities of life.

METEMPSYCHOSIS. The teaching that human souls at death transmigrate into another body or succession of

bodies.

MICROMERISM See Merism.

MIND. The conscious knowing subject or the conscious knowing part of the subject.

MIND-DUST THEORY. The theory that an atom of consciousness or mind is attached to every atom of matter in the universe, both developing together in the evolution of beings.

MITOSIS. The biological process of cell division.

MONADISM. The theory that all beings consist ultimately of monads.

MONISM. The doctrine which seeks to deduce all the varied phenomena of both the physical and spiritual worlds from a single principle which is in a continuous state of evolution; specifically, the metaphysical doctrine which holds that there is but one substance, either mind (idealism), or matter (materialism), or a neutral substance that is neither mind nor matter but is the substantial ground of both.

MONOCHEOMATISM. Total color blindness.

MOTIVATION. The arousal of the will from a state of inaction into a state of action.

MOTIVE. An appreciated value realizable through an act of volition.

NATIVISM. In the problem of the perception of visual space, it is the theory which claims that our perceptions of space are the result of a native or constitutional property of vision itself, independent of learning and interpretation; opposed to 'empiricism.'

NECESSITARIANISM. See Determinism.

NEOVITALISM. The vitalistic theory of organic bodies which maintains that the vital energies are subject to the general law of the conservation of energy.

NERVE SYSTEM, AUTONOMIC. That part of the peripheral nervous system regulating responses not directly under voluntary control.

NERVES, AFFERENT. Sensory nerves.

NERVES, EFFERENT. Motor nerves.

NEURON. A nerve cell, with all its processes.

NEUROSIS. A functional mental disorder.

OCCASIONALISM. The theory that God, on the occasion of certain conditions, produces activity in His creatures, although the creatures, to all appearances, produce this activity themselves.

ONTOLOGISM. The theory that God and the divine Ideas are the primary object of the human intellect, and the first act of the intellect is the intuition of God.

ORGANICISM. The theory of holism. See Holism.

ORGANISM. Biologically, an individual constituted to carry on the activities of life by means of parts or organs more or less separate in function but mutually dependent. Considered philosophically, a substance consisting of matter animated by a vital principle.

ORGANIZATION. Biologically, the characteristic of living bodies possessing organs or structural parts distinct from one another, each of which has a specific function to perform.

PAN-EGOISM. The doctrine which identifies all reality with the universal consciousness or Ego.

PAN-PHENOMENALISM. The doctrine which holds that the human mind can know nothing but the phenomena or appearances of things.

PAN-PSYCHISM. The theory that everything existing is fundamentally psychic or mental in nature.

PANTHEISM. The theory that God is everything that exists.

PARALLELISM, PSYCHO-PHYSICAL. The doctrine which holds that the psychical and physical are but a manifold of interrelated occurrences, running parallel to one another without mutual influence.

PARAPSYCHOLOGY. The psychology of extra-normal phenomena, for instance, of extra-sensory perception.

PERCEPTION. The cognizing of the object which produces sensation.

PERCEPTION, EXTRA-SENSORY. A perception obtained through channels other than those of the known senses.

PERMANENCE, THEORY OF. The theory which maintains the stability of organic species, acknowledging only minor variations within the framework of the specific type; opposed to organic evolution of species.

PERSON. An individual, complete, subsistent, rational (intellectual) substance.

PERSONALITY, SPLIT. An abnormal condition of mental dissociation in which the same human mind manifests alternately two or more very different characters or personalities.

PHASE, REFRACTORY. The period of recuperation of an activated nerve during which it resists stimulation.

PRESENCE, DEFINITIVE. As applied to the soul, it is the presence of the soul in the body in virtue of which the soul exercises its life-giving power ubiquitously in the whole body and in every living part of it.

PROTANOPIA. Red blindness.

PSYCHIATRY. That branch of medical science which treats of mental disorders.

PSYCHOANALYSIS. A method devised and developed by Sigmund Freud for the examination of the contents and mechanisms of an individual's mind, for the purpose of treating and curing mental disorders.

PSYCHOLOGY. Literally, the science of the soul. Some define it as the science of the mind; or, as the science of consciousness or of the conscious states; or, as the philosophy of organic life; or, as the philosophy of the nature of man.

PSYCHOLOGY, EMPIRICAL. See Psychology, Scientific.

PSYCHOLOGY, EXPERIMENTAL. See Psychology, Scientific.

PSYCHOLOGY, PHILOSOPHICAL. The philosophic science of the life of the human organism.

PSYCHOLOGY, RATIONAL. See Psychology, Philosophical.

PSYCHOLOGY, SCIENTIFIC. A department of knowledge which seeks to discover all facts pertinent to mental phenomena by means of observation and experiment, to describe these facts in their proper order, and to establish the general laws according to which these facts occur.

PSYCHOMETRY. Clairvoyant knowledge of facts concerning an object or its possessor through contact with, or proximity to, the object.

PSYCHO-PHYSICS. That branch of psychology which studies the relations between mental and physical processes by investigating the response to stimuli and the perception of physical magnitudes.

PSYCHO-VITALISM. The vitalistic theory of organic bodies which maintains that the vital forces existing in every type of organism are conscious, psychic factors.

RAPPORT. In hypnosis, a mental alertness in the hypnotized subject toward the suggestions given by the operator.

REASON. The power of the mind which perceives the truth and validity of derived ideas, judgments, and principles on the basis of indirect and mediate evidence.

REASON, PARTICULAR. See Sense, Cogitative.

RECALL. The mental reproduction of a former stimulus or experience.

RECEPTOR. A cell or group of cells which function in the reception of stimuli; a sense organ.

RECOGNITION. The apprehension of the sameness of two representations or perceptions, one present and one past. Remembrance.

REFLEX. See Action, Reflex.

REFLEX, CONDITIONED. The reflex response of a neural mechanism to a stimulus which has been substituted for the natural stimulus normally evoking this particular reflex action.

REFRACTORY PHASE. See Phase, Refractory.

REMEMBRANCE. See Recognition.

REMINISCENCE. The spontaneous and gradual improvement of memory with a subsequent higher score in recall, without a relearning or rehearsal of the memorized material.

REPRODUCTION. Biologically, the process by means of which cells produce new cells and plants and animals produce new plants and animals of the same kind.

SANCTION. A reward given for the observance of a law and the punishment meted out for the violation of a law.

SELF-CONSCIOUSNESS. It is man's consciousness of his self or Ego as the subject and bearer of all the conditions and states affecting his being, particularly of consciousness itself.

SENSATION. A conscious experience aroused by the stimulation of an organ of sense.

SENSATIONALISM. The doctrine which assumes that all human knowledge originates solely in sensation and that all intellectual cognitions are ultimately nothing more than complex and elaborated products of sense impressions and their reproduced images.

SENSE. A specialized mechanism or function by virtue of which an animal organism is receptive and responsive to a certain class of physical stimuli, resulting in knowledge of some sort.

SENSE, CENTRAL. The mental power to consciously perceive, distinguish, and synthesize the objects and operations of the presently active external senses; synthetic sense.

SENSE, COGITATIVE. Man's perception of the useful or harmful character of particular things not merely in a purely sensory fashion, but also by means of a collation of ideas. Particular reason.

SENSE, COMMON. See Sense, Central.

SENSE, CUTANEOUS. A sense located in the skin region. Pressure, pain, warmth, and cold are experienced by the cutaneous or skin senses. See Senses, Somethetic.

SENSE, EQUILIBRIUM. See Sense, Static.

SENSE, ESTIMATIVE. The brute animal's sensory appreciation or estimation of the concrete usefulness or harmfulness of a perceived object with reference to the animal's organism or to the species.

SENSE, EXTEROCEPTIVE. A sense which is activated by stimuli originating outside the organism. The exteroceptive senses are sight, hearing, taste, smell, and the cutaneous senses of pain, pressure, cold, and warmth.

SENSE, INTEROCEPTIVE. A sense which is activated by stimuli originating within the viscera and within the vestibule of the internal ear. The interoceptive senses are the intraorganic visceral and static senses.

SENSE, KINESTHETIC. The sense which mediates sensations of the position and of the active and passive movements of the bodily members in relation to one another. See Senses, Somesthetic.

SENSE, LABTEINTHINE. See Sense, Static.

SENSE, PROPRIOCEPTIVE. A sense activated by stimuli originating within the organism by movement or tension in its own tissues; the kinesthetic sense.

SENSE, SKIN. See Sense, Cutaneous.

SENSE, STATIC. A sense, the end organs of which lie in the internal ear and are stimulated by the pull of gravity and by head movements. See Senses, Somesthetic.

SENSE, SYNTHETIC. See Sense, Central.

SENSE, TEMPERATURE. The sense or senses responding to stimuli with the sensation of warmth or cold. See Senses, Somesthetic.

SENSE, VESTIBULAR. See Sense, Static.

SENSE, VISCERAL. A sense which is activated by stimuli originating in the viscera. See Senses, Somesthetic.

SENSES, INTRAORGANIC. The somesthetic senses which are activated by stimuli originating within the organism. The kinesthetic, visceral, and static senses belong to this group. See Senses, Somesthetic.

SENSES, SOMEESTHETIC. What is generally referred to as the sense of 'touch'; they comprise the intraorganic kinesthetic, visceral, and static senses, and also the cutaneous senses of pain, pressure, cold, and warmth.

SIGHT. The sense, whose end organ is the eye, which is responsive to the stimuli of radiant energy or light.

SIMPLICITY. That positive property in virtue of which the essence of a being is not composed of distinct and distinguishable parts or principles.

SMELL. The sense by which certain properties of bodies (called their smell, odor, or scent) become known through the stimulation of receptors responsive to chemical substances in a gaseous form or to minute particles which reach them normally from a distance and in low concentration.

SOCIETY. A permanent union of a number of persons in fellowship and co-operation for a common purpose of benefit to all.

SOMNAMBULISM. Sleepwalking; in hypnosis, the production of action on the part of the hypnotized subject through images derived from the suggestion of the operator.

SPECIES, EXPRESSED INTELLIGIBLE. See Image, Expressed Intelligible.

SPECIES, EXPRESSED SENSIBLE. See Image, Expressed Sensible.

SPECIES, IMPRESSED INTELLIGIBLE. See Image, Impressed Intelligible.

SPECIES, IMPRESSED SENSIBLE. See Image, Impressed Sensible.

SPIRITISM. The belief that departed spirits communicate with the living by means of physical and psychical phenomena, commonly manifested through a medium.

SPIRITUALITY. The property in virtue of which a being is neither composed of matter nor intrinsically dependent on matter; immateriality.

STRUCTURALISM. The theory that all thought processes can be reduced to sensations, so that the sensation is the 'structural unit or element' of everything occurring in consciousness.

SUBCONSCIOUS. Certain mental items and processes which are apparently of the same nature as the normally conscious items and processes, yet of which the subject is not aware in the waking state.

SUBCONSCIOUSNESS. That part of consciousness which is, figuratively speaking, 'beneath the threshold' of the normal waking consciousness.

SUGGESTION, POST-HYPNOTIC. A suggestion given during hypnosis, but to be carried out by the subject after hypnosis has been terminated.

TASTE. The sense by which certain qualities (taste, savor, flavor) of soluble substances become known by contact with a particular set of epithelial end organs (taste buds) located mainly in the papillae of the tongue.

TELEPATHY. The extra-sensory perception of subjective events, i.e., the knowledge of objects or occurrences obtained from another mind in an extra-sensory manner.

TENDENCY, DETERMINING. A postulated psychic force which, acting subconsciously, proceeds from a resolution and carries out the task to a correct conclusion, notwithstanding the fact that the former resolution is forgotten.

THOUGHT, IMAGELESS. The theory that an idea can occur without a perceptible image being present.

TOUCH, SENSE OF. See Senses, Somesthetic.

TRADUCIANISM. The theory which explains the origin of the individual human soul as the product of parental generation; generationism.

TRANSFER. A theory of retroactive inhibition. See Interference.

TRICHROMATISM. The ability to perceive the three primary colors equally well.

TRITANOPIA. Blue-yellow blindness.

TROPISM. The involuntary movement of an organism or any of its parts, involving turning or curvature and axial orientation, and induced either automatically or in response to one or more stimulating influences.

UNCONSCIOUSNESS. The absence of consciousness.

UNDERSTANDING. The power of the mind which perceives the truth and validity of ideas and principles on the basis of direct and immediate evidence.

UNIT, KINETIC. The neuro-muscular co-ordination of a number of nerves and muscles in an intricate series of part movements.

VALUE. That which is perfect or perfective.

VISION, ACHROMATIC. Vision of neutral (achromatic) colors, namely, of white, black, and intermediate grays.

VISION, CHROMATIC. The vision of chromatic colors, namely, of the colors of the spectrum.

VITALISM. The theory which demands something distinctly vital in the organism, over and above the physico-chemical forces, in order to account for the structural and functional unity of the organism as a whole.

VITALISM, OLD. The vitalistic theory of organic bodies which ascribes the phenomena of life to some kind of immaterial vital force.

VOLITION. Rational appetite.

VOLITION, DELIBERATE. Volition which results in consequence of a deliberation over the respective merits of particular values.

VOLITION, NATURAL. Volition which must follow the apprehension of a perfect good.

WILL. The rational appetency or the power to strive for an intellectually perceived good and to shun an intellectually perceived evil.

PREFACE

EVERYONE is aware of the distinction between right and wrong, between what is morally good and morally bad. The distinction is made by people every day, in the home and in the school, in business and labor, in courts and police actions, in politics and in government. And yet, the attitude of many persons toward human conduct is largely amoral.

Tradition and training direct conduct toward correct living. However, due to the separation of religion and education, the rising generation lacks the foundation of true morality. Actions are frequently good, but a knowledge of principles is often missing.

Since the belief in revelation and Christianity has become weakened in the minds and wills of so many persons, they know intuitively 'that' some actions are morally good and others morally bad, but they are not sure 'why' they are so. It is therefore necessary to reaffirm the principles which underlie morality. Natural morality is the foundation and bulwark of supernatural morality, just as nature is the substructure of grace. Even the Christian must base his moral life to a great extent on conscience and natural law.

Ethics, or moral philosophy, seeks to lay bare the natural foundations of correct living, to uncover the principles which govern morality and make individual actions to be right or Wrong, and thus develop the science of right conduct. In view of the secularistic trend in modern institutions of learning, a thorough knowledge of ethical principles and their applications is imperative. Incompetence here would be a calamity. Not rationalism or liberalism, but ethics based on eternal and natural law, is the safe guide for human conduct in personal and international affairs.

Rationalism set up the principle that human reason is supreme and independent. Liberalism accepted this principle and proclaimed the supremacy and independence of man as a law unto himself, so that man is free from every type of law except the law which proceeds from his own will. The result was the ethical system of 'independent morality.' It was but logical that liberalism would eventually terminate in the vicious doctrine of nazi, fascist, and communistic dictatorship which recognizes no law but that of superior force and is expressed in the immoral formula that 'might is right.' Instead of becoming free, man became the slave of the political state and its ruthless leaders; and untold misery engulfed the world as a consequence.

Ethics, as here presented, is a department of philosophy. As such, this book is primarily intended as a textbook for the college undergraduate. In accordance with this purpose, the style is essentially non-technical, because it was felt that this method is best suited to the mentality of the student. The presentation adopted has proved workable

in the colleges and universities where the other books of the series are used. It is also hoped that the book will furnish profitable instruction for others, especially for professional people who are confronted by ethical problems in their daily occupation. Once they are certain of the principles, the application of the principles to particular situations should not be too difficult.

The students of today will be the leaders of tomorrow. Their ideals must be grounded on a solid ethical foundation. Loose thinking on the great moral issues of the times will inevitably lead to confusion in action, and confusion in action will be disastrous both for the individual and for society. The salvation of the individual and of society depends vitally on a correct system of ethics. Pagan and Christian, Jew and Gentile — all are in need of sound ethical principles if mankind is to escape moral chaos and final dissolution.

PART I

GENERAL ETHICS

Chapter 1

NOTION AND SCOPE OF ETHICS

MAN, BECAUSE HE IS RATIONAL, IS A MORAL BEING. WHETHER learned or ignorant, civilized or savage, rich or poor, isolated or in social relations, man feels constrained to guide his conduct by rules and codes which are, no matter how primitive and confused, distinctly moral in character.

The entire recorded history of mankind can be viewed as a history of morals, because moral factors have always played a prominent part in the rise and fall of nations. That moral considerations have swayed the conduct of individuals and nations in the international upheaval of our recent world wars is apparent. The widespread discussion of the guilt of aggressor nations and of the morality of the use of bombs on cities and civilians is an instance. The establishment of the organization of the United Nations, which attempts to define and regulate the rights and duties of individuals and nations, is another. Civilization is permeated with moral problems and principles.

All people, then, live according to a more or less definite code of right and wrong. To determine the ultimate basis upon which their isolated moral actions rest, one must delve beneath the surface of these actions. The science

which results from such an investigation is the *science of ethics*.

The Meaning of Ethics

The word 'ethics' is derived from the Greek word *ἠθική*, which in turn has its origin, as Aristotle¹ points out, in *ἔθος* (habit, custom). The word 'moral' comes from the Latin word *mores* (customs). By 'customs' one usually understands usages, practices, standards, and codes which are common to certain groups or classes of people and which regulate their actions in social and religious affairs. In so far as such customs contain laws governing actions with regard to their 'rightness' or 'wrongness,' they are 'ethical' or 'moral'; otherwise they are of a purely social nature.

The *basis* of ethics (morals) is the *rightness* or *wrongness* of human conduct. Almost all ethicists, no matter to what particular school of thought they belong, agree on this. A random selection of definitions of ethics, as proposed by various authors, brings this point out clearly. Here are some. James Seth: "Ethics, or Moral Philosophy, is the Philosophy of Morality or Conduct"; J. H. Muirhead: " . . . the science of moral character"; Ella L. Cabot: " . . . the science of right-choosing and well-doing"; John S. MacKenzie: " it considers the actions of human beings with reference to their rightness or wrongness, their tendency to good or to evil"; Joseph Rickaby: " . . . the science of human acts in their bearing on human happiness and human duty"; S. Alexander: the proper business of ethics is

the study of moral judgments . . . which express approval or disapproval of certain kinds of human conduct”; John Dewey and James H. Tufts: the science that deals with conduct, in so far as this is considered as right or wrong, good or bad”; D. Card. Mercier: it deals with the order to be realized in the free acts of the will.” The wording differs, but the general meaning is much the same.

An analysis of these views and definitions shows that ethics is considered by all to be a science which deals with human conduct from the standpoint of ‘good’ or ‘bad,’ ‘right’ or ‘wrong.’

Ethics — A Philosophical Science

Ethics is a department of philosophy. Many authors simply designate ethics as ‘moral philosophy.’ *Philosophy* is defined *as the science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason alone.*

When it is stated, therefore, that ethics is a department of philosophy, we mean that it treats of human conduct in its ultimate reasons, causes, and principles, so far as is possible by the aid of human reason alone, according to the definition just given. Consequently, ethics properly is called *moral philosophy* or the *philosophy of morals*. In this respect ethics takes its place among the other departments of philosophy, namely, logic, epistemology, ontology, cosmology, psychology, and theodicy.

There are two types of philosophy, just as there are two types of science in general: speculative and practical. A ‘speculative’ science is any science whose fundamental

purpose is the acquisition of *knowledge as such*; it seeks to discover the truth about objects for the sake of knowing the truth. The objects themselves are given, and the mind endeavors to conform itself to them by knowing as many facts about them as it is able to ascertain; in a speculative science, therefore, the mind is concerned with the 'being' of objects and wants to know 'what they are.' A 'practical' science, although it is also concerned about the truth of things, seeks to discover the rules and norms which determine how an object 'ought to be' in order to be correct; its fundamental purpose, therefore, is the knowledge of the principles of regulation which govern the correctness of certain acts in accordance with definite rules and norms. Among the philosophical sciences, cosmology, for instance, attempts to penetrate to the ultimate reasons, causes, and principles of the universe at large and of the essential constitution of the bodies which compose the universe; cosmology is a speculative science. Logic, on the other hand, analyzes the various functions of the human intellect and expounds the rules and norms which the intellect follows and ought to follow in order to think correctly at all times; logic is a practical science.

Like logic, *ethics is a practical science*. It investigates human conduct from the standpoint of 'rightness' and 'wrongness' and searches for the rules and norms which must regulate this conduct, so that man may know how to lead a life which is good and right. Since the practical sciences treat of 'norms of action,' they also are designated 'normative' sciences. Ethics, then, is numbered among the *normative*, not the speculative, sciences.

Furthermore, ethics does not merely show how the will must regulate itself, if man desires to lead a good life; it also points out and demonstrates the *duty* of man to order his life in such a way that it will conform to the principles of proper conduct. The intellect, of course, has as its purpose in ethical study to discover the 'truths' which underlie morality, but it does not labor for its own benefit, merely seeking knowledge for the sake of knowledge; rather, the intellect labors in the service of the will, placing all its information at the disposal of the will, so that man may know definitely what he 'ought to do' and act accordingly. And since intellect and will are the highest powers of man, in virtue of which he is a rational being, superior to all other beings in the visible universe, ethics or moral philosophy is the pre-eminent practical science.

We are now in a position to define ethics. *Ethics is the philosophical science of human conduct in so far as conduct is viewed as good or bad, right or wrong.* Every science has a material and a formal object with which it occupies itself. The 'material' object of a science is the general subject matter which it treats in its investigation; usually this material object is common to two or more sciences. The *material* object of ethics is the conduct of man — the acts controlled by his will. The 'formal' object of a science is that specific aspect of the general subject matter which is taken as the proper object of this particular science and which distinguishes this science from all others. The *formal* object of ethics is the 'rightness' and 'wrongness,' the 'goodness' and 'badness,' of human conduct. This aspect, or viewpoint, is characteristic of ethics

and is not found in any other science. Ethics, therefore, is a science in its own right, distinct from all others.

At the present juncture, the definition of ethics as a philosophical science of human conduct is, of course, an unproved statement. The entire subsequent treatise will have to show whether ethics is really a true 'science' and whether it actually succeeds in explaining moral conduct in its 'ultimate reasons, causes, and principles.' But a preliminary definition of this kind is necessary, because only in this manner will the student of moral conduct know what ethics is supposed to be and to treat. As a matter of fact, ethics as a philosophical study of conduct has been carried on since the days of Plato and Aristotle and has verified the above definition to the fullest extent. The definition, therefore, can be accepted safely as true.

The Scope of Ethics

It is the general *scope* of ethics to outline the main facts of moral conduct, investigate their implications, examine the grounds of the 'oughtness' or necessity which underlie them, and expound the rules and norms to which conduct must conform in order that it may be designated 'right' and 'good.'

Ethics is a *science* and as such seeks to discover the 'truth' about these things, for the purpose of every science is to discover 'truth.' The knowledge acquired through the study of ethics will never, of its own accord and by itself, 'make' a person good; knowledge alone cannot compel the will to do good and avoid evil. But this knowledge will

furnish the principles which can be applied to conduct, so that man will be able to form correct judgments about what is right or wrong, good or bad; in other words, ethics 'shows the way' to right living, just as a road sign indicates the right road to travel. The decision to follow or not follow such directions will always be left to the individual's choice.

The scope of ethics does *not* consist in giving a mere *history* of moral judgments and customs. Such a history can only pose the problems, but offers no solutions. Ethics, to be of any practical value, must strive to find the solution; in doing this, it becomes a 'moral philosophy' in the true sense of the word. The history of morals is important for the science of ethics, but it must not be identified with ethics itself.

Some are of the opinion that ethics is primarily the 'art of right conduct.' An art, however, is a facility or skill acquired through practice. The art of right conduct, therefore, is the facility or skill of doing good and avoiding evil derived from persistently following the rules and methods necessary for destroying evil habits and acquiring good habits. The person using the art of right conduct already possesses a knowledge of what is right and wrong and knows why it is necessary to do the right and avoid the wrong. But the art itself does not supply this prerequisite knowledge. The art of right conduct tells a person 'how' something should be done, but not 'why' it should be done. Ethics lays the foundation of the art of right conduct by supplying the necessary information concerning the distinction between right and wrong and the reasons upon which this distinction is based. Ethics is like a book which

explains the rules of the game of football and the reasons for the rules and also expounds the fundamental principles and tactics of the game; the art of playing the game, however, must be learned by continued practice on the gridiron itself. Ethics treats of the truths and principles which underlie the art of right conduct; the art of right conduct is the application of these truths and principles to the actual conditions of life in all their concrete details.

The Facts

Ethics begins by accepting certain *unquestionable facts*. These facts are the *moral convictions* prevalent in mankind, no matter what our ultimate verdict may be as to their worth and truth.

Each individual's experience is witness to the fact of moral convictions. And since all persons have the same or similar experience, this experience is practically that of all men.

All people make a distinction between the *physical conditions* of life, such as health and disease, and the morality of acts and things, such as are involved in the quality of 'good' and 'bad,' 'right' and 'wrong.' True, people speak of a 'good' and a 'bad' heart, etc. But they use the words in an entirely different sense when they speak of virtues and vices, such as honesty and dishonesty. With reference to physical conditions, the terms 'good' and 'bad' denote proper or improper function; with reference to morality, a course of action to be approved or condemned. The distinction is paramount. Furthermore, all people have

the conviction that the *morally good should be done and the morally evil should be avoided*. They may act in opposition to this standard, but they are convinced that the standard 'should be' observed as a norm of conduct in themselves and in others. Self-interest may prompt them at times to excuse their own wrong action, but they usually are quick in condemning the same action in others.

People are convinced also that there are such things as *rights* and *duties*. Each individual feels that he has certain inherent rights which others have the duty to respect. Prominent among these rights are the right to life, liberty, and the pursuit of happiness, the right to the ownership and use of property, the right to defend oneself against unjust aggression and interference, the right to obtain the sustenance necessary for the maintenance of life, and the right to enter marriage and raise a family. In marriage, husband and wife have corresponding rights and duties toward themselves and their children. Children have rights and duties toward their parents and among themselves. Definite rights and duties pertain to individuals as members of a community, clan, tribe, or state. Violation of these rights is called 'wrong'; performance of these duties, 'good.' Rights and duties have a 'moral' character.

Many of these rights and duties are crystallized in the *customs* of groups and nations. As a general rule, people make a clear distinction between 'social' and 'moral' customs. The violation of social custom involves an impropriety of some sort, but not moral turpitude. Most of the customs of etiquette are of a social, not moral, nature; they should be observed, if one wishes to be a gentleman or

lady, but there is no moral obligation to observe them. To eat peas with a knife may be bad etiquette, but it is not morally bad to do so; to use a knife to stab someone in a brawl is a morally reprehensible act. We fought not' eat peas with a knife and we 'ought not' stab another in a brawl, but everyone is convinced that the instances of 'ought not' in the two cases are poles apart so far as morality is concerned. Customs themselves often are judged to be morally good or morally bad. The mere conformity, therefore, of some course of action with a certain custom does not exempt it, in the estimation of upright persons, from the demands of good morals.

Every individual experiences within himself the *dictates of conscience*. Conscience makes us aware that certain actions should be performed because they are right, and others should be avoided because they are wrong. We experience a sense of satisfaction and self-approval if we do what we believe is right, and a sense of guilt and self-condemnation if we do what we believe is wrong. And this feeling is present, irrespective of the approval or disapproval of others. Social effects and personal prestige make no difference; even when actions are strictly internal or private, we experience the feeling of righteousness or guilt. Conscience does not always give commands and make demands. It differentiates between 'indifferent' and 'moral' acts. Under ordinary circumstances, our conscience, for example, will consider it to be indifferent whether we indulge in a smoke and select this or that particular brand of tobacco; but if our health is such that a competent physician has forbidden us this type of indulgence as a

serious matter, then our conscience will upbraid us for any infraction of his orders. It is the steadfast conviction of people who mean well that conscience and its dictates must always be obeyed.

History is also a witness to the fact of moral convictions among men in all ages.

Contracts between individuals and organizations and treaties between governments and nations always have been considered sacred obligations. Their stipulations bind the contracting parties under the conditions laid down in the contract or treaty, both as to the matter and the time. To violate a contract or treaty always has been held as criminal. All tribes and nations have courts to uphold rights and punish infringements of the law. All tribes and nations have codes and laws which regulate the rights and duties of its citizens. Law enforcement is universal in some form or other. It is the uniform conviction of people all over the world and at all times that these and similar obligations are not left to the arbitrary discretion of individuals and communities but are matters which are necessary and binding; in other words, these obligations 'should' be met and discharged and 'should not' be side-stepped or violated.

Such are, in rough outline, some of the main facts which reveal the conviction of mankind that a moral order should and actually does prevail. One could multiply individual instances by the thousands, but this brief enumeration of facts will suffice to show that certain human acts are affected by morality. *Morality* is that quality or property of human acts in virtue of which they are termed 'right' or

‘wrong,’ ‘good’ or ‘bad.’ It is evident from the attitude of people toward certain acts, that they consider these acts to possess this quality or property of morality.

At present we are merely concerned with the general *fact of the conviction* of men that morality exists and with particular sets of facts which manifest this conviction. These facts cannot be denied, and they form the material for the study of ethics as a science. Whether this conviction is justified or not, is precisely the issue which will have to be settled in the course of ethical study.

Postulates

All sciences rest upon certain postulates. A postulate is not an unwarranted assumption or hypothesis. A scientific *postulate* is a proposition which is either self-evident, or which is taken over without proof by one science from another science because it has been proved by this other science. Hence, such a postulate need not be proved or it already has been proved. For example, the astronomer presupposes the validity and truth of mathematics in his own science of astronomy and feels no need first to prove the principles of mathematics before he applies them to the movements of the stars; the principles of mathematics thus become postulates of the science of astronomy.

ETHICS ALSO HAS ITS POSTULATES.

If the scientific inquiry of ethics is to have a start at all, we must begin by assuming the trustworthiness of human

reason. This assumption is not arbitrary and gratuitous, but is based on the undeniable and self-evident ground that without it no science of ethics is possible. Consequently, we must accept the postulate: *Human reason is a reliable and trustworthy source and instrument of true and certain knowledge.*

Theodicy is that department of philosophy which treats of the existence, nature, attributes, and government of God. It is not within the province of ethics to prove the existence of God as the Creator and Supreme Ruler of all things. The moral philosopher is justified in *assuming*, without explicit proof on his part, that God exists, that He is a Person and the Supreme Being, infinitely intelligent and powerful and good and just, regulating all things through His benign Providence. Whoever wishes to assure himself of these truths should consult a textbook on theodicy.

The ethicist thus assumes the postulate: *God exists and is infinitely intelligent, good, and just.* God, as postulated here, is not the impersonal god of the pantheists, in a constant process of development in and with and through nature. Nor is He the god of the deists, who consider Him to be so transcendent that He takes no interest in human affairs and in men as individuals. We accept God as the Supreme Being who is indeed extramundane (i.e., who exists beyond the visible universe as its Creator), but who is an infinitely intelligent Person with an interest in all things pertaining to man and his conduct.

Man is man, and as such he is superior to the plant and brute, because he has a rational soul. The rational soul possesses two supreme powers, *intellect* and *will*. By means

of his intellect man forms abstract ideas, judgments, and logical inferences. By means of his will man is capable of striving for every type of good, because his intellect can propose every type of good, material and spiritual.

The *freedom of the will* is man's greatest prerogative, but also his greatest hazard. Psychology proves the freedom of man's will. Our own conscious experience is witness to it. 'Freedom' here means the absence of intrinsic necessity or determination in the performance of an act.

The psychological postulate can be formulated as follows: Man is a rational organism composed of matter and a spiritual soul united into a unitary nature, endowed with intellect and free will. This postulate is extremely important, particularly the item of man's free will. Without free will there can be no responsibility for our acts, no obligation to do good and avoid evil, no meaning to approval or disapproval of conduct, guilt or righteousness, reward or punishment, virtue or vice. We accept this postulate. In doing so, we are not making an unwarranted assumption, because the postulate is founded on the positive findings of sound psychology. The ethicist is entitled to accept these fundamental truths as a postulate, because he cannot be expected to incorporate the entire science of psychology into the science of ethics.

Sources and Method

The main source for ethical knowledge is the body of definite and certain *principles of reason* which man finds, upon reflection and analysis, to be self-evidently true.

The child, after reaching the age of discretion, soon perceives the existence of certain *moral principles* as governing conduct. A child has an acute consciousness of 'mine' and 'thine,' of guilt and innocence, of justice and injustice, of fairness and unfairness in treatment. A child, for example, resents being punished for something it did not do, because it realizes it does not deserve the punishment. The understanding of such fundamental moral principles becomes clear to the child early in life and remains with it for the rest of its days.

All normal people, whether civilized or uncivilized, develop the same mental processes of moral judgment, because all are endowed with the same nature and powers. The fundamental principles of morality are common to all persons. It is upon them that all moral conduct rests. Moral philosophy must take these and similar concepts, judgments, and principles, as given by human reason, and examine their ultimate validity.

Besides the principles of reason, *experience* and *history* are important secondary sources for ethical study. It is obvious that the ethicist often must consult his own experience and the experience of others in moral problems, because it is in his own conduct and in the conduct of others that morality manifests itself. Without the data of experience the study of ethics would lack concreteness and actuality, and the ethicist would run the serious risk of building up a science of imaginary events. The history of morals is also important as a source of information regarding the principles and codes of conduct prevalent among individuals and nations. Such a history reveals the

crystallized judgments of people concerning what is right and wrong in human conduct.

As regards the *method* to be employed by ethics in its investigation of moral phenomena, it must utilize both the data of *experience* and the *principles of reason*. Experience furnishes the facts of human conduct and most of the moral problems which perplex the human mind. Without these facts and problems of human conduct the ethician would have no subject matter to investigate and analyze. Hence, the method of ethics is to a great extent 'empirical.' Facts and problems alone, however, do not constitute a science. These facts and problems must be investigated in the light of certain, primary, and irrefutable principles of reason, so that the science of ethics will rest upon a solid foundation. Only through the application of rational principles to the specific cases of human conduct will it be possible to deduce laws and norms which must govern human conduct in general. And only in this manner can the ethician arrive at truths which can be arranged into the complete system which is 'science.' Hence, the method of ethics is also 'speculative' or 'rational.' It would be fatal to ethics to overemphasize or underemphasize either experience or the principles of reason. A proper balance between these two phases of the method of ethics will lead to sound conclusions.

Ethics and the Supernatural

Ethics, being a department of philosophy, must seek its solutions to moral problems through the aid of human

reason. This procedure is characteristic of philosophy as a science, and the ethicist must abide by it. As a consequence, divine revelation is excluded as a source of information for the moral philosopher. The ethicist must arrive at his conclusions through the application of rational principles to moral phenomena, without the explicit aid of revelation, by basing his deductions on the essential constitution and the natural powers of man as a human being.

However, divine revelation actually occurred, and the Christian philosopher accepts its teachings. These doctrines inform us that man has never been in a purely natural state. Man was created as a *super-naturalized* being, having been placed on a supernatural plane from the very beginning. Man has a super-natural destiny, and the Creator has given him supernatural aids (namely, grace) to realize this destiny. The fall of man from grace and the restitution of man to grace through the Redemption are tremendous facts which perforce alter our outlook on moral problems. There are many duties incumbent on man because of his supernatural state and destiny.

The science of ethics is a 'natural' science and thus is definitely *restricted* in its scope and purpose. The Christian philosopher leaves out of consideration ('prescinds from') the entire field of revealed truths that pertain to the supernatural moral order, though he accepts them on the grounds of faith. As a result of this limitation, philosophical ethics cannot possibly solve all moral problems. However, the supernatural presupposes the natural. The conclusions of ethics on the basis of man's nature will, therefore, be

legitimate, even though not complete. The student of moral problems must never forget, in the course of the subsequent discussions, that moral philosophy is a restricted science which cannot lay claim to being able to solve all the moral problems of life, particularly those in the field of the supernatural; the teachings of revelation also must be consulted, so that conduct will be ordered rightly in every respect. *Indirectly*, revelation will and should be a guide for the moral philosopher in the solution of ethical problems.

Division of Ethics

It is traditional to divide ethics into two main parts: *general* and *special*. 'General ethics' treats of the moral concepts, judgments, and principles which are basic to the entire moral order. These concepts, judgments, and principles must first be clarified and validated, so that a general doctrine of right conduct can be formulated. 'Special ethics' applies this general doctrine with its established principles to man in so far as his conduct is affected by the special duties which fall to his lot in the course of life.

Human life is a concrete reality, and its moral problems are not 'general' or 'special.' The ethicist, however, must treat the entire matter of morals in a gradual and methodical fashion. The division of ethics into 'general' and 'special' ethics is, therefore, merely a methodological device necessary for the orderly progress of investigation; otherwise there would be nothing but confusion of thought.

Summary of Chapter I

The notion and scope of ethics.

1. *The Meaning of Ethics.* Ethics is related to 'custom,' but must not be identified with it, because some customs are merely social in character. Ethics is considered by all to be a science which deals with human conduct from the standpoint of 'good' or 'bad,' 'right' or wrong.

2. *Ethics — a Philosophical Science.* Ethics is a department of philosophy, and philosophy is the science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason alone. Ethics, therefore, is philosophy applied to human conduct; it is 'moral philosophy.' Ethics is a *practical* science since it investigates conduct from the standpoint of 'rightness' and 'wrongness' and searches for the rules and norms which must regulate this conduct in practical life.

Ethics is defined as *the philosophical science of human conduct in so far as human conduct is viewed as good or bad, right or wrong.* Its 'material' object is the conduct of man, the acts controlled by the will. Its 'formal' object is the 'rightness' and 'wrongness,' the 'goodness' and 'badness,' of human conduct.

3. *The Scope of Ethics.* It is the general scope of ethics to outline the main facts of moral conduct, investigate their implications, examine the grounds of the 'oughtness,' or necessity, which underlie them, and expound the rules and norms to which conduct must conform in order that it may

be designated 'right' and 'good.' Ethics is *not* a mere *history* of morals, nor is it the *art* of right conduct.

4. *Facts*. Ethics begins by accepting the unquestionable facts of *moral convictions* prevalent in mankind, as evidenced by experience and history.

5. *Postulates*. A 'postulate' is a proposition which is either self-evident, or which is taken over without proof by one science from another, because it has been proved by this other science. Ethics, like all sciences, rests upon certain postulates.

The *epistemological postulate* of ethics reads: Human reason is a reliable and trustworthy source and instrument of true and certain knowledge.

The *theodicean postulate* reads: God exists and is infinitely intelligent, good, and just.

The *psychological postulate* reads: Man is a rational organism composed of matter and a spiritual soul united into a unitary nature, endowed with intellect and free will.

6. *Sources and Method*. The main source for ethics is the body of definite and certain *principles of reason* which man finds to be self-evidently true. Secondary sources are 'experience' and 'history.'

In its method ethics must utilize both the data of experience and the principles of reason; that is to say, ethical method must be both 'empirical' and 'speculative (rational).'

7. *Ethics and the Supernatural.* Ethics, being a philosophical science, must seek its solutions to moral problems through the aid of *human reason*. Divine revelation is, therefore, excluded as a source of information in ethics. Revelation, however, actually has occurred. Man leads a super-naturalized existence, and there are many duties incumbent on man because of his supernatural state and destiny. Since ethics is a natural science, it is *restricted* in its scope and purpose and cannot be expected to solve all moral problems of human life.

8. *Division.* *General* ethics treats of the moral concepts, judgments, and principles which are basic to the entire moral order. *Special* ethics applies this general doctrine with its established principles to man in his special duties.

Chapter 2

THE HUMAN ACT

WE KNOW A THING BY WHAT IT DOES. ACTION FOLLOWS THE nature of a thing. The nature gives rise to various powers, and the powers determine the acts. We do not perceive the inner nature of things, but we do perceive their acts. From the acts we conclude to the powers which perform the acts; and from the powers we conclude to the underlying nature. If the acts of a being are entirely and exclusively on a material plane, then we are justified in concluding that the powers are material powers, and the being's nature is a material nature; but if the acts are spiritual, then the powers must be spiritual, and we rightly conclude that the being's nature is also spiritual.

Since ethics is the normative science of human acts, an examination of the acts of the will is required. Thereby we will discover the nature of the *human act*.

The Will as Rational Appetency

Man is a rational animal and as such belongs to the genus 'animal.' As an animal the life of man is characterized by two phases: knowledge and appetency.

In sensory knowledge, physical objects act upon the senses, and the senses, in conjunction with the brain, react with sensations and perceptions. Thereby the properties of these objects, and through these properties the objects themselves, become known in a concrete sensory manner. Sense knowledge is one phase of the life of the animal organism. There is another phase, and it is equally important; it is *sensuous appetency*.

In its most general meaning, *appetency*, or appetite, is *the tendency of one thing toward another*. The term 'appetency' is a Latin derivative (*ad* and *petere*) meaning 'to strive for,' 'to seek for,' 'to tend toward,' something. The appetency present in the animal organism is a conscious appetency. It is termed 'conscious,' because the animal is aware of the object for which it strives; a dog, for instance, sees and smells a piece of meat and then seeks to make off with it and eat it. This conscious apprehension of the object is a deciding factor in the animal's striving for the object. The appetency of animals is the result of a spontaneous inclination following conscious apprehension. Knowledge and appetency always go together; knowledge comes first, and appetitive striving follows.

Man, being an animal organism, possesses sensuous appetency and strives for sensory objects. But man is also a *rational* animal. Over and above his senses he is endowed with a rational principle of knowledge, the intellect. Due to the higher nature of the intellect, man knows super-sensory objects, such as science, virtue, loyalty, honor, happiness, law, morality, duty, God. These are objects which do not and cannot affect the sense organs; hence, they are outside the

purview of sense knowledge and sense appetency, and for this reason brute animals do not and cannot desire them. Man, however, knows them through his intellectual apprehension and actually, at least in many instances, strives for them. And since we know a thing by what it does, man must also possess a rational appetency. Just as sensuous appetency follows sensory knowledge, so rational appetency follows the rational knowledge of the intellect. Man, therefore, possesses two kinds of knowledge and two kinds of appetency: sensory and intellectual knowledge, sensuous and *rational appetency*. Similar to sensuous appetency, man's rational appetency is the result of a spontaneous inclination following conscious intellectual apprehension.

Man's rational appetency is designated by a special name. It is called the will. The exercise of the will is termed 'volition.'

The Will and the Good

Whatever the type of appetency, whether sensuous or rational, that which moves it to action and is the object of its striving is the *good*. Something is said to be 'good' for a being when it is *suitable* in some manner for it. A being strives for an object because it satisfies some need, some demand, some exigency, some natural aptitude; such an object helps the striving being in some way or completes it in some fashion or gives it pleasure in some form or actualizes some potentiality of its nature or has the capacity to realize some end and purpose in it. In a word, a being

strives for something because it is an object apprehended as being 'suitable' or 'befitting' and in so far 'good' for it. The *well-being* of the striving subject itself is the all-embracing goal of its appetitive activities, because nothing is so basically good and suitable for an individual as its own nature.

Since an appetency seeks only what is 'suitable' and 'good,' no being ever seeks what it apprehends as harmful to itself. Every being *avoids what is harmful to its nature*, because it is unsuitable for the satisfaction of its needs and its well-being. If something harmful confronts the appetency, the being possessing this appetency either avoids it or fights it; no being ever consciously seeks it and strives for it.

Appetency, then, has *two phases*: the 'positive' phase, in which it consciously and actively seeks to attain what is suitable (good) to the nature of the striving subject; and the 'negative' phase, in which it consciously and actively seeks to avoid what is harmful (evil) to this nature.

In general, therefore, an appetency can be defined as a power in virtue of which a being tends toward a consciously apprehended good and away from a consciously apprehended evil. If this appetency is confined exclusively to the good as apprehended by the senses, it is a 'sensuous appetency'; but if it is directed toward the good which is apprehended by the rational power of the intellect, it is a 'rational appetency' or 'will.' Hence, the *will* is defined as *rational appetency or the power to strive for an intellectually perceived good and to shun an intellectually perceived evil*. Man, of course, has both types of appetency;

he has a sensuous appetency which follows the apprehension of his senses and a rational appetency (will) which follows the apprehension of his intellect.

By directing its attention to the images present in the senses, the intellect, through a process of abstraction,¹ acquires a knowledge of the physical world and its objects and passes judgment on these material objects as being 'good' or 'evil.' The intellect also acquires a knowledge of immaterial things, such as virtue, duty, blasphemy, and passes judgment on them as being 'good' or 'evil.' In consequence of this fact, the will can strive for goods of both the material and immaterial order, depending upon the judgment of the intellect as to their 'goodness.'

Whatever the will desires it must desire under the aspect of a 'good.' Only the good is desirable, and it is desirable only because it is suitable in some manner toward satisfying a need of the individual person who strives for it.

The Will and Evil

Evil is the antithesis of 'good.' *Evil* is the *unsuitability of something for a natural tendency or appetency*. It is not a positive thing, but it is not a mere absence of being. Sightlessness, for example, in a stone is not an evil, because a stone is not supposed to have sight. But sightlessness in man is an evil, and is called 'blindness,' because man is supposed to have sight. An evil, therefore, is the absence of a reality which ought to be present; it is a defect, a privation of reality — *the privation of a required good*.

The will cannot desire an *evil precisely as an evil*. The will is an appetency, and it is the essence of an appetency to strive for a thing so as to bring about a union between the striving person and the desired object; the purpose of this union is to benefit the person in some way. Now, if it were possible for the will to strive for the evil as such, it would by its very nature seek the harm and eventual destruction of the person. An appetency of this kind would be a useless, contradictory, and destructive tendency, existing in man as an integral part of his constitution; the creation of such a being, however, would be contrary to the wisdom of the Creator. As a matter of fact, every being tends to preserve and increase its own perfection and well-being; not to diminish or destroy it. The will naturally shuns the evil, just as it naturally desires the good.

The student may voice an objection to these statements and point to facts which seem to show plainly that man actually wills evil. Do not people willingly undergo painful operations? Are not many persons guilty of theft and robbery, although they know that such acts are morally evil? Is not suicide, the willful destruction of one's own life, a great evil, and is it not all too frequently committed? No one will deny these facts. However, just what do these persons strive for when committing such acts? Whoever undergoes an operation does not submit to the surgeon's knife in order to experience the sensation of severe pain; what such a person really wills is the good of restored general health which follows the operation. He who steals or robs hopes to acquire money or valuables which, in his estimation, are goods more worth while than the

observance of the law. Even the suicide strives only for the good, because he judges that death is the escape from misery or sickness or poverty or disgrace; he, too, desires to avoid a greater evil by choosing what is, in his opinion, a lesser evil, and thereby he really wills a relative good. Cases like these, therefore, actually prove the truth of the statement that the will always seeks what is good and shuns what is evil. *Directly*, the will desires only the good; *indirectly*, the will may desire an evil, namely, as a means toward acquiring a good of greater value.

No earthly beings are good in every respect for every other being under all circumstances. Something, for instance, may be a *physical* good for a being, but a *moral* evil. The intellect may concentrate its attention upon the physical good and minimize its aspect as a moral evil; it 'knows' that an act is morally evil, but judges the physical good to be preferable. Again, man's intellect is not infallible. It may mistake an *apparent* good for a *real* good. The will depends upon the judgment of the intellect. Although the will can command the intellect to give better attention to a problem and make a deeper study of the value of things, in all too many instances it follows the hurried judgment of the intellect, with the result that the will is liable to strive for the physical rather than the moral good, for the apparent rather than the real good.²

Acts of Man and Human Acts

Man possesses the spiritual powers of intellect and will. These powers are distinctly human properties.

Now, morality affects acts in so far as they are *controlled by the free will* of man. Only under that supposition can the will be held responsible for them, because only then can they be said to proceed from the will as from their cause.

It is obvious, however, that not all acts occurring in the human organism are under the control of the will. Innumerable chemical reactions take place in the human body; the intellect is unaware of them, and the will cannot control them. Man's body is subject to the common physical forces, as when a paratrooper jumps from a plane and immediately falls according to the law of gravity; his jump is under the control of the will, but the will can exert no influence in altering or nullifying the law of gravity upon the fall of his body once the jump is made. In man's vegetative life, the entire process of cell division, digestion, and growth is beyond the control of the will. Many acts of sensory life are not subject to the will; for instance, if a gun is fired in close proximity to the ear, the ear, provided one is not totally deaf, must register the sound of the shot. It may even happen that acts which are normally subject to the will are performed in such a manner that they are not attributable to the will; for example, a student, while totally absorbed in his work, may stroke his chin, run his fingers through his hair, bite the end of his pencil, cross his knees, and be altogether unaware of having performed such acts. Similarly, acts performed while unconscious or asleep, acts performed by children before they arrive at the age of discretion, acts performed during insanity or advanced senility — all such acts lie beyond the control and causality of the free will. They are grouped together under the

common name *acts of man*, but they are not what ethicists call 'human acts' in the strict sense of the term.

In the language of moral philosophy, a *human act* is an act which is performed by man precisely as man (*homo quâ homo*) and is defined as *an act proceeding from the deliberate free will of man*. That which distinguishes man from every other creature of the visible universe, that which makes him specifically 'human,' is his intellect and free will, because these powers belong to him and him alone and not to chemicals, plants, or brutes. Hence, only those acts are properly styled 'human acts' which proceed with the advertence and knowledge of the intellect and from the decision of the free will. Any other act will be merely an 'act of man.'

In order that an act be attributed to the will and the will be responsible for it, it must owe its being to the will as its *cause*; in other words, the will must *will it* as an effect. Since, however, the will is an appetitive power and not a faculty of knowledge, it can will only that which the intellect grasps and proposes to it for volition. Consequently, every act must be ascribed to the will as its cause which proceeds from the free will after due enlightenment by the intellect. Both the advertence of the intellect and the free decision of the will are necessary to make a truly 'human act.' That is why it is stated in the definition of the human act that it is 'an act proceeding from the *deliberate free* will of man.' If the act were not 'deliberate,' or if it were not 'free,' it would fall under the category of 'acts of man.'

While an 'act of man' (*actus hominis*) and a 'human act' (*actus humanus*) are, when viewed from the standpoint of

ethics, mutually exclusive, it should be fairly obvious that some 'acts of man' may become 'human acts,' and *vice versa*. As was mentioned above, a student may, in a condition of absent-mindedness, bite the end of his pencil; that is an act of man. He may, however, perform the same act with full knowledge and consent, so that he deliberately bites the end of his pencil; that is then a human act. The reverse is also true. A person may suffer from a rash and deliberately scratch the skin, so as to remove the itch; here the act of scratching is a human act because it proceeds from the deliberate free will. The same person, however, may perform the act of scratching while asleep; then the act is an act of man. It also should be obvious, though, that some acts can never be anything other than 'acts of man.' Such are, for instance, the acts performed in infancy and the operation of the organs in digestion; they are outside the control of the free will entirely and always. Other acts always must be 'human acts,' because they can never be performed except by the deliberate free will. Such are, for instance, the acts of choosing and the other internal acts which depend directly on the will.

Classification of Human Acts

There are *two main classes* of human acts, i.e., of acts which proceed from the deliberate free will as from their cause.

First, the rational will is the cause of *elicited* acts. Elicited acts are produced directly by the will itself, so that they are *begun* and *completed in the will* as their sole

agent. The acts of love and hate are such. This does not mean that love and hate cannot find expression in external acts of the body; they can and usually do. But love and hate themselves are internal acts which reside in the will as in their proper subject and are begun and completed in the will as their sole agent. For the same reason, a desire, considered purely as such, is an elicited act of the will.

Second, the rational will is the cause of *commanded* or *imperate* acts. These are acts which are begun in the will, but they are *completed through the medium of other powers or faculties* under the command and control of the will. In the case of commanded or imperate acts, the will is the main cause of the action, but it uses these other powers as instrumental causes in order to bring the action to completion. Some of these powers are 'internal,' such as intellect, memory, imagination; others 'external,' such as those of bodily members. An example. I 'intend' to deliver an address; this intention is an elicited act. In carrying out this intention, my will influences the intellect, memory, and imagination to collect and arrange the material of the address, and then I deliver the address by means of speech and gestures; both the internal and external powers of my organism acted under the command and control of my deliberate free will as their main cause of action.

In every series of actions of this nature, when executed externally, a number of elicited and commanded acts are involved, forming a set or unit. In such a series it is comparatively easy to distinguish between 'internal' and 'external' commanded acts; but beyond this no reasonable classification of commanded acts is possible, because they

are too manifold and diversified. The *elicited* acts of such a series, however, have a certain arrangement or sequence, so that they constitute what may be called the *psychological structure* of the will-act. The number and sequence of these elicited acts of the will are as follows:

First in order is the *wish* or *liking* (*velle*). Love is the basic tendency of the will; it underlies all the activities of the will as a rational appetency. After the intellect has approved something as good and proposed it as such to the will, the will experiences an inclination toward this good as something suitable and desirable. By 'wish' or 'liking' we understand this simple 'inclination toward' a recognized good. Oftentimes the will does not go beyond this simple stage, as when we say to ourselves: 'I wish the winter were over.

Next in order is the *intention* (*intentio*). The intention implies much more than a mere wish. Besides the mere 'love of,' and 'inclination toward,' a recognized good, the will by means of the intention does something about putting this recognized good within reach. In other words, the will definitely 'tends toward' the good. The wish now becomes an active striving of the will for the attainment of this particular good. The difference between 'wish' and 'intention' can be seen by comparing the statement, 'I wish I were South,' with the statement, 'I intend to go South.' The latter statement implies an active and effective desire to make the wish become an actuality.

Once the intention is present, the will proceeds to *consent* (*consensus*). By 'consent' is meant the decision of the will to use the means necessary for bringing the

intention into execution. If a variety of means are at hand, 'consent' implies that the will must be ready to use one or the other of the possible means which will produce the intended result. Thus, if I consent to go on a trip, I must also will to travel either by plane, train, automobile, boat, or by some other method suitable for the purpose. The reason is clear: he who wills an end, must also will the means to this end.

After consent comes *choice* (*electio*). Just what means are or are not available is a matter of knowledge, and knowledge pertains to the intellect. Hence, the will must consult the intellect concerning the proper means to carry the intention into effect. The intellect responds by making a comparison of the various means which might possibly be used and then 'counsels' the will as to what means are available. Thereupon the will makes its 'choice' of the means. If the intellect informs the will that but a single means can bring about the intended result, then 'consent' and 'choice' are one and the same. If, however, two or more possibilities are open, so that the intended result can be effected by more than a single means, then it is left to the 'choice' of the will to select one of the various means. Thus, if I discover that the only way to reach a certain place is by going on foot, then my choice must be to travel there by walking; but if I can reach the place either on foot or on horseback, and in no other manner, then I must make a definite choice between these two methods of travel. Here, too, the reason is clear: he who wills a definite end, must also choose a definite means to attain that end.

The choice of the means having been made, the will proceeds to the *use* (*usus*) of the chosen means. Since the will cannot achieve the end except through the means suitable for the purpose, it is obvious that the will must command and direct whatever powers of mind and body and whatever other things are necessary in order to bring about the desired result. The 'use' of the means is nothing more than the practical execution of the 'choice' of the means. If, for example, I have made the decision to travel to a certain place on foot, then I must begin walking; otherwise I will not reach the place.

The last in the series of elicited acts is *delight* or *enjoyment* (*fruitio*). The attainment of the end means the possession of the good intended from the beginning, and the possession of the good aimed at and striven for naturally produces in the will delight and enjoyment. The will has now realized its intention and comes to rest, filled with satisfaction in its final achievement. When the destination is reached, the traveling ceases, and one enjoys the end of the trip.

Of the six elicited acts here enumerated, wish, intention, and fruition pertain to the good which is the object of the will, while consent, choice, and use pertain to the means employed in the attainment of the good.³

Commanded Acts

That the will is responsible for its own elicited acts is evident from the fact that elicited acts are produced by the will as by their sole cause. With regard to *commanded acts*,

acts performed by powers other than the will, such acts must also be ascribed to the causality of the will in so far as they are performed under the 'command,' direction, and control of the will.

Wherein does the *command* of the will consist and *how* far does it reach?

When I command someone to do something, I intimate or declare to him that it is the decision of my will that he do it and should do it. Essentially, a command, being an intimation or declaration, is an act of the intellect; but this act of the intellect derives its whole force from an act of the will. Hence, from a practical standpoint, it is the will which issues the command, and the intellect makes the command known. We can issue a command to someone else, as when the professor says to his class: "Study this lesson!" We can also issue a command to ourselves, as when a student says to himself: "Get busy and study this lesson!"

There can be no question that the will has command over many powers of the human organism, *but not over all powers nor in the same degree.*

Over the vegetative powers the will exerts only an 'indirect' command. For example, the will can control digestion only by controlling the quantity and quality of the food to be consumed. Once the food is consumed, control ceases.

The will exerts a 'direct' command over the other powers of the organism, but even here the command differs. The movements of the *powers of locomotion* are under the 'despotic' control of the will; that is to say, they obey the will without opposition. The muscles controlling locomotion are

completely at our disposal, and we can use our limbs as we please. The *external senses* are also subject to this sort of control, so far as their movements are concerned. I can, for example, control the movements of my eyes at will. However, once the stimuli have affected the nerve terminals of a sense organ, I cannot control the resultant sensation.

The *interior senses* and *sensuous appetency* are not ruled 'despotically,' as the slave is ruled by his master, but 'politically,' as a citizen is ruled by his regent. These expressions of Aristotle⁴ are descriptively apt. These powers are not under the absolute control of the will. The will can stimulate them into activity and direct their activity along certain channels, but they can get out of control and lead to results contrary to the will's original intention. For example. A person may intend to take just one or two highballs; then the craving gets the best of him, and he ends up by becoming drunk.

As for the *intellect*, the will can control the intellect both directly and indirectly. The will can command the intellect to turn its attention to a certain object or to desist from thinking about it. The will cannot command the intellect to see something as false which the intellect recognizes as true, nor something as true which the intellect recognizes as false; but where full clarity is absent, the will can induce the intellect to give greater consideration to the opposing arguments and thus influence it indirectly. And in case of doubt, the will can influence the intellect to form an 'opinion' favoring one side of the question. Everyone is aware of the fact that prejudices and passions, used by the will, can influence intellectual judgment. Shakespeare

expressed this when he stated that “the wish is father to the thought.” Bias unduly influences the judgment of the intellect, especially in industrial, political, and religious matters. Even scientists, who are usually the protagonists of objective judgment, may be so ensnared by their desire and eagerness to prove a pet hypothesis that they often overlook facts and fail to draw conclusions militating against their favored hypothesis. Obviously, then, the intellect also stands, to a greater or lesser degree, under the command of the will.

The distinction between ‘acts of man’ and ‘human acts’ is vital to the study of conduct, because conduct is ethical only under the aspect of ‘human acts.’ This truth follows from the fact that actions are morally good or morally bad only for the reason that they proceed from the free will and as such are imputable to the will. This distinction will enable us to pass a proper judgment on the *voluntariness* of human acts.

Summary of Chapter II

This chapter treats of the human act and its characteristic features.

1. *The Will as Rational Appetency.* Man, like every other animal, possesses knowledge and appetency. In general, an appetency is a 'tendency of one thing toward another.' In animals it is the result of a spontaneous inclination following conscious apprehension: sensuous appetency. Besides sensuous appetency, based on sensory knowledge, man possesses a rational appetency, based on intellectual knowledge. Rational appetency is called the *will*.

2. *The Will and the Good.* That which moves an appetency to action and is the object of its striving is the *good*, and the 'good' is anything that is 'suitable' in some way for the striving subject. Appetency has *two phases*: the 'positive' phase, in which it consciously and actively seeks to attain what is suitable (good); and the 'negative' phase, in which it consciously and actively seeks to avoid what is harmful (evil).

Hence, the *will* is *defined* as 'rational appetency,' or 'the power to strive for an intellectually perceived good and to shun an intellectually perceived evil.'

3. *The Will and Evil.* 'Evil' is the unsuitability of something for a natural tendency or appetency. It is the privation of a required good.

The will can never desire an evil precisely as an evil. *Directly*, the will desires only the good; *indirectly*, the will may desire an evil, namely, as a means toward acquiring a

good of greater value. It may choose a 'physical' rather than a 'moral' good, or an 'apparent' rather than a 'real' good; but whatever it chooses, it chooses under the aspect of a 'good.'

4. *Acts of Man and Human Acts.* Morality affects acts in so far as they are controlled by the free will of man. A human act is an act performed by man precisely as man; it is *an act proceeding from the deliberate free will of man.*

Man is distinctively 'human' because he has a rational intellect and will. The will cannot exercise its power of causality unless previously enlightened by the intellect. Hence, both the advertence of the intellect and the free decision of the will are necessary to make a truly 'human act.' Consequently, all acts which escape the knowledge of the intellect or the free control of the will are not 'human acts,' but *acts of man*. Some acts are always 'acts of man,' others are always 'human acts'; some acts may be 'human acts' at one time and 'acts of man' at another.

5. *Classification of Human Acts.* There are *two main classes* of human acts: *elicited* acts, those that are produced directly by the will itself, so that they are begun and completed in the will as their sole agent; and *commanded* or *imperate acts*, those that are begun by the will, but are completed through the medium of other powers or faculties under the command and control of the will.

In every series of actions, when executed externally, a number of elicited and commanded acts are involved, forming a set or unit. In such a series, the elicited acts constitute what may be called the *psychological structure* of

the will-act. The number and sequence of these elicited acts are: wish, intention, consent, choice, use, and fruition.

6. *Commanded Acts*. Commanded acts must be ascribed to the causality of the will in so far as they are performed under the command, direction, and control of the will. The influence of this 'command' varies with the different powers; it does not extend over all powers nor in the same degree.

Over the vegetative powers the will exerts only an indirect command. The movements of the *powers of locomotion* and of the *external senses* are under the 'despotic' control of the will. The *interior senses* and *sensuous appetency* are ruled 'politically' by the will. Over the intellect the will exercises both direct and indirect control.

Chapter 3

VOLUNTARINESS

A 'HUMAN ACT' PROCEEDS FROM THE 'DELIBERATE FREE WILL' of man. Cronin¹ lists three essential qualities of the human act: (1) knowledge — the intellect must be conscious of the act; (2) voluntariness — the act must have the will as its cause; (3) freedom — it must lie within the self-determining power of the will to bring the act into being or not to bring it into being.

As will be noted, a distinction is made here between 'voluntary' and 'free' acts. Strictly speaking the distinction is justified and correct. Any act which proceeds from the will is 'willful' or 'voluntary' (Lat.: *voluntas*, will), whether the act be free or necessary. Man's will, for example, by its very nature necessarily loves and seeks happiness; it is not free in this act, though the act is 'voluntary.' However, outside this one act, all other voluntary human acts of the will are 'free' acts, issuing from the choice of the will as a free agent. Therefore, for all practical purposes of ethics, 'voluntary' acts are identical with 'free' acts. Because of this fact, moral philosophers, as a rule, ignore the distinction between 'voluntariness' and 'freedom' and treat all human acts simply as voluntary.

Voluntariness is the basis of man's *moral responsibility*, for man is responsible for all acts which have his free will as their cause. We must, therefore, investigate when and *in how far* acts can be said to be voluntary or involuntary.

Classes of Voluntary Acts

Since a human act is one which proceeds with knowledge from the free will as from its cause, the voluntariness or involuntariness of a particular act will depend upon complete or partial presence or absence of this knowledge and freedom and upon the extent of the causality of the will. We therefore distinguish between the following *classes* of voluntary acts. In making these distinctions and classifications, the consent of the will is presupposed, because without this consent the act would not be voluntary.

1. The *perfectly* and *imperfectly* voluntary act (*voluntarium perfectum et imperfectum*). An act is 'perfectly voluntary,' or, in other words, there is 'perfect voluntariness' in an act, when the preceding knowledge of the object and its circumstances is complete, so that the act is performed with full knowledge and full consent. When, however, the advertence of the mind is incomplete and only partially present, the consent of the will is also imperfect, and such an act is said to be 'imperfectly voluntary.'

It may happen, for example, that someone performs an act which is morally bad, in a condition of semi-intoxication or semi-wakefulness, or in a fit of violent passion, where the judgment of the mind is clouded and full advertence to the

gravity of the act is impeded to a great extent; such an act would be only 'imperfectly voluntary,' provided it were not clearly foreseen and consented to beforehand. The distinction receives a practical application in the question of murder and manslaughter and of many other acts. In all such cases the problem revolves around the fact whether full knowledge, and therefore also full consent, was present or not.

2. The *directly* and *indirectly* voluntary act (*voluntarium directum et indirectum*). It is also called an act voluntary *in itself* (*in se*) and an act voluntary *in its cause* (*in causa*). Here it is a question of the mode or manner in which something is willed. An act is said to be 'directly voluntary' or willed 'in itself,' if it is the *immediate* object of the will's striving and as such is immediately caused by the will. That, however, which is the *effect* of such an object immediately willed, is 'voluntary in its cause' or 'indirectly voluntary,' because that which is immediately willed is the cause of this effect. This effect is truly willed by the very fact that its cause is willed, provided it is foreseen that this effect will follow out of the cause. If I deliberately kill a man, what I will directly and in itself is his death; however, in as much as I foresee that his family will be deprived of income by his death, this injury to his family is willed in its cause and is indirectly voluntary on my part by causing his death.

It is well to remember that something may be willed 'in itself' even if it is only a means to an end, and not the end itself. A physician, for example, who kills an unborn child in order to save the mother's life, wills the death of the foetus

directly and in itself, but only as a means to save the mother's life.

There are many instances in which the effect is not willed at all but merely 'allowed to happen.' This is a particularly knotty problem which will be treated specially a little later.

3. The *expressly* and *tacitly* voluntary act (*voluntarium expressum et taciturn*). An act is 'expressly voluntary' when the consent is manifested externally by some word or sign. It is 'tacitly voluntary' when the consent is not manifested externally in any way, but is indicated by some fact or the omission of some fact which entitles one to conclude that the consent is present; the principle is embodied in the phrase:

'Silence means consent.'

A student, for example, asks permission from the professor to absent himself from class; the professor nods his head, thereby expressly manifesting his consent. A student has a package of cigarettes on his desk. His roommate walks over and helps himself to a cigarette. The owner sees the act but says nothing; he tacitly reveals his consent.

Silence, in itself, signifies neither consent nor dissent. The circumstances must determine what sort of interpretation can or must be placed upon the silence of a person. If a robber holds up a storekeeper at the point of a gun and takes his money, the storekeeper may maintain silence; but his silence does not imply consent. If the disciplinarian sees a student loitering in the corridor instead of studying his lessons, and if he says nothing to the

student, although as disciplinarian he should correct the student, then his silence may be construed by the student as tacit consent.

4. The *positively* and *negatively* voluntary act (*voluntarium positivum et negativum*). An act is 'positively voluntary' when it consists of an act actually willed and performed. An act is 'negatively voluntary' when the person deliberately decides not to perform a particular act but to omit it.

It is a positively voluntary act when a thief breaks into a house and steals the silverware; or when a man gives a beggar a coin to relieve his hunger. On the other hand, it is a negatively voluntary act when a man refuses to take an oath in court; or when a martyr refuses to deny his faith in the face of torture and death.

In all cases of negatively voluntary acts, the decision of the will is a positively voluntary elicited act in itself; but the decision refers to the 'omission' of some other act, and it is the omission of this other act which is designated a negatively voluntary act, because it is this *omission* which is the object of the will and its decision. In positively voluntary acts, on the other hand, it is the *performance* of an act that is the object of decision.

5. The *pure* and the *mixed* voluntary act (*voluntarium urum et mixtum*). The 'pure voluntary' act is one in which the object willed is pleasing in all its qualities and is therefore willed with full consent and without any repugnance. The 'mixed voluntary' act has reference to an object which pleases in some qualities but displeases in other qualities; with regard to these displeasing qualities or

circumstances, the will would rather withhold consent. As a result, there is a mixture of desire and repugnance, of voluntariness and involuntariness; hence, such an act is said to be a 'mixed voluntary' act, consisting of a mixture of *simple* voluntariness (*voluntarium simpliciter*) and *conditional* voluntariness (*voluntarium secundum quid*). The act as such, so far as the total outcome of willing is concerned, actually is willed and performed; that is why it is said to possess 'simple' voluntariness. The object of the will's consent has certain qualities which are displeasing, and the will *would* reject the object *if* it were possible to apply its consent or dissent to the displeasing qualities alone. It being impossible, however, to dissociate the pleasing and displeasing qualities in the total object under consideration, the will gives its consent to the total object as it is (simple voluntariness), but with an ineffectual dissent regarding that part of the total object which is displeasing (conditional voluntariness or involuntariness). The final outcome of the deliberation is a will-act of 'mixed' voluntariness, one aspect of the will-act containing 'simple' voluntariness and the other aspect containing a 'conditional' (but ineffectual) involuntariness.

Cases of 'pure' voluntariness are frequent. When one is hungry and the time arrives for the banquet one sits down at the table with pure voluntariness. The soldier who has served overseas for a long time gladly obeys the order to board the ship which will take him home, because everything about the prospect is pleasing.

Cases of 'mixed' voluntariness are not difficult to find. The classic example, used by Aristotle, St. Thomas, and

many ethicists, is that of a ship's captain who jettisons his cargo in a heavy storm in order to escape shipwreck and consequent loss of life. He deliberately throws the cargo overboard, with full knowledge and consent; his act, therefore, is 'simply' voluntary. He does it, however, with repugnance, and he would not do it, if there were no storm; hence, his act is 'conditionally' involuntary or, to look at it from the positive side, it is only conditionally' voluntary. In other words, his decision of relinquishing his valuable cargo possesses a 'mixed' voluntariness.

6. The *actually, virtually, habitually, and interpretatively* voluntary act (*voluntarium actuale, virtuale, habituale, et inter pretativum*). These qualifications really affect the 'intention' of the act; however, since the will-act is determined by the intention, the voluntariness of the will-act also is affected by them. By 'intention' is meant the tendency of the will to obtain a definite end through appropriate means.

An actual intention is one which is present here and now, effectively influences the act, and is consciously before the mind while performing the act. A person, for instance, has the intention to say a prayer and, while thinking of it, really says a prayer. Such acts are 'actually' voluntary.

A *virtual* intention is one which was elicited at some former time, is present here and now, and influences the act to be performed, although the intention is not adverted to consciously during the performance itself. The term 'virtual' comes from the Latin *virtus*, power, and indicates that the 'power' of the intention still persists and produces its effect, even though the intention itself is no longer actually

present in the mind at the moment the act is performed. Such acts are quite common, especially when the end to be obtained lies somewhat in the future and a number of separate actions are required in order to obtain the end. A student, for example, intends to be present at the next class and must go to another building for the purpose; he walks along the street toward the building, but enters into a conversation on the way, so that he no longer is conscious of his intention, and so reaches the building and attends class. A goodly portion of his walking was done without consciousness of his original intention, but the 'power' of his intention still was present and influenced his act of 'walking to the building.'

A *habitual* intention is one which was made at some former time and never retracted, but whose power of causality does not exist here and now, so that the present act can no longer be considered to be influenced by it; at best, the present act can be said to be *in conformity with* the intention previously made and never actually retracted.

An example. Two boys get into a quarrel, in the course of which the younger expresses his intention of 'beating up the big bully.' Nothing happens for years, and both have forgotten the boyhood incident. Then one day they quarrel again, and the younger man actually thrashes the older. One cannot say that the intention of years past has survived in efficacious force; however, since the original intention actually has not been revoked and the present thrashing is in harmony with the original intention, this intention is a 'habitual' intention and the thrashing is 'habitually' voluntary.

An *interpretative* intention is one which was never present and cannot have an influence upon an act; but the character of the person is such that one prudently judges an actual intention would be present, if the person had a proper understanding of the situation.

A child, for example, is born in a hospital and is at the point of death. The nurse baptizes it on the grounds of an interpretative intention; she judges that the child, if it had the use of reason and understood the value of baptism, would certainly have the actual intention of being baptized. As things stand, the child is judged to consent to baptism with an 'interpretative' voluntariness.

Imputability

Human acts, viewed from the standpoint of their goodness and badness, are 'moral' acts. By the *imputability* of moral acts we understand that property of moral acts in virtue of which these acts are attributed to a person as his own, because he is their author and cause. Now, it is obvious that moral acts, since they proceed from the deliberate free will of a person, come into existence through the action of the deliberate free will of this person. Such a person, therefore, is the author and cause of moral acts. Hence, moral acts must be 'imputed' to such a person and are said to possess the attribute of 'imputability.'

The *ground* and *basis* of the imputability of moral acts rests in the *free will* of man. It is through his free will that man is the author of his human and moral acts and the master of his conduct. And since moral acts are either

‘good’ or ‘bad,’ their goodness or badness must be attributed (imputed) to man, so that he deserves commendation for their goodness and condemnation for their badness. The moral acts themselves are said to be ‘praiseworthy’ or ‘blameworthy,’ but in reality it is the person performing the moral acts who is praiseworthy or blameworthy.

Since human acts depend upon the deliberate free will for their morality and consequent imputability, certain *general conditions for imputability* are required on the part of the intellect and on the part of the will:

1. In order that complete imputability of a moral act be present, the *knowledge* of the act on the part of the intellect must be *perfect*; there must be no impediment or obstacle to the natural activity of the intellect, so that the person truly can be said to have the full use of his reason. Whatever hinders the natural activity of the intellect in its knowledge of the act, diminishes imputability.

Furthermore, the intellect must have at least a *general* or *confused* knowledge of the *morality* of the act. This knowledge of the morality of the act will refer either to the plain fact that the act is good or bad, or to the specific character of the act (for example, whether it be murder or mere homicide), or to the gravity of the act (for example, whether the theft be a slight or serious matter).

2. In order that complete imputability be present, the consent of the will must be perfect; otherwise the act would not be perfectly human. Ordinarily, perfect knowledge of the intellect implies perfect consent of the will. Anything, however, which impedes the natural activity of the will in its

consent, also diminishes imputability. The modifiers of voluntariness and imputability will be treated later.

In order that a morally *good* act be imputed to the will, its moral goodness must be intended by the person performing the act, because the will cannot be judged to be 'good' except through the 'goodness' of the object which it intends. Hence, the moral good which results from the writing of a book will not be imputed to the writer, if he writes merely for profit and does not intend the morally good results. In order that a morally *evil* act be imputed to the will, it suffices that the will strive for an object which it knows to be bad. The reason is this. The will cannot strive for the evil as such, since an appetency can only strive for a good; hence, the will cannot be judged to be 'bad' except through the 'badness' connected with some object, and it is this 'badness' which the will must seek to avoid. Consequently, if a person knows that certain morally bad effects will result from his act, he is, absolutely speaking, bound to avoid this act, or the act will be 'morally bad.' A writer, for instance, may write a book, merely intending to make a profit from its sale; but if he knows that the book will work moral harm in its readers, this morally bad effect must be imputed to him, even though he may not intend them: he may not only not *intend* evil, but must, when possible, *avoid* evil.

The principle just stated applies to all morally good and evil acts, whether they be voluntary in themselves or in their cause. However, when *evil* is voluntary in its *cause*, a special problem of strict imputability arises.

Imputability of Evils in Cause

The problem revolves around the fact that in many cases *mixed effects*, both *good* and *evil*, result from a certain act deliberately willed and performed. Oftentimes, a person intends an act which is in itself either good or indifferent, but some evil effect is connected with the act as willed and performed. This evil effect is, let us presume, not directly willed; the will is displeased with it and rather wishes that it were not present at all. The evil effect, however, is foreseen as following from the act as intended. Here we have again an instance of a 'mixed voluntary' act, where the morally good or indifferent object is willed with 'simple voluntariness' and the morally evil effect is willed with 'conditional involuntariness.'

THE *FIRST QUESTION*: CAN OR MUST THE WILL BE CONSIDERED THE *cause* of such evil effects?

Generally speaking, the answer is *affirmative*. This answer is based on the universally recognized principle: *causa causae est causa causati*: that is to say, who is responsible (or is the cause) for setting a particular cause in motion, is also responsible (or is the cause) of the effects which this particular cause produces. It makes no difference whether these evil effects are displeasing to the will. They are the effects of the cause directly intended by the will and are included in the efficiency of that directly intended cause; hence, they are caused indirectly by the

will, and the will, since it foresees these evil effects, must be held accountable for their production.

Hence the conclusion: Every evil effect, even if only voluntary in cause, which flows *from the nature of the cause directly and necessarily*, so that no other effect is possible, must be imputed to the will which sets the cause in motion.

THE *SECOND QUESTION*: MUST EVERY EVIL EFFECT BE AVOIDED BY the very fact that it flows from a good cause freely and deliberately set into motion by the will? Or, to put it in a different way, is it *ever permissible* to allow an evil effect, voluntary in cause, to occur, provided certain conditions are fulfilled?

The answer to the first part is negative and to the second part *affirmative*. The general reason is this: If every evil effect would have to be avoided under all conditions, and if it were never permissible to allow an evil effect, only voluntary in cause, to occur, so that one would be obligated to omit a directly willed good or indifferent act on that account, then life would become an insupportable burden. There exists hardly a single good act which might not have some evil effect connected with it in some form, no matter how remotely. Hence, one cannot expect a person to omit a good or indifferent act under all circumstances and conditions, simply because some evil effect is foreseen to occur with this act. It is always presupposed, of course, that the person does not directly intend the evil effect itself. The *obligation*, therefore, to omit an act because of some evil

effect, foreseen but not directly intended, is *relative*; that is to say, under certain conditions a person may perform a directly intended good act, and there is no obligation to omit it because of a foreseen but not directly intended evil effect, provided one has a sufficient reason to perform the good and permit the evil effect connected with it to occur. This is the case of the so-called *double effect*, one good and one evil; the good effect is 'intended' with direct voluntariness, and the evil effect is 'permitted' with conditional involuntariness.

THE *THIRD QUESTION*: WHAT ARE THE *PRECISE CONDITIONS* UNDER which a certain act is allowed, from which both a good and an evil effect is foreseen to follow?

There are *four conditions* which must always be present *simultaneously*, in order that a person may permit the double effect to occur. These are:

- 1. The action directly intended must be good in itself or at least morally indifferent.
- 2. The good effect must follow from the action at least as immediately as the evil effect; or the evil effect may follow from the good effect. It is never morally right for the good effect to be produced through the evil effect, because the evil would be intended as the means to bring about the good effect, and in that case the (good) end would justify the (evil) means. One may not do evil in order to accomplish good.

The following diagram will illustrate the principles of this second condition. The letter C represents the 'cause'; the letters GE represent the 'good effect'; and the letters EE represent the 'evil effect.'

In Figure I it will be seen that both the good effect and the evil effect follow with equal immediacy from the cause; the action, generally speaking, may be performed. In Figure II the good effect is produced directly by the cause, and the evil effect follows from the good effect; the action, generally speaking, may be performed. In Figure III the evil effect is produced directly by the cause, and the good effect follows from the evil effect; the action may not be performed, because the evil effect here is the means used to accomplish the good effect.

- 3. The foreseen evil effect may not be intended or approved, but merely 'permitted' to occur. If the evil effect were intended or, when it occurred, approved, then the will itself thereby would become evil in its inclination, and the action would be morally wrong.

- 4. There must be a proportionate and sufficient reason for permitting the evil effect to occur while performing the good action. Obviously, the production of a minor good effect would not be a proportionate and sufficient reason for permitting the production of a very great evil.

With regard to this fourth condition, it will at times be rather difficult to judge what reasons may be regarded 'proportionate and sufficient' in particular instances. The following considerations should help in passing a proper judgment on this important matter. The greater the evil effect, the greater must be the reason for permitting it. A lesser reason is required if the evil effect would probably happen through some other cause; and a greater reason, if the omission of the good action would effectively and definitely hinder the evil effect. The closer the relation between the cause and the evil effect, the greater must be the reason for setting the cause into motion. If the evil effect is only probable, the reason need not be as great as when its occurrence is certain. A greater reason is required to permit an evil effect, if the person responsible for the cause has the official duty to hinder the effect; but if the person is not obligated in virtue of his official position to hinder the evil effect, the reason may be proportionately less.

Cases of Double Effect

In order that an action with a double effect, one good and one evil, be morally right and justified, all four conditions just enumerated must be present simultaneously; if one or more of these four conditions be absent, the action is morally wrong and unjustified. The best way to illustrate these principles is by use of concrete cases.

Cases in which the action is '*morally right*.'

The college authorities schedule a football game with a rival college, foreseeing that in all probability some drunkenness, anger, and foul language will occur. A football game is a morally indifferent matter (condition 1). The prestige of the school is intended (good effect), but not drunkenness, anger, and foul language (evil effect); the prestige of the school is caused, not by the evil effect of drunkenness, etc., but by the playing and winning of the game; the evil effect is merely a concomitant phenomenon (condition 2). The authorities neither intend nor approve drunkenness, etc. (condition 3). The prestige of the school and the innocent enjoyment of the bulk of the spectators outweighs the relatively few instances of drunkenness, etc., particularly since the cause of the evil effect lies, not in the authorities, but in the misbehaving spectators themselves (condition 4). See Figure I.

Another case. A large hotel is on fire. All means of escape being cut off, with the fire already raging in their rooms, a number of people jump from the windows, with the practical certainty that they will be killed in the fall to the pavement below. Even aside from the fact that panic may rob them of proper judgment, the act is justifiable on the following grounds. These people do not seek death through

the fall; they merely intend to avoid the horrible torture and death which threatens them here and now, so as to prolong their life so long as possible, and the prolongation of life is something good (condition 1). Jumping from the window means attempting to escape death by fire (good effect); death does not occur through the jumping from the window, but occurs in striking the pavement (evil effect) sometime later (condition 2). These people do not want to be dashed to pieces, nor do they approve of death in this form (condition 3). Death might happen either by fire or by being dashed to pieces; but death by fire would be certain, While some fortunate circumstance might intervene which would hinder them from being killed through the fall onto the pavement (condition 4). See Figure II.

Again. A pregnant woman suffers from serious ailment which directly threatens her life. This ailment is not caused by the pregnancy, though it may be aggravated by it. The physician knows of only one medicine which will cure her ailment and avert her death, but it will cause the death of her unborn child. He may administer the medicine. The effect directly intended is the cure of the serious ailment of the woman, and that is a good in itself (condition 1). The good effect (averting the death of the mother) does not follow from the death of the foetus (evil effect), but follows from the use of the medicine; the death of the foetus is a concomitant effect which also follows with equal immediacy from the use of the medicine (condition 2). The death of the child is not intended or approved, but permitted to happen; if this death could be avoided by the use of some other medicine, the physician would use this other medicine

(condition 3). The saving of the mother's life under the circumstances is sufficient reason to permit the unavoidable death of the child (condition 4). See Figure I.

And again. The officer flying a torpedo plane, through an opening in the clouds, sees an enemy aircraft carrier on its way to attack the fleet. His position is such that he cannot effectively launch his torpedo against the carrier. He deliberately dives out of the clouds and rams the carrier, with the intention of putting it out of commission and perhaps sinking it, thereby inflicting heavy damage on the enemy. He succeeds in hitting the side of the carrier, the torpedo explodes, and he himself is killed. Is this suicide? Or is his action morally justifiable? If the flyer was fighting a just war, his action under the circumstances cannot be condemned. He intends to protect his own fleet and comrades by putting the enemy carrier out of action; that, in itself, is a good act in time of war (condition 1). The damage to the carrier (good effect) and his death (evil effect) result with equal immediacy from the same action; the blowing up of the carrier does not result from his own death, but his own death (evil effect) results from, or at least as a separate effect together with, the explosion of the torpedo against the enemy carrier (condition 2). He does not really want to die, but would be only too happy to survive, if that were possible (condition 3). The reason for his action is sufficiently and proportionately grave, because he not only ruins the enemy's carrier with its planes and personnel, but saves his own fleet from possible destruction and many of his comrades from probable death (condition 4). See Figure I.

And another case. A cruiser is torpedoed through enemy action. Water is rushing into some compartments and threatens to sink the ship. The commander orders the bulkheads in that part of the cruiser secured, although he foresees that a number of his crew thereby will be drowned. His intention is to keep the ship afloat and in action, thereby saving both the ship and the lives of as many of the crew as possible; this is good in itself (condition 1). The men in the torpedoed section are not killed by securing the bulkheads, and the death of the men (evil effect) does not save the ship (good effect); rather, by securing the bulkheads and thereby saving the ship and the crew (good effect), the death of the trapped men (evil effect) will eventually follow as an indirect result (condition 2). The commander regrets that he is forced to this drastic action and would, if possible, first rescue the men; but he cannot save the men and the ship at the same time, so he reluctantly gives the command (condition 3). In order not to have the cruiser sink with all its personnel, he endeavors to save what he can, hoping at the same time that many or even all of the trapped men will somehow survive. In any case, though some must perhaps die, the majority will have a reasonable chance of coming out alive (condition 4). See Figure II.

A final case. The crew of a bomber squadron receives orders to demolish a railroad and industrial center of considerable importance to the enemy. The general issuing the orders realizes that children and non-combatants will thereby be killed. He may issue his orders to bomb the city. His direct intention is to reduce the enemy's war potential

by demolishing a military objective; that in itself is good (condition 1). The death of civilians is, though unavoidable, a concomitant result and is not the cause of reducing the enemy's war potential; the death of civilians (evil effect) occurs simultaneously with the destruction of the military objective (good effect), because they were not evacuated (condition 2). The death of these non-combatants is not intended or desired, but merely permitted (condition 3). The general has a sufficient and proportionate reason to permit their death to occur (though their death is by no means certain), because he aims at defeating the enemy, winning the war, and thereby putting an end to the killing of his own men and of people in general (condition 4). See Figure I.

Cases in which the action is 'morally wrong.

First case. John is employed by the city as a lifeguard to protect the bathers of the municipal bathing beach. It being a warm afternoon, he decides to take a nap while on duty. One of the bathers gets into trouble and shouts for help. By the time John is awakened, the bather is drowning. John rushes into the water, but is too late to save the drowning person. He excuses himself on the grounds that the bather went of his own accord beyond the safety ropes. John's excuse is invalid, because it was his duty in virtue of his official position to watch over the bathers. Taking a nap was an indifferent act in itself, but his duty demanded that he stay awake and protect the bathers. He violated condition 4, in as much as he did not have a sufficient reason to run the serious risk of someone drowning (evil effect) while he

sought the benefit of a rest (good effect). John is guilty of a serious dereliction of duty.

Another case. The teller in a bank has a tubercular wife who should reside for a while in a dry southern climate. Not having the money for her prolonged sojourn in the South, he embezzles some bank funds, with the firm purpose of refunding the money at the earliest opportunity. The good effect (his wife's health) is sought through the evil means of embezzlement of someone else's money (evil effect). See Figure III. He violates condition 2.

Again. An unmarried woman becomes pregnant. In order to avoid the disgrace of giving birth to an illegitimate child, she takes medicine to bring on abortion. The death of the child (evil effect) is intended directly as the means to save her own reputation (good effect). See Figure III. She violates condition 2.

And again. A flier piloting a pursuit plane sees a train moving in enemy territory. Upon approaching it, he sees the Red Cross insignia painted on every coach, informing him that this is a hospital train. He machine-guns the train, killing a number of wounded enemy soldiers and also a few nurses and physicians. Since belligerents are obligated by international law not to fire on hospitals and hospital trains which are plainly marked as such, he violates condition 4 and is guilty of murder.

Another case. A submarine commander has just torpedoed an enemy passenger-freight ship. While the civilian passengers are in the lifeboats, he orders his gunners to shell the lifeboats. Most of the civilians are killed or wounded. He is guilty of murder and wanton cruelty,

because the wounding and killing of non-combatants is directly willed and intended. He violates condition 1.

While it is a simple matter in most instances to decide whether an act is performed with voluntariness or involuntariness, the complication of circumstances attending indirect voluntariness often makes a decision rather difficult. It is of vital importance, therefore, that the student be familiar with the various kinds of voluntariness and the principles which govern them.

Summary of Chapter III

This chapter treats of *voluntariness* as a specific attribute of human acts and their morality. For all practical purposes, 'voluntary' acts are identical with 'free' acts of the will.

1. *Classes of Voluntary Acts.* (1) The perfectly and imperfectly voluntary act. (2) The directly and indirectly voluntary act. (3) The expressly and tacitly voluntary act. (4) The positively and negatively voluntary act. (5) The pure and mixed voluntary act. The mixed voluntary act is a mixture of simple voluntariness and conditional voluntariness (or conditional involuntariness). (6) The actually, virtually, habitually, and interpretatively voluntary act.

2. *Imputability.* By 'imputability' is meant that property of moral acts in virtue of which these acts are attributed to a person as his own, because he is their author and cause. The ground and basis of imputability rests in the free will of man. The *general conditions* of imputability are as follows: (1) The *knowledge* on the part of the intellect must be 'perfect,' so that the person truly may be said to have the full use of his reason. The intellect must have at least a general or confused knowledge of the 'morality' of the act. (2) The *consent* of the will must be 'perfect.' Ordinarily, it is perfect when the knowledge is perfect.

3. *Imputability of Evils in Cause.* In many cases *mixed effects*, both good and evil, result from a certain act deliberately willed and performed. It is the problem of 'mixed voluntariness,' where the good effect is willed with

'simple' voluntariness and the morally evil effect is willed with 'conditional' involuntariness.

Generally speaking, the will must be considered the cause of the indirect evil effects (evils in cause): *causa causae est causa causati*, i.e., he who is responsible (the cause) for setting a particular cause in motion, is also responsible (the cause) for the effects which this particular cause produces.

Not every evil effect must be avoided simply because it flows from a good cause; evil effects, voluntary in cause, may at times be *permitted* to occur, provided certain conditions are fulfilled.

In order that an act be morally allowed, from which a 'double effect,' one good and one evil, is foreseen to follow, *four conditions* must be present *simultaneously*. These conditions are: (1) The action directly intended must be good in itself or at least morally indifferent. (2) The good effect must follow from the action at least as immediately as the evil effect; or the evil effect may follow from the good effect. The good effect may never be produced through the evil effect, because the (good) end does not justify the (evil) means. (3) The foreseen evil effect may not be intended or approved, but may be merely 'permitted' to occur. (4) There must be a proportionate and sufficient reason for permitting the evil effect to occur while performing the good action.

4. *Cases of Double Effect*. See the text.

Chapter 4

IMPEDIMENTS TO HUMAN ACTS

VEGETATIVE AND SENSORY FUNCTIONS ARE INTRINSICALLY dependent on bodily organs, and diseases of these organs have abnormal functions as their natural result. Intellect and will, however, reside in the spiritual soul directly and are not intrinsically dependent on bodily organs for their functions. In the strict sense of the term, therefore, there can be *no diseases* of intellect and will and *no abnormal functions* of intellect and will. Since, however, the intellect is 'extrinsically dependent' on the sense powers for the data from which it derives its knowledge, sensory functions, both normal and abnormal, naturally affect the intellect in its operations and, through the intellect, also the will.¹

Disturbances and distortions on the sensory level bring on disturbances and distortions on the intellectual level of man's being. These disturbances and distortions thereby impede the proper action of the free will and as such are *impediments to human acts*. Impediments are those factors which impair perfect knowledge and perfect consent in moral matters. There are two main classes of such impediments: (1) *transitory* and (2) *permanent*.

Transitory Impediments

In order that an act be truly human and moral, it must proceed from the will exercising its freedom, together with proper advertence of the intellect. Certain conditions are required if the will's exercise of its freedom in any particular act is to be *perfect*. For one thing, the intellect must clearly perceive the object to be chosen in its concrete circumstances and the motives which favor or disfavor the choice of this object. Then, too, the attitude of the will must be such that it can expeditiously and readily determine itself, without being unduly swayed in its action by contrary inclinations. If these conditions are not present, the exercise of freedom cannot be said to be 'perfect.'

Whatever, therefore, influences the intellect in such a manner and in such a degree that its judgment about an object and its morality ('rightness' or 'wrongness') is incorrect or downright false, influences the exercise of freedom adversely and constitutes an impediment to the truly human and moral act on the part of the intellect. And whatever influences the will in its proper activity, so that it finds difficulty in choosing the moral good, due to opposing tendencies which attract it toward sensible things and away from the supra-sensible moral good, also influences the exercise of freedom adversely and constitutes an impediment to the truly human and moral act on the part of the will itself. Hence, any influence which prevents or lessens the advertence of the intellect or restricts the will in the exercise of its freedom, is an impediment to the human

and moral act; correspondingly, voluntariness and imputability are lessened or destroyed.

Some impediments merely affect *individual* human acts in a transient or *transitory* manner, thereby lessening or preventing the exercise of freedom in their regard. For this reason these transitory impediments are also termed *actual* impediments. Others, however, lessen or prevent the exercise of freedom more or less permanently and habitually, producing a relatively stable condition of intellect and will; these are *permanent, habitual* impediments.

We will first consider the *transitory, actual* impediments. There are four of them: ignorance, concupiscence or passion, fear, and violence. Every act, to be human and moral, must proceed from the free will with advertence of the intellect.

Ignorance directly affects the advertence of the intellect, in so far as this advertence must precede the act of the will. Violence impedes the act of the will, in so far as the human act must be produced by the will as an internal principle of activity. Concupiscence (passion) and fear affect both intellect and will.

Ignorance

In a wider sense, ignorance means simply the absence of knowledge regarding something, in a being capable of possessing such knowledge. A child of five, for example, may not know the alphabet, although it is capable of knowing it. In a strict sense, however, *ignorance* is the *lack*

of required knowledge. In this strict sense, a person is said to be 'ignorant' of something, if he is supposed to possess this knowledge but actually lacks the required knowledge. Lack of the knowledge of mathematics on the part of an astronomer and lack of the knowledge of court procedure on the part of a lawyer, would be ignorance in the strict sense of the term.

Ignorance differs both from *error* and *inadvertence*. Error always involves a judgment contrary to truth. If I see a man and judge him to be John Jones, while in reality he is Ed Smith, then I am mistaken in the identity of these two persons and I have committed an error. Inadvertence happens, when I really know a thing, but for the moment the thing fails to register upon my mind as something with which I am acquainted. I meet Ed Smith, whom I know well, on the Street; however, being absorbed in thought at the moment, I fail to recognize him and pass him by as if I did not know him.

Ignorance is not an act, but a negative or privative state of mind. In so far as this state of mind influences the judgment concerning the morality of a *particular act*, it is an actual, transitory impediment.

THERE ARE MANY KINDS OF IGNORANCE.

From the standpoint of the *object* of which one is ignorant, we distinguish between ignorance of the 'law' and ignorance of the 'fact.' It is ignorance of the law when one lacks the knowledge of the existence of the law or the content of the law. For example, the principal of the school

has forbidden the students to loiter around the main entrance of the school; John, however, was absent the day the principal made his announcement and so is unaware of the existence of the law prohibiting loitering. Alfred may know that the Church has issued a list of forbidden books and that he is not allowed to read them without special permission; but he is under the impression that only heretical books, not obscene books also, are on this list, and so he is ignorant of something that is contained in the law. If one has knowledge of the law, but is ignorant of the necessary conditions required for the application of the law to a particular situation, so that one is ignorant whether the law actually applies to a specific act, then one is said to be ignorant of the *fact*. Edward, for instance, knows that the principal has forbidden loitering around the main entrance of the school; but he is supposed to meet someone after classes at the main entrance, and he does not know whether he should consider this loitering. Again, he knows about the different types of books which are placed on the forbidden list, but he is ignorant of the fact that a book by David Hume, which he is reading, is on the list.

From the standpoint of the *subject* who is ignorant, we distinguish between 'invincible' and 'vincible' ignorance.

Ignorance is *invincible* when it cannot be removed. Ignorance is *physically* invincible if it cannot be removed at all. Such is the case, if the person has not the slightest inkling that a law exists, or that a certain act falls under the law, or that he has the duty to investigate about the law or the fact. Since no effort can remove this type of ignorance, because such a person under the circumstances has not the

faintest idea of the presence of ignorance in his mind, it is 'physically' impossible for him to pass from ignorance to knowledge. A soldier, for example, borrows one dollar from a comrade and promises to refund the money. The two become separated; years pass, and the soldier has totally forgotten the incident, so that at present his mind is in a state of physically invincible ignorance concerning his debt.

Ignorance is *morally* invincible if it cannot be removed by any reasonable effort which normally would be expended under the circumstances by prudent and conscientious persons. The word 'morally' is used here in opposition to the word 'physically.' Physically invincible ignorance cannot be removed at all; morally invincible ignorance can be removed, but with such difficulty that the normal effort characteristic of prudent and conscientious persons would be insufficient to remove it. What kind of effort is 'reasonable' and must be expended to dispel the ignorance naturally depends on the matter in question; it is relative to the importance and gravity of the contemplated act. In a grave matter, a relatively great effort must be made to remove the ignorance; in a matter of minor importance, a relatively minor effort must be made. A 'supreme' effort need not be made, but only such diligence must be used as is customary among prudent and conscientious persons under the given circumstances in any particular case; if the difficulty still remains and the matter cannot be decided definitely, then ignorance is 'morally' invincible. An example. During World War I, an officer, stationed on an island in the South Pacific, receives orders to lead his men the next morning against the enemy, with the specific

instructions that no quarters' are to be granted. He is not sure about the morality of these instructions. No chaplain is on the island whom he might consult regarding the permissibility of granting 'no quarters' to the enemy in combat. He could radio to the chaplain on another island, but this would give notice to the enemy of the impending attack. After discussing the matter seriously with other prudent and conscientious officers, he still does not know whether such an act is justifiable. Having done what he reasonably could under the circumstances, he carries out his instructions. His ignorance is 'morally' invincible. Absolutely speaking, his ignorance could be removed by sending a radio message to the chaplain; but that would be practically a supreme effort which he is not obliged to make under the circumstances.

Ignorance is *vincible* when it can be dispelled with the diligence and effort customarily applied by prudent and conscientious persons under the given circumstances. A man, for instance, has promised to pay a certain sum of money on a definite date, but he does not remember the exact date on which the payment is due. He does remember, however, that his diary contains the date. All he need do is take the diary out of the safe and read it. His ignorance is, as will be readily seen, *vincible*.

According to the varying *degrees* of vincibility, there are different *kinds* of vincible ignorance. If a person uses some diligence, but not a sufficient amount to remove the existing ignorance, this ignorance is termed *simply* vincible. If a person uses hardly any reasonable diligence, the ignorance is *crass* or *supine*. If a person deliberately fosters the

ignorance, and in consequence does nothing to remove it, it is a studied or affected ignorance. 'Affected' ignorance is willed directly in itself; this happens, for instance, when a person purposely refuses to find out about a law which he suspects to exist, so that he will not know whether his contemplated action is wrong. 'Crass' (or 'supine') ignorance and 'simply vincible' ignorance are voluntary in cause, because the omission of proper diligence is willed; the reason for this omission may be carelessness, laziness, false modesty, indifference, unwillingness to manifest one's ignorance to others, and so forth.

FROM THE STANDPOINT OF THE *ACTION* ITSELF, IGNORANCE MAY BE 'antecedent,' 'concomitant,' or 'consequent.' Two things must be considered here: the causal influence of ignorance on the action, and the causal influence of the will on the ignorance.

With reference to the causal influence of *ignorance on the action*, we distinguish between 'antecedent' and 'concomitant' ignorance. Ignorance is *antecedent*, when it precedes the will's decision and is the (negative) cause of the action. The action is performed *through* ignorance and *on account* of ignorance; it would not be performed if knowledge were present. John and Joe, two intimate friends, go hunting. Upon arriving at the location, each goes in a different direction. John sees something move in the underbrush and thinks it is a deer; in reality, however, it is his friend Joe. John would not, of course, fire at Joe, if he knew the moving object to be his friend; but he is ignorant

of this fact, fires, and kills Joe. Since ignorance was the (negative) cause of his shooting at Joe, the killing was done 'through' ignorance and 'on account of' ignorance. Ignorance is *concomitant* if an action is performed, not through ignorance and on account of ignorance, but *in* and *with* ignorance. In concomitant ignorance the action, though performed in and with ignorance, is such that the agent would have performed it, even if he had full knowledge of the facts of which he is here and now actually ignorant. John, for example, hates Alfred intensely and has long been looking for a favorable opportunity to kill him. John goes hunting, sees something move in the underbrush, and thinks it is a deer; in reality, however, it is his enemy Alfred. John is ignorant of this fact and kills Alfred; but his disposition is such that he would have killed him, even if he had known that it was Alfred. John killed Alfred 'in' and 'with' ignorance; but not 'through' and 'on account of' ignorance, in the sense that his ignorance was the (negative) cause of the shooting, because he would have shot him even if he had known the moving object to be his enemy Alfred. Under the circumstances, ignorance exerted no causal influence on the action. This is 'concomitant' ignorance, since it merely accompanies the action. With reference to the causal influence of *the will on ignorance*, we distinguish between 'antecedent' and 'consequent' ignorance. It is *antecedent* if it precedes the decision of the will and is independent of the decision of the will. Antecedent ignorance, in this sense, is non-voluntary and invincible. It is *consequent*, if it follows from the decision of the will and is dependent on the decision of the will.

Consequent ignorance, therefore, is either willed 'directly,' and then it is 'affected' ignorance; or it is willed 'in cause,' and then it is crass (supine) or simple ignorance. Since consequent ignorance is always willed in a greater or lesser degree, it is voluntary and vincible. The examples of invincible and vincible ignorance, given above, apply here as instances of 'antecedent' and 'consequent' ignorance.

IN HOW FAR IS *IGNORANCE IMPUTABLE*?

The following *principles* show how ignorance modifies the voluntariness of human acts.

1. All actions performed in invincible *ignorance* are *involuntary*; therefore, both the actions and their effects are not *imputable*. The reason is obvious. The will can strive only for that which the intellect knows and proposes. If the intellect is ignorant of the wrongness of a certain action, this wrongness is simply, unknown to the intellect, and the will cannot strive for it; hence, such a wrong action cannot be said to be willed 'directly.' Nor can it be said to be willed 'indirectly' or in cause.' Indirect volition could only occur if the ignorance were in some manner freely willed and in so far voluntary. That, however, is impossible, because the type of ignorance involved here is 'invincible.' If the ignorance is 'physically' invincible, the performer of the action is totally unaware that a moral law is being violated. A child, for instance, may perform a sexually immoral act, but has no idea that the act is wrong. If the ignorance is 'morally' invincible then the performer of the act exerted every reasonable effort, in proportion to the gravity of the matter,

to remove the ignorance, but was unsuccessful; ignorance still remains invincible. Hence, morally invincible ignorance is, under the circumstances, willed neither directly nor in cause; it is involuntary. The requisite knowledge is simply lacking through no fault of the person. For instance, if a physician, notwithstanding a reasonably thorough investigation of a patient's condition, makes a wrong diagnosis, his ignorance and subsequent erroneous treatment of the patient cannot be considered voluntary and imputable. Even the man who kills his enemy in concomitant ignorance (as John killed Alfred in the hunting episode mentioned above) kills him by accident and is not guilty of murder; at the most, he is guilty of malicious joy at the thought of having accidentally killed his enemy, but that immoral act occurs after the killing is over and is due to a separate act of the will.

2. *Vincible* ignorance does *not destroy* voluntariness, but lessens it.

A person with vincible ignorance is aware of his lack of required knowledge, but refuses or neglects to exert a reasonable effort to dispel his ignorance. Because of this willful refusal or neglect, his ignorance is 'voluntary in cause.' Hence, voluntariness is *not destroyed* in actions performed with vincible ignorance; and this applies to every type of vincible ignorance, whether it be simple, crass (supine), or affected, because the omission of the requisite diligence needed to dispel ignorance is due to the will's own decision. When, therefore, a physician, through neglect of study and reasonable examination, makes a wrong diagnosis, his ignorance is vincible and voluntary in cause.

However, vincible ignorance *lessens* voluntariness to a greater or lesser degree, depending upon the circumstances. Voluntariness depends on the preceding knowledge of the intellect, and the knowledge of one who acts in ignorance, even though this ignorance be vincible, is less than the knowledge of one who is fully cognizant of the action in all the particulars of its morality. Hence, a person acting in vincible ignorance, which he fails to remove through negligence, etc., wills the act 'in cause,' but the voluntariness is lessened to some degree. Crass ignorance is more voluntary than simple ignorance, and affected ignorance more voluntary than crass; their imputability corresponds to their voluntariness.

Concupiscence or Passion

Another transitory impediment to the human act is 'concupiscence' or 'passion.'

We must first of all know the meaning of 'concupiscence' and 'passion' in the context of ethical study. Many persons are acquainted with the idea of 'concupiscence' only in its theological sense, meaning the tendency of man toward evil as a consequence of original sin; and they think of 'passion' only as the excitement attending the emotion of love or the function of sex. As used by moralists, both terms have a broader significance. In ethics we use the term *concupiscence* to mean the natural tendency or inclination of sensuous appetency toward a consciously perceived sensuous good and away from a consciously perceived sensuous evil. Passion is the emotional excitement which

normally accompanies the sensuous appetency in its activity of striving for a sensuous good and of avoiding a sensuous evil. While 'concupiscence' and 'passion' are not identical in meaning, they usually go together in actual experience.²

Since man is an animal organism, concupiscence and passion, as just defined, are *natural* tendencies flowing from his very constitution; they are part and parcel of his organic being, endowments of his nature given by the Creator for the preservation of the individual and of the race. Concupiscence and passion, as used in this connection, are terms which represent all the various driving forces and impulses which work in man toward change, growth, development, and improvement in the field of his animal life. Without them man could not live. Every appetitive power strives instinctively toward the attainment of its own proper object, and the normal activity of such powers is also accompanied by pleasure, so that man has the natural desire to exercise them. In the presence of a consciously perceived good or evil, the sense appetites go into action *with necessity*.

Just as the vegetative powers and their functions in man are subservient to the sensory powers, so the sensory powers and their functions are intended by the Creator to be subservient to the rational powers of intellect and will. Unfortunately, the good of the sense appetency does not always coincide with the good of the intellect and will, and this gives rise to a conflict between the sensory and rational appetencies. The sensory appetency should be controlled by intellect and will, but this control is by no means complete (at least not since the Fall). Concupiscence and passion

often present a sensuous good in such attractive colors that the judgment of the intellect is clouded and the free decision of the will is adversely influenced. Because of this fact, concupiscence and passion are *an impediment to complete voluntariness*.

There are two kinds of concupiscence (and passion): 'antecedent' and 'consequent,' both taken in reference to the free decision of the will regarding them.

Concupiscence, in reference to the act of the will, is *antecedent* when it occurs *prior* to any act of the free will in its regard. In practical experience, the situation is as follows. An object is presented to the sensory consciousness, and it is perceived to be a sensuous good. Since sensuous appetency acts with necessity and not with free choice, this appetency spontaneously goes into action, desiring this good. Such a desire may be vehement and cause considerable organic excitement (passion): concupiscence is already present before the intellect adverts to it properly and before the will has made any choice of its own. In such a situation, concupiscence and passion evidently are 'antecedent' to the act of the will in its exercise of freedom. Concupiscence and passion are natural functions of natural powers, acting from necessity and not from choice, and as such are neither morally good nor morally bad. 'Morality' enters into the situation when the intellect sees that the action prompted by concupiscence is contrary to the rational nature of man and therefore immoral.' The intellect prompts the will to reject the desired action, because the will in its freedom has it in its power to decide for or against the action. If the will decides

against the desired action, its own act of decision is 'morally good'; but if it decides for the desired action, its own act of decision is 'morally evil.'

In most instances, especially if a person has trained the will to select what the intellect has perceived to be morally good, the will is capable of checking concupiscence and passion. But not always. In rare cases, concupiscence and passion may rise with such force and fury as to go into action before the intellect has a chance to consider the situation properly and before the will has a chance to make a decision. In the course of a conversation, for example, James is gravely insulted. He 'sees red' and, without premeditation, goes immediately into such a paroxysm of anger that he fells his opponent with a cane and kills him; the act was done spontaneously and without proper advertence, and his anger occurred 'antecedently' to any free decision of his will.

Concupiscence is *consequent* when it occurs *after* an act of the free will in its regard. Concupiscence may follow and be consequent upon the act of the free will in a *threefold* way. First, the initial movement of concupiscence arises spontaneously; the intellect adverts to its presence immediately, or at least before it makes appreciable headway, and the will freely consents to it and fosters the movement to its natural completion. James, for example, has been told that John has been talking detrimentally about him. James sees John on the street the next day. He feels anger rise up in his heart against John, deliberately consents to the anger, and excites it to a higher pitch. Second, concupiscence, not present at the moment, is

deliberately aroused. James, let us say, has been insulted. The next day, while reading the newspaper, he happens to think of the insult; so he puts the paper aside, relives the episode in thought and imagination, with the intention of arousing his anger and working himself into an emotion of revenge. Third, without concupiscence itself being actually intended, the free act of the will may be so vehement that concupiscence naturally and spontaneously arises as an after-effect of the vehement will-act. To take James again as an example, he may deliberately entertain a desire for revenge on an intellectual level, but the desire is so vehement that the emotions of hate and anger arise as a natural consequence.

IN HOW FAR IS *CONCUPISCENCE (PASSION) IMPUTABLE?*

The question must be answered through a consideration of the influence which concupiscence (passion) exerts on voluntariness. This influence is radically different in the two types of concupiscence.

1. *Antecedent* concupiscence *lessens* voluntariness and at times *destroys* it completely.

Antecedent concupiscence *lessens* voluntariness. Complete voluntariness is present only when intellect and free will are not impeded in any manner in their natural activity. When reason is impeded in its advertence and deliberation, and when the will is impeded in its exercise through the attraction of an outside influence, then voluntariness is not complete. Now, that is precisely what happens when concupiscence (passion) precedes the act of

intellect and will. The movements of concupiscence are usually vivid in the imagination and strong in the sensuous appetency; as such they distract the intellect in its deliberations and confuse it in its judgment. What appeals to the senses will appeal also to the intellect and will, because man is a composite organism, a unitary nature. Hence, when antecedent concupiscence is present, intellect and will are disturbed in their own proper function, and this disturbance, being an impediment to their activity, influences the free choice of the will adversely and thus lessens voluntariness.

Antecedent concupiscence at times *destroys* voluntariness completely. This happens when concupiscence (passion) is so violent that deliberation is impossible and the morality of the act can no longer be perceived. Where there is no possibility of deliberation and no perception of morality, there is no voluntariness on the part of the will. Experience proves that some people, while in a storm of excessive emotion, commit acts which plainly indicate that they are practically bereft of reason at the time; they are then said to be 'temporarily insane.' Such acts are 'acts of man' rather than 'human acts.' A man, for instance, convinced of the infidelity of his wife, may be so emotionally upset through jealousy that he kills her in a fit of rage and then commits suicide. A mother may be so overcome by grief over the death of her child that she takes her own life in despair and despondency, never giving a thought to the morality of her act. A sex-crazed individual, totally blinded by passion, may commit rape and not realize the enormity

of his act. Antecedent passion of this sort destroys voluntariness in a person.

2. *Consequent* concupiscence (passion) is always *voluntary*, because it is caused by the free decision of the will. In the first and second type, consequent concupiscence is willed 'directly'; in the third type, it is willed 'in cause.' Voluntariness in consequent concupiscence is without impediment, because the activities of intellect and free will are complete and perfect before concupiscence (passion) sets in to disturb them.

SO FAR AS *IMPUTABILITY* IS CONCERNED, WE MUST DRAW THE following conclusions.

Consequent concupiscence, since it is consented to with complete voluntariness, is always imputable. Antecedent concupiscence, when it is of such a nature that it destroys voluntariness, cannot be imputed to the will.

Antecedent concupiscence, when it lessens voluntariness, is imputable in proportion to the degree of voluntariness. This voluntariness differs, and each case must be judged on its own merits. In many cases it will be next to impossible to state in how far intellect and will are affected by the impediment of concupiscence and passion.

Fear

Fear is also a transitory impediment of the human act. *Fear* is an affective state of the mind in virtue of which a person shrinks from an impending evil considered to be difficult or

impossible to avoid. The impending evil may belong either to the sensible or spiritual order of things. Correspondingly, the faculty, in which fear resides, will be either the sensuous appetency or the will; oftentimes, both faculties are involved.

Someone is said to act *out of* fear if fear is the real cause of the action. In such a case, fear is *antecedent* to the action, because a cause is always prior to the effect which it produces.

Thus a thief, seeing himself closely pursued by the police, discards his booty so as not to be caught with it on his person; he fears that the presence of the booty on his person will definitely mark him as the thief and bring about his conviction. Someone is said to act with fear when fear merely accompanies the action, but the action itself is produced by a different cause. A soldier, for example, goes into battle with fear for his life; but he really goes into battle out of a sense of duty to his country. Such fear is *concomitant*, not antecedent. When we speak of fear as an impediment to the human act, we mean 'antecedent' fear; only actions which occur 'out of' fear are considered here, because only in such actions will fear impair proper deliberation and free choice.

There are various *kinds* of fear.

1. From the standpoint of the *quantity* of fear, fear is either *grave*, or *slight*, depending upon whether the evil is grave or slight. In order that fear be 'grave,' two conditions are required. The impending evil must be grave in itself, such as death, severe illness, considerable loss of valuable goods, and imprisonment; and this evil must be difficult to

avoid. If a grave evil can easily be avoided, or if the impending evil is of minor importance, then the fear is 'slight.' Grave fear is 'absolutely grave' if the impending evil is actually grave in itself. It is 'relatively grave' if the impending evil is only slight but produces grave fear because of the timid disposition of the fearing person. Something, for instance, may cause relatively grave fear in a child, woman, or elderly person, while it would cause only slight fear in a stouthearted, well-disciplined soldier.

2. From the standpoint of the *cause* which produces fear, fear is either *from within* or *from without*. Fear is from within if a person, because of the imminence of the evil, decides on a certain action himself; otherwise he would not so decide. The captain of a ship, for example, decides of his own accord to cast his cargo overboard, because he fears that the weight of the cargo threatens to wreck his ship in the heavy storm. Fear is from without if the fear which induces one to act is caused by another person who threatens one with evil unless the action is performed. Thus, when a man gives up his valuables to a robber who threatens to take his life, his fear is caused 'from without.' Fear from without may have a just cause, as when a mother threatens punishment to her daughter if she does not behave; or it may have an unjust cause, as when a robber demands one's valuables at the point of a gun. Fear from without is a *reverential* fear if one commits or omits an action because one fears to offend a person whom one reveres or to whom one owes reverence. A boy, for instance, may refrain from raiding the pantry because he fears he will hurt his mother's feelings; or, he may steal a neighbor's

tools, because his father demands it and would punish him if he did not do it.

IN HOW FAR IS AN ACT, PROMPTED BY FEAR, *IMPUTABLE*?

It all depends on the adverse influence which fear has on the activities of the intellect and of the free will.

It happens in rare cases that *uncontrollable* fear arises with such suddenness as to engulf reason and free will completely. In such a situation the person acts in a frenzy of panic, without thought of the morality of the act, simply intent on avoiding the imminent grave danger. An example. Fire rages in a hotel. Escape is impossible. A man is trapped in his flaming room. The torturing death by fire stares him in the face. Frenzy seizes him; he is gripped by uncontrollable fear. In a moment of extreme anguish he takes a revolver and ends his life. Under the circumstances as narrated, it is very easily possible that he momentarily lost the use of reason entirely. Such an act lacks the proper conditions of a 'human act' and becomes a mere 'act of man.' His suicide is not imputable.

In ordinary cases of fear, even of grave fear, voluntariness is not destroyed but merely *diminished* to a greater or lesser degree. Fear brings in a 'mixed' voluntariness, so that the total act is freely willed, but with a certain amount of 'conditional' involuntariness. Absolutely speaking, therefore, acts committed out of fear, unless they rob a person of the use of reason, are *imputable*. Since, however, grave fear will disturb the intellect in its impartial judgment by unduly directing its attention to the impending

evil, it interferes also with perfect free choice, and thus imputability is also *lessened*. In such cases, the degree of imputability depends on the degree of interference caused by fear, and that will naturally depend on the gravity of the evil and the disposition of the individual person.

Violence

Violence is the fourth of the transitory impediments to the human act.

Violence is physical force applied to a resisting person by an external agent. Two factors must be present in order that an act can be designated 'forced': the violence must issue from an outside principle or agency; the act must be contrary to the will, and the will must truly resist this imposition of force.

It should be obvious that the *elicited* acts of the will can never be subject to violence. He who suffers violence does something against his will. To maintain that the elicited acts of the will could be forced, would be the same as to maintain that the will could be made to will something which it does not will; that is a contradiction in terms. Hence, *only external or internal commanded acts* (see Chapter 2) can be subjected to violence. A person, for example, may be dragged into a pagan temple, and his head may be grasped by his assailants' hands and forced to bow before an idol; but his will cannot be compelled to make an act of internal adoration. A girl may be coerced to submit to a sexual act committed on her body; but her will cannot be compelled to consent to the act.

When a person is subjected to violence in the true sense of the term, the person suffering duress must not only *withhold consent*, but must, so far as possible, *actively resist* the force applied. If consent is given to the forced act, then the act is voluntarily permitted, though not originally intended. A girl, for instance, may have no intention of committing a sexually immoral act; but if undue familiarity is forced upon her, and she then gives her consent, she consents to the act itself. If active resistance, when possible, is omitted, then the omission of resistance is willed, and the act itself thereby becomes indirectly voluntary, even though direct consent be withheld. If the girl in question does not repel her assailant's immodest advances, although she could do so, she cannot be said to be altogether unwilling.

IN HOW FAR ARE FORCED ACTS *IMPUTABLE*?

Coerced external and internal commanded acts, effected through force upon an unwilling and resisting person, are completely involuntary and therefore *not imputable*.

Coerced acts, to which consent is given during performance, are simply voluntary; if no resistance is offered to them, although they could and should be resisted, they are indirectly voluntary: such acts, therefore, are *imputable*. However, since these acts would not have been performed under ordinary conditions by the person suffering violence, one may judge that there is some interference with the normal activities of intellect and free will, so that voluntariness is to some extent diminished; hence, there is a *lessened imputability* in such coerced acts.

Obviously, however, in matters of grave moral importance, imputability, though lessened in some degree, is still grave and serious.

Having concluded the discussion on the four major transitory impediments to human acts, we must now turn our attention to the permanent impediments.

Permanent Impediments

A *permanent impediment* is an impediment to the human act which lessens or prevents the advertence of the intellect and the exercise of freedom in the will in such a manner that a *more or less stable condition of involuntariness* results in a person. This permanence or stability may be absolute, so that the person is always incapable of perfect voluntariness or ,of any kind of voluntariness; or it may be relative, so that voluntariness is lessened or destroyed only for a time. But whether 'absolute' or 'relative,' the result of a permanent impediment is always a more or less 'stable condition' involving *entire series of actions*. Therein lies the difference between a 'transitory' and a 'permanent' impediment, because a transitory impediment affects only the voluntariness of 'individual' acts, not of entire series of acts.

The main *general kinds* of permanent impediments are divided into *three classes*: (1) infancy, idiocy, moronism; (2) propensities and habits; (3) mental diseases. They will be treated in this order.

Infancy, Idiocy, Moronism

This class of impediments to the human act is *constitutional*, in as much as the cause which gives rise to them is the undeveloped constitution of the human person. Man being an organism, the full use of his rational powers of intellect and will depends on the proper development of his bodily and sensory powers. If the latter are undeveloped, either totally or partially, it is evident that intellect and will cannot function properly, and voluntariness is thereby affected.

Infancy. Infancy is that period in the life of the individual human person which extends from conception to the age of reason and discretion. The brain and nervous system are in a process of development, but during this formative period the development of the senses has not become perfected enough for reason to distinguish between moral good and moral evil. Hence, *voluntariness is absent* in infancy, and all acts are neither morally good nor morally evil; they are simply 'acts of man.' The infant, of course, should be trained to do what is good and avoid what is evil, for the sake of its future moral Welfare, but the acts themselves lie outside the sphere of the Freedom of the will and as such are *not imputable*.

After the *age of discretion* has been reached, the child is able to distinguish to some extent between the morally good and morally evil, but this knowledge is very imperfect at first. It becomes more perfect as the child grows older, but it still remains relatively imperfect over a period of many years. Childhood, therefore, represents an *incomplete voluntariness* in many respects. For this reason it is

customary to speak of 'juvenile delinquency' rather than of 'juvenile crime,' and the courts take the moral inadequacy of childhood into consideration when judging the imputability of a child's act.

Idiocy. Idiocy is extreme deficiency of intelligence, commonly due to an undeveloped or abnormally developed brain. The condition may be congenital, or it may be the result of injury or illness in infancy. An idiot or imbecile, though he may have reached physical adulthood, never passes mentally beyond the stage of infancy. He is, therefore, *incapable of morality*, and his acts are not imputable.

Moronism. Moronism is a state of moderate feeble-mindedness. An adult moron may have the mental age of a child of six or eight or ten, etc. The mental development of morons is arrested. Since the adult moron has the physical instincts and passions of a grownup, coupled with the partially undeveloped mentality of a child of a much lower age, it is natural that the normal activities of intellect and will are impaired to a lesser or greater degree, depending upon the mental age of such a person. Correspondingly, volutariness is lessened, and so is imputability; volutariness, however, is not destroyed entirely.

Propensities and Habits

Propensities are natural dispositions, inclinations, drives, which are rooted in the particular kind of nervous system which the individual has inherited. Propensities are derived from the so-called 'temperaments,' at least to a large

extent. Since propensities naturally incline the person to perform a certain type of action, they often are referred to as 'inchoate habits.' Some persons have a propensity toward meekness and submissiveness, others toward anger and fighting; some toward sensuality, others toward self-discipline; some toward drunkenness, others toward sobriety; and so forth. Such propensities, since they are congenital and natural, are in themselves neither morally good nor morally evil; but they incline a person toward acts which are morally good or morally evil, depending upon the attitude of the free will.

A *habit* is a facility and readiness of acting in a definite manner, acquired by the frequent repetition of a certain kind of act. Habits are not inborn; they are acquired by practice and are superadded to the powers, so that these powers, in consequence of the acquired habit, have a distinct tendency to perform this particular kind of act. After attaining the use of reason, man deliberately forms habits. He may follow the bent of his natural propensities, going along the line of least resistance, and acquire habits which indulge in the pleasures of the passions; or he may go along the line of greatest resistance, by forming habits which run counter to his natural propensities, thereby checking and controlling the passions. The former habits weaken the will, the latter strengthen it. Habits can be made and unmade by repetition of acts. Even if a vicious habit has been active for a long time, the will can resist its promptings and form a counter-habit by frequent repetition of the opposing acts. Some habits are *natural*, when they are contracted without advertence to their moral effects;

others are moral, when they are contracted and retained with advertence to their moral effects. The latter will be 'morally good' or 'morally bad.'

Under the heading of 'habits' should also be included the *permanent mental attitudes* which persons may acquire as the result of indoctrination through a false educational system, such as was fostered in the education of children under the Nazi regime in Germany and is still in vogue in communistic Russia.

SO FAR AS *IMPUTABILITY* IS CONCERNED REGARDING PROPENSITIES and habits, the following considerations will help to clarify the question.

Propensities, simply as such, are organic and natural, and therefore morally indifferent. Consequently, their initial promptings and movements are *involuntary* and *not imputable*. Thus, the urges to immodesty, anger, drunkenness, pity, generosity, etc., arising from a natural propensity, are in themselves neither morally good nor morally bad; they become so, however, as soon as the intellect adverts to them and the free will accepts or rejects them. Then, of course, they become voluntary and are imputable to the will. If such propensities are strong, they interfere with the unrestricted activity of intellect and will and in so far, depending upon their strength, are an impediment to the human act.

Habits are acquired. They are formed through the exercise of the will, unless contracted in early childhood or without adequate knowledge of their moral character. Once

they are formed, habits lead more or less spontaneously to their respective acts. Acts performed through habit usually occur without much advertence on the part of the intellect, and in many instances advertence is absent altogether. Are evil acts performed through force of habit imputable?

The *principles* governing the imputability of *habitual evil acts* can be summarized as follows:

First, an act proceeding from an evil habit, if adverted to and consented to, is directly voluntary and imputable. A man, for example, may have the evil habit of using God's name in vain; if he adverts to the fact that he is here and now using God's name in vain and deliberately does it, the act is voluntary.

Second, if an evil habit has been contracted involuntarily, then an act performed through this habit is also involuntary and not imputable. A child, for example, in his ignorance of sex forms the habit of handling himself immodestly; all acts which are performed in this state of ignorance, or which are performed inadvertently after acquisition of the necessary knowledge, are not voluntary. If the evil habit has been contracted with full knowledge and consent, then the single acts performed inadvertently are not imputable; but the evil habit itself is imputable, when no effort is made to counteract it. For instance. A soldier, in order to appear 'tough,' deliberately forms the habit of using obscene expressions. Once the habit is formed, the single acts of using such expressions, when done without advertence, are not imputable; but the evil habit as a whole is imputable until such time as he makes an effort to break it.

Third, an evil habit, knowingly and freely contracted, is directly voluntary and imputable, as when a boy deliberately gets into the habit of cursing. If an evil habit is already contracted, and no effort is made to check it and get rid of it, it remains voluntary and imputable. If, for example, the boy just mentioned has contracted the evil habit of cursing and does not bother about it in any way, he remains guilty of the evil habit.

Fourth, if an evil habit has been voluntarily contracted, but an effort, proportionate to the gravity of the habit, is made to counteract it and dispose of it, then the habit itself and the single acts inadvertently proceeding from it are not voluntary and are not imputable. If a soldier, for example, after having deliberately formed the habit of using obscene words, realizes his error and endeavors to check himself in the use of such language, neither the habit nor the inadvertent use of obscene words is voluntary any longer.

Mental Diseases

Neither the intellect nor the will, since they are spiritual powers, is subject to any kind of diseases. Only an organism can become diseased. Since man's nervous system and his sensory powers are organic, they are subject to disorder and disease. By *mental diseases*, therefore, we understand disorders and abnormalities of the brain and nervous system, resulting in disturbances in the sensory powers of knowledge and appetency and involving indirectly a consequent disturbance in the proper functions of the intellect and will. Some mental diseases are 'functional' in

character; they are characterized by abnormality in the functioning of organs, though the organs themselves manifest no pathological degeneration or change. Others are 'organic,' in as much as the organs are affected by pathological degeneration or change.

It is not within the province of ethics to give a complete treatise on psychiatry nor to give a complete enumeration of mental diseases. Psychiatrists are by no means in agreement as to the exact number and nature of mental disorders or even of nervous abnormalities. Some disorders are serious and others are of minor importance. Some involve only a slight disturbance of sensory function and others involve the complete disorientation of the person's mental outlook. The term 'mental disease' does not necessarily mean 'insanity' in the popular use of the word; it includes 'insanity,' but it also includes many nervous disorders of a far less serious character. Many of us suffer from nervous disorders of some sort, but we are not on that account insane; we are aware of our disorders and somehow adjust ourselves to their inconveniences and disturbances, leading an otherwise fairly normal life.

Some nervous disorders result in a state of practically *complete mental derangement*. Persons afflicted in this manner are incapable of proper judgment in matters of morality. Whatever acts they perform must be considered 'acts of man, and such acts are devoid of voluntariness and imputability.

Some nervous disorders result in *irrational conduct* only *along certain lines*; in other respects persons subject to such disturbances are capable of rational judgment and

freedom of will. Acts performed because of this particular type of disorder are involuntary; others are voluntary, but voluntariness probably will be diminished.

Any type of mental disorder, if it lessens the unrestricted activity of intellect and will, in so far also lessens voluntariness and imputability.

The summary of this discussion on the impediments to the human act can be made in a few words.

The general principles are few and can be stated clearly. The application of these principles to particular acts frequently is difficult and in many instances next to impossible. Transitory and permanent impediments to voluntariness undoubtedly exist. But only God actually knows the complete case history of every act and its imputability.

Summary of Chapter IV

Impediments to the human act are those factors which impair the perfect knowledge of the intellect and the perfect consent of the will in moral matters. There are two main classes: *transitory* and *permanent*.

1. *Transitory (Actual) Impediments*. These impediments affect individual human acts, thereby preventing or diminishing full freedom of the will in regard to moral acts. There are four transitory impediments: ignorance, concupiscence, fear, violence.

2. *Ignorance*. Ignorance is the lack of required knowledge in moral matters.

There are various *kinds* of ignorance. From the standpoint of the *object*, it is an ignorance either of 'law' or of 'fact.' From the standpoint of the *subject*, ignorance is either 'invincible' (physically or morally), when it cannot be removed; or 'vincible,' when it can be removed with the effort customarily applied by prudent and conscientious persons, and such ignorance is either 'simply' vincible or crass ('supine') or 'affected.' From the standpoint of the *action* itself, ignorance is twofold: with reference to the causal influence of ignorance on the action, it is either 'antecedent' or 'concomitant'; with reference to the causal influence of the will on ignorance, it is either 'antecedent' or 'consequent.'

So far as *imputability* is concerned, the following principles apply. All actions performed in invincible

ignorance are involuntary and not imputable. Vincible ignorance does not destroy voluntariness, but lessens it.

3. *Concupiscence or Passion.* *Concupiscence* is the natural tendency of sensuous appetency toward a consciously perceived sensuous good and away from a consciously perceived sensuous evil. *Passion* is the emotional excitement which normally accompanies the sensuous appetency in its activity of striving for a sensuous good and of avoiding a sensuous evil. Concupiscence and passion are 'natural' tendencies acting with necessity.

There are two *kinds* of concupiscence and passion: 'antecedent,' when they occur prior to any act of the free will in their regard; 'consequent,' when they occur after an act of the free will in their regard.

Imputability. 'Antecedent' concupiscence lessens voluntariness and at times destroys it. 'Consequent' concupiscence is always voluntary, either directly or in cause.

4. *Fear.* Fear is an affective state of the mind in virtue of which a person shrinks from an impending evil considered to be difficult or impossible to avoid. When fear is the 'cause' of an action, it is 'antecedent'; if it merely 'accompanies' an action, it is 'concomitant.'

There are various kinds of fear. From the standpoint of *quantity*, it is either 'grave' or 'slight.' From the standpoint of the cause, fear originates either 'from without' or 'from within.'

Concerning the *imputability* of actions performed through fear, if uncontrollable fear robs a person of the use of reason, the action is involuntary and not imputable;

otherwise, actions are imputable, but voluntariness is lessened.

5. *Violence*. Violence is physical force applied to a resisting person by an external agent. The 'elicited' acts of the will are not subject to violence; only 'external' or 'internal' commanded acts can be coerced. The person suffering duress must withhold consent and, so far as possible, actively resist the force applied.

Coerced external and internal commanded acts are involuntary and *not imputable*, provided the person withholds consent and resists. If consent is given, or no resistance (where possible) is offered, acts are *imputable*; but in such cases, voluntariness is lessened.

6. *Permanent Impediments*. Besides 'transitory' impediments, there are 'permanent' impediments. A *permanent* impediment is one which lessens or prevents the advertence of the intellect and the exercise of the freedom of the will in such a manner that a more or less *stable condition* of involuntariness results. There are three classes: infancy, idiocy, moronism; propensities and habits; mental diseases.

7. *Infancy, Idiocy, Moronism*. In the actions of *infants* voluntariness is absent. Even childhood represents an incomplete voluntariness in many respects. *Idiots* are incapable of morality. *Morons* suffer from an arrested mental development. Though voluntariness in morons is not destroyed entirely, voluntariness is lessened considerably.

8. *Propensities and Habits*. *Propensities* are natural dispositions rooted in the particular kind of nervous system which the individual has inherited. A *habit* is a facility and

readiness of acting in a definite manner, acquired by the frequent repetition of a certain kind of act.

So far as imputability is concerned, the initial promptings and movements of propensities are *involuntary*, because natural; but as soon as the intellect adverts to them and the free will accepts or rejects them, they become voluntary and imputable.

The following *principles* govern the imputability of acts performed through force of *habit*.

First, such an act, if adverted to and consented to, is voluntary and imputable. *Second*, if an evil habit has been contracted involuntarily, an act performed through habit is involuntary; if the habit has been contracted voluntarily, the single acts performed inadvertently are not imputable, but the habit itself is imputable, when no effort is made to counteract it. *Third*, an evil habit, knowingly and freely contracted, is directly voluntary and imputable. *Fourth*, if an evil habit has been contracted voluntarily, but a proportionate effort is made to counteract it, then the habit itself and the single acts inadvertently proceeding from it are not voluntary and are not imputable.

9. *Mental Diseases*. By *mental diseases* we understand disorders and abnormalities of the brain and nervous system, resulting in disturbances in the sensory powers of knowledge and appetency and involving indirectly a consequent disturbance in the proper functions of intellect and will.

If nervous disorders result in *complete mental derangement*, acts performed in such a condition are devoid of voluntariness. If nervous disorders result in

irrational conduct only *along certain lines*, acts performed in such a condition along these lines are involuntary; other acts are voluntary, but voluntariness probably will be diminished.

Chapter 5

ENDS OF THE HUMAN ACT

AN ACT, TO BE TRULY HUMAN AND MORAL, MUST BE PERFORMED by man with advertence on the part of his intellect and with free choice on the part of his will. Whatever destroys or diminishes the proper activity of the intellect and will, also destroys or diminishes voluntariness and thereby the morality of the act thus influenced.

We now come to the consideration of the *end of the human act*. The morality of a human act receives a definite character from the end on account of which it is performed; that is to say, the rightness or wrongness of a human act is determined to a great extent by the end or goal toward which the act tends.

From the ethical standpoint, an *end* is *that for the sake of which an advertent intellect and a free will act*; or, to put it in different words, an 'end' (purpose) is that which an advertent intellect and a free will intend in their action; or, to simplify matters still more, an 'end' (purpose) is that which man intends when he acts intelligently and freely.

Kinds of Ends

Since the end or purpose plays such an important part in the human act, an understanding of the various *kinds of ends* is necessary.

The End Which and the End for Which (Whom). The *end which* is intended is the *good itself* which is striven for as the end to be realized by the efficient cause (the 'agent') through the action. When a man builds a house, the house itself is the 'end which' he has in view as the final result of his action of building. The *end for which (or whom)* is the *thing* or *person* that is to benefit by the acquisition or realization of the 'end which' is acquired or realized. When a man builds a house, he may build it as a home for his family or he may build it to sell it at a profit; either purpose would be the 'end for which' he built the house.

Proximate End, Remote End, intermediate End, Ultimate End. So far as this division and classification is concerned, two or more ends are always presupposed, with a relation between them of nearness or remoteness regarding the final result intended. An end is *proximate*, if it is referred to some ulterior end, but has no other end referred to itself. When a man builds a house, the proximate end is the completed house itself. An end is *remote*, if one or more ends are referred to it. And this remote end will be either an 'intermediate' or an 'ultimate' end. The remote end is *intermediate*, if some other end is referred to it and it is itself referred to some ulterior end. A man builds a house (which is his proximate end), in order to have a comfortable home for his family (intermediate end), so that his family may enjoy earthly happiness (ulterior end). A remote end will be *ultimate*, if it has one or more ends referred to itself,

while it is not itself referred to any other end. This ultimate end will again be either 'relatively' or 'absolutely' ultimate. It is *relatively ultimate* when it is the last end in a particular series of ends. In the example just given, the 'ulterior' end mentioned may be the relatively ultimate end of that particular series of proximate and intermediate ends. If that be the case, then for the builder it is the earthly happiness of his family. An end is *absolutely ultimate* when it is the last end of all proximate and intermediate ends in every series, so that no further ulterior end or purpose can be conceived for which to tend. Subjectively, the builder, in his private estimation, may consider the relatively ultimate end just mentioned as the final goal of all his aspirations; in that case, his relatively ultimate end, as given, would coincide with his absolutely ultimate goal. Objectively, however, his absolutely ultimate end actually would be his eternal happiness and the glory of God.

Primary and Secondary End. An end is the *primary* or principal end, when it is the main one among two or more which actuate an agent (efficient cause) and is sufficient of itself to make the agent act. It is secondary or accessory, when it is intended together with a primary end, without however exerting the same potent influence on the action of the agent. Thus, the primary end of a man building a house may be the comfort of his family, and the secondary end may be the enjoyment of the scenic surroundings in which the house is situated.

End of the Act (finis operis) and End of the Agent (finis operantis). The 'end of the act' is that particular end which is present in the act itself and which the act as such tends

to realize because it is this particular kind of act. For instance, the 'end of the act' of building a house is the actual building of the house. The 'end of the agent' is the end or purpose which induces the agent as a motive to perform this particular kind of act. For instance the 'end of the agent' for the builder of a house may be the motive of an investment or the happiness of his family. Ordinarily, the 'end of the act' is simply called the *object* of the action.

Objective End and Subjective End. We understand by the 'objective end' the 'object' or 'thing' itself which is striven for and realized as the result of purposive action. For the builder of the house the objective end is the completed house. We understand by the '*subjective* end' the 'possession' of the objective end and the personal satisfaction or happiness which accompanies this possession. For the builder of a house the subjective end is the possession of the completed house and the satisfaction he experiences in having it.

Natural End and Supernatural End. An end is said to be natural, if it lies within the tendencies and powers of the nature of the agent to strive for this end and realize it. The builder constructing a house has a 'natural end' in view, because he is capable of realizing his purpose by using the tendencies and powers of his nature as a rational being. An end is *supernatural* if it lies beyond the tendencies and powers of the nature of an agent to strive for this end and to realize it. The builder would have a 'supernatural end' in view, if' he performed his respective activities for the purpose of working out his eternal salvation and attaining the happiness of the Beatific Vision. He could not realize

such an end through the tendencies and powers of his nature; for this he requires the special guidance of faith and the special assistance of divine grace. A supernatural end presupposes the supernatural order. Since ethics is restricted in its knowledge to facts of the 'natural' order, nothing further will be said in this connection about the supernatural end.

All Actions Are for Ends

To state that all actions are for ends is equivalent to saying that every agent, when it acts, *always intends an end*. And this end is a *definite* end.

Every agent, when it acts, is in *movement*, either quantitatively or qualitatively. Quantitative movement is local motion'; qualitative movement is 'change' of some sort. In both cases, movement presupposes the passage in action from a starting-point (*terminus a quo*) to a stopping-point (*terminus ad quem*). Starting-point, stopping-point, and the passage between the two points, are the essential elements of every movement; if any one of these elements were missing, there would be no true movement.

St. Thomas Aquinas, with his usual clarity of thought,¹ formulates the general argument in this manner: "The movement of every agent tends to something determinate, since it is not from any force that any action proceeds, but heating proceeds from heat, and cooling from cold; and therefore actions are different by their active principles. Action sometimes terminates in something made, as for instance building terminates in a house, and healing in

health; while sometimes it does not so terminate, as for instance in the case of understanding and sensation. And if action terminates in something made, the movement of the agent tends by that action toward the thing made; while if it does not terminate in something made, the movement of the agent tends to the action itself. It follows therefore that every agent intends an end while acting, which end is sometimes the action itself, sometimes a thing made by the action." A little farther on in his text St. Thomas puts the argument this way: "Were an agent not to act for a definite effect, all effects would be indifferent to it. Now that which is indifferent to many effects does not produce one rather than another. Therefore, from that which is indifferent to either of two effects, no effect results, unless it be determined by something to one of them. Hence it would be impossible for it to act. Therefore every agent tends to some definite effect, which is called the end."

Human acts are simply a special kind of action. And if all actions must tend toward a definite effect as an end, then the human act must also tend toward a definite end. An analysis of the human act makes this evident. Every human act presupposes the advertence of the intellect to the contemplated action, otherwise it would not be a 'human' act. Since the intellect must be aware of the contemplated action, it must also be aware of what is supposed to be effected by the action, because no action can be without a definite effect. Consequently, when the intellect knows of the contemplated action and the will freely decides to perform the action, the will must also intend the definite effect which the action by its nature produces. This effect,

however, is the 'end' of the action. Hence, every human act has a definite end. For example. I point a loaded revolver at a person standing close by. I know that the revolver is loaded and I also know that, if I fire the weapon under such circumstances, the bullet will cause considerable injury to the person at whom the revolver is aimed. The contemplated action is the firing of the weapon; the *injury* is foreseen as the definite effect of the action. Knowing all this, if I decide to fire the revolver, I must also intend the effect which the firing will produce, namely, the injury of the person whom the bullet will hit, because this injury is the natural and inevitable result of the contemplated action. Since I will this definite action, I also will this definite end (effect) of the action. And thus it is with all human acts; they must have a definite end. The reason is clear: man, acting with and through the knowledge of his intellect, *knows beforehand* what the effect (end) of his action will be and thereby freely decides to produce this definite effect (end) of his action.

Every agent, therefore, and especially man in his human act, acts for an end.

There is an important truth in this principle. The end or purpose is not something extraneous and foreign to the action, not something super-imposed upon it and added to it; *the end is an integral and essential part of the very action itself* and can no more be separated from it than the curved line can be separated from a circle. Take away the end from an action, especially from a 'human act,' and there can be no action; given the action, the end (purpose) is also given. The end is simply *the term* of the action; it is the

point of realization of the action in its final completeness; it is the stopping-point which brings the movement of the action to a state of rest, because the intended goal has been reached.

Object, Circumstance, End

There are *three elements or determinants* which contribute to the morality of a human act; that is to say, there are three factors which determine the 'rightness' or 'wrongness' of a concrete individual human act. They are: the *object*, the *circumstances*, and the *end of the agent*.

THE OBJECT

The *object* of the moral act is that which the will intends *directly and primarily*. This object may be a thing, such as money; or an external act, such as going to a show; or an elicited (internal) act, such as the will to love God. The circumstances and the end are also intended but not so directly and primarily as the object.

Human acts receive their morality *essentially from the object* which is intended by the will, so that human acts receive their specific moral character principally from the object willed. The reason for this lies in the fact that the faculties of man are moved to action primarily and specifically by the object, rather than by the circumstances of the act or the end of the agent. A man, for instance, who steals money in order to get drunk, simply commits an act of theft, because the object (taking money belonging to

another), and not the end or purpose (to get drunk), is the primary element in the act of stealing.

Some objects are *intrinsically* and by *nature* good or evil, others are so *incidentally* and by reason of a *precept*. The former, therefore, are always and under all conditions good or evil; the latter are not always, or at least they need not always be, good or evil. The former, if good, are prescribed because they are good in themselves, or forbidden, if evil, because they are evil in themselves; the latter are good because prescribed, or evil because forbidden. To love God, for instance, is intrinsically and by nature good; to perjure oneself is intrinsically and by nature evil. Doing a chore around the house is morally good if done because commanded by one's parent; going to a show is morally evil if forbidden by one's parent while one is still under the authority of the parent.

Again, some evil objects are *absolutely evil*, so that not even God can make them right and good. This sort of evil is intrinsically and by nature evil, independent of any condition, such as perjury and blasphemy, because God cannot countenance a direct insult to his person. Some evil objects are *conditionally evil*; if the condition is removed they are no longer evil. Some acts against human beings are ordinarily evil, such as killing and taking another's property against his will, because these acts violate God's supreme dominion over creatures; if God, however, removes this condition of dominion, then the acts would not be wrong. In a case of extreme necessity, for instance in facing death through starvation, the ordinary right to private property no longer holds and the starving person

may take surplus goods from another in order to avoid death by starvation. Similarly, dominion over human life rests in God, and this condition obtains as a general rule binding all people; this condition is lifted, however, in the case of unjust aggression, and it is therefore right to kill a person who unjustly attempts to take another's life, and it is right for a soldier in a just war to kill the enemy.

Finally, we distinguish between the *material* and the *formal* object of the will. The 'material' object is the object itself, considered merely in itself, as intended by the will. If I desire or take another's property, then this 'property,' considered in itself, is the 'material' object of my will-act. The 'formal' object is the material object in so far as it is intended with full knowledge of its moral character as right or wrong. I see for example, a fine overcoat in a restaurant which belongs to someone else; if I take the overcoat, with full knowledge that I am stealing, then the overcoat is the 'formal' object of my will-act. This distinction is important. If I take another's property while under the impression that it belongs to me, I commit a 'material' theft, but not a 'formal' theft, and my act is not immoral and blameworthy. Contrariwise, if I take my own property while under the impression that it belongs to someone else, I commit a 'formal' theft, because of my evil intention to steal, and my act is immoral and blameworthy, even though I am actually taking what rightfully belongs to me.

THE CIRCUMSTANCES

Circumstances are conditions superadded to the essence or nature of the moral act and affect its morality. There are seven universally recognized circumstances, expressed in Latin in the well-known hexameter: *Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando*.

Any one of these various circumstances may make a difference in the morality of an act.

Quis? Who? This circumstance indicates any special quality of the person involved in the moral act. It is worse, for instance, to strike one's parent than to strike a neighbor.

Quid? What? This circumstance indicates the quantity or quality of a moral object. It makes a difference, for instance, if I steal five cents or five thousand dollars.

Ubi? Where? The place is denoted where the act occurs. Because of scandal, for instance, it is worse to use foul language in a public gathering than in a small group; similarly, it makes a difference, whether I commit a crime in a church or in a tavern.

Quibus auxiliis? By what means? Here we consider the means used in the act. If I desire to get drunk, that is bad enough; but if I steal the liquor in order to have the means to get drunk, that makes matters much worse.

Cur? Why? The 'end' or 'purpose' here is considered as a circumstance affecting the morality of the action. The 'end' however, is an integral part of every moral act and as such will be treated separately.

Quomodo? How? This circumstance denotes the manner in which the action is performed. For instance, the moral act will be influenced considerably if performed advertently

or inadvertently, in good or in bad faith, impulsively or with premeditation, with fervor or with reluctance, intensely or remissly, etc.

Quando? When? This refers to the time involved in the action, both as to the quantity and the quality of the time element. It makes a difference, for example, to the sentiment of hatred whether it is entertained for a few minutes or for years; whether it is entertained during divine services or otherwise.

Circumstances contribute to the morality of an act in a *fourfold* way: An 'indifferent' act may become morally good or evil through the attending circumstances. To go to a tavern is, in itself, an indifferent act; but if I go there to hinder a friend from becoming intoxicated, it is a good act. On the other hand, if I go to a tavern, knowing that I will drink intemperately, the act of going to the tavern becomes wrong.

An 'objectively good' act may become morally evil. To attend divine services, for example, is an objectively good act; but if I do so contrary to a conscientious physician's strict orders, it becomes evil.

An act whose object is 'morally good' may receive an added goodness because of some circumstance, and an act whose object is 'morally wrong' may receive an added wrongness because of some circumstance. For instance, to practice total abstinence is a morally good act of temperance; to practice total abstinence because I have made a vow to do so is an act of temperance and of religion. Reversely, to become drunk is a morally evil act against temperance; to become drunk, although I have vowed to

observe total abstinence, is a sin against both temperance and religion.

Circumstances may make an 'objectively good' act more good or less good and an 'objectively evil' act more evil or less evil. If I give an alms with great charity of heart, my almsgiving becomes more good; and if I give an alms somewhat grudgingly, my almsgiving is less good. If I use God's name profanely because I want to shock someone's pious susceptibilities, the evil act becomes more evil; but if I do so under the stress of great provocation, the evil act becomes less evil.

THE END OR PURPOSE

In this connection we take the term 'end' or 'purpose' in the sense of the *end of the agent* which prompts the person to act. That the 'end' or 'purpose' affects the morality of an act in its very essence, is clear. All human acts, whether internal or external, are manifestations of the will, and the 'end' or 'purpose' is an expression of the attitude of the will. The attitude of the will may be good or evil, and this attitude will show itself in the 'end' or 'purpose' with which the will intends the act. If this 'end' or 'purpose' corresponds to the right order, the will is right and good; if it deviates from the right order, the will is wrong and evil.

The end contributes to the morality of the act in a *number of ways*:

An 'objectively indifferent' act will become good through a good intention (end, purpose) and evil through an evil intention. To visit a sick friend is, in itself, an objectively

indifferent act. To visit this person in order to give him cheer and comfort is an act of mercy and a good act; but to visit him in order to aggravate his condition is an act of cruelty and an evil act.

An 'objectively good' act receives added goodness from a good intention (end, purpose). To give an alms to a needy person is an act of charity; to do this with the intention of also pleasing God increases the moral goodness of the act.

An 'objectively good' act, if done with an evil intention, becomes either totally or partially evil, depending on whether the evil intention is the total or only the partial cause why the agent acts. If the evil intention of the agent is the total and sole cause of the act, so that the act would not otherwise be performed, then the entire act is vitiated and becomes evil; the reason is that in such a case the will is actuated solely by an evil intention and intends primarily nothing but evil. For a young man, for instance, to offer himself as an escort to a girl, to see that she arrives home safely, is in itself an objectively good act; but if his total intention is to seduce her, his evil intention makes his act evil. If the evil intention is only the partial cause of the act and only slightly evil, the act is essentially good but partially evil. For example, if I give alms to a destitute person with the intention of relieving his distress, but also with the vainglorious intention of having him praise my generosity, my act is partly good and partly evil. Of course, if the evil intention, which is the partial cause of the act, is seriously evil, the total act is seriously evil and the objectively good act becomes totally vitiated. For example, if a man give alms to a destitute girl with the genuine intention of relieving her

poverty, but also with the intention of inducing her to become his mistress, his partial intention is seriously evil, and even his act of generosity becomes seriously evil; such an act cannot please God, when his will has turned completely against God.

An 'objectively evil' act cannot become good through a good intention (end, purpose). The reason is evident. The act is objectively evil in itself and it remains evil. This fact is not changed through a good intention. The will would still intend an evil, even though the objective evil is chosen as a means to realize a good end. The act would not, of course, be as evil as an objectively evil act willed with an evil intention, but it remains essentially evil nevertheless. The principle, then, that a good intention justifies an evil means, is a morally vicious principle. It would, for instance, be morally wrong to perjure oneself in order to help a friend out of his difficulties. It is also wrong to tell a 'white lie' in order to avoid unpleasantness. And a man may not embezzle funds for the laudable purpose of procuring a good education.

For an act to be truly morally good, therefore, it must be good in all its elements: object, circumstances, end. All three elements contribute their respective share to the morality of the human act. The defect of any of these three elements makes an act morally wrong. But since an act is human and moral only because it proceeds from the deliberately free will, morality resides formally in the will. In the will it is the 'end' (purpose, intention) which moves the will to action. "Consequently," as St. Thomas² argues, "the species of a human act is considered formally with

regard to the end, but materially with regard to the object of the external action.” Hence the vital importance of the ‘end’ as the determining factor in the morality of the human act, viewing the act as the direct product of the will.

The End as a Good

Aristotle begins his *Nicomachean Ethics*³ with the statement: “Every art and every inquiry, and similarly every action and pursuit, is thought to aim at some good; and for this reason the good has rightly been declared to be that at which all things aim.

If the good is “that at which all things aim,” it can only be for the reason that such an object is desirable because it is in some manner *suitable* to the being striving for it. It is characteristic of every type of appetency to strive for things under the aspect of a ‘good’ and to shun things under the aspect of an ‘evil.’ To shun an evil is merely the result of every appetency’s inevitable tendency to strive for a good. Now, to say that an appetency strives for a good is the same as to say that an appetency has the good as the ‘aim’ or ‘goal’ or ‘end’ of its striving. Hence, whatever is the ‘end’ of an appetency in its striving must be intended under the aspect of a ‘good.’ Consequently, the ‘end’ of an action is always a ‘good.’

The same principle applies to human acts, but with a qualification. The will can strive only for that which the intellect proposes to it as a ‘good.’ The intellect, however, can be mistaken in its judgment and propose something to the will which is an *apparent* good rather than a *real* good.

That is why it is possible for the will to strive for a morally evil object. Even a morally evil object may be viewed by the intellect as a good under a certain aspect of its being; for instance, although the intellect recognizes the object as morally evil, it recognizes it also as a physical good and as such proposes it to the will as an 'end' for its action, considering the immorality of the object to be of less importance than its physical goodness. Emotion and passion contribute toward the false estimation of the intellect and sway the will to decide in favor of the morally evil object. But whether the 'end' of the will's action be a morally good or evil object, the 'end' of the will's action is a 'good,' either real or apparent. The will, as an appetency, cannot strive for anything except as a good' in some form. Hence, the 'end' of the will's action is a good (real or apparent).

No Infinite Number of Ends

In the manifold series of human acts, must there be some good which is the 'absolutely ultimate end' to which all other ends in the series are subordinated? Or, is it possible that all ends of human acts are 'intermediate ends' leading interminably toward other ends, without being directed toward some 'absolutely ultimate end'?

Such a theory of 'intermediate ends without an absolutely ultimate end' implies an *infinite number of intermediate ends*. If a 'last end' were reached, the series would stop, and the number of intermediate ends would be terminated; if there were no 'last end' to reach, the series would continue, and the number of intermediate ends

would go on increasing. Hence, if there were a 'last end,' the number of intermediate ends would be finite and could be counted out; but if there were no 'last end,' the number of intermediate ends would of necessity not be finite but infinite. It follows, then, that a theory of 'intermediate ends without an absolutely ultimate end' implies an infinite number of intermediate ends.

The problem, therefore, is this: *is an infinite number of ends in a series possible?*

An end is that *for the sake of which* something is done or effected. Every action is for an end, and every end is a good. If the end is missing,, no action can occur; and if there be no 'good' for the sake of which the action occurs, there is no end to strive for by means of the action.

Every series of intermediate ends must be directed toward a *determinate good* 'for the sake of which' they operate as means, so as to bring about its realization. No matter how long such a series of ends may be, even if it were supposedly infinite, no intermediate end can operate as a means toward the realization of *something that cannot be realized*. Now, in an infinite series of intermediate ends there is no ultimate end to be realized. Consequently, since all the ends of an infinite series would be only intermediate ends acting as means, there is nothing for them to realize; they cannot operate, and there is no reason for their existence. But if there is no reason for their existence, they cannot exist. In order to exist, therefore, *there must be an ultimate end* for them to realize. An ultimate end, however, implies a stopping-point in the entire series of ends, beyond which these ends do not go; and such a series is not infinite,

but finite. Hence, a series of intermediate ends, in order to exist at all, must be a finite series with an ultimate end toward which they all tend.

It follows, therefore, that an *infinite series* of intermediate ends is *impossible*. And since we are concerned here with all ends of all human acts, it also follows that it is impossible for them to be intermediate ends leading interminably toward other ends, without being directed toward some absolutely ultimate end. Now, the last end of all proximate and intermediate ends in every series, so that no further ulterior end can be conceived for which to tend, is the 'absolutely ultimate end.' It follows, therefore, that there must be *an absolutely ultimate end of all ends of all human acts*.

Man's Basic End

Man is a complex being. A composite of body and soul, he is endowed with manifold powers. Some of these powers are vegetative, some sensory, and some rational. Some are cognoscitive, others are appetitive. All strive in their own fashion for their respective good; the ends of all differ in many respects. Yet man is a unitary substance, and the various powers conspire toward the general well-being of the individual.

Individuals strive for many things — wealth, pleasure, honor, leisure, work, knowledge, virtue, power, and a host of other things. From morning until night, year in and year out, from youth until old age. man is always seeking to acquire or achieve something. Why this ceaseless striving?

What does man really want? Is there some fundamental objective, some basic end, to all these uninterrupted activities and tendencies?

Since all men possess the same essence and nature, notwithstanding their individual differences in activities and tendencies, it appears to be a foregone conclusion that all men have some basic end which is the key to all their striving. It is not difficult to designate this all-embracing end:

the fundamental objective of all man's endeavors, the *basic end* of all his activities and tendencies, is *happiness*.

The ancients recognized this fact. Aristotle⁴ has summed up the argument for happiness as the basic end of man tersely and clearly.

"Since there are evidently more than one end, and we choose some of these (e.g., wealth, flutes, and in general instruments) for the sake of something else, clearly not all ends are final ends; but the chief good is evidently something final. Therefore, if there is only one final end, this will be what we are seeking, and if there are more than one, the most final of these will be what we are seeking. Now we call that which is in itself worthy of pursuit more final than that which is worthy of pursuit for the sake of something else, and that which is never desirable for the sake of something else more final than the things that are desirable both in themselves and for the sake of that other thing, and therefore we call final without qualification that which is always desirable in itself and never for the sake of something else.

“Now such a thing happiness, above all else, is held to be; for this we choose always for itself and never for the sake of something else, but honor, pleasure, reason, and every virtue we choose indeed for themselves (for if nothing resulted from them we should still choose each of them), but we choose them also for the sake of happiness, judging that by means of them we shall be happy. Happiness, on the other hand, no one chooses for the sake of these, nor, in general, for anything other than itself.”

Though ‘happiness’ is rightly considered to be the basic end of man’s striving, there still remains a big problem to solve. Wherein does ‘happiness’ really consist? Can it be acquired? And if so, how and when and where? Can it be acquired by itself or only through and with something else? The solution of this problem is naturally of vital importance to man, because upon it depends the total ethical direction of all man’s activities and tendencies. The problem of the *absolutely ultimate end of man* will be the subject next to be considered.

Summary of Chapter V

The morality of the human act receives a definite character from the end. From an ethical standpoint, an 'end' is 'that for the sake of which an advertent intellect and a free will act.'

1. *Kinds of Ends.* We distinguish between various kinds of ends: the 'end which' and the 'end for which (whom)'; proximate, remote, intermediate, ultimate end, and the ultimate end is either 'relatively' or 'absolutely' ultimate; primary and secondary end; the 'end of the act (*finis operis*)' and the 'end of the agent (*finis operantis*)'; objective and subjective end; natural and supernatural end.

2. *All Actions Are for Ends.* In human acts, since the intellect must be aware of the contemplated action, it must also be aware of the effect of the action, because no action can be without a definite effect. Hence, the will, in willing the action, also must will the definite effect of the action. This effect is the 'end' of the action. Hence, every human act has a *definite end*, and this end is an *integral part of the action itself*.

3. *Object, Circumstance, End.* These are the *three elements or determinants*, which affect the morality of the concrete individual act.

The Object. It is that which the will intends directly and primarily.

The Circumstances. They are conditions superadded to the essence of the moral act and affect its

morality. Such circumstances are: Who? What?
Where? By what means? Why? How? When?

The End or Purpose. Here we take 'end' in the sense of the end of the agent. It affects morality in a number of important ways.

For an act to be morally good, the object, the circumstances, and the end must all be good; the defect of one of these elements makes the act morally evil.

4. *The End as a Good.* The good is that at which all things aim, because it is suitable to the being striving for it. That an appetency strives for a good means that the good is the 'aim' or 'end' of its striving. Hence, the 'end' of an action is always a 'good,' either real or apparent. Even when the will strives for something objectively evil, it strives for it under the aspect of a 'good.'

5. *No Infinite Number of Ends.* Is it possible that all ends of human acts are 'intermediate ends' leading interminably toward other ends, without being directed toward some 'absolutely ultimate end'? Such a theory implies an *infinite number* of intermediate ends. But an infinite number of intermediate ends is *impossible*.

An end is that 'for the sake of which' something is done or effected. An intermediate end is a *means* to realize the next end in the series. Every series of intermediate ends must be directed toward a determinate good 'for the sake of which' they operate as 'means,' so as to bring about its realization; they cannot operate toward the realization of *something that cannot be realized*, because they would then have no reason for their existence. But in an infinite

series of intermediate ends there is no ultimate end and therefore nothing to realize. Hence, these intermediate ends cannot operate. In order to exist and operate, there must be an ultimate end of this supposedly infinite series. It follows, therefore, that there must be an *absolutely ultimate end* of all ends of all human acts.

6. *Man's Basic End*. Man is a complex being, endowed with manifold powers, activities, and tendencies. The 'basic end' of all human activity is happiness.

Chapter 6

MAN'S ULTIMATE END

THERE MUST BE AN *ABSOLUTELY ULTIMATE END* TOWARD WHICH the single human acts, taken individually and collectively, tend; and, since every end is a good, there must be an *absolutely ultimate good* which serves as the absolutely ultimate end toward which all human acts tend. The basic end of man being happiness, this happiness depends on the absolutely ultimately good toward which all human acts tend. Now a good can be viewed both objectively and subjectively.

The absolutely ultimate *objective* good is that supreme good through the acquisition and possession of which man obtains his supreme happiness. The absolutely ultimate *subjective* good is man's supreme happiness itself which man obtains through the acquisition and possession of the supreme objective good. This part of ethics which treats of the supreme happiness of man is called *eudaemonology* (Gr., *εὐδαιμονία*, happiness, and *λόγος*, treatise, doctrine).

That the striving for happiness is the basic end of all human acts, already has been pointed out. Men, however, are very vague and hazy in their idea of what constitutes true happiness. The problem, therefore, remains to be

solved: Wherein does the supreme happiness of man consist? And what is the nature of the supreme good or absolutely ultimate end which, through its possession, will furnish supreme happiness to man?

The Meaning of Happiness

In order to approach the problem of man's ultimate end in a logical fashion, we must first of all have a clear idea as to the exact meaning of the word 'happiness.'

Just what is *happiness*? Aristotle¹ says in this connection: "Verbally there is very general agreement; for both the general run of men and people of superior refinement identify living well and doing well with being happy; but with regard to what happiness is they differ, and the many do not give the same account as the wise." As ethicists we are, of course, interested only in *perfect happiness*, or *beatitude*, as the absolutely ultimate end of all man's strivings.

Cicero² defines the happy person as follows: "When we call someone 'happy,' we mean by the word the sum-total of all goods, together with the exclusion of all evils." St. Augustine³ calls happiness "the plenitude of all things to be desired." The definition of Boethius⁴ is famous: Happiness is a state made perfect by the aggregation of all good things." St. Thomas Aquinas⁵ gives this definition: "For nothing else is meant by the term 'beatitude' than the perfect good of an intellectual creature capable of knowing that it has a plenitude of the good it possesses." More briefly St. Thomas⁶ defines beatitude as "the perfect good

of an intellectual nature. As will be noticed, all these definitions of 'beatitude' or 'perfect happiness' are in substantial agreement. The one most commonly accepted is that of Boethius.

So far as man is concerned, 'happiness' or 'beatitude' signifies the *possession of all good* consonant with man's nature. Herein consists the *positive* element of beatitude. To lack any good which man as man should or could possess would be an evil; and to be afflicted with an evil would make 'perfect happiness' impossible, because man would be happier if he also possessed the good which he lacks. Hence, *all evil must be excluded* if man is to enjoy true beatitude. The exclusion of all evil is the *negative* element of beatitude. Furthermore, the possession of all good and the exclusion of all evil must be *everlasting*. The very possibility of losing the actual possession of all good is itself an evil and contradicts the concept of beatitude. Consequently, three things are essential for the beatitude of man: (1) actual possession of all good consonant with his nature; (2) exclusion of all evil; (3) eternal duration of the state of beatitude, and certainty of this eternal duration.

Beatitude may be considered abstractly and concretely. The definitions given above consider beatitude *abstractly*. In this sense beatitude is the everlasting possession of all good consonant with man's nature, together with the exclusion of all evil. Considered *concretely*, beatitude signifies the possession of that specific good or of those specific goods which man must possess in order to enjoy perfect happiness. To define beatitude 'abstractly' is not difficult. The crux of the problem of beatitude consists in

determining 'concretely' the good or goods through whose possession man will obtain supreme happiness.

The Possibility of Beatitude

All men seek happiness, at least in a limited degree. Beatitude, or perfect happiness, however, in the strict sense of the term is the everlasting possession of all good with the exclusion of all evil. Taken in this sense, is beatitude possible? The answer is:

BEATITUDE IS POSSIBLE AND ATTAINABLE.

Man has a craving for perfect happiness. The average person may not be able to give an adequate definition of 'happiness,' but everyone, as a mere matter of fact, seeks to avoid every type of evil and to possess every kind of good, so far as he can. Without perhaps realizing it, all men implicitly strive for perfect happiness. This craving is universal and irresistible.

The craving for perfect happiness is *universal*. It is the root of all man's striving; it underlies all the tendencies and urges of sensuous and rational appetency. It is at the bottom of his desire for power, for wealth, for honor, for pleasure, for comfort, for achievement, for sex love, for health, for security, for all the efforts expended in domestic and civil society. Art and science, industry and commerce, international rivalry and treaties, war and peace, morality and religion — all are inextricably tied up with man's insatiable craving for happiness. It begins with the infant's

cry for food, endures through the years of youth and mature age, and flickers in the centenarian's feeble clutch at the thinning thread of life. Wherever man goes and whatever he does, everything in his being is an expression of this craving. Man does not only strive, like the brute, for this or that particular concrete good. He has an immaterial intellect which grasps the meaning of the good-as-such, universal good, good without limit as to time or place or range or content, whatever that may be, because it is coextensive with being in general.

And this craving for happiness is *irresistible*. It is not a matter of free choice on the part of man's will. The will must desire what is proposed by the intellect as a 'perfect good,' and perfect happiness is such a good. To strive for the realization of perfect happiness is simply the dictate of the *nature* of rational appetency. No human person can rid himself of this craving, any more than a hungry person can rid himself of the craving for food or a thirsty person of the craving for drink. It is only with a good of limited value that man has freedom of choice; in its striving for perfect happiness the will is determined by the law of inexorable necessity. Even materialists, evolutionists, and pessimists recognize this fact as undeniable.

The universality and irresistibility of man's craving for perfect happiness, like every other urge of appetency, cannot be the result of mere chance but must have its source in the very *nature* of man.

Such a *natural* craving, universal and irresistible in character, demands that the perfect happiness toward which it is directed *exist and be attainable*; and this

happiness must be of *endless* duration. Here are some reasons.

This world is not a world of irrational chance, but a rational, *purposive* world of *law* and *order*. Law and order rule supreme throughout. Even the atoms and elements are miniature systems of orderly arrangement. The biological sciences, in particular, disclose more and more the marvelous reciprocal relationship which exists between organic structure and function and between the organism and its environment. When a biologist discovers an organ in a living being of any kind, it is a foregone conclusion that this organ has a definite function to perform in the cycle of the organism's life. He is so certain of this fact that he sets himself the task to find out the purpose and object of this function and the conditions under which it operates.

Applying this principle of universal purposiveness to man's craving for perfect happiness, it is clear that man must be *able to attain perfect happiness*. Should man, the highest and noblest creature in the universe, alone be frustrated in his nature? Man's irresistible craving for happiness is as much a natural function of his rational nature as is the function of any of his bodily organs with respect to its proper object. If the digestive apparatus has the natural function of assimilating food and actually does assimilate it; and if the sensory nervous system has the natural function of receiving sense impressions and actually does receive them; and if the sensuous appetency has the natural function of obtaining the sensuous good and actually does obtain it: then the human soul, since it has the natural function to crave and strive for perfect happiness,

must be capable of actually attaining perfect happiness. Otherwise the constitution of his nature would be frustrated in its very foundation, and the natural tendencies of his innermost being would be purposeless. *It is contrary to reason* to suppose that the universal purposiveness of the world would reach its highest peak in man and then suddenly stop and end in a contradiction. Such a supposition would run counter to the basic principles of sound philosophy and cannot be admitted.

Again. God is the Creator of all beings. He gave to each being its specific nature with all its powers and tendencies. Since God is infinitely *wise*, He would not have given man a soul with an irresistible craving for perfect happiness if He never intended to place this perfect happiness within his grasp. God is also infinitely *just*; but it does not seem consonant with infinite justice to give man a rational nature which is filled with an unquenchable desire for perfect happiness and then make it impossible for man to attain it. Similarly, God is infinitely *good*; it would, however, be irreconcilable with infinite goodness, if God imposed a natural tendency upon man which can never accomplish its purpose. The craving for happiness was placed in man, without his asking, through the goodness of a kind Creator, and it would be an unmerited torture to labor under an irresistible craving without the possibility of ever having it receive its normal satisfaction, because this craving flows from man's constitution with natural necessity. Man's condition would be worse than that of the brute, because the brute is able to find the realization of its tendencies and cravings in its immediate environment and is not endowed

with an insight capable of envisioning future possibilities of happiness. Man, therefore, must be capable of attaining perfect happiness.

Finally. The very concept of perfect happiness, which man craves unceasingly and irresistibly with every fiber of his being, demands *endless duration*. If happiness were not endless, one of *three possibilities* would occur of necessity. Man would either be aware of the eventual termination of his happiness; or he would be unaware of its termination, in such a manner that his ignorance would be invincible; or his ignorance would not be invincible, so that he could arrive at a knowledge of the actual or probable termination of his happiness. In the first case, there could be no perfect happiness; the mere fact of being aware of its ultimate termination would haunt man during every moment of his existence, and so his happiness would never be perfect, because of the knowledge of its eventual loss. In the second case, this invincible ignorance would itself be an evil precluding perfect happiness; besides, such an ignorance could only prevail under the unthinkable supposition that God would deliberately blind man as to his real condition and permanently deceive him. In the third case, knowledge or doubt as to the actual or possible termination of happiness would, as in the first case, destroy perfect happiness from the very beginning of his knowledge or doubt. Hence, man's happiness, in order to be perfect, must be endless in duration, or there is no possibility of perfect happiness at all. And yet, as we have shown, perfect happiness must not only be possible but actual. Consequently, perfect happiness must be endless in

duration, and man must be able to enjoy it endlessly, knowing that it is endless.

Immanuel Kant (1724—1804), the eminent German philosopher, places great stress on the moral law and its supremacy. He admits that man is actuated by the natural craving for perfect happiness. However, absolute happiness is inseparably connected with absolute holiness, and both together constitute the supreme good and end of man. Now, absolute holiness is of such a character that man can never, either in this life or in the next, attain it; as a consequence, absolute happiness is also actually unattainable. According to Kant, then, man is destined to a *perpetual progress* in holiness and happiness, but without any hope of ever reaching the goal. Hobbes defended a similar theory of endless progress toward moral perfection.

From what has been said, it is obvious that *such a theory is false*. All actions would be intermediate ends leading interminably on to further ends, without the possibility of ever reaching a final end. Strictly speaking, there is no 'final end' at all in which the entire series of intermediate ends could come to rest, because an end that cannot be reached ceases to be an end. Man's natural craving for perfect happiness, therefore, is doomed to eternal frustration, and this frustration is an evil which must inevitably lead to eternal torture of the mind. Such being the case, why should man observe the moral law and strive for a holiness and happiness that must forever elude his grasp? The theory would engender nothing but despair in the human heart.

The Object of Perfect Happiness

Perfect happiness, or beatitude, is man's subjective ultimate end and as such attainable. Now, an end is always a good. Therefore, there must be a perfect good or a number of perfect goods as the *object which confers perfect happiness*, when obtained, on man. We now consider beatitude, not in the abstract, but in the *concrete*. The problem, therefore, before us is this: What precisely is the *objective good* which is capable of making man perfectly happy? Can any creatural, finite goods give perfect happiness? Or, must this objective good be an uncreated, infinite good? The answer to these questions is obviously of the utmost importance to man for his entire personal life. The answer is given in the following propositions: (1) creatural, finite goods are incapable of conferring perfect happiness; (2) God alone is the objective good capable of conferring perfect happiness.

Finite Goods Not This Object

Creatural, finite goods are incapable of conferring perfect happiness on man.

Creatural, finite goods, which might come under consideration in this connection, are of various kinds. Some are external' goods, in the sense that they are found outside the person of man. Others are 'internal' goods, residing in the person of man. Among these 'internal' goods, some pertain to man's body, while others pertain to his soul.

In order that any type of good be capable of making man perfectly happy, a number of conditions are required. Such a good must be 'desirable for its own sake'; if it were desirable for the sake of some other good, it would be only a means toward a higher good and insufficient in itself to confer happiness. Such a good must 'satisfy man's rational nature,' because man's rational nature is the source of his striving for perfect happiness. Such a good must 'contain no evil nor lead to evil'; otherwise there would be no perfect happiness. Such a good must be 'imperishable and capable of endless possession perfect happiness implies endless duration. Such a good must be 'accessible to all men'; all men have the same nature and irresistible craving for perfect happiness, and therefore all men must be able to attain this happiness. If any of these conditions is absent, the good in question is not the objective good that is capable of conferring perfect happiness, or beatitude, on man. All these conditions are not verified in the case of *creatural, finite goods*.

EXTERNAL GOODS. AMONG THE EXTERNAL GOODS WHICH MEN desire are money, property, physical conveniences, honors, etc. Such goods, whether taken singly or collectively, cannot be the objective good which could serve as the ultimate end of man's striving for perfect happiness.

Goods of this sort are never ends in themselves, but only *means* toward some other good or goods, for instance, pleasure or esteem. Their acquisition, possession, and use is often accompanied by many *evils* of body and soul; for

example, wealthy people are frequently ill and miserable, unable to enjoy the fruits of their wealth. These goods *are not stable*, nor do they last forever. Finally, they are not accessible to all men, nor can all men possess all of them all the time. External goods, though desirable in many respects, are too limited in extent and too low in value to be capable of giving rational man perfect happiness.

Bodily Goods. Health, beauty, strength, pleasure, etc. — such are the goods which many consider to be the end and goal of all living. In general, the bodily members and the sense organs, together with their proper functioning, are not desired for their own sake, but because they either provide sense pleasure or because they are required for physical well-being or mental development. Particularly, it is *sense pleasure* which is desired *for its own sake* by all too many people, and they are of the opinion that happiness is found therein. Bodily goods, however, including sense pleasure, cannot give perfect happiness.

For one thing, man possesses a rational nature which stands on a plane much higher than his bodily being. The good of the body, therefore, does not of necessity coincide with the good of the spiritual soul. Bodily goods, being of a lower order, cannot satisfy the demands and desires of rationality. On the contrary, the body, being the material part of man's composite nature, must be subservient to the interests of the rational soul. Man has his physical being in common with the brute; and if man seeks happiness in the pleasures of sense, he places himself on the level of the brute. But man is not a brute. He has a rational appetency which far surpasses the sensuous appetency of the brute,

and this *rational appetency* strives for rational goods which lie beyond the powers of sense. Hence, bodily goods, since they satisfy only a part of man's nature, and the lower part at that, cannot be the supreme good capable of giving man perfect happiness.

Again. Pleasure accompanies the normal activity of every healthy bodily member and organ. Sense activity is dependent on the nervous system and consumes nerve energy. Now, the amount of nerve energy is limited in its supply. When nerve activity is prolonged or intense, this supply of energy becomes depleted; from this point on, the continued activity produces fatigue, pain, and eventually illness. It is a biological law, therefore, that all sense pleasure, be it of sight, hearing, taste, smell, sex, or of whatever kind, is *necessarily limited in duration*; and the more intense the pleasure, the shorter is its duration. Constant pleasure is simply an impossibility, because the human system cannot sustain it. Every attempt to actively produce constant pleasure inevitably leads to nerve deterioration and consequent *disorder and pain*. Hence, sense pleasure cannot be the supreme good which results in perfect happiness.

Finally. The bodily goods, in order to qualify as man's supreme good, must be within the grasp of all human beings. Evidently, however, they are *not accessible to all*. Many persons have congenital defects; some acquire serious abnormalities in the course of their life through illness or accidents; many are doomed to suffering and pain for months and even years. All persons, as they advance in age, experience the gradual breakdown of their bodily

system and the steady impairment of their capacity for pleasure. The final stage is extreme weakness and misery. No wonder, then, that King Solomon called the pursuit of pleasure 'vanity of vanities' and a 'vexation of spirit.' If the goods of the body were the supreme and ultimate object upon which man's perfect happiness depended, then life were indeed an illusion and a mockery.

Goods of the Soul. These goods may be either of an intellectual or a moral character. Among the intellectual goods must be reckoned science and art; among the moral goods, the virtues. Neither class is sufficient of itself to produce perfect happiness.

With regard to the *intellectual goods*, there can be no question that science and art afford great enjoyment to the rational nature of man. Nevertheless, this enjoyment must always fall short of perfect happiness. Science and art can be acquired only through much study and practice, and that is by no means always pleasurable. No one can become proficient in all the sciences and arts within the span of a lifetime, even if he expended a maximum of effort without ceasing. Besides, progress in the sciences and arts is slow and laborious, and what one actually knows is infinitesimal in comparison to the amount of things one could learn but never does. So long as humanity exists, this general fund of knowledge will increase as the centuries roll on, but complete knowledge always will be impossible for the individual. There are, of course, individual persons who are great scientists and great artists, but the average person has neither the opportunity nor the time nor the capability of dedicating his life to the sciences and arts; and yet, if

intellectual accomplishment were the supreme good resulting in perfect happiness, all men would, by their very nature, of necessity have to be in a position to acquire complete possession of science and art. The intellectual goods, therefore, are not the object of perfect happiness for man.

Neither are the *moral virtues* this object. Among the many finite goods which man could desire, one might feel inclined to think that the moral virtues are best suited to be the supreme object able to furnish perfect happiness to man. That, however, is not the case. The moral virtues, for instance, prudence, justice, temperance, and fortitude, are *not desired for their own sake*. Their function consists in governing and curbing the movements of sensuous appetency or in giving proper direction to actions in conformity with the norm of morality. Hence, the moral virtues are desired for an end outside themselves. Since they are not sought for their own sake, but for the sake of something else, they are *not self-sufficient* and cannot confer perfect happiness on man. Furthermore, the practice of the moral virtues entails *self-abnegation* in many ways, especially with regard to the restraint which they impose on the passions and sensuous inclinations; and that involves unpleasantness and pain. The moral virtues also assist man in bearing up patiently and bravely under the evils and adverse conditions which are the common lot of men, but they do not remove these evils and adverse conditions themselves; rather, they presuppose their existence. Hence, the practice of moral virtues does not constitute perfect happiness. The *Stoics*, therefore, were

mistaken when they made moral virtue an end-in-itself and man's supreme good.

No class of finite goods, taken singly, can be the ultimate objective good of man. Nor can all classes of creatural, finite goods, taken *collectively*, be this ultimate objective good which, as a totality, would make man perfectly happy. It is utterly impossible for all men to possess all classes of finite goods at once, together with the exclusion of all bodily and mental evils.

God Is Man's Ultimate Good

Since no finite good, taken singly, nor all finite goods, taken collectively, constitute the supreme good of man, capable of conferring upon him beatitude in the true sense of the word, what then, specifically and concretely, is man's ultimate objective good? It is God. God is the necessary and adequate objective good for man's beatitude.

GOD IS THE 'NECESSARY' OBJECTIVE GOOD OF MAN'S BEATITUDE OR perfect happiness.

Beatitude, or perfect happiness, is attainable by man; this was proved. Creatural, finite goods are not the perfect good or object which, singly or collectively, is capable of making man perfectly happy; this was also proved. Yet, there must be an ultimate objective good for man, or perfect happiness would not be attainable. Consequently, only an *uncreated, infinite good* is the object which, as man's ultimate end, is capable of making man perfectly

happy. There is, however, only one uncreated, infinite good, and that is God. God, therefore, is necessarily the objective good of man's beatitude, and that is equivalent to stating that God is the 'necessary objective good of man's beatitude.'

Another point. The reason why man craves for perfect happiness lies in his *rational nature*, in his intellect and will. His intellect grasps the concept of beatitude, and his will necessarily tends toward it. The sensory powers, rooted in matter, are incapable of conceiving beatitude or of striving for it. Now man is specifically 'man' because he has intellect and will. Hence, intellect and will, primarily and more than any other powers, are the subject in which beatitude must reside, because they must of necessity strive for that perfection which is proper to them and for that object which can give them perfection. What is the proper object of the intellect and the proper object of the will?

The proper object of the *intellect is truth*; whatever is 'true' is the proper object of man's intellectual insight. Now, all being can be known and as such possesses truth-value; truth, therefore, extends to all being, to *being-as-such*, without qualification and distinction. The tendency of the intellect thus embraces all being and all truth in so far as the capacity of the intellect reaches. Finite beings do not exhaust truth. Hence, the intellect, in its natural and necessary tendency to embrace all truth, must go beyond finite beings to the infinite, in order to find its adequate object. Only God, however, contains all being and all truth, because He is essential, infinite being and truth. Consequently, only God, the infinite source and ground of

all being and truth, can be the ultimate objective end of the intellect.

The proper object of the will is the *good*. Since the intellect apprehends good simply as 'good,' the *good-as-such* without qualification and distinction, the will strives for it accordingly. The will, therefore, can never be completely satisfied in striving for 'this or that good' in particular. It strives for 'perfect happiness,' and no particular, finite goods can give beatitude. Consequently, only God, the infinite source and ground of all good, can be the ultimate objective end of the will.

Although man's intellect and will are finite in their capacity, man, in having as his *object* God who is the infinite truth and good, will find perfect happiness, because the total natural capacity of his intellect and will thereby is filled.

GOD IS THE 'ADEQUATE' OBJECTIVE GOOD OF MAN'S BEATITUDE OR perfect happiness.

Man must be able to attain beatitude, and he cannot attain it except through the possession of God through his intellect and will: God is the 'necessary' objective good which is the ultimate end for all man's striving. Now we must show that God *suffices* for man's beatitude, because He is the 'adequate' objective good which gives man beatitude.

That God is the *adequate* ultimate objective good, capable of conferring perfect happiness on man, should be evident. It is man's *rational* nature which demands

beatitude, because *man precisely as man* has the rational powers of intellect and will, and through intellect and will he knows what perfect happiness is and strives for it. God, however, since He is the infinite truth and the infinite good, is obviously 'adequate' for the complete satisfaction of all the tendencies of the intellect for the acquisition of 'truth' and of all the desires of the will for the possession of 'good.' Hence, if man's intellect and will are adequately and completely satisfied, man as man has perfect happiness.

The question, however, arises: How about man's *body* and *bodily tendencies*? Must these not also receive complete satisfaction if man is to enjoy perfect happiness? The body, it is true, is an essential part of man's composite nature, not a mere adjunct to the soul. However, the body is *subordinated* to the rational soul in all its powers and activities; its purpose is more that of a vital instrument in the service of the intellect and the will. Hence, the interests of the body must be subservient to the interests of the rational soul, and the ultimate end of the soul is also the ultimate end of the body in every respect. The body as such, being material, is incapable of perfect happiness; it fulfills its purpose in assisting the rational soul to acquire perfect happiness. More light will be thrown on this perplexing problem when we bear in mind that perfect happiness cannot be obtained in this life on earth.

Eternity Necessary for Beatitude

Man is destined for perfect happiness, and this happiness is attainable. When we consider the requirements of perfect

happiness, as outlined in the previous discussion, it is evident that our *earthly life is incapable of giving beatitude* to man.

The earth is not a paradise; and no man here is perfectly happy. While he lives on earth, man is subject to many *evils* — ignorance, error, sin, passion, illness, accidents, and all the vicissitudes that human flesh is heir to. At any rate, there is always the possibility and probability that sundry evils will overtake us. The *goods* which this earthly life has to offer are too meager and limited and superficial to satisfy completely man's hunger for perfect happiness. *Life* itself is entirely too short for true beatitude, because beatitude demands endless duration. *God*, the supreme good, in whom alone man can find perfect happiness, can indeed be known and loved; but man's knowledge of God in this life is extremely inadequate and not at all sufficient, as we know from personal experience, to give us the perfect happiness we so ardently desire.

The conclusion is therefore inevitable that man has not been destined to find beatitude in his earthly existence. There must be a life beyond the present, and it must be an *immortal life*, because a perfect happiness which is not endless in duration is a contradiction in terms. Only in this immortal life after death can the soul be so intimately united with God as the infinite truth and the infinite good, that all the natural tendencies of man's intellect and will can be satisfied to capacity and God actually become for man the one and only good that brings perfect happiness with its possession. Hence the necessity of an immortal, eternal life for beatitude. Given this eternity and

immortality in existence, we can readily see that *all men* without exception can attain the perfect happiness which they desire with a natural, irresistible craving implanted in their very constitution by the Creator Himself.

We are now in a better position to answer the question:

What about the *body* and its *tendencies*? At death, body and soul are separated; the body returns to the earth, but the soul passes over into immortal life. The body fulfills its natural purpose during man's earthly life; the soul, with its rational powers of intellect and will, no longer needs a body in the superior type of life which it leads in eternity. Speaking from a purely *philosophical* standpoint, therefore, man would be able to enjoy perfect happiness in possession of his supreme good without a body. Philosophy, through the aid of human reason alone, is unable to show that resurrection of the body is even probable. That would depend entirely on God. If there should be a resurrection (Revelation assures us there will be, but philosophy must prescind from this supernatural fact), then it is evident that the human body would be completely different from what it is now; if it were the same, perfect happiness, even in eternity, would not be possible. Granted the resurrection of the body, the body would of necessity be completely *subservient to the soul*, so as not to be a hindrance to the union of the soul with God. Under such a supposition, the body would *participate indirectly* in the beatitude of the soul, because it is in the soul that beatitude ultimately resides. A more complete answer philosophy cannot give, due to the limitations of its method of research.

A Controversy

The view expounded in the preceding sections has been current among scholastic philosophers during the past three centuries. Prominent among modern authors defending this view are Joseph Rickaby, Victor Gathrein, Michael Gronin, Thomas Zigliara, Jacques Maritain, Henry Grenier, and Joseph Gredt. They maintain that God is the object of perfect happiness for man even in the natural order, so that man, if he had not received as his supernatural destiny the intuitive beatific vision of God's essence, could attain perfect *natural beatitude* in God, at least in the life after death.

During recent years this view has been seriously questioned by a group of scholastics. Henry de Lubac,⁷ for example, defends the position that God could not keep an intellectual creature, including man, in a purely natural status and that every intellectual creature can have but a single ultimate end, namely, Beatific Vision. Joseph Buckley,⁸ on the other hand, maintains that man could exist, absolutely speaking, in a purely natural status, if God so ordained; but God would not be his determinate, concrete, ultimate end in the natural order. He claims that the view expounded by the authors mentioned above is based on an invalid confusion of the metaphysical order and the psychological or moral order.

In the *metaphysical* order, God is the last end of all created things, including man, because He created them for the sake of His own goodness and they are thus ordained (entitatively, metaphysically) to God. In the *psychological*

order man intends in all his acts simply his own perfection. The will follows the good as presented by the intellect. Man's intellect, however, embraces 'truth-in-general'; and since the 'true' is also the 'good,' the will strives for the 'good-in-general.' However, the 'good-in-general' is merely 'indeterminate good' and as such is by no means identical with the determinate 'infinite good' which is God Himself. Man, therefore, is moved by nature toward the 'good-in-general' as the supreme object of his will and toward 'beatitude-in-general' as the last end of his will. Since the proper object of man's intellect is the essences of sensible things, his intellect is restricted to creatural things. For this reason man can know God, not as He is in Himself as absolute and infinite, but only as He is causally related to the creatures participating in His goodness, namely, after the manner of a participated and partial good. Because the will can only strive for an object as perceived by the intellect, the proper object of man's will is restricted by the limitations of his intellect, so that the proper object of man's will is partial, participated good. Now, in the natural order there exists no concrete good or group of goods which would exhaust the comprehension and extension of 'good-in-general,' so that any one or all of them could completely satisfy man's nature as an intellectual and volitional being. Hence, man can have no concrete last end in the natural order and, as a consequence, no complete beatitude. Man simply cannot obtain full happiness all at once'; he can obtain happiness only piecemeal —progressively and cumulatively, in a series of incomplete and successive actualizations.

To assert that man in the natural order (a possibility which must be accepted in view of the gratuitous character of man's supernatural destiny) can have no concrete, determinate, objective ultimate end as the object of his natural striving, is indeed a startling doctrine. It is true, of course, that perfect happiness for man is impossible in his earthly existence. But conditions in the immortal life of eternity may be so radically different from those of man's sense-dependent earthly existence, that it seems strange to deny that man's full beatitude as a rational being could ever be realized in a natural order. Is there a limit to God's wisdom and power? Progressive and cumulative perfection, never reaching full beatitude, is nothing more than an interminable series of intermediate ends unable to realize a final end. "An end without end" and "a last end that is open," as Buckley⁹ calls it, is no final end at all. In this view, man in the natural order, if God created him such, would be destined to an eternal frustration.

Man's Purpose on Earth

Since man's ultimate subjective end or good is perfect happiness in eternity, and since his ultimate objective end or good is God, what is *man's supreme purpose* during his sojourn on earth? All men possess the same fundamental nature and have as their ultimate end the acquisition of perfect happiness. Hence, all men, by the very fact that they are human beings, must have a common end or purpose to which all their human acts, while they live on earth, must be directed. Manifestly, the common purpose of all men on

earth is the purpose God had in view in giving them an earthly existence. What is it?

The *common purpose* of all men in their earthly existence consists in *the preparation for eternal happiness*.

The common nature of all men demands a common purpose for all men while they live on earth. The various activities of man have an immediate or proximate end, and there are as many such ends as there are activities. The only way in which there can be unity among these various ends is to have a common end' to which all diversified ends are *subordinated as intermediate ends*. Intermediate ends, however, depend for their existence on the final end to which they are directed, because they are the 'means' to achieve the final end. Now, the final, supreme end of man is perfect happiness in eternity. Consequently, the common end of all the activities of man and of man's earthly existence itself must be to achieve man's ultimate end of perfect happiness in eternity. It follows, therefore, that all the activities of man and of man's earthly existence must be directed as means to achieve this eternal happiness. That, however, is tantamount to stating that man's entire existence on earth must be lived as a *preparation* for the realization of his perfect happiness in eternity. If man fails to live his life in this manner, he fails in his destiny.

Furthermore, the preparation for perfect happiness consists in *the observance of the moral law*.

All nations without exception make the distinction between the 'morally good' and the 'morally evil,' between 'virtue' and 'vice,' and recognize the necessity of leading a life in conformity with moral law. The application of the

general principles to concrete moral problems may be faulty or even erroneous, but the application is at least attempted and made. It is a common practice, too, to make a division of all people into those who are 'virtuous' and those who are 'criminal,' and it is the conviction of all men that virtue leads to happiness and crime to unhappiness. Since virtue, however, does not lead to perfect happiness in this life nor crime to unhappiness, the religions of the world express a belief in a life after death in which the good are rewarded and the evil punished. The only logical explanation for such a universal conviction can be *human nature* and its *rational insight*. Reason, therefore, leads inevitably to the conclusion that man must seek his eternal happiness through the observance of the moral law in his earthly existence.

This conclusion is justified. Through what other means could man hope to obtain perfect happiness? Certainly not through wealth, honor, power, beauty, science, art, talent, or any other natural endowment or achievement. These things are not within the reach of all men. According to God's purpose and intention, *all human beings are*, absolutely speaking, destined for this happiness, so that it must be within the power of all, whether rich or poor, healthy or sick, learned or unlearned, young or old, strong or weak, powerful or helpless, ruling or subjugated, to achieve beatitude in the life to come. Now, there is but a single thing in the power of the free will of all men without exception: love of God and the practice of virtue. Hence, this must be the road which man must follow on earth in order to prepare himself for eternal happiness. Reversely,

whoever does not love God and does not practice virtue forfeits the right to beatitude.

A consideration of the *nature of God* leads to the same conclusion. God is *infinite holiness*. He cannot be indifferent to the kind of a life which men embrace during their earthly existence. On the contrary, He must insist that men be in all things like Himself — holy. It is unthinkable that the All-Holy give Himself for all eternity in the most intimate union of perfect happiness to a soul which despised the moral law and the very Lawgiver Himself. Virtue and vice cannot both lead indiscriminately to God and eternal happiness with Him; such a contention would be an insult to the infinite perfection of the All-Holy.

The *purpose of God in creating* all things, including man, sheds further light on this problem. The ultimate end or purpose which actuated God's will to create could not lie in anything outside Himself; otherwise His will would be dependent on this extra-divine reality, and such a dependence would be contrary to His infinity. The ultimate end of creation, therefore, can be only *God Himself*. This end could conceivably be one of two: His benefit or His glory. It cannot be that God created the world and man for His own benefit; God, since He possesses infinite perfection, cannot derive any benefit from His creatures, particularly since they have received all their perfections from Him. Hence, the ultimate end which actuated God's will in the creation of the world and of man cannot be anything but *His own glory*. This glory consists in the manifestation of God's perfections in His creatures. God made all things out of infinite goodness, so that the creatures should share, as

manifestations of His perfections, in various degrees of reality and being.

Irrational creatures manifest God's perfection by the very fact that they exist and carry out God's designs in an orderly world. Man, being rational, must glorify God through the *acknowledgment* of God as the Supreme Creator and Ruler of all things, because man is the only creature in the visible world capable of recognizing the power, wisdom, and goodness of God as manifested in finite things. Hence, man was created to rise above the irrational creatures to God, to proclaim His glory, to love Him, to praise Him, to thank Him, to worship Him, in the name of all creatures.

Furthermore, having alone been endowed with reason and free will, he is made into *the image and likeness of God* and must strive, of his own free will, to cultivate this image and become more like to God day by day throughout his life. He can do this, however, only by striving to imitate the infinite holiness of God and thereby manifest God's glory in his own life. Man, therefore, was created to know and love God by leading a virtuous life on earth; in no other way can he be more 'like to God.' God, therefore, created man for Himself and His glory, the culmination of which purpose will come about in the next life in the union of man with God in perfect happiness through holiness here on earth. And holiness means conformity with the moral order established by God. By the very fact, then, that man on earth leads a life in conformity with the moral law, he promotes the glory of God and obtains perfect happiness for himself in the life to

come. He attains his ultimate subjective end by striving for his ultimate objective end.

Such is the privileged destiny of man.

Summary of Chapter VI

In this chapter we seek to determine man's *ultimate end*. The absolutely ultimate 'subjective' end of man is his supreme happiness. The absolutely ultimate 'objective' end of man is the supreme good which gives happiness.

1. *Meaning of Happiness*. Happiness is a state made perfect by the aggregation of all good things. Three things are essential for man's beatitude or perfect happiness: the actual possession of all good consonant with his nature; the exclusion of all evil; the eternal duration of the state of beatitude and the certainty of this eternal duration.

2. *The Possibility of Beatitude*. Beatitude is possible and attainable. Man has a universal and irresistible craving for perfect happiness; this craving must, therefore, have its source in the very nature of man. Since this is a purposive world of law and order, in which every natural tendency has its definite end and object, man's natural tendency toward perfect happiness must also be capable of realization. The wisdom, justice, and goodness of God demand that, since He gave man an irresistible craving for beatitude, man's natural tendency toward beatitude be not frustrated and in vain. Beatitude, therefore, must exist and be attainable. This beatitude must also be *endless in duration*; the mere probability or possibility of cessation would contradict the very concept of perfect happiness.

3. *The Object of Perfect Happiness*. Beatitude is man's subjective ultimate end. Since an end is a good, there must

be an object or good which is capable of making man perfectly happy.

4. *Finite Goods Not This Object.* Some finite goods are 'external' to man; others are 'internal' and are either goods of the 'body' or goods of the 'soul.' In order that any or all of these finite goods qualify as man's supreme objective good, they must fulfill the following *conditions*: they must be desirable for their own sake; they must satisfy man's rational nature; they must contain no evil nor lead to evil; they must be imperishable and capable of endless duration; and they must be accessible to all men. No finite goods, taken singly or collectively, fulfill all these conditions.

5. *God Is Man's Ultimate Good.* Since perfect happiness is attainable through the possession of some concrete supreme good, and finite goods are not capable of conferring perfect happiness on man, it follows that the infinite good, which is *God*, is alone the ultimate objective good capable of giving beatitude to man. God is the *necessary* and *adequate* object of man's beatitude.

6. *Eternity Necessary for Beatitude.* Man's earthly life does not and cannot give perfect happiness to him. Consequently, there must be an *eternal life* beyond the present earthly life, for man to be able to attain beatitude.

7. *Controversy.* In recent years the view is being defended that man cannot receive full beatitude in the natural order. God is not man's determinate final end, and no creatural good or group of goods can satisfy man.

8. *Man's Purpose on Earth.* Since all men possess the same rational nature with the same natural tendency toward beatitude, all men must have the same *common end*

here on earth to which all the other ends and activities must be subordinated. This common end is the preparation for eternal happiness through the observance of the moral law. God created all things for Himself and His glory, and God is infinitely holy. Hence, His ultimate purpose in creating man must be that man glorify God and be similar to God in *holiness*. Holiness, however, means leading a life in conformity with the moral law.

Chapter 7

THE NORM OF MORALITY

A HUMAN ACT, BY THE VERY FACT THAT IT IS PERFORMED WITH advertence of the intellect and by the free decision of the will, partakes of the character of 'morality.' Morality is that attribute or property of the human act in virtue of which it is said to be 'morally good' or 'morally evil.' The factors which make an act morally good or morally evil are called the 'moral determinants,' and these are, as we have seen, the object, the circumstances, and the end or purpose of the agent. If all these determinants are morally good, the act itself is morally good; but if any of these determinants is morally evil, the act itself is morally evil.

But how are we to know *whether* and *when* an object or a circumstance or an end is good or evil? These determinants do not appear with labels attached, to indicate that they are good or evil. Nor is their moral character self-evident; that is clear from the divergence of opinion which exists regarding the morality of many acts. How, then, are we to know?

The question leads us to the problem of the *norm and criterion of morality*.

Criterion and Norm

A 'criterion' and a 'norm' have much in common, but their concepts are not identical.

In general, a *criterion* is a *standard of judging*; that is to say, it is a rule or standard by which principles, facts, statements, and conduct are tested, so as to form a correct *judgment* concerning them. A thermometer, for example, is a criterion for judging heat. What a thermometer really shows is the expansion and contraction of a column of mercury in a tube; this action of the mercury, however, is the result of the application of heat and as such an indication of the temperature. Hence, although the mercury reveals no heat precisely as heat, it is for us a criterion by means of which we can test the presence of heat and pass a correct judgment regarding the relative increase or decrease of the heat itself. To be a true criterion, however, the thermometer must be correct in its calibration, and it will be correct only if it agrees with the calibration of some thermometer which serves as the 'standard' for this type of thermometer. Applied to ethics, a *moral criterion* is a rule or test by means of which we are able to discriminate between what is morally good and morally evil and to judge correctly that a particular act is morally good or morally evil. Such a criterion is 'subjective,' not in the sense of being 'arbitrary,' but in the sense that it enables man, the thinking 'subject,' to test and judge the morality of an act. But just as the ordinary thermometer presupposes the existence of an objective 'standard' thermometer with which it must agree in its calibration, in order that it be a

true criterion of temperature, so the moral criterion presupposes the existence of an objective moral 'standard' or 'norm' with which the particular act can be compared, in order that man can test the morality of the act and judge whether it be good or evil.

In general, a norm is an *authoritative standard* which serves as a pattern or model to which things of a similar nature must conform. For example, business concerns manufacturing thermometers have a thermometer in their possession which is exact in all details and which serves as the pattern and model for all the thermometers which they make. If a thermometer measures up to this standard in its essential characteristics, it is put on the market; if not, it is discarded, because it is 'no good' for the purpose intended. Ethics also demands a *norm of morality*, that is to say, an *objective standard or rule or principle* which determines the morality of *an act in itself*. If a particular act conforms to this norm, it is morally good 'in itself'; if it deviates from this norm, it is morally evil 'in itself.'

Such a norm, therefore, is 'objective,' in the sense that it refers to the 'object' of the act, and determines whether a particular act is in itself morally good or morally evil, irrespective of, and prior to, any judgment of man regarding its morality. Our judgment follows the comparison of the act with this standard or norm. If we find that the act conforms to the norm of morality, we judge the act to be good; but if we find that the act deviates from this norm, we judge it to be evil.

If such a norm of morality exists, it is evident that at least some human acts will be *objectively good or evil in*

themselves, depending upon whether they agree or disagree with the objective norm of morality. Such an objective norm would then serve as a 'standard of comparison,' enabling us to test a particular act as to its morality by comparing it with the standard and pass a correct judgment as to whether it is morally good or morally evil. We would then have a 'moral criterion' or standard of judging.

THE NORM OF MORALITY, TO BE EFFECTIVE AS A MORAL CRITERION or standard of judging for man in the thousand and one practical problems of life, must have certain *qualifications*. (1) This norm must be *unchangeable*. If it would change and fluctuate, there would be no fundamental stability to morality; then murder or adultery, for instance, might be morally evil at one time and morally good at another. Such a norm would, therefore, not be a reliable standard, and man would never be certain of the morality of his acts. It is, however, the purpose of a norm to give us certainty in matters for which the norm is the standard. (2) This norm must be *universal*, so that it will apply to all men. All men feel themselves bound to the moral law; hence, the norm of morality must apply to all men. (3) This norm must be *accessible to all*, young and old, learned and unlearned, rich and poor, high and low, at all times and in all places. All men, no matter what their condition of life, must be able to know at least the fundamental principles of morality; otherwise they could not lead a moral life. They can, however, never arrive at a knowledge of these principles,

unless the norm of morality be accessible to all, because all moral principles flow naturally from this norm. (4) This norm must be *applicable to all conditions* of life. The individual must be able to make all his actions conform to the norm of morality, and this is only possible if the norm is within the mental reach of every individual; otherwise such a norm could not serve as a standard for every individual in all his actions. (5) This norm must be a *single standard*. Moral actions are many, but morality is one. All men have the same human nature, and the moral standard for all must be the same. Hence, there cannot be one norm for one set of persons or actions and another norm for a different set of persons or actions.

If the norm of morality is to be a genuine norm and serve as a true criterion, according to which we are to judge whether an act is good or evil, these qualifications are required. So far, of course, we have not proved the existence of a norm of morality nor the necessity of its existence. We know that all people are convinced of the existence of moral goodness and moral evilness in human acts. The question, therefore, arises:

Are acts good or evil because we *judge* them to be so? Or do we judge them to be so because acts are good or evil in *themselves*? In other words: Is the distinction between morally good and evil acts *subjective or objective*? If the distinction depends solely on our judgment, then the distinction is 'subjective'; but if the distinction is based on the acts themselves, then the distinction is 'objective.' Are there acts which are objectively good or evil, independent of our subjective judgment?

Some human acts are good because *commanded* by proper authority, and others are evil because forbidden. Parents, for instance, may command or forbid certain acts in virtue of their parental authority, and such acts become morally good or evil thereby. We are not concerned here with acts of this kind. What we wish to know is: Are any acts morally good or evil independent of any command or prohibition by authority, be this authority human or divine, so that they would be good or evil *in their very nature* and therefore good or evil 'at all times' and 'under all circumstances'? We are here face to face with one of the most fundamental problems of ethics.

Acts Objectively Good or Evil

When we speak of acts which are 'objectively good or evil,' we mean acts which are, as just explained, good or evil in their very nature and not in virtue of a command or prohibition by authority. These acts would be morally good or evil in themselves, prior to, and independent of, any judgment regarding their morality. Our judgment regarding their morality might even be wrong, so that we judge a good act to be evil or an evil act good; but the *intrinsic* goodness or evilness of the act would remain unchanged by our judgment. We claim that *some acts* are 'objectively good or evil' in the sense defined.

The reason why some acts are objectively and intrinsically good or evil lies in the *ultimate end of man* and all creatures. All finite, creatural beings, as we know, were intended by God for the furtherance of His glory. God could

have no other ultimate end in creation than Himself and His glory. Whatever furthers His glory must be desired by God and is therefore good in itself; whatever hinders His glory must be detested by God and is evil in itself. Irrational creatures further the glory of God by simply being what they are and fulfilling their ultimate end through their nature and its proper functions, because they perform all their actions through necessity. Man, on the vegetative and sensory side of his nature, in so far as his nature functions through necessity and not through the control of his free will, furthers the glory of God in the same manner as the irrational creatures, namely, by being what he is and by fulfilling his ultimate end through his nature and its proper functions. Man, however, is also a *rational* creature. Through intellect and free will many of his acts are distinctively 'human' acts, radically different from those which are styled 'acts of man.' Because he is endowed with intellect and free will, man has it within the power of his choice to perform many acts and to omit them. Man can freely decide to perform acts which will promote the glory of God or not promote the glory of God.

Now, some human acts, *by their very nature*, promote the glory of God, while others detract from His glory. It cannot be otherwise. God is infinite perfection. He is good, kind, merciful, just, truthful, faithful; and these and all other attributes are infinite perfections, because they are identical with His infinitely perfect nature. He loves His nature with an infinitely perfect love. The creatures are mirrorings of His nature and perfections. In so far, therefore, as they *imitate His perfections* they promote His

glory and fulfill their ultimate end. Irrational creatures do this of necessity; rational creatures must do this through the exercise of their free will. Since God loves His own nature and perfections, He must also desire that His creatures imitate His perfections, each in its own particular way — irrational creatures through the necessity of their nature and functions, man through the free choice of his will. Man, therefore, not only has the power freely to imitate God's perfections in his human acts, but he *ought to* imitate God's perfections; that he 'ought to' do this, indicates the moral obligation to perform acts which will be in conformity with the perfections of God, but it also indicates that he can refuse to act in accordance with this *moral obligation*. Human acts, then, that are in conformity with God's perfections and nature, are *morally good*, intrinsically, objectively, and by their very nature, independent of, and prior to, any judgment on man's part as to their morality. Human acts, on the other hand, that are in opposition to God's perfections and nature are *morally evil*, intrinsically, objectively, and by their very nature, independent of, and prior to, any judgment on man's part as to their morality. We are speaking here of the acts as such, considered 'objectively.' Obviously, moral acts cannot be imputed to man 'subjectively,' unless he passes judgment on their morality and performs them freely. Some human acts, therefore, are by their very nature in conformity with man's ultimate objective end and as such are objectively and intrinsically good in a moral sense, while other human acts, being in opposition to that end, are, by their very nature, objectively and intrinsically evil.

Beatitude, man's ultimate subjective end, is inextricably bound up with his ultimate objective end, namely, God and His glory. Human acts which tend toward the realization of God's glory also tend toward the realization of man's beatitude.

The *conclusion* is inevitable: those human acts which are in conformity with man's ultimate objective and subjective end are objectively, intrinsically, and by their very nature morally good; those human acts which are in opposition to man's ultimate objective and subjective end are objectively, intrinsically, and by their very nature morally evil.

The Ultimate Norm of Morality

A *norm of morality* is an authoritative standard to which the human acts of man must conform, in order to be morally good. Must there be a norm of morality? And, if so, what is it?

There *must* be a norm of morality. Only under the supposition that such a norm exists, can man have a *criterion* enabling him to pass a discriminatory judgment on the morality of an individual act. Man has the obligation to perform acts which tend to realize his ultimate objective and subjective end and avoid acts which tend to nullify the realization of this end. The former acts are morally good, the latter morally evil. He therefore has the obligation to perform morally good acts and avoid morally evil acts. Without a norm, however, he would have no objective standard of comparison, and his judgment in moral matters would be altogether subjective; he would have no means of

checking the accuracy of his judgment. As a consequence, every person's individual judgment would have the same value, and moral chaos would result.

What *is* the objective norm of morality with which the individual moral act must be compared in order that man can correctly judge whether it is morally good or evil? It is the 'ground' and 'reason' why human acts are morally good or evil. From what has been said in the foregoing section, one might be inclined to state that the norm of morality consists in the ultimate objective and subjective end of man's existence and human acts, namely, God and His glory and man's final beatitude. In a sense this is true. Whatever agrees with this double end is morally good, and whatever disagrees with it is morally evil. However, the matter goes deeper than that. Man's final beatitude (his ultimate subjective end) depends entirely on God and His glory (man's ultimate objective end). And the ground and reason why God's glory is the ultimate end of all creatures, including man and his acts, lies in the infinite perfection of God's attributes and nature. In the final analysis, therefore, we must say that all human acts which agree with God's nature are morally good, and those which disagree with His nature are morally evil. *God's nature*, and through it and with it man's ultimate objective and subjective end, is the ultimate norm or standard of comparison for judging the morality of any human act. Whatever agrees with God's nature and perfections will also tend to realize God's glory and man's final beatitude; for all purposes, therefore, God's nature is the norm or standard of judging moral acts.

However, it should be evident that God's nature, though it is the 'ultimate norm' of morality, does not suffice as the *immediate* norm in the many moral problems which crop up in everyday life. It is too remote, too vague. It is not a practical norm for the average person, because it is *not accessible to all* without exception. Even the most learned philosopher or theologian has at best a very imperfect knowledge of God's nature and attributes. Most people living on the globe have no adequate knowledge of the true God at all. Nevertheless, all peoples and persons consider themselves obligated to observe the moral law. There must, then, be a practical norm accessible to all. This norm cannot be the nature and perfections of God nor the glory of God and the final beatitude of man. If I am in doubt whether an individual concrete act is morally good or evil, how can I settle this doubt by comparing it with the ultimate norm of morality? How am I to judge whether it is in agreement with the infinite perfection of God's nature and attributes? How am I to know whether it will promote God's glory? How can I be certain that it will contribute toward the realization of my final beatitude? The perfect knowledge of God and final beatitude lies in the next life, not in this; hence, my knowledge of the 'ultimate norm' is too imperfect to serve as a practical norm of morality for judging the acts which confront me day after day in all their concrete individuality. Besides the 'ultimate norm,' there must be an immediate, 'proximate norm' which can serve as a standard of comparison and as the connecting link between the individual human act and the ultimate norm.

The Proximate Norm of Morality

Most persons have not the necessary knowledge to use the ultimate norm of morality for practical purposes. Those who have the necessary knowledge seldom use it, because its application is often difficult. Yet everybody makes the distinction between right and wrong, good and evil, many times each day. What norm do they use? What is the *proximate norm of morality* used as a standard with which to compare individual moral acts? Without such a standard they could not pass a judgment on the moral goodness or evilness of the act. We claim that the proximate, immediate norm of morality is *the nature of the whole man*.

Such a norm has all the *qualifications* required by a practical norm. It is 'unchangeable,' because human nature is essentially the same in all persons, at all times, and in all places; it is therefore always reliable. It is 'universal,' because it applies to all men, since all men have the same human nature. It is 'accessible to all,' no matter what their condition in life, because man knows man better than anything else in the world; he has an introspective knowledge of himself and, through the medium of language, a thorough knowledge of other men. It is 'applicable to all conditions,' because each individual has his own human nature and can thus apply the knowledge of human nature as a standard to all conditions which may arise. It is a 'single standard,' because human nature is the same the world over; the standard, therefore, will be one for all types of persons and all sets of actions. The mere fact, however, that the qualifications required in a genuine practical norm

of morality are found to be present in human nature, is as yet no proof that human nature is this norm.

WE MUST NOW SHOW THAT *HUMAN NATURE IS THE PROXIMATE norm of morality.*

All finite beings owe their existence, either directly or indirectly, to God. God is infinitely good. In giving existence to finite beings He manifested His goodness. Since all finite beings are manifestations of God's goodness, they are themselves good in whatever amount of being they possess. Every finite being, therefore, is good in its nature, powers, and functions. Philosophers express this fact by saying that every being is an ontological good, that is to say, is good in its entity or being. Now, all finite beings have an ultimate end or purpose of existence, and this purpose, as we have seen, is the glory of God. They fulfill the purpose of their existence by the very fact that they have being, have a nature, powers, and natural functions. A being has but a single essence or nature, but it may have many powers and many functions. Functions are determined by the powers, and the powers are determined by the nature. Some powers are primary, others secondary; and that applies correspondingly to the functions. There thus exists a natural hierarchy of functions and powers in every being. Each being has its own intrinsic purpose, manifested by its constitution, and all beings have the ultimate purpose of glorifying their Creator. Hence, they glorify God by their very *nature* and by every *natural function*. And they do this

by the *necessity of physical law*, without any choice on their part.

Man, too, is a creature of God and as such an ontological good, i.e., his nature, powers, and functions are good in themselves in the physical order of being. In man, too, there exists a hierarchy of functions and powers: the chemical functions and powers are subordinated to those of the vegetative order; the chemical and vegetative functions and powers are subordinated to those of the sensory order; the chemical, vegetative, and sensory functions and powers are subordinated to those of the rational order. Such was the purpose of God in giving man this particular kind of nature. Now, every power has the *nisus* or tendency to perform its characteristic function when its proper object is presented to it, because it is prompted to do this by the very 'nature' of the being. Hence, all such functions are natural and according to the purpose of the Creator, provided they occur in the proper relationship of the hierarchical order inherent in the nature of the being. In this respect man's nature is no different from the nature of any other being in the universe.

It follows, then, that all functions of man's powers and tendencies, provided they occur in their proper hierarchical order, are intended by God and in so far are ontologically good and natural. These functions carry out the intrinsic purpose of man's nature as given to him by God, and by that very fact they also realize the ultimate end of all finite beings, namely, the furtherance of God's glory. Hence, man, if he acts according to the *dictates of his nature as a human being*, will not only fulfill the intrinsic purpose of his being

but also the ultimate purpose of his being, which is the glory of God in His creatures. In order, however, to act in this manner, he must observe the *hierarchical order* of functions and powers intended by God in giving him this human nature. If man deliberately disturbs this hierarchical order of functions and powers, he disturbs the order intended by the Creator and deviates from the ultimate end of his being; to do that would be contrary to God's perfections.

Many powers of man function strictly according to the inexorable necessity of physical laws, and man has no control over them; they always fulfill their purpose. Man, however, has a free will, and many powers and their functions are subject to the control of his free will. To have a free will, however, does not mean that he has the right to disturb or pervert the hierarchical order of his powers and functions as intended by God. This hierarchical order should be preserved by man by the exercise of his free will, because that is the intrinsic purpose of his nature as God intended it to be. God intended this hierarchical order of man's nature, and man's free will 'ought to' preserve it, in order to fulfill the intrinsic purpose of his nature and thereby the ultimate end of his existence. Man, through his free will, can disturb or pervert this hierarchical order, but he 'ought not' do it; otherwise he will frustrate the intrinsic purpose of his nature and thereby also the ultimate end of his existence.

It is in this connection that 'morality' enters into man's decisions of his free will. The ultimate end of man is God's glory and his own final beatitude; and this ultimate

objective and subjective end of man is based on God's infinite nature and perfection. The immediate or *proximate norm* must be that authoritative standard with which the human acts must immediately conform, in order that they may at the same time conform to the ultimate norm. Now, if man acts, as we have just seen, according to the dictates of his nature as a human being, he will fulfill both the intrinsic purpose of his own being and also his ultimate end. Hence, man's nature is the immediate or *proximate norm of morality*. All human acts, therefore, which are performed by the free will in accordance with the hierarchical order of powers and functions intended by God, will be morally good; and all human acts, which are performed by the free will in opposition to the hierarchical order intended by God, will be morally evil. The former obviously conform to human nature; the latter conflict with human nature.

The nature of the *whole man*, not merely a part of it, must be taken as the standard or norm of morality. In order that the proper hierarchical order be observed and preserved, man's vegetative functions must have precedence over his chemical functions, his sensory functions must have precedence over his vegetative and chemical functions, and his rational functions must have precedence over his sensory, vegetative, and chemical functions. This is the order man must freely choose to follow; otherwise he will deviate from both the proximate and ultimate norm of morality.

Man must do more than preserve the hierarchical order of the powers and functions of his human nature as intended by the Creator. Every power has a *natural*

tendency and function which is *proper* to it according to the nature of the being to which it belongs. Irrational beings automatically use each power according to the requirements of their nature, because they have no freedom of choice but are determined by their very nature to act in a specific manner. Man alone has intellect and free will and can thus command the functions of certain powers over which he has control. He can, therefore, use these powers in a manner which agrees or disagrees with their natural tendencies and functions as intended by the Creator. Again, though, he 'ought to' use them according to their proper tendency and function and 'ought not' use them in opposition to their proper tendency and function; in the former case his action will fulfill their immediate (intrinsic) and ultimate end and be morally good, and in the latter case his action will divert them from their immediate (intrinsic) and ultimate end and be morally evil. The nature of man as a whole will indicate the proper function and tendency of a particular natural power and the place which it is to occupy in the hierarchical order of powers and functions, for so it is intended by the Creator of man. The 'proper use' of a natural power, therefore, is morally good, while its abuse is morally evil. Here, too, the *nature of the whole man* will be the objective *proximate norm of morality*.

IN CONSIDERING HUMAN NATURE AS THE PROXIMATE NORM OF morality, it would be erroneous to view man as a being existing in isolation. Man does not live in a vacuum. He is an

autonomous person, but he lives his life in a *three fold natural relation* to other beings.

1. Man is primarily a *rational being*. As such he stands at the peak of the visible creation. According to the natural hierarchy of beings in the universe, all irrational finite beings must be subordinated to his rational nature. The visible world is man's home, and everything in it should serve as a *means* for the preservation and development of his physical and mental powers, so that he can achieve his ultimate end, the manifestation of God's glory and his own final beatitude. For him, therefore, to forget his superior position as the master of irrational beings, and treat them no longer as a means but as *ends in themselves*, is a violation of the natural order and contrary to his rational nature. It is, for instance, immoral for man to subject his rational nature to the dominance of earthly things, as he does when he succumbs to avarice, gluttony, or drunkenness; they become 'ends in themselves' and obtain thereby an importance greater than that of the rational nature of man itself, and that is a subversion of right order.

2. Man is by nature a *social being*, intended by God to live with other human beings as a member of society for mutual benefit and support. All human beings have the same nature and the same final end, and all must work together toward the realization of their common end; that is the essential purpose of human society. It follows, then, that everything which furthers the well-being of society as a whole and of the individuals as members is morally good, because it is conducive to the realization of man's intrinsic and ultimate end; whatever hinders or frustrates this well-

being, is by that very fact morally evil. Since private property, for instance, is necessary for the well-being of man as a member of human society, respect for the property of others is morally good; theft and robbery, on the other hand, are morally evil. So, too, the power and functions of sex are given to the individual for the benefit of human society, for such is the intention of the Creator; to use this power according to the intention and prescription of the Creator is morally good, but to use it otherwise is morally evil.

3. Man is by nature a *creature of God*. Because of that fact, man is not the absolute master of himself, but is subject in all things to his Creator and to the purposes of the Creator in giving him his human nature. Now, God created man, as He created all things, as a manifestation of His glory. Irrational creatures fulfill this ultimate purpose by the necessity which governs their entire nature. Man, however, is a rational creature and has been endowed with intellect and free will. By means of his intellect he must seek to understand himself and other beings in their relation to God as their ultimate end; by means of his free will he must seek to direct, intelligently and voluntarily, his entire nature with all its powers, tendencies, and functions toward God. Thereby he will not only fulfill the immediate, intrinsic purpose of his being, but also the ultimate purpose — God's glory and his own final beatitude with God. Man must, in virtue of his very nature, worship God and serve Him. He must strive to know and love God in this world, so as to be happy with Him in the next. Consequently, whatever assists man in the realization of his supreme end

is morally good; whatever hinders him in this is morally evil. Therefore, if man follows the dictates of his nature, as manifested by *right reason*, he lives as God wants him to live, and he then leads a morally good life; contrariwise, he leads an immoral life.

To sum up: the *proximate objective norm of morality* for man is his own *entire rational nature* considered in its threefold relation to the world, society, and God. This threefold relation is the basis, as we will see, of Special Ethics.

Conscience

In order that man may know the rightness or wrongness of his personal actions, they must be compared with the objective norm of morality and adjudged to be morally good or bad. The objective norm does not itself make the comparison; the comparison of the actions with the norm of morality and the subsequent judgment as to the morality of individual, specific, personal actions are made by the individual person. It is the function of conscience to make known the morality of any action.

That conscience is a *function of the intellect* should be fairly obvious. Moral goodness is the agreement of an action with man's proximate end (human nature) and ultimate end (God's nature); or, to put it in a different way, an action is morally good if it conforms to his proximate and ultimate end. Moral badness is, of course, the reverse. To know, therefore, whether an action is morally good or evil, a person must *compare* his action with the norm and then

judge whether the action is in conformity or disconformity with the norm. Now, only the intellect can know what the 'proximate and ultimate end' of man is; only the *intellect* can make the comparison' between an action and the norm and pass 'judgment on the conformity or disconformity between the one and the other. Morality affects only *human acts*, and human acts, as we have seen, proceed from the will under the direction of the intellect or reason; hence, again, it is the intellect or reason which judges whether an action is good or evil. It is, however, the function of conscience to judge whether an action is good or evil. Consequently, 'conscience' is nothing other than 'intellect' or 'reason' judging whether an action is good or evil.

There is another point to consider. When we wish to decide the morality of an act, we seek to determine whether the contemplated action falls under a general law as a particular instance of that law. We argue somewhat as follows: 'It is wrong to lie; but if I state this as a fact, although I know it is not a fact, it is a lie; therefore, if I state this as a fact, it is wrong.' Conscience always functions in this manner, either explicitly or implicitly. That is to say, we *always reason* from a general law to a particular instance which falls (or does not fall) under that law. Since, however, the application of a general law to a particular instance involves a process of reasoning, and since a process of reasoning is a function of the intellect or reason, it is evident that the intellect or reason is the mental faculty which judges the morality of an action. To judge the morality of an action is universally conceded to be the function of 'conscience.' Therefore, 'conscience' is intellect

or reason judging the morality of an action. If, then, we consider conscience to be any kind of a mental faculty at all, it must be identified with intellect or reason.

Strictly speaking, though, *conscience is not a faculty*, but an *act*, namely, an act of the intellect or reason. The intellect, in so far as it seeks to discover truth for the sake of knowledge as such, is called 'speculative reason'; the same intellect, in so far as it seeks to discover truth for the sake of directing action in a practical manner, is called 'practical reason.' Morality pertains to actions as directed to their proximate and ultimate end. Morality, therefore, belongs to the field of practical reason. And 'conscience' is simply the *judgment* of the practical reason that an action is morally good (or evil) because it tends (or does not tend) to realize its proximate and ultimate end.

Experience proves that this concept of conscience is the correct and true representation of its essence. If I have been led by greed to commit a theft, I reproach myself for having committed an immoral act, I condemn the act in my own mind, I am conscious that I deserve punishment, and I should restore my ill- gotten gain if I desire to have peace of mind. This reproach (the result of my conscience) presupposes a knowledge of the general law that 'theft is wrong and therefore forbidden.' I realize that I could and should have observed the general law, but I transgressed it voluntarily. Practical reason formulated the following (at least implicit) syllogism: 'Theft is wrong (general law); this act was theft (individual action); therefore, this act was wrong (practical conclusion).' It is the *declaratory judgment* which subsumes an individual act under the precept of the

general law and declares that the act conforms or does not conform to the general law, that constitutes conscience.' General laws are the concern of the intellect as objects of knowledge; individual acts are the concern of conscience declaring them to be permitted or forbidden. In this respect conscience acts like a judge in a criminal court. The general laws are on the statute books prior to the time when the judge ascends the bench to try a case. The judge applies the general law to the individual action committed by the defendant and gives a verdict of 'guilty' or 'not guilty.' Such is the action of conscience. That is why St. Thomas,¹ in speaking of conscience, simply states: "Conscience is nothing else than the application of knowledge to some action.

Conscience, therefore, is defined as the *immediate judgment of practical reason with respect to the character of individual acts as being permitted, commanded, or forbidden.*

The Dictates of Conscience

Conscience is the *immediate subjective* and *manifestative norm* of moral conduct. Since man's conscience is the immediate judgment of the practical reason applying the general principles of morality to individual concrete actions, it is the natural guide of man in matters of moral conduct. Man must follow the dictate of his conscience, whenever he is subjectively certain of this dictate. There is no problem when conscience is certain and agrees with the objective

norm of morality. But man's conscience may rest on an erroneous judgment. What then?

In the case of a conscience which is (subjectively) *certain* but (objectively) *erroneous*, a person must also follow the dictate of conscience. The principle is clear. Where there is error, there is a false judgment; and where there is false judgment, there is ignorance of the true state of affairs. When a person's conscience is erroneous, he mistakingly considers an objectively evil action to be morally good or indifferent and thus commanded or at least permitted, or considers an objectively good or indifferent action to be morally evil and thus forbidden. The ignorance underlying this false judgment is, under the circumstances, *invincible*. Only under the supposition that ignorance is invincible is it possible for an erroneous judgment to be 'certain.' Certitude implies the exclusion of all fear of possible error, but such a state of mind can exist only when there is no doubt as to the truth of the judgment. In the case of a conscience which is 'certain but erroneous,' the situation is this: the person's practical judgment concerning the morality of an action is contrary to the objective truth of the law, but the person's conscience is certain of the presence of the law as (erroneously) understood. What is the person supposed to do in such a case? Here, too, the person *must follow the dictate of his certain conscience, even if it is erroneous*. In other words, a person must follow the dictate of a (subjectively) certain but (invincibly) erroneous conscience in all that it commands and forbids; otherwise he will commit an immoral act; and a person may follow the judgment of conscience in all that it declares to be

permitted. The reason is clear. The will of man is blind and in moral matters is bound to follow the guidance of the practical reason when the latter declares with certitude that something is commanded or forbidden or permitted. In the absence of a special revelation from God, reason is the only normal guide for the direction of human acts; in fact, reason is the only guide under ordinary conditions of life. If, then, the conscience of a person declares with certitude that the law of God commands or forbids a certain action, even though this judgment is erroneous, then the will, in following this (erroneous) declaration of conscience, actually *decides to obey the law of God* as expressed by conscience. But the will must decide to obey the law of God as recognized by reason. Consequently, the will *must* follow the dictate of a certain, though erroneous, conscience. The morality of the will, it is obvious, depends on the object as known by reason and then proposed to the will. If the will decides on an action proposed by reason as morally evil, the will desires something considered to be morally evil and becomes itself morally evil; on the other hand, if the will decides on an action proposed by reason as morally good, the will desires something considered to be morally good and becomes itself morally good. That conscience is erroneous in its declaration is accidental, due to the invincible ignorance of the practical reason. As a result of this invincible ignorance and the subsequent error of judgment, the person following the dictate of a 'certain but erroneous' conscience commits an act that is *materially evil* but *formally good*; such a person must be considered *objectively wrong* but *subjectively right*. According to the

same principle, and for the same reason, one may follow the judgment of a 'certain but erroneous' conscience without sin in all that it declares to be permitted. When a person does the very best he can, he is not subject to censure in what he does.

WHAT SHOULD A PERSON DO WHEN HIS CONSCIENCE IS *IN DOUBT* as to the rightness or wrongness of a particular action? The practical reason cannot reach a definite decision whether the contemplated action is good or evil. The fear of possible error is present in the mind while facing the problem of making a decision. May a person act while in a state of *practical doubt* as to the morality of the contemplated action? In order to solve this problem, we must begin with an indubitable principle of correct action. This principle can be stated as follows: 'Every person is bound to avoid, as much as lies in his power, everything which is morally wrong.' This principle flows necessarily from the basic precept: 'Do the good, avoid the evil.' Now, whoever commits an act, while in the mental state of a practical, reasonable doubt as to its morality, violates the principle just given. A practical, reasonable doubt implies that reason cannot arrive at a definite judgment as to whether the contemplated act is morally good or evil: there are valid grounds for judging that the act is good, but there are also valid grounds for judging that the act is evil. The act, therefore, might be evil. But if the will decides to perform an act which conscience declares might be evil, it practically desires to do what is evil, and thereby the will

itself becomes evil; this is evident from the fact that the will, in order to be and remain morally good, must desire only the good. Consequently, a person with a conscience in a state of 'practical doubt' is not allowed to perform an act which might be evil.

What, then, must a person with a doubtful conscience do in order to be able to act correctly? Such a person must endeavor to *remove the doubt* and *obtain certitude*. 'Absolute' certitude is not required. In practical matters of conduct absolute certitude is seldom obtainable, due to the perplexity of many moral problems and the limitations of the mind in its reasoning powers. Were absolute certitude required for every action, an unbearable burden of inquiry would be placed upon the shoulders of men, because it is seldom possible for them to arrive at a conclusion which would exclude every kind of doubt. The certitude which is required and is sufficient for the practical affairs of everyday moral conduct is the *relative certitude* which satisfies prudent people, namely, certitude which excludes the *prudent* fear of error.

Doubt can be removed in one of two ways: 'directly' or 'indirectly.' It is removed *directly* by means of close examination of the principles and facts involved in the case, so that one is able to decide definitely that the contemplated action does or does not fall under a commanding or prohibiting general law. Oftentimes a thorough study of the case in question will reveal the truth. If a particular individual is incapable of making such an examination himself, due to lack of the necessary knowledge or training, he should consult expert moralists

on the matter. It happens quite frequently, however, that even experienced moralists disagree among themselves as to whether a concrete action is licit or illicit. In that event the practical doubt must be removed *indirectly* before one is allowed to act. When diligent research has proved to be of no avail in removing the doubt, and when experienced moralists cannot agree, one may correctly conclude that the very *existence of the law is positively doubtful* and therefore does not bind in conscience. He is, as a consequence, free in his action.

Synderesis

By *synderesis*, or, as some prefer to term it, synteresis, we understand the *habitual knowledge of Primary moral axioms* or practical principles of moral action which are present in the human intellect.

The intellect has two sets of such fundamental axioms or 'first principles.' In the speculative order there are the Principles of Identity, Contradiction, Excluded Middle, and Sufficient Reason. They are not innate in the sense that they are present ready-made in the speculative intellect at birth; but they are so simple and self-evident that they are readily understood (even though not expressly formulated) and remain habitually in the intellect as long as the intellect functions. In a similar manner, there are certain simple and self-evident principles of the practical order of conduct which every person understands and accepts whenever practical reason functions; they, too, are habitual in character and are never really lost. Such principles or

moral axioms are, for instance: 'Do the good, and avoid the evil'; 'live moderately'; 'honor your parents'; 'murder is a crime'; 'theft is wrong.' Even the child and the unlettered savage are aware of their basic truth. Axioms of this sort need no demonstration: they are obvious to any normal person and are accepted without proof or question. Synderesis, therefore, is the dictate of the practical reason having as its object these 'general' principles of moral conduct, just as conscience is the judgment or dictate of practical reason declaring that a 'particular' action is licit or illicit. Conscience, it will be observed, thus depends to a great extent on synderesis, because conscience applies the knowledge given through synderesis to individual actions.

Conscience, partly by instruction and partly by original reasoning, gradually will amplify its fund of moral truths; good living will make conscience sharper in its moral discrimination and more accurate in its deductions. Habitual evil living will blunt the delicacy of conscience and cause it to decay. Man, however, no matter how depraved he may be, never can obliterate completely the basic principles of morality from his mind; he will at least demand justice from others in their treatment of himself. The 'amoral man' is a myth.

Morally Indifferent Acts

A heated controversy has centered around the question whether any human acts can ever be really *morally indifferent*. All scholastic authors agree that many human acts, considered merely from the standpoint of their *object*,

are morally indifferent; such are, for instance, walking, playing a game, wearing a brown or black suit, taking food or drink. The controversy is about such acts, when considered in the concrete as individual acts from the standpoint of the *circumstances* and the *end of the agent*.

St. Bonaventure (1221—1274) and Duns Scotus (1266 [or 1274]—1308) defended the view that will-acts having an indifferent object also can remain indifferent as concrete acts. They contended that the agent can make the ‘end of the object’ his personal ‘end of the agent.’ Hence, the end of the agent need not, even in a concrete act, change the nature of an act which is directed toward an indifferent object; it would still remain essentially indifferent.

St. Thomas,² on the other hand, maintained that will-acts, in the concrete as individual acts, cannot remain indifferent, even though directed toward an indifferent object; every will-act is either morally good or morally evil. He argues as follows. Every indifferent object of a will-act must be, at least in a general way, a good and as such agree with the nature of man. Since it is a good, it can be referred to the ultimate end of man, namely, the glorification of God. Man, however, as a rational being, is created for this ultimate end and must seek to realize this ultimate end in all his acts, at least in his deliberate acts. Hence, all deliberate acts, even those directed toward an indifferent object, not only can but must be directed toward his ultimate end, either actually and explicitly or virtually and implicitly. Such an act, however, if directed toward the ultimate end, is morally good; if not, it is morally evil.

Consequently, all human acts, in the concrete as individual acts, will always be either morally good or morally evil.

Most scholastic moralists follow St. Thomas.

Some Reflections

There are a number of important points in connection with the norm of morality which should be considered before this subject is concluded.

One point is the distinction between objective and subjective morality. *Objective morality* is the conformity or disconformity of a particular human act and its object with the objective proximate and ultimate norm, irrespective of our judgment. *Subjective* or *personal morality* is the conformity or disconformity of a particular act and its object with the objective norm of morality, according to our judgment. Conduct consists of human acts. An act, to be human, must be under the control of the free will, and the will is dependent on the judgment of the intellect. This judgment regarding the objective morality of the proposed act may be correct; but it may also be erroneous. It may happen, therefore, that a person judges an act to be morally good, while in reality it is objectively evil; or, that it is morally evil, while in reality it is objectively good. Imputability follows the judgment, and so does responsibility. Hence, the individual must follow his *personal considered judgment*, even if this judgment is erroneous. In such a case, the individual would perform an act which is *materially* (objectively) evil, but *formally* (subjectively) good; or *vice versa*.

Another point. Some people use the term 'subjective morality' in the sense that all moral distinctions between good and evil are *purely subjective*, as when the statement is made that "Morality is what you make of it" or "That is morally good or evil what you think is morally good or evil." Such a view implicitly denies the existence of an objective norm of morality in virtue of which some acts are morally good in themselves and other acts morally evil in themselves. From what has been said, it should be clear that this view is false. This view could be true only on the supposition that God does not exist; if God exists, there must be an objective norm of morality and an objective distinction between moral good and evil.

A further point. Every finite thing, since it is in some degree an imitation of God's perfections, is good. But if it is good, how can it ever be morally evil to strive for it? A distinction must be made. Every being is good in its physical being; it is an 'ontological' good. Such a being is good, considered in itself and for itself, without regard to its relation to other beings; in this sense it is said to be an 'absolute' good, even though it is finite in being. Thus, carbolic acid and a pork chop are an ontological and absolute good. However, every being also can be considered in its relation to other beings. If it benefits another being, it is a 'relative' good for this being; if it harms another being, it is a 'relative' evil for it. When a person eats a pork chop, this food is a relative good for him, because it benefits the person; but when a person drinks carbolic acid, this drink is a relative evil for him, because it harms the person. Even on the level of physical being,

therefore, something that is an ontological and absolute good, considered in itself, may be either a relative good or evil, considered in its relation to the well-being of another being. In a similar manner, something is an ontological and absolute good in itself, but a *relative moral evil* or a *relative moral good* for the person striving for it, depending on whether this ontological and absolute good is evil or good for the *moral welfare* of the person; if it promotes the attainment of the ultimate end of man, it is morally good, and if it hinders this attainment, it is morally evil. To drink poison in order to commit suicide is a relative moral evil; to eat food in order to preserve one's health is a relative moral good. If a physician has forbidden the eating of pork for a certain person as harmful, then the eating of pork under the circumstances would be morally evil. An onto-logical, absolute good, therefore, may be a *morally evil* object for the will in its striving. In order that something be the proper object for the will, it must be both an ontologically and morally good object.

Another point. Oftentimes it is stated that the proximate norm of morality for man is *reason* or *right reason* (*recta ratio*). If understood correctly, the statement is true. St. Thomas³ uses the expression and explains it as follows: "It must be observed that the nature of a thing is chiefly the form from which that thing derives its species. Now man derives his species from his rational soul, and consequently whatever is contrary to the order of reason is, properly speaking, contrary to the nature of man, as man; while whatever is in accord with reason is in accord with the nature of man, as man." The will must rely entirely on the

judgment of the intellect or reason as to what is morally good or evil; consequently, if something is adjudged to be in accord with reason, it is morally good, and if contrary to reason, it is morally evil. For all practical purposes, therefore, the judgment of reason is the proximate, *subjective* norm of morality for man. In order, however, that reason be 'right' and not purely subjective in its judgment, it must base its judgment on an 'objective' norm. It is because some objects or acts agree or disagree with this objective norm that reason declares these objects or acts to be morally good or evil; and this proximate objective norm is the nature of man.

A final point. What God can or cannot do is not the result of an arbitrary decision, but depends on *His infinitely perfect nature*. God cannot be deceitful or lie or break His promise, because that would not be consonant with the infinite perfection of His wisdom. God cannot punish the good and reward the wicked, because that would not be consonant with the infinite perfection of His justice. And so with other acts of God. God's nature is the ultimate objective norm for all His acts. This is the reason why His nature is the ultimate objective norm for the morality of man's actions and the reason why certain acts of man are intrinsically good or evil. Lying, for instance, is intrinsically evil for man because it contradicts the infinite veracity of God; mercy is *intrinsically* good because it agrees with the infinite mercy of God. The basic reason why certain acts of man redound to the glory of God and promote man's final beatitude is that they ultimately agree with God's nature and infinite perfections. Here we have the *fundamental*

ground of all morality. Thus, also, it can be seen why the ultimate objective norm of morality for man was not placed in the fulfillment of his ultimate end, but in the nature of God.

Moral Positivism

Moral positivism is any system of ethics which denies the *natural* (intrinsic) distinction between the morally good and morally evil and claims that this distinction is derived solely from the *free and positive enactment of authority*.

There are *two types* of moral positivists. One places the ultimate ground for the distinction between right and wrong (good and evil) in the enactment of some form of *human institution*; the other type, in the enactment of the *free will of God*. Moral positivism, in the first meaning, is 'anthroponomic' (Gr., *άνθρωπος*, man, and *νόμος*, law); in the second meaning, 'theonomic' (Gr., *θεος*, God, and *νόμος*, law).

Anthroponomic positivism has had many defenders, though they differ widely among themselves when they attempt to specify the ultimate ground of morality. We find moral positivists already among the ancient philosophers, for example, Aristippus, Protagoras, Gorgias, Carneades, Pyrrho, and Sextus Empiricus.

Among the more modern writers, Montaigne (1533—1592) was the first to deny the objective validity of moral concepts and principles. However, to *Thomas Hobbes* (1588—1679) must go the dubious honor of being the first to develop a complete system of positivistic ethics. The good,

according to Hobbes, is a relative idea which changes with the subjective temperament of the desiring person; what may appear as a good to one may appear as an evil to another. It is only through the state and its laws that a moral standard of universal validity has become established. The distinction, therefore, between right and wrong has its origin in the civil laws of the state. Other positivists are J. J. Rousseau (1712—1778), B. Mandeville (1670—1733), Ch. F. de Saint-Lambert (1717—1803), Aug. Comte (1798—1857), W. Wundt (1832— 1920), L. Levi-Bruhi, and most evolutionists, socialists, and communists. The latter derive all morality from the economic and social conditions prevailing at any particular period of history. All who reduce the norm of morality to convention, custom, public opinion, and governmental law are moral positivists.

Theonomic positivism bases the distinction between the morally good and morally evil on the *free will of God*. Certain acts are morally good because God, through His free will, commands them; others are evil because He forbids them. Since such a command or prohibition is an act of God's free decision, He could, absolutely speaking, reverse His decision and thereby reverse the concept of what is morally good and morally evil.

Among those who defended this view are William of Occam (died 1347) and J. Gerson (died 1429). *René Descartes* (1596—1650) contended that all things, even the essences of beings, have their ultimate ground in the will of God; he therefore drew the conclusion that the ultimate reason for the distinction between right and wrong (good and evil) lies in the free decision of God's will. *Samuel von*

Pufendorf (1632—1694) considered 'law' to be the ultimate ground of morality; and since all law depends upon the will of God, the ultimate ground for the distinction between the morally good and the morally evil lies in the free decision of God's will.'

Both types of moral positivism, the anthroponomic and theonomic, deny the 'intrinsic' distinction between any and all moral acts as good or evil in themselves; they are good or evil merely because of some 'positive' law of God or man.

There is no need to formulate a distinct refutation of moral positivism. Some acts are, it is true, morally good or bad because of a positive precept of some kind. However, many acts, as was shown above, are *intrinsically* (by their very nature) good or bad in a moral sense, irrespective of the will of God or man.

We have now established a few truths which form the very basis of all morality: God's infinitely perfect nature is the ultimate objective norm to which all human acts must conform, if they are to be adjudged morally good; the nature of man, viewed in its entirety and in all its essential relations, is the proximate objective norm to which all human acts must conform in order to be morally good. Some human acts, by their very nature, agree with this ultimate and proximate norm and as such are objectively and intrinsically good in a moral sense; others, by their very nature, disagree with this ultimate and proximate norm and as such are objectively and intrinsically evil in a moral sense. *Morality*, therefore, is not subjective but *objective*.

Summary of Chapter VII

This chapter treats of the *norm of morality*.

1. *Criterion and Norm*. A moral *criterion* is a rule or test by means of which we are able to discriminate between what is morally good and morally evil. A *norm of morality* is an objective standard or rule or principle which determines the morality of 'an act in itself.'

The *qualifications* of an effective norm of morality are: it must be unchangeable; it must be universal; it must be accessible to all; it must be applicable to all conditions; it must be a single standard.

2. *Acts Objectively Good or Evil*. The reason why some human acts are objectively and intrinsically good or evil lies in the ultimate end of man and all creatures. All finite beings, including men, were intended by God for the furtherance of His glory. Now, some human acts, *by their very nature*, promote the glory of God, while others detract from it. Man, therefore, 'ought to' imitate God's perfections, so as to fulfill his ultimate end; and this implies *moral obligation*. Human acts, then, that are in conformity with God's perfections and nature, are morally good, intrinsically, objectively, and by their very nature; contrariwise, they are morally evil.

3. *The Ultimate Norm of Morality*. Man's final beatitude (his ultimate subjective end) depends entirely on God and His glory (man's ultimate objective end). And the ground and reason why God's glory is the ultimate end of all creatures, including man and his acts, lies in the infinite

perfection of God's attributes and nature. Hence, *God's nature is the ultimate norm* or standard of comparison for judging the morality of any human act.

4. *The Proximate Norm of Morality.* The proximate norm is the nature of the whole man. Such a norm has all the qualifications mentioned above.

All creatures glorify God by their very *nature* and by every *natural function*. Man, therefore, if he acts according to the dictates of his nature as a human being, fulfills his ultimate purpose. To do this, however, man must, by a free decision of his will, observe the *hierarchical order* of functions and powers intended by God in giving him this human nature. *Man's nature* is thus the immediate or proximate norm of morality. All acts performed in accordance with the hierarchical order of functions and powers intended by God will be 'morally good'; acts performed in opposition to this order will be 'morally evil.'

5. *Conscience.* Only the *intellect* can know what the 'proximate and ultimate end' of man is and what the 'norm' is which results from this end; only the intellect can 'compare' an action with the norm and pass 'judgment' on the conformity or disconformity between the one and the other. Usually a 'process of reasoning' is required to determine whether a particular act is an instance falling under a general law. Hence, conscience is an act of the intellect or reason and is defined as the *immediate judgment of practical reason with respect to the character of individual acts as being permitted, commanded, or forbidden.*

6. *The Dictates of Conscience.* The judgment of conscience is expressed in the form of commands or *dictates*.

A person is obviously bound to obey his conscience, if the latter is *certain* and *true*. A person must follow the dictates of his conscience, if the latter is *certain* but *erroneous*. When a person is 'certain' in his moral judgment, but the judgment is 'erroneous,' then his ignorance is invincible. Such an act would be 'materially evil' but 'formally good.'

A person in a state of *practical doubt* about the morality of an act is not allowed to act while in this state of doubt; he must first *remove the doubt* and seek to obtain a relative or *prudent certitude*, if 'absolute' certitude is unobtainable. The doubt may be removed either 'directly' or 'indirectly.'

7. *Synderesis.* *Synderesis* is the habitual knowledge of primary moral axioms or practical principles of moral action which are present in the human intellect. Conscience depends to a great extent on synderesis, because conscience applies the knowledge given through synderesis to individual actions.

8. *Morally indifferent Acts.* St. Thomas maintains that there can be no really morally indifferent acts, when considered in the light of concrete circumstances and of the end of the agent. All deliberate acts, even those directed toward indifferent objects, must be directed toward man's ultimate end, either actually and explicitly or virtually and implicitly. Such an act, however, if so directed, is morally good; if not, it is morally evil.

9. *Some Reflections.* *Objective* morality is the conformity or disconformity of a particular human act and its object

with the objective proximate and ultimate norm of morality, irrespective of our judgment. *Subjective*, or personal morality is the conformity or disconformity of a particular act and its object with the objective norm of morality, according to our judgment.

Morality can never be 'subjective' in the sense that it is *purely subjective*. Since God exists, there must be an objective norm of morality and an objective distinction between the morally good and the morally evil.

Every being, considered in its being, is an 'ontological' and 'absolute' good. Considered in its relation to another being, it may be *a relative good or a relative evil* for that being. Such an ontological good, if it promotes the ultimate end of man, will promote man's moral welfare' and as such is a 'morally good object' for man; if it hinders man in the attainment of his ultimate end, it is a 'morally evil object' for man.

Right reason is the proximate norm of morality, because what ever is in accord with reason is in accord with the nature of man as man.

What God can or cannot do is not the result of an arbitrary decision, but depends on His *infinitely perfect nature*.

10. *Moral Positivism*. It is the system which denies the *natural* (intrinsic) distinction between the morally good and the morally evil and claims that this distinction is derived solely from the *free and positive enactment of authority*. It is either 'anthroponomic' or 'theonomic.'

Chapter 8

FALSE NORMS OF MORALITY

THE ULTIMATE OBJECTIVE NORM OF MORALITY IS THE NATURE OF God and its perfections. The proximate objective norm is man's nature considered in its entirety. The rational nature of man, in whatever grades of being it possesses, is a true though imperfect representation and imitation of God's infinitely perfect nature. Therefore, all human acts which agree with man's rational nature also agree with God's nature and as such are morally good; on the other hand, those which disagree with man's rational nature thereby also disagree with God's nature and are morally evil.

Not all moral philosophers, however, are in accord with our view of the proximate and ultimate norm of morality. The history of ethics acquaints us with a *variety of norms* which have been advanced and advocated in the course of the centuries.

General Survey

It would be an impossible undertaking to list all the individual views concerning the norm of morality. However,

a broad division of ethical systems, based on their doctrine of the ultimate norm, can be made.

There are *two main classes* of ethical systems, those that advocate an intrinsic norm of morality and those that advocate an *extrinsic norm* of morality.

The systems with an 'intrinsic' norm are characterized by the doctrine that the morality of a human act must be judged by its relation to the *human person* performing the act. These systems were divided into two main groups. The one group accepts an intrinsic 'objective' norm as the ultimate standard, namely, human nature. Chief among these are 'stoicism' and 'perfectionism.' The other group accepts an intrinsic 'subjective' norm as the ultimate standard, namely, some faculty of man, such as a moral sense or feeling. This last group often goes under the designation of 'intuitionism,' because the moral character of an act, according to this doctrine, is perceived through some form of immediate intuition by man.

The systems with an 'extrinsic' norm are characterized by the doctrine that the morality of an act must be judged by its *usefulness* in attaining a certain end, and this end lies outside the individual human nature. These systems go under the general designation of eudaemonism (Gr., *εὐδαιμονία*, wellbeing), because they consider earthly 'happiness' to be the ultimate end of man and the standard according to which we must judge what is morally good or evil. Happiness, however, may be taken from the standpoint of the individual human being or from that of the human race at large. If individual human happiness is considered to be the norm of morality, we speak of 'egoistic hedonism'

(Gr., *ἡδονή* pleasure). A system which considers the happiness of the race the norm of morality, is designated 'utilitarianism.' The combination of the doctrine of happiness of the race with the theory of evolution is 'evolutionary naturalism.'

Stoicism

Stoicism was founded by *Zeno* (356—264 B.C.) of Cittium in the year 308 B.C. in Athens. He had many followers among the Greeks and Romans. Prominent among the latter were Cicero (104—43 B.C.), Seneca (A.D. 4—65), Epictetus (A.D. 60—110), and Marcus Aurelius (A.D. 121—180).

Zeno accepted the doctrine of Socrates that the virtuous man is the one who has attained happiness through knowledge. Virtue is the only good. The supreme good of man is happiness, and happiness consists in virtue. Virtue and happiness consists in living a *life consonant with reason*.

Virtue and happiness being identical, *virtue alone* suffices for happiness and is for man an end-in-itself. Whatever is neither a virtue nor a vice is indifferent and can, according to circumstances, be striven for or avoided. Pleasure is a result of virtue, but may never be made the end of an action and be desired for its own sake. Since life according to reason is the norm of morality, the stoics considered the *emotions* and *passions* as unworthy of the wise man. In fact, emotions and passions are transgressions of the right order, diseases of the soul, irrational. The virtuous man, therefore, while not insensitive, must be

emotionless and passionless. Complete *apathy* is the characteristic mark of stoic virtue and a duty.

Evaluation. Stoicism is an austere code of morals. The idea that the norm of morality is the nature of man as a rational being is fundamentally sound. The stoic norm, however, is too *one-sided* and *limited*, basing its norm *solely on reason* to the exclusion of every other part of man's composite nature. As a result, the stoics were compelled to condemn all emotions and passions as irrational and evil. Why should emotions and passions be morally evil in themselves? They are part and parcel of man's nature as much as reason is. True, they should be governed by reason according to the hierarchical order of man's being, but they cannot be excluded from this hierarchical order as such. As was pointed out in the preceding chapter, man's entire composite nature is good in itself and the proximate norm of morality.

Kant's Formalism

Immanuel Kant (1724—1804), the eminent German philosopher, was essentially a stoic in trend and principle. He considered 'apathy' to be a perfectly correct and sublime principle of the stoical school.

After having destroyed the foundations of human knowledge in his *Critique of Pure Reason*,¹ Kant sought to re-establish our knowledge of the soul, the world, and God by means of his *Critique of Practical Reason*. By means of the 'practical reason' he believed he could save our belief in

these supreme realities, because they are 'postulates' of the moral order.

Kant begins his moral discussion with an investigation as to what constitutes *moral goodness and duty*.

Gifts of body and mind, gifts of fortune, and even happiness, are good only in a limited sense, because they can be abused. Nothing is good without limitation except a *good will*.² In order that the will be truly good, it must perform actions not only 'in accordance with' duty, but rather *because of duty*. An action performed by the will receives its moral value, not from the object which it intends, but from the maxim by which it is determined. *Duty is the obligation to act from pure reverence for law* and from no other motive. Thus, according to Kant, two things are required for the 'good will' and the 'morally good act': the objective principle, or the law, which prescribes the action; and the subjective principle, or the maxim, through which the will is driven to perform the prescribed act.³

The 'object' of volition is the matter of volition; the 'motives of volition is the form of volition. Since, in Kant's view, the norm of morality is not found in the matter but in the form of volition, the matter of volition does not determine the morality of the action. The reason is that the volition of a definite object proceeds from self-interest, and self-interest possesses no universal character which could be formulated into a universal law. Furthermore, the matter of volition can lead only to 'hypothetical imperatives,' i.e., to counsels of prudence. One then acts according to the principle: 'if you wish to realize a certain end, you must act in a certain manner' (for instance, if you wish to become a

competent physician, you must study medicine). The principle or norm of morality, however, must be a *categorical imperative*, i.e., reason must command moral action in a categorical and unqualified manner, no matter what the consequences may be; the command is definite and unconditional: 'Thou shalt, thou must.' As Kant states:

"The categorical imperative declares that an act is in itself or objectively necessary, without any reference to another end. There is therefore but one categorical imperative, which may be thus stated: *Act in conformity with that maxim, and that maxim only, which you can at the same time will to be a universal law.*" In its final formula the categorical imperative can be expressed: "*Act so that the will may regard itself as in its maxim laying down universal laws.*"⁴

The renunciation of all interest in volition and duty is characteristic of the categorical imperative. A volition of this nature is only possible, if the will is not subject to any outside law, but is 'nomothetical,' i.e., is the author of its own laws. The result of this is the *autonomy* of the will. Heteronomy, or being subject to a law imposed by another, does not lead to 'duty,' but to the necessity of action out of interest for one's self or another.

Freedom is a postulate of morality. 'You can, because you should.' And freedom is only possible, if man, as a rational being, belongs to an intelligible world; hence, such a world is also a postulate of morality. Similarly, the immortality of the soul and the existence of God are postulates of moral living.

EVALUATION. KANT'S ENDEAVOR TO FREE MORALITY FROM THE baneful effects of English empiricism was laudable; but his own teachings suffer from a number of serious *defects* and *errors*.

First. Kant builds his system of morality upon the principle of the 'good will' and claims that the will is only then 'good in itself' when it performs actions, not merely 'in accordance with' duty, but exclusively 'because of' duty, from '*pure* reverence for the moral law.' To perform an action out of personal inclination or from a motive of self-interest, Kant asserts, makes this action 'legally good,' but not 'morally good,' even though the action be in conformity to the moral law. This is an unheard-of doctrine. Do we really judge that only those actions are 'morally good' which proceed *exclusively* from a pure sense of *duty*, and that personal inclination and self-interest destroy the morality of an act? Not at all. We consider almsgiving from a motive of compassion, neighborly assistance from a motive of friendliness, conjugal affection of spouses for each other and parental affection toward children and filial affection toward parents from a motive of love, to be morally good acts, even though they are not performed from a motive of pure and strict duty. According to Kant, the motive of *charity* would have no moral value at all, and acts performed out of charity would not be morally good. Everybody acknowledges that many heroic acts in time of peace and war go far 'beyond the call of duty,' because duty does not demand such supreme sacrifices under the circumstances. Yet such acts are considered to be of the highest moral character, because 'greater love hath no man

than that he lay down his life for his friends.' What a distortion of moral values and principles to consider such acts of supreme devotion and loyalty toward one's country and fellow men only 'legally' but not 'morally' good! Kant's principle is definitely at variance with the common conviction of mankind, because mankind always judges acts performed out of love and charity to be of greater moral value than those done merely from a sense of duty.

Again. The will or practical reason, Kant claims, must be *autonomous*, i.e., not subject to any law but to a law of its own making; otherwise there would be no freedom but compulsion. Man is his own supreme end and the sole maker of laws for his moral conduct. On the other hand, Kant postulates the existence of God as the Creator of all things, including man. Yet God can make no laws for man's moral conduct, and man is not subject to such laws, because that would be 'heteronomy'; to perform an act out of obedience to God's command would not be a morally good act! Such a doctrine means a complete deification of man and a subversion of the whole moral order. The final supreme end of man, as we have shown, is the glorification of God, and the realization of this supreme end can only be achieved if man leads a life in conformity with God's attributes.

If man's will is 'autonomous' and makes its own moral laws, then morality is completely *individualistic*, dependent solely on the individual's own will. Morality should then differ from individual to individual. As a matter of fact, why should the individual will burden itself with any laws of morality at all? We are conscious that we are subject to the

moral law as something independent of our wishes and desires, and we are in no way conscious that we ourselves are the authors of the moral law which binds our will. Finally. According to Kant, the *norm* of morality consists in the categorical imperative of the autonomous practical reason (will). The *categorical imperative*, in its final formulation, is expressed as follows: 'Act on maxims which can at the same time have for their objects themselves as universal laws of nature.'⁵ Hence: "Morality then is the relation of actions to the autonomy of the will, that is, to the potential universal legislation by its maxims."⁶ Such a norm, however, is useless for practical purposes. How is the ordinary man to know whether his maxims of conduct are fit to become universal laws? The norm of morality must be accessible to the generality of persons, because all persons without exception are bound by the law of morality in their daily conduct. Most persons, however, are not capable of judging whether their maxims of conduct "can at the same time have for their objects themselves as universal laws of nature." Even the learned will find it difficult to apply Kant's expression of the categorical imperative to human conduct. In order to know whether our maxims are capable of universal legislation, we must have a *norm over and above these universal laws*. That norm, as we have shown, is the *rational nature of the whole man* as an individual, as a social being, and as a creature subject to God.

Kant's ethics exerted a great influence upon many subsequent thinkers. The neo-Kantian *Marburg School*, headed by Hermann Cohen (1842—1918) and Paul Natorp (1854—1924) and supported by Ernst Gassirer (1874—

and Rudolf Stammier (1856—1938), carried on the Kantian tradition even up to present times.

Perfectionism, Sell-Realization

Perfectionism, or *self-realization*, as an ethical system, maintains that the total perfection of man is the end of all ethical striving. This perfection pertains chiefly to a life of virtue, but it also embraces all man's natural endowments.

Christian Wolff (1679–1754) considered it to be the foremost duty of man to perfect himself by bringing his various powers and activities into a harmonized whole. Whatever furthers this harmony is morally good; whatever hinders or disturbs it is morally evil. A somewhat similar view was advocated by *A. Ferguson* (1723—1816), with the additional contention that the achievement of complete perfection is never actually realizable by man. *H. Ulrici* (1806—1884) taught that the good is 'the willing of perfection for its own sake'; the end and goal of this willing is a perfect humanity, and the cognitional principle which enables man to recognize what promotes perfection is an innate 'feeling of oughtness.'

The idealists *G. Hegel* (1770—1831) and his followers, *T. H. Green* (1836–1882) and *F. H. Bradley* (1846—1924), expounded perfectionism as the self-realization of man through the unfolding of the Absolute in the consciousness of man. In as much as man is a phase of the Absolute, the self-realization of the Absolute involves also the self-realization and perfection of man. *B. Spinoza* (1632—1677) and *J. G. Fichte* (1762—1814), in their system of idealism,

proposed a theory of transcendental evolution which, in its ethical portions, develops a form of perfectionism.

Evaluation. The perfection of the human personality as a norm of morality *is not adequate*. The norm of morality must be the same for all persons and for all times and under all circumstances, because such is the nature of morality itself. The norm of perfectionism, in its very concept, refers to the human person in so far as he is 'perfectible,' capable of development and improvement; it applies to the variable elements in man. Such a norm would differ according to the differences of the various personalities, and such a norm is too *vague* to be applicable to the conduct of all as a standard and measure of moral living. While good morals tend, no doubt, to perfect the human person, the supreme end of man is not the perfection of his personality, but a life lived for the glorification of God and for the achievement of perfection and happiness in the life to come.

Intuitionism

Intuition means a mental process of direct and immediate apprehension. Applied to ethics, it means the direct and immediate perception of human conduct as 'good' or 'evil,' so that the knowledge of the distinction between good and evil conduct is not the result of an intellectual process or reasoned judgment, but of a special perceptual faculty or sense. The human mind would then perceive this moral distinction as clearly, directly, and intuitively as it does the distinction between red and green color, between the shape

of a cube or sphere, or between the hard or soft texture of objects. Hence, intuitionism or, as it is also called, *intuitionism* is that theory of ethics which claims that man possesses a *distinct faculty or power or sense* which, through its own immediate perception, is the criterion of what is right and wrong, good and bad, in human conduct. Intuitionism, in the main, defends the intrinsic distinction between moral good and evil and stresses right motives in conduct. According to the intuitionists, man should do right because it is right, and not so much because of the consequences of the moral act.

Ralph Cudworth (1617—1688) maintained that moral principles derive their origin from the ideas which exist in the mind of God and which are immutably present in the mind of man. Samuel Clarke (1675—1729) held a similar view. *Anthony A. C. Shaftesbury* (1671—1713) was an aesthetic intuitionist. According to his theory, morality consists in the balancing of the selfish and social propensities. The faculty of moral discrimination is not a rational faculty but an 'aesthetic sense.' *Francis Hutcheson* (1694—1746) advocated a 'moral sense,' implanted in the soul by the Creator, as the faculty of moral discrimination, and the faculty is distinct from reason. *Joseph Butler* (1692—1752) followed Shaftesbury and Hutcheson in his general theory, but substituted 'conscience' as the distinct and immediate faculty of approval and disapproval in moral matters. *Richard Price* (1723—1791) followed more in the footsteps of Cudworth. *Adam Smith* (1723—1790) regarded the disinterested feeling of 'sympathy' as the norm of morality, namely, the sympathy of the impartial and well-

informed spectator. David Hume (1711—1776) defended a ‘moral faculty’ as distinct from reason.

Thomas Reid (1710—1796) based his philosophy on the principles of ‘common sense.’ In the field of ethical behavior, Reid attributed the immediate perception of moral principles to ‘conscience’ as the proper cognitional faculty; most of the content of morality, he claimed, could be discriminated and understood by the ordinary man’s conscience. Among the followers of Reid were *Dugald Stewart* (1753—1828), *Thomas Brown* (1778—1820), and *James McCosh* (1811—1894).

According to *F. H. Jacobi* (1743—1819), man possesses a reason which is merely receptive and which perceives spiritual realities, including moral principles, just as immediately as the senses perceive physical realities; and since this spiritual perception manifests itself in ‘feeling,’ we feel instinctively what is morally good or bad, and this ‘feeling’ thus becomes the norm of morality. *J. F. Herbart* (1776—1841) placed ethics under aesthetics, and moral judgments are simply the result of a ‘moral taste’ based upon various harmonious relations of the will. *James Martineau* (1805—1900), in his ‘moral impulse’ theory of ethics, contended that the ‘sense of right and wrong’ is primarily directed toward the perception of the comparative excellence of motives. In recent time, the doctrine of intuitionism has been defended by a number of *neo-intuitionists* at Oxford, among them H. A. Prichard, W. D. Ross, and E. F. Carritt.

Writers make a distinction between the formal and material goodness of acts. They understand by ‘formal’

goodness the goodness of the act as such; the goodness is considered to be 'inherent' in the act, irrespective of its consequences. They understand by 'material' goodness the goodness of the act in its results; if the consequences of the act are good, the act itself is considered good. Since intuitionism looks toward the formal goodness of acts, it is often referred to as *ethical formalism*.

Evaluation. The 'moral sense,' by whatever name it goes, is not the same as the reasoning intellect, but is a distinct and special faculty which discriminates between good and evil in conduct directly and not by means of any reasoning process or conclusion. We must *reject intuitionism* as false.

For one thing. There is *no evidence* for the existence of such a special faculty. Psychology, both through introspection and experimentation, has discovered but two distinct spiritual powers, namely, the cognitive power of the intellect and the appetitive power of the will. The discrimination between the moral goodness and badness of conduct is always expressed in the judgments: 'This act is morally good,' or 'This act is morally bad.' Since discrimination is a matter of *judgment*, and since judgment is an act of the intellect, there is no justification in assuming a special 'moral sense' or 'moral faculty' distinct from the intellect itself.

Again. Even if such an intuitive 'sense' or 'feeling' existed for moral conduct, it would be nothing more than a *discriminatory* faculty, enabling us to distinguish between what is morally good and morally bad, so that we can pass proper judgment on the morality of human acts. Now, in order that moral conduct be intelligent and reasonable, we

must not only be able to judge *that* an act is morally good or bad but also *why* the act has the character of moral goodness or badness. Hence, a special 'moral sense' might be a *criterion* for judging the morality of an act, but it is not in any sense a norm of morality which would enable us to know 'why' an act is good or bad. By comparing an act with the 'norm,' we discover the reason why the act is *objectively* good or bad *in itself*, and that is of paramount importance to the moral philosopher, because he must seek to determine the ultimate reasons, principles, and causes of the morality of human conduct. A 'criterion' of morality is altogether too subjective, unless it is based upon an objective norm. An intuitive moral faculty might serve as a subjective guide in our moral conduct, but it could tell us nothing of the 'ground' on which its judgments are based. As rational beings, however, we should also know the ground or reason of our moral judgments, otherwise our judgments are blind; but the ground or reason for our distinction between good and bad acts can only be furnished by an 'objective norm' with which moral acts are compared. As we have seen, this proximate objective norm is the complete rational nature of man. Since intuition is at best only a criterion, not a norm, we must reject it as *inadequate*.

So far we have investigated various ethical theories which attempt to give an 'intrinsic' norm of morality. One way or another, they are deficient. We must now turn our attention to another group of theories. This group looks to the consequences of actions as the constituent norm. Such a norm is 'extrinsic,' because they do not consider human

acts to be intrinsically good or bad, but good or bad in virtue of their effect in furthering or hindering the well-being of either the individual or the race. Since temporal *well-being* or happiness is the goal of action in this group of theories, many writers, for the sake of convenience, place them together under the general heading of eudaemonism.

Egoistic Hedonism

Hedonism, as an ethical theory, had its beginning among the Greeks. Aristippus, born in Cyrene about 435 B.C., the founder of the Cyrenaic School of Philosophy, is the father of hedonistic ethics.

The Gyrenaics were sensists. They accepted the teaching of the sophist Protagoras that all knowledge is relativistic; so they maintained that man's knowledge is restricted to his experiences or feelings. Assuming with Socrates that the aim of human conduct is happiness, they perverted Socrates' doctrine of happiness and gave it the meaning of *personal pleasure-feelings*. Pleasure is the supreme and only good. Everything, even virtue, is good only as a means of procuring and maintaining the maximum of pleasurable emotion, together with a minimum of painful emotion. Some of the later Cyrenaics, like Theodorus and Hegesias, advanced a less crude system of hedonism.

The Epicureans took over the general tenets of hedonism. *Epicurus* (341 or 342—270 B.C.) founded the Epicurean School. Pleasure is the only unconditioned good; everything else, including virtue, has only relative value. According to the Epicureans, however, pleasure is viewed

more in its negative aspect as 'repose of mind.' Hence, there exists a hierarchy of pleasures, and among them the pleasures of the mind and of social life are more important than mere organic pleasures of sense, if they contribute more to painlessness or repose of mind. Basically, though, all pleasure is reduced to the pleasure of sense, because Epicurus and his followers were materialists. Each person must determine for himself what is more pleasant and less painful. Moderation is the practical principle of virtuous living, and the wise man will restrain his needs and desires within the limit of his ability to satisfy them.

With the spread of Christianity egoistic hedonism died out. *Thomas Hobbes* (1588—1679) revived it. Hobbes was a thoroughgoing materialist, denying everything spiritual. He identified the good with the desirable, and, since man is only a sense-being, it follows with necessity that pleasure is man's supreme good; whatever, therefore, agrees with man's appetites or desires is morally good. Similar views were held by *J. O. de Lamettrie* (1709—1751) and *C. A. Helvetius* (1715—1771). *Pierre Gassendi* (1592—1655) defended the system of Epicureanism, including its ethical teachings.

Evaluation. Hedonism is correct, of course, in stressing the fact that pleasure and pain are important factors in driving men to action and play a prominent part in the general pattern of moral conduct. But hedonism, as an ethical theory, is a decadent system and must be *rejected*.

First. It identifies *physical* and *moral good*, although the very reason for the existence of any moral philosophy is the necessity to explain the universal conviction of mankind

that there is a radical difference between physical and moral good and between physical and moral evil.

Another point. If pleasure is the constituent of moral good, then everything which furthers the individual's sum of pleasure would be morally good and everything which hinders it would be morally evil. In that case, however, *crimes* like theft, drunkenness, adultery, and murder could, in many circumstances, be morally good. The laws of the state, however, which hinder and punish these acts would be morally evil.

Finally. The consequences for the *social life* of man would be disastrous, if egoistic hedonism were carried out to its logical conclusion. Man cannot live in isolation; he must live as a member of his family, his community, and his nation. The interests of society, however, often are at variance with the private interests of individuals. If egoistic hedonism were a correct theory of ethical living, each individual would be constrained to consider the conflicting interests of society as morally evil, and society would become a war of all against all. To sacrifice one's life in a spirit of duty and devotion for the welfare of one's country and fellow men would not only be the height of folly but a supreme act of immorality.

Utilitarianism

The absurdities inherent in egoistic hedonism brought about a broadening of the hedonistic principle so as to include both the happiness of the individual and that of the race. *Social eudaemonism* or utilitarianism was the result.

Utilitarianism (universalistic hedonism) was founded by Jeremy Bentham (1748—1832). He states his position⁷ as follows: “Nature has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do. On the one hand the standard of right and wrong, on the other the chain of causes and effects, are fastened to their throne. They govern us in all we do, in all we say, in all we think; every effort we can make to throw off our subjection, will serve but to demonstrate and confirm it.

The *principle of utility* recognizes the subjection, and assumes it for the foundation of that system, the object of which is to rear the fabric of felicity by the hands of reason and of law.” The end of human conduct is thus seen to be ‘felicity’ or ‘happiness,’ and happiness consists in the maintenance of pleasure and the diminution of pain. ‘Utility’ is the power of human action to produce, sustain, and promote pleasure; whence the term ‘utilitarianism.’ Although Hutcheson had already used the formula ‘the greatest happiness for the greatest number,’ it was Bentham who promulgated the formula as the fundamental aim of moral endeavor and as the basic principle of utilitarianism. The ‘greatest happiness principle’ in terms of pleasure for the greatest number of men is the *norm of morality*: what contributes toward this happiness is morally good, and what detracts from it is morally evil. Beginning with Bentham, therefore, hedonism ceases to be egoistic and becomes *altruistic* and *universalistic*, uniting the

welfare and happiness of the individual with that of the community and of the race.

James Mill (1773—1836) was a faithful disciple of Bentham, but his son, *John Stuart Mill* (1806—1873), revised Bentham's doctrine by recognizing qualitative as well as quantitative differences in pleasure. John Stuart Mill leaves no doubt as to his position. "The creed," he states,⁸ "which accepts as the foundation of morals, Utility, or the Greatest Happiness Principle, holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure, and the absence of pain; by unhappiness, pain, and the privation of pleasure. . . . It is quite compatible with the principle of utility to recognize the fact, that *some* kinds of pleasure are more desirable and valuable than others. It would be absurd that while, in estimating all other things, quality is considered as well as quantity, the estimation of pleasure should be supposed to depend on quantity alone. . . . It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied."

As a proof of the truth of ethical utilitarianism Mill advances the doctrine of *psychological hedonism*. Ethical hedonism, of itself, merely claims that pleasure 'ought to' be the only thing desired; psychological hedonism, however, claims that the only thing man 'can and does' desire is pleasure. Here are Mill's words:⁹ "The only proof capable of being given that an object is visible, is that people actually see it. The only proof that a sound is audible, is that people hear it; and so of the other sources of our experience. In

like manner, I apprehend, the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it. . . . No reason can be given why the general happiness is desirable except that each person, so far as he believes it to be attainable, desires his own happiness. This, however, being a fact, we have not only all the proof which the case admits of, but all which it is possible to require, that happiness is a good; that each person's happiness is a good to that person, and the general happiness, therefore, a good to the aggregate of all persons." In these words J. S. Mill believes he has given the proof that the happiness of the individual and of the race ("the aggregate of all persons") is the supreme good of man and that pleasure-and-pain is the norm of morality.

Henry Sidgwick (1838—1900) modified the strict tenor of utilitarianism to some extent. He made some concession to intuitionism. He did not consider the pleasure-and-pain standard serviceable as a universal norm; the primary norm of conduct, however, is general happiness. In general, Sidgwick subscribes to the principles of utilitarianism.

Among the utilitarians must also be numbered *A. Comte* (1798—1857), *A. Bain* (1818—1903), *G. Fechner* (1801—1887), *H. Lotze* (1817—1881), *F. Ueberweg* (1826—1871), *F. Paulsen* (1846—1908), and *A. Schopenhauer* (1788—1860), even though the latter was a pessimist.

The main feature of utilitarianism is the transition from *egoism* to *altruism*, from 'the agent's own happiness' to 'the happiness of all concerned.' Its most striking characteristic is the identification of 'self-interest' and 'benevolence,' and of the 'morally good' and the 'useful.'

Evaluation. There can be no question about the fact that utilitarianism is a great improvement on the older system of egoistic hedonism. It at least makes a brave attempt to bring man's social nature into the general field of ethical conduct. Nevertheless, utilitarianism must be rejected as *deficient* and *inadequate*.

First. John S. Mill admits that a distinction must be made between *quantitative* and *qualitative* pleasures and that the latter are 'preferable' because they are 'higher.' On the mere basis of 'pleasure' there are no such things as 'higher' and 'lower' pleasures, and Mill has no right, from a utilitarian standpoint, of making such a distinction; pleasure is simply pleasure. By making such a distinction, Mill surreptitiously introduces a 'moral' classification that has no foundation in utilitarian principles. If there are 'higher' and 'lower' pleasures of 'higher' and 'lower' moral value (and we do not deny this), we admit some *other criterion and norm* as the standard which measures the morality of actions, independently of their pleasurable or painful effects, so as to know which pleasures are 'higher' and which 'lower' and *why* they are to be adjudged in this manner. That, however, is a relinquishment of the fundamental position of utilitarianism, and utilitarianism collapses as the true interpretation of moral conduct.

Again. Mill is guilty of two serious *logical fallacies* in his proof of utilitarianism. Something is 'visible' because people see it, and something 'audible' because people hear it. From this he concludes that something is 'desirable' because people actually desire it. There is an equivocation in the word 'desirable,' as used here by Mill. 'Visible' means

‘capable of being seen’ and ‘audible’ means ‘capable of being heard’; hence, Mill should conclude that ‘desirable’ should here mean ‘capable of being desired,’ and that conclusion would be logically correct. But that is not what Mill intends to infer. The word ‘desirable’ has a twofold meaning, namely, ‘capable of being desired’ and *ought* to be desired.’ The first meaning represents a *psychological fact*, the latter a *moral fact*, and the two meanings are obviously not identical. The argument by analogy, which Mill here uses, merely establishes the first meaning; but Mill would have us believe that it establishes the truth of the second meaning in the sense that ‘desirable’ means ‘ought to be desired.’ This is an illegitimate substitution of meanings. Mill is guilty of the fallacy of figure of speech,¹⁰ and he does not prove his point that man ‘ought to’ desire general happiness. The *second fallacy* consists in the manner in which he attempts to prove that “general happiness is desirable (because) each person, so far as he believes it to be attainable, desires his own happiness.” Here he argues from the fact that each individual desires his own happiness to the fact that each individual also desires, or should desire, the happiness of all. The fallacy is patent. The fact that each individual desires his own happiness merely proves that each individual in the entire aggregate of human beings desires his *own happiness*; it does not prove that he ‘ought to,’ or actually does, desire the ‘general happiness of the aggregate of all persons’ *as distinct from his own*, and that is precisely the point in question so far as the truth of utilitarianism is concerned. Due to this double fallacy, Mill has failed to prove that universal happiness, in

the sense of 'earthly happiness through pleasure,' is the supreme moral end of man.

Finally. As a criterion and norm of morality the 'greatest happiness principle' is valueless. Everybody without exception is bound by the law of morality. But how is the average man to know what actions are conducive to the general happiness of all concerned? The interests of the various individuals and groups and communities and nations are so different, depending so much on circumstances of time and place and social conditions, that even the wisest statesmen often are not in a position to decide what course of action is best for the promotion of the general welfare. The consequences of actions are as a rule so manifold and complex that 'general happiness' as a norm of moral action is undeterminable and inapplicable and therefore useless.

Evolutionary Naturalism

Herbert Spencer (1820—1903) and modern evolutionists in general united the principles of utilitarianism with those of organic evolution to form the ethical theory of evolutionary naturalism. In opposition to the empirical utilitarianism of Bentham and his followers, Spencer called his own system *rational utilitarianism*.

Spencer accepts the 'greatest happiness' principle as the supreme end of man and 'pleasure' as man's supreme good. Life, for him, was good or bad, in so far as it does, or does not, "bring a surplus of agreeable feelings." As he states:¹¹ "The conception of good conduct always proves,

when analyzed, to be the conception of a conduct which produces a surplus of pleasure somewhere; while, conversely, the conduct conceived as bad proves always to be that which inflicts somewhere a has any concomitant of pain, or any painful consequence. is surplus of either positive or negative pain. . . . Conduct which partially wrong; and the highest claim to be made for such conduct is, that it is the least wrong which, under the conditions, is possible — the relatively right.” At other times, Spencer defines the good as “the preservation of human society” or “quantity of life measured in breadth as well as length.”

Moral conduct is the product of *organic evolution*, In the lowest forms of animal life actions are often purposeless; in the higher forms, as evolution progressed through the ‘struggle for existence,’ they become purposive, i.e., actions are performed to realize definite ends. Gradually conduct was evolved which progressed from ‘self-maintaining’ to ‘race-maintaining’ interests through the development of instincts and other tendencies. This evolution took place through the adaptation of individuals and groups to their environment. Man inherited these social instincts and tendencies, and they form the foundation of moral conduct. From ‘egoism’ man thus progressed to ‘altruism.’ The ultimate goal of the evolutionary process of man’s moral life is *the ideal man in the ideal society*.

On the basis of this evolutionary process Spencer developed his doctrine of *absolute* and *relative ethics*. ‘Absolute ethics’ is the ethics which prevails in the ideal society; here conduct is perfectly adapted and adjusted to the environment and produces pure pleasure unalloyed by

any pain. Spencer delineates the conditions existing in this ideal state and from them deduces the ethical principles concerning what conduct is detrimental or beneficial. 'Relative ethics' consists in the application of the principles of absolute ethics to the present conditions of human society in its evolutionary stage where adaptation and adjustment are still incomplete. The four principles for the guidance of human conduct are 'justice' (it is really 'non-interference' with others), 'negative beneficence' (to perfect one's own nature without causing unhappiness in others), 'positive beneficence,' and 'enlightened self-interest.'

According to Spencer, the 'more evolved' life is the 'higher' or 'better.' The *norm* of morality then would be the greater quantity of life in length and breadth' attained for the individual and promoted in others. On the other hand, Spencer interprets 'happiness' in terms of the 'pleasurable.' His 'norm' is both evolutionary and hedonistic, and his thought seems to be definitely that the 'more evolved' life is the 'better' and 'higher' in moral value because it is proportionately productive of more pleasure.

Evaluation. No one denies the fact that moral customs and maxims undergo change and development, particularly as regards the application of moral principles to changing conditions. Evolutionary naturalism, however, as an explanation of moral consciousness and moral conduct, is an *inadequate* and *false theory*.

First. It is assumed that mankind goes through a continuous process of evolution, starting with a *pre-moral primitive stage*, in which man is but very imperfectly

adjusted to his environment, and ending in the stage of an *ideal society*, in which he is perfectly adjusted and will enjoy pure pleasure unalloyed with any pain. Man's present condition is thus a stage somewhere between these two extremes. In the primitive stage man had no morals; in the present stage, he has need of morals; in the ideal stage morals will be superfluous. This view is altogether speculative and devoid of any real evidence: the past is too obscure and the future too uncertain to permit of anything but guesswork and conjecture. In terms of the present condition of man, there is no solid reason for the conclusion that mankind will reach an ideal state of perfect happiness through pleasure without the admixture of any pain. In the ideal state men will either die or not die. If they will not die, the world will soon be overpopulated, and men will again have to struggle for existence, one against the other; such a struggle, however, involves pain and misery, just as it did in the past and as it does now. If they will die, there will be organic disintegration of the individuals; and physical degeneration without pain and misery of body and mind would indeed be an evolutionary miracle.

Again. Evolutionary ethics is guilty of an *illegitimate transition from descriptive to normative morality*. A knowledge or science is said to be 'descriptive,' when it merely acquaints us with things as they actually are; it is 'normative,' when it tells us how things really *ought to be*. The former explains what kind of a thing something is; the latter explains why it *should be* this kind of a thing. For example, logic not only gives us a description of the various types of arguments used by the human mind as they

actually 'are,' but it also shows us 'why' these arguments are valid or invalid; logic is a normative science. Ethics, too, is a normative science. It does not merely point out that a certain act 'is' morally good or bad; since man is convinced that the good act 'ought to' be done and the bad act 'ought to' be avoided, ethics must be able to account for this 'ought' over and above the mere 'is.' To attempt to explain the 'ought' by describing merely what 'is,' is an illegitimate transition from the descriptive to the normative.

Evolutionary ethics is guilty of this fallacy. The social tendencies of man, evolutionists claim, have evolved out of the social instincts of animals because of their usefulness or utility for race-maintenance. In animals these instincts or tendencies are non-moral because purely natural. In man these tendencies have a moral character: he 'ought to' promote the welfare of the race. However, on evolutionary principles, *nothing new has been added* to these instincts, so as to make them 'moral'; the utility for survival remains unchanged in both cases. By merely giving a description of the supposed genesis of man's social tendencies out of the animal's social instincts, the evolutionists believe and claim they have explained the 'ought' of morality and the origin of man's moral consciousness with its peremptory judgments that certain actions are not only 'useful' but 'morally good.' One might just as well ascribe moral goodness to the lioness defending her cubs and to the bird feeding her fledglings. From an evolutionist standpoint the instances are identical, so far as utility for survival is concerned. Why the distinction between these instances, so that the action of the animal is declared 'non-moral' and the same action of

man moral'? Evidently something else is required in the case of man. The description of the genesis of man's social tendencies is not sufficient to explain the character of human conduct and its 'moral demands.' Here evolutionists are guilty of what has been aptly called the *genetic fallacy*. The irrational simply cannot account for the rational, nor the non-moral for the moral: the effect would be greater than the cause.

Furthermore. It is a common practice among scientists in their research to concentrate their attention upon a pertinent feature of the object investigated, to the exclusion of other features which they consider irrelevant to the investigation. This is a legitimate procedure. The mere fact, however, that a scientist may 'prescind from,' or ignore and exclude, certain features, obviously does not entitle him to consider them as non-existent; to do so would make him guilty of the *fallacy of false exclusion*. A geologist, for example, may examine Michelangelo's statue of 'Moses' and consider it merely from the standpoint of the 'marble' which was used; he may ignore the artist and the representation of 'Moses' in the marble. If, however, the geologist denied the existence of the artist and the artistic representation and declared that the statue is 'nothing but' a block of 'marble,' he evidently would be in error, being guilty of a 'false exclusion.' In a similar manner, evolutionary scientists, in investigating the possible process of evolution in ethics, may ignore the existence of God and His causal influence on the elevation of man to the higher plane of morality. If, however, these scientists claim or imply that morality is 'nothing but' a naturalistic phenomenon of

evolution, they commit the fallacy of false exclusion; and that is precisely what they do, but have no right to do. That evolution should tend toward a higher development, from primitive animals to man and to an ideal state of society, is one thing; but that this purposive tendency should originate and be carried through to completion through the agency of unintelligent natural forces, is a totally different thing. Morality involves rationality, and only a *rational agency* can adequately account for the distinctive fact that man experiences the 'rational demands' of morality in his individual and social life. Only on this basis is it possible to explain why man is obligated to strive not only for his own welfare but for the welfare of others as well. Man is not the author of the moral law; he is subject to the law and feels that the law has been imposed upon him, because he is incapable of escaping its force or of changing its demands. Since the moral law is superior to the biological law, a being superior to irrational nature and to man must be admitted in order to explain the origin and presence of the moral law in man's nature. There is only one such being — God.

Finally. The supreme good aimed at by moral living, according to evolutionary ethicists, is the 'welfare of human society.' Human actions are morally good or bad in so far as they promote or do not promote this welfare. The *welfare of human society*, therefore, is the *norm* and *criterion* for determining what is morally good or bad. As in the case of universalistic utilitarianism, the morality of conduct is judged by its consequences for the welfare of society: if the consequences are such that the act promotes the welfare of society, it must be adjudged morally good'; if

the consequences are such that the act opposes the welfare of society, it must be adjudged 'morally evil.' The term 'society,' of course, can only mean 'mankind.' Evolutionists surreptitiously endow 'society' with a sort of mythical personality, as if it were an entity distinct from the individuals which compose it. In reality, however, 'society' or 'mankind' is an abstraction and means nothing more than the sum-total of individual men united in a community of interests. The 'welfare' or 'happiness' of society, therefore, can only mean the happiness of the individuals, because individuals alone are capable of experiencing pleasure and pain. To be consistent, evolutionists should restrict their norm of morality and apply it only in so far as it affects the individuals: whatever affects the individual favorably for survival in the struggle for existence should be considered morally good; whatever affects him unfavorably for survival, morally evil. Needless to say, such a norm would open the door to murder, theft, and every sort of crime.

Recent Trends

The hedonistic pleasure-principle is now quite generally abandoned, at least in so far as pleasure is considered to be the supreme good and ultimate end of man in his moral life. Pleasure is recognized as being an accompaniment of the normal, healthy function of all organic and mental powers which aim at the realization of natural ends; we seek to attain desired objects, and pleasure results from the activity involved. Hence, man strives for these ends directly and for

pleasure only indirectly. Aristotle was aware of this truth and expressed it long ago.

The number of writers on ethical subjects has been, and still is, very numerous. Uniformity of doctrine, however, is conspicuously absent. Outside of the circle of traditional Christianity, the views are kaleidoscopic. In the welter of opinions the shift is decidedly toward *teleological* ethics, not formalistic (intuitional) ethics.

Until recently the 'formalism' of textbooks on ethics was quite pronounced. They stressed the 'inherence' or intrinsic objective character of rightness and wrongness and gave extensive lists of virtues and duties. This formalism is unequivocally present in the writings of men like William Paley, Joseph Haven, William Whewell, Francis Wayland,

L. P. Hickok, Mark Hopkins, and Paul Janet. Since the beginning of the century this attitude has changed, and the 'new morality' is based primarily on the 'results of conduct,' consciously directed toward the *perfection of the individual* and the attainment of *maximum happiness for mankind*. This trend is manifested in the writings of J. H. Muirhead, J. C. Mackenzie, J. Seth, W. Fite, F. Thilly, W. James, J. Dewey, J. H. Tufts, H. W. Wright, W. G. Everett, F. C. Sharp, C. Barrett, P. E. Wheelwright, D. Drake, W. M. Urban, W. E. Hocking, R. B. Perry, D. H. Parker, A. P. Brogan, and others. Many names have been given to this 'new morality,' among them 'self-realization,' 'energism,' 'total self-development,' 'idealistic perfectionism,' 'cultural progress,' 'meliorism,' and 'value ethics.' The most recent trend is toward the betterment of society in the economic and political order.

Evaluation. Notwithstanding the chaos in present-day ethical teaching, the recession from hedonism to a more rational basis of moral living is a good sign. The characteristic of the recent trends is a mixture of personal perfectionism, utilitarian happiness of the race, and evolutionary progress toward a better world. The norm of morality, as exhibited in these teachings, suffers from the same defects as those manifested in these basic systems: it is too vague and fluctuating, or too individualistic and subjectivistic, to serve as a practical standard and criterion for deciding what is morally good and morally evil in the actions of daily life.

The reason for this confusion in ethical thinking and for the existence of so many diverse systems of morals is clear: it is the secularistic and naturalistic approach and outlook. So long as moral philosophers deny or ignore the existence and governance of God as the Creator and Lawgiver of mankind, no solid objective basis for ethics will be forthcoming, as the history of ethics proves only too abundantly. Man is not altogether autonomous, either in his physical or in his moral being. Not until moralists recognize the fact that the proximate norm of morality is man's complete rational nature and the ultimate norm is God and His infinite attributes will order be brought into the present-day disorder of ethical thinking.

Summary of Chapter VIII

History acquaints us with a number of ethical systems which have advanced false norms of morality.

1. *General Survey.* There are two main classes. First, those with an 'intrinsic' norm: stoicism, Kant's formalism, perfectionism, intuitionism. Second, those with an 'extrinsic' norm: egoistic hedonism, utilitarianism, evolutionary naturalism.

2. *Stoicism.* The supreme good is happiness, and happiness consists in virtue; virtue is the only good. Virtue and happiness consist in living a *life consonant with reason*. Emotions and passions are irrational and must be avoided.

Evaluation. The stoic norm is *one-sided and limited*, since it is based solely on reason to the exclusion of every other aspect of man's composite nature. Emotions and passions belong to man's being, and many of them are praiseworthy and morally good.

3. *Kant's Formalism.* Nothing is good without limitation but a good will. The will is truly good only when an act is performed 'because of duty.' Duty is the obligation to act from 'reverence for law.' Man must act in such a way that he can will that his maxim should become a *universal law*. The moral norm is the *categorical imperative*: "Act so that the will may regard itself as in its maxims laying down universal laws." 'Autonomy' of the will is required, because the will is 'nomothetical,' i.e., is the author of its own laws. 'Heteronomy' does not lead to duty, but to necessity of action out of interest.

Evaluation. For one thing. An act, Kant asserts, is morally good only when performed from pure reverence for the law, 'because of duty.' This is contrary to the conviction of mankind. In the estimation of Kant, acts performed out of *affection* and *charity* would have no moral value. — Again. Kant claims that the will must be 'autonomous.' This makes man his own supreme end and excludes God; it means the *deification* of man. Morality then is completely individualistic. If the will is the sole lawgiver, no reason can be given why man should burden himself with moral obligations. — Finally. The categorical imperative with its potential legislation is an *impractical norm*, because most persons are incapable of applying such a norm.

4. *Perfectionism. Self-Realization.* This system maintains that the total perfection of the human person is the end of all ethical striving.

Evaluation. As the norm of morality, perfectionism is not adequate. It refers merely to the 'perfectible' and variable elements in man, and such a norm is too vague to be applicable to the conduct of all. It excludes God from morality and pertains only to the perfection of human personality in this life.

5. *Intuitionism.* Intuitionism postulates the direct apprehension of human conduct as 'good' or 'bad.' The discrimination is made, not as the result of a reasoned judgment, but of a special *perceptual faculty or sense*. Man should do right because it is right, and not because of the consequences of the act. Some consider this special faculty to be an 'aesthetic sense'; others, a 'moral sense'; others, 'a feeling of sympathy'; others, 'conscience'; others, a

‘spiritual feeling’; others, a ‘moral taste.’ Intuitionism often is referred to as *formalism*, because it stresses the ‘formal’ or intrinsic morality of acts.

Evaluation. For one thing. There is no evidence for the existence of such a special intuitive faculty. Discrimination is always expressed in an *intellectual judgment*; hence, the intellect is the power which distinguishes between good and bad, not a ‘moral sense’ or ‘moral faculty.’ — Again. The intuitive faculty would be only a ‘discriminatory’ faculty, telling us ‘that’ an act is good or bad, but not ‘why’ it is so. It might serve as a criterion for judging an act, but *not as a norm* whereby we could discover the reason why the act is objectively good or bad in itself.

6. *Egoistic Hedonism.* The hedonists consider pleasure to be the supreme good and pain the supreme evil. Everything, even virtue, is good only as a means of procuring and maintaining the maximum of pleasurable emotion, together with a minimum of painful emotion. *Egoistic* hedonism considers the pleasure of the *individual* as the supreme good and norm of morality.

Evaluation. The identification of ‘physical’ and ‘moral’ good contradicts the universal conviction of mankind. — Again. If pleasure is the constituent of moral good, then crimes could be morally good, provided they procure pleasure. — Finally. The consequences for the *social life* of man would be disastrous: each individual would be constrained to consider the conflicting interests of society as morally evil, and society would become a war of all against all.

7. *Utilitarianism.* — According to utilitarianism or universalistic hedonism, the end of human conduct is ‘the greatest happiness for the greatest number’ in terms of pleasure. This is the *norm* of morality: what contributes toward this happiness is morally good, and what detracts from it is morally evil. Bentham admitted only a ‘quantitative’ difference between pleasures; John S. Mill admitted also a ‘qualitative’ difference. Both based their ethical hedonism on *psychological hedonism*: man not only ‘ought to’ strive for pleasure, but pleasure is the only thing man ‘does and can’ strive for.

Evaluation. First. The admission of *qualitative* differences in pleasures implies some other criterion and norm which will enable man to know which pleasures are ‘higher’ or ‘lower’ and ‘why’ they are adjudged to be so. — Again. Mill is guilty of equivocation in the use of the term ‘desirable,’ in as much as he passes surreptitiously from the meaning ‘capable of being desired’ to ‘ought to be desired.’ Similarly, because each desires ‘his own’ happiness, he falsely concludes that each desires the ‘happiness of all.’— Finally. As a norm the ‘greatest happiness’ principle is *useless*, because the average person is incapable of knowing whether his individual actions are conducive to the happiness of all.

8. *Evolutionary Naturalism.* In this system the principles of utilitarianism are united with those of *organic evolution*. Man inherited the social instincts and tendencies from animals, thus progressing from ‘egoism’ to ‘altruism.’ The ultimate goal is the ideal man in an ideal society. The ‘more evolved’ life is the ‘better’ life.

Evaluation. First. It is assumed that man evolved from a 'premoral stage' and evolves into 'ideal society.' This is all conjecture. — Again. Evolutionary ethics is guilty of an illegitimate transition from *descriptive to normative morality*. By merely describing the supposed genesis of man's social tendencies out of the social instincts of animal, evolutionists do not adduce anything 'new' to account for the 'moral demands' present in human conduct; they are thus guilty of the *genetic fallacy*. — Furthermore. Evolutionists are entitled to focus their attention upon the circumstances and factors of a possible evolution in ethics. But when they consider other circumstances and factors as non-existent, because 'excluded' from consideration, they are guilty of the *fallacy of false exclusion*. They do this, when they consider God and His governance excluded from morality. — Finally. The welfare of society is a norm of morality which is too *vague* and *fluctuating* to be of any value. Since views differ as to true and false welfare, another norm is required to determine what is true and what is false welfare.

9. *Recent Trends.* No uniform doctrine exists, but the general shift is toward *teleological* ethics, not formalistic (intuitional) ethics. The 'new morality' is based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the maximum happiness for mankind. It has different names: self-realization, energism, total self-development, idealistic perfectionism, cultural progress, humanism, meliorism, value ethics, etc.

Evaluation. The recent trends are characterized by personal perfectionism, utilitarian happiness, and

evolutionary progress. The *norm* of morality is too *vague* and *fluctuating*, too *individualistic and subjectivistic*, for daily conduct.

Chapter 9

THE MORAL LAW

THE CONTENT OF MORALITY, AMONG ALL NATIONS, IS EMBODIED IN a code of laws which governs the activities of the individual, the group, the tribe, the nation. No nation is without laws. And laws partake, to a great extent at least, of a moral character.

When the critical mind of man began to philosophize about the different types of laws, their nature and binding power, distinctions arose between laws and laws. The philosophers of Greece led the way. The Romans followed. Christianity deepened the trend of thought considerably. Controversies raged, and schools were formed. The discussions centered around divine law and human law, natural law and positive law.

The vital questions of 'duty' and 'moral obligation' depend in a great measure on the nature of law. No one can have a clear conception of the possible moral obligation to obey the law, if he is vague about the nature of the various types of laws. Hence, the necessity for the ethicist of a philosophy of the *moral law*.

General Concept of Law

The term *law* appears in a threefold connotation or meaning, depending on the field of action in which it is found.

In its widest and most general meaning a 'law' is the *rule* or *norm* according to which something is *drawn toward an action or restrained from an action*. All beings in the universe, whether living or nonliving, are governed by laws in this sense. They are styled 'laws of nature.' Thus, we speak of the laws of electricity, of light, of heat, of magnetism, of gravity, and of motion; they are the laws which govern physical and chemical bodies in their actions. We also speak of the laws *which* control the biological functions of plants and animals, such as the laws of nutrition, of growth, of reproduction, and of heredity. In every case, a 'law' is conceived as a directive of action.

In a more restricted sense, a 'law' is the rule or norm which governs the *free actions* of rational beings in any field of practical endeavor. Such laws refer to the techniques of the various crafts or arts. In order that the work pertaining to a craft or art be done expeditiously and the product itself be a perfect sample of its kind, certain rules and norms of procedure must be followed; these rules and norms of procedure are the 'laws' which govern the action of the craftsman or artist. In this sense, we speak of the laws of painting, of music, of architecture, of literature, of logic, of singing, and so on. Actions of this kind are within the free control of the person performing them and are not

determined by the necessity characteristic of the action of physical bodies.

In its *ethical* or strictest sense, the term 'law' means the rule or norm governing the free actions of man relative to *moral obligation*. The violation of a law in this sense involves moral delinquency and sin. The laws mentioned in the preceding paragraph also pertain to free actions, but they lack the peremptory, unconditional command and demand of the moral laws. An example will illustrate the difference. If I wish to make a valid process of syllogistic reasoning, I must observe the laws of logic; if I deliberately violate the laws of logic, I will draw an invalid conclusion, but such an act is not in any sense an 'immoral act.' On the other hand, if I violate the moral law of right speech knowingly and voluntarily, I tell a lie, and a lie is an 'immoral act.' There is no obligation of the will to observe the laws of logic, but man feels obligated to observe the laws of the moral order.

Ethics, of course, is vitally interested in *moral laws*, and these will now be examined more fully.

The Nature of Law

A *law* is defined as an *ordinance of reason directed toward the common good and promulgated by the one who has the care of the community*.¹ This definition, given by St. Thomas Aquinas, is adequate and agrees with the idea of 'law' as generally understood.

A law is an '*ordinance*.' By this is meant, that a law is a directive demanding a definite course of action from them

to whom it is given; they are not at liberty to accept or reject this ordinance, but are subject to a moral (not physical) constraint to carry out the injunction demanded by the ordinance and contained in it. The ordinance 'can' be disregarded and disobeyed, but it *ought to*, or *should be*, carried out. The moral obligation is expressed in the words: 'Thou shalt!' and 'Thou shalt not!' The decalogue, for instance, has the form of an ordinance when it states: 'Thou shalt honor father and mother' and 'Thou shalt not steal.' The exact wording is inconsequential here; it is the intent that must be considered. An ordinance always contains a peremptory command to perform or omit an act. In this it differs from a 'plea' or 'advice,' because these do not demand obedience and subjection of the will.

A law is an 'ordinance of *reason*.' A law, in the strict sense, is a directive of action that is free because it is rational; hence, a law can be given only to *rational* beings, with the purpose of controlling their 'human acts.' A law, therefore, belongs to the rational order and, in order to be a true law, cannot command anything contrary to reason. Everything immoral is contrary to reason and the rational order, and it follows that no law is a right and just law if it commands anything irrational and immoral. No law can bind the will to commit acts which are intrinsically evil, for instance, to commit perjury, to cheat, to dishonor God, to kill an innocent person, because such a law would be contrary to reason and therefore in itself immoral; such a law cannot command obedience, and one may not submit to such a law.

A law is an 'ordinance of reason *directed toward the common good.*' A law is not directed to promote the private welfare of individuals or relatively small groups within a community, but to the common good, the welfare of the community as a whole. In other words, a law has as its objective 'public welfare,' so that the activities of the members of the community may be harmonized and ordered for the benefit of all concerned. Parents can make regulations governing the conduct of their household, and cities can issue ordinances controlling the activities of their subjects in certain matters; but neither the family nor the city is a sovereign unit capable of making laws in the strict sense of the term, because they are subordinate units of the community at large. Only a sovereign state is a perfect society with the 'common good' as its supreme concern, and therefore only a sovereign state has the power to make laws affecting the entire community under its jurisdiction. Hence, laws must really promote the common good if they are to be considered 'laws' in the strict meaning of the word; otherwise public welfare would be made subservient to private welfare, and that would be a subversion of the right order.

A law is an 'ordinance of reason directed toward the common good and *promulgated by the one who has the care of the community.*' Laws are matters of public authority and jurisdiction, and only the bearer (or bearers) of the supreme public authority and jurisdiction has (or have) the authority to enact a law affecting the common good of all. A law is binding upon all subjects and is enacted for the common good of all; hence, the law must proceed

from the supreme legislative power, because only that person or body represents the community at large and can issue commands binding upon all for the welfare of all. Since all citizens as a body must direct their activities toward the common good of all, only the citizens themselves or their legal representatives have the necessary authority and jurisdiction to make ordinances affecting the common welfare. In order, however, that such public ordinances or laws be binding upon the will of the citizens, the laws must be promulgated by public authority. Every law is a directive to action; hence, the persons affected by the law must become acquainted with the existence of the law; otherwise they cannot direct their actions accordingly. Rational beings can be obligated only through knowledge of the law, but knowledge of the law would be impossible without proper promulgation. It is a universally recognized principle that a law which is not known because not properly promulgated, has no binding power.

On the part of the legislator, *three acts* at least are required so that an ordinance may be considered to have the *force of law*. First, the legislator must possess the *knowledge* that the ordinance which is to be a rule and norm of action for his subjects is rational and serves the common good. Were this not the case, the legislator would have neither the reason nor the right to set up the ordinance as a law. Second, the legislator must have the *will* to impose upon his subjects the 'obligation' that they submit to this particular rule and norm of action. If the legislator had no intention of binding his subjects in virtue of his sovereign authority as ruler, there would simply be no

‘law.’ Third, the legislator must *manifest* his will to his subjects, so that they know that he intends to bind them to the observance of the ordinance which is present in his intellect and decreed by his will. This manifestation of the will of the legislator constitutes the ‘promulgation’ of the law and is the most essential point so far as the subjects are concerned, because without it they could not become aware of the existence of the law. So far as the legislator himself is concerned, the law proceeds from his *reason* and his *will*. That is why St. Thomas² states: “All law issues from the reason and the will of the legislator: the divine and natural law from the reasonable will of God, but the human law from the will of man as regulated by reason.”

Kinds of Laws

A law, as just defined and explained, implies obligation, and obligation implies morality. Obligation, however, is not the same for all types of laws. Laws can be viewed from various standpoints, and accordingly we distinguish between different *types of laws*.

Viewed from the standpoint of the *obligation* imposed by the law, we distinguish between four kinds of laws: affirmative, negative, permissive, and punitive.

An *affirmative* law is a law of ‘command’ obligating a person to perform a definite positive act. Such is the law of the decalogue commanding children to honor their parents and the law of the state commanding citizens to pay taxes in support of the government. A *negative* law is a law of ‘prohibition’ obligating a person to refrain from performing

a definite act. Thus, the decalogue forbids adultery and murder, and the state forbids the taking of a false oath in a court of justice. A *permissive* law is one which allows a person to perform a certain act without hindrance from others. In the case of a permissive law, no obligation is imposed upon the persons benefiting from the law; but certain rights are granted to such persons, and the obligation is imposed upon other persons not to interfere with the exercise of these rights. The state, for example, may permit a homesteader to cut timber in a restricted area, and others have the obligation to respect the homesteader's right. A *punitive* or *penal* law is one which imposes a penalty upon violation. The law itself may stipulate the exact penalty, or it may be left to the discretion of the judge; the obligation consists in the assumption of the penalty imposed by the law or the judge. Some laws may be *merely penal* laws; laws of this kind do not obligate in conscience to the performance of the act prescribed, but only to the penalty after due conviction of a violation of the law. Under ordinary circumstances, the law which imposes a fine for fishing or hunting out of season is a purely penal law; it is also the opinion of conscientious moralists that, in general, excise laws, game laws, and many traffic laws are of a purely penal character. The following points may assist in recognizing a purely penal law, one not strictly binding in conscience: the wording of the law may indicate that the legislators do not intend imposing an obligation binding in conscience; the penalty may be so disproportionately severe in comparison to the matter of the law that it is obvious that the legislators are satisfied that the penalty

alone will compel observance; the considered judgment of competent and conscientious moralists may regard it as such.

Viewed from the standpoint of the *legislator*, we distinguish between divine and human laws. *Divine* laws emanate from God as the legislator. The laws contained in the decalogue were given by God directly. *Human* laws are enacted by legitimate human authority, for example, by the state as properly constituted and recognized. Such are the laws regulating the use and sale of property, inheritance, and similar transactions.

Viewed from the standpoint of *promulgation*, we distinguish between natural law and positive law. Natural law is a law in so far as it is manifested by the natural light of human reason reflecting on the fundamental principles of morality. *Positive* law is a law enacted by legitimate authority, such as the state, supplementing the provisions of natural law and made in view of the special needs of the community.

Viewed from the standpoint of *duration*, we distinguish between eternal law and temporal law. *Eternal* law is the plan of God's wisdom directing all created things toward the realization of their natural end. *Temporal* laws are those enacted, not from eternity, but in time by temporal authorities, for example, by the state, through legislative channels. The eternal law is the exemplar, foundation, and source of all temporal laws, because all legislative power is derived ultimately from God.

The Eternal Law

When speaking on the eternal law, St. Thomas³ makes some profound observations. He says: “Just as in every artificer there pre-exists an exemplar of the things that are set up by his art, so too in every governor there must pre-exist the exemplar of the order of those things that are to be done by those who are subject to his government. And just as the exemplar of the things yet to be made by an art is called the pattern or model of the products of that art, so, too, the exemplar in him who governs the acts of his subjects has the character of a law, provided the other conditions be present which we have mentioned above as belonging to the nature of law [Quest. 90]. Now God, by His wisdom is the Creator of all things, in relation to which He stands as the artificer to the products of his art. . . . Moreover, He governs all the acts and movements that are to be found in each single creature. . . . Therefore, just as the plan of the divine wisdom, in as much as all things are created by it, has the character of an exemplar, a model or an idea, so the plan of divine wisdom, as moving all things to their due end, has the character of law. Accordingly, the eternal law is nothing else than the plan of divine wisdom, as directing all actions and movements.” In these simple, lucid words the Angelic Doctor develops the basic concept of the eternal law.

In the words of St. Thomas, the *eternal law* is defined as “*the plan of divine wisdom directing all actions and movements.*” The present world is not the only possible world God could have created. Among all possible worlds

He freely chose this one and gave it existence. The creatures of this (and any other possible) world had their intrinsic possibility in the fact that they could, in some measure, imitate the perfections of God's essence. The present world owes its existence to God in a twofold manner: the *idea* of the world and all its contents was present from eternity in the intellect of God, and this idea is the exemplar or model of the world and the creatures in it; the *creative will* of God then gave them their being and existence, as they were foreknown in the exemplars of His divine intellect. The ultimate end of all creatures could be no other than the glorification of God, because God can have no end which would be outside, and ulterior to, Himself. The essence and activities of all creatures, therefore, were *planned* by God from eternity for this supreme end. This supreme end, however, could not be achieved except in so far as God *directed* the essence and activities of His creatures toward this end; and He directed their essence and activities by impressing upon all creatures the natural impulse to act in such a manner that they actually do co-operate with His plan of the world as a whole and thereby promote His glory. Such is the *law* of their being in virtue of their very creation. This law, viewed from the standpoint of God as the plan of His wisdom directing all the activities and movements of creatures toward their supreme end, is the 'eternal law' itself; viewed from the standpoint of the creatures, their natural propensities and impulses to act in accordance with the divine plan of God's wisdom are the creatural participation in the eternal law. The law itself is eternal, because it

existed from eternity in God's intellect and will; the creatural participation began in time, because the creatures themselves are not from eternity.

The eternal law, as just explained, extends over all creatures, whether inanimate or animate, whether irrational or rational. In a more restricted sense, the term 'eternal law' is applied only to rational creatures, because they alone are capable of receiving commands with an understanding of their meaning and import. Taken in this restricted sense, the eternal law is the *rational will of God commanding the preservation of the natural order and prohibiting its violation*.

That the eternal law is an *actuality*, should be evident to all who are convinced of the existence of an infinite personal God. The wisdom of God demands that He create the world for the ultimate end of His glory; it also demands that He give the creatures of this world a nature and activities which will enable them to achieve this ultimate end. It follows, then, that His wisdom had to have such a plan and that His will had to impress upon the nature of the creatures the natural tendency to carry out this plan. Hence, this plan of His wisdom is present from all eternity as the eternal law, because God Himself is eternal.

The Natural Law

'Natural law' can be taken in a general and in a strict sense. In a *general* sense, a natural law is a participation in the eternal law on the part of creatural beings, based on the *nature* of creatures urging them by means of natural

tendencies and impulses to realize the supreme end of their being according to the plan of divine wisdom. Inanimate beings, such as bodies in their physical and chemical activities, and animate beings, such as plants, animals, and men in their biological and sentient functions, carry out the eternal law through the very *necessity* of their nature. There is nothing 'moral' about such activities, because there is no understanding or freedom of choice in these activities of nature.

In a strict sense, we mean by 'natural law' the participation of rational man in the eternal law, not in so far as he is compelled to follow the blind, unconscious impulses of his nature, but in so far as he is capable of realizing the demands and prohibitions of the eternal law through the use of reason and will. The natural law in this sense has a 'moral' character and is more properly termed the *natural moral law*. It is defined as the *moral law, manifested by the natural light of reason, demanding the preservation of the natural order and forbidding its violation*; or, more briefly but with the same meaning, as the *binding norms of moral actions, in so far as these norms are manifested by mere reason*. For the sake of convenience and brevity, the 'natural moral law' is usually termed simply the 'natural law' in ethics, because ethics is not concerned with the natural law as it applies to irrational beings in a general sense, but only as it applies to rational man as a moral being. It is in this strict sense of a 'natural moral law' that the term 'natural law' will henceforth be used.

There are no innate ideas in man. Man is not born with a preformed knowledge of good and evil. The human infant

has no moral concepts or principles ready-made in its mind. What it possesses as a native endowment is the *ability* and *disposition* to develop spontaneously through experience the concepts of 'good' and 'evil' and certain practical judgments concerning conduct based on these concepts. When the child arrives at the age of discretion and it begins to use its reasoning powers, this native ability comes into play. In the presence of concrete actions the child now perceives, directly and spontaneously, that some actions are 'good' and other actions 'evil,' and it also forms the practical judgments that 'the good action *ought* to be done' and 'the evil action *ought* to be avoided.' Parental precepts and training may have engendered morally good habits in the child, but the child, before it reached the age of discretion, merely did what it was told; upon the awakening of its reason, however, it makes its own distinction between good and evil conduct and experiences the obligation to do the good and shun the evil. The child has now laid the foundation of its own morals by virtue of its conscious insight into the morality of actions. What the natural law, therefore, presupposes in man is nothing more than this ability and disposition eventually to make the distinction between good and evil and to form the practical judgments that the good should be done and the evil avoided.

So far as the *extent* of the natural law is concerned, it is obvious that the natural law embraces everything which man's natural reason declares to be *obligatory*, independent of any positive law. Much more is contained in the natural law than the mere moral principle that 'the good should be done and the evil should be avoided.' This

principle is self-evident, even to the child's practical reason. Many applications of this fundamental principle, though also contained in the natural law, are not self-evident but must be learned through a process of deductive reason. Changing social conditions require new applications and specifications of this fundamental principle; for instance, in the questions of property rights, of the just relation between industry and labor, and of the permissibility of bombing enemy cities in time of war. The solution to many complicated moral problems can be found through deductions from established moral principles by reason alone, without recourse to the prescriptions of positive law, on the basis of the proximate and ultimate norms of morality; and all such conclusions and solutions pertain to the natural law. Of course, the farther man proceeds from fundamental principles in his deductions and applications to complicated moral situations, the greater is the possibility of error in his judgment, because the conclusions of his reasoning are no longer self-evident; the objectively true answers, however, are implicitly present and are capable of being discovered by man's reason, because they are part and parcel of the natural law. A hundred thinkers may arrive at false conclusions, due to prejudice or the frailty of human reason; the truth, however, would still be there, ready to be discovered. It is the privilege and duty of the ethicist to make the true deductions and find more and more valid applications of the natural law to the manifold new situations which arise in an ever changing world. The natural law is not static, but dynamic. As the problems are

multiplied, the implicit contents of the natural law should become explicit.

Natural Law in History

Before study of the proofs for the existence of the natural law, it will be advisable to see how the doctrine concerning the natural law has fared in the course of the centuries. This history of the doctrine will of necessity have to be brief.

The diversity of laws among nations and the changes effected among the laws of the same nations led to the distinction between divine and human laws, in the sense that human laws are subject to modification and abrogation, while the divine laws remain ever the same. When faith in the tribal and national deities waned, the question of the binding force of law became acute and demanded a solution. Has all law a merely human origin, so that all laws are only positive human laws made for convenience and for the stabilization of order? If so, how can it have any binding power in conscience? It was in the attempt to find a solution to this burning problem that the *philosophy of law* arose, primarily among the Greeks.

Laws are necessary. And they bind in conscience. This fact was universally perceived to be certain. Beyond the changing positive laws, therefore, there exists an unchanging *natural law* which is the foundation for all positive laws and gives the legislators the authority to bind the consciences of subjects to the observance of the law. However, from the very beginning of Greek philosophy, two

divergent conceptions of the natural law were defended, and these distinctive theories exist even to this day.

Heraclitus of Ephesus (about 536—470 B.C.) held the view that nothing abides; everything is in a state of ceaseless change. Nevertheless, *Heraclitus* maintained that above and beyond all change there exists a divine *logos* or universal reason which is the eternal norm and law ordering all phenomena. This eternal law of nature is the source of all human laws and of the moral law. Hence, all persons are bound to obey the laws of the (Greek) city-state, because they are founded on the eternal law of the *logos*.

The *sophists* were mostly foreigners and therefore 'barbarians without rights in the city-state. They lacked the reverence which Greek citizens bestowed upon their laws. To the sophists these laws were artificial regulations made for the benefit of the powerful aristocrats. In opposition to these human laws they stressed the natural law as embodied in man as a human being, irrespective of class or nationality. They defended the doctrine that all men are by nature free and equal, that above the city-state there stands the much superior world community. The city-state and every organization of a political character, they contended, are but the result of convention, of a free contract, and not based on natural law. Originally, and prior to all human laws, man existed in a pure 'state of nature' in which no other law prevailed but the natural law; and man was happy in this state.

Epicurus, the sensist, agreed with the sophists' criticism of the positive laws as having no immutable value. Since

pleasure and utility are the sole principles of conduct, all laws are merely human conventions made for the purpose of preventing mutual injuries. These agreements were necessary, because prior to these laws men in the natural state lived like beasts.

With Socrates, Plato, and Aristotle, a new era began in the doctrine of the natural law. As against the sophists' revolutionistic attack on the positive laws of the Greek city-state and their defense of the natural-law freedom and equality of all individuals in the *civitas maxima* or world community, this trio of great philosophers defended a more conservative view of the relationship between the natural law and the positive laws.

Socrates (469—399 B.C.) identified knowledge with virtue. There exists a world of goodness, beauty, and justice which all who care to learn may know; this world has objective validity and is not a mere human figment. Conscience testifies to the eternal value of goodness, beauty, and justice and to the divinely instituted order present in the world. The laws are the reflection of this order and ought to be obeyed by all.

Plato (about 427—347 B.C.), like Socrates, attacked the sophists' destructive criticism of positive laws and their extreme individualism. The prototypes of all things are eternal Ideas; all things must be patterned after these eternal prototypes as their norms. Laws, too, will be true laws, if they conform to the eternal Idea of law. A law is a true law only if it benefits the community and promotes the common good; if it does not, it is a false law. The natural law

is the ideal law, and it is the norm of the positive laws of the city-state.

Aristotle (384—322 B.C.) finds the norm of moral good not in a supramundane Idea, as Plato did, but in the very nature of man. For him, what is natural to rational man is ethical. Man's essence being unchangeable, what is naturally good and right remains unchangeably so, no matter how much the positive laws may change. Justice is expressed in both the natural law and the positive law, in the former perfectly and in the latter more or less imperfectly. Natural law has its source in reason, the positive law in the legislator; the positive law, however, must always be based on the natural law, because it represents the application of the natural law to the manifold situations confronting mankind.

The *skeptics*, since they repudiated certitude in knowledge, considered all laws to be the result of arbitrary decisions and agreements. As a consequence of their teaching of skepticism, they maintained that natural law does not exist.

By contrast, the *stoics* stoutly defended the existence of an immutable natural law against the sensualism and individualism of the corrupt Roman Empire of their day. The doctrine of natural law is clearly enunciated by such eminent stoics as Seneca, Epictetus, Marcus Aurelius, and particularly Cicero. Cicero,⁴ for example, writes: "True law is right reason in agreement with nature; it is of universal application, unchanging and everlasting. . . . We cannot be freed from its obligations by senate or people, and we need not look outside ourselves for an expounder or interpreter

of it. And there will not be different laws at Rome and at Athens, or different laws now and in the future, but one eternal and unchangeable law will be valid for all nations and all times, and there will be one master and ruler, that is, God, over us all, for He is the author of this law, its promulgator, and its enforcing judge.” The stoics revived the doctrine of the dignity of the human person, stressed so much by the sophists, as a freeman and citizen of the *civitas maxima*, the world community. Through the influence of stoic teaching, Roman jurisprudence accepted ‘natural law’ as the basis of its entire legal structure, especially in its *jus gentium*, the Law of Nations. It became the universal legal practice among jurists, when the positive law contained no definite norm, to decide all litigated matters according to the dictates of the natural law. The natural law became the true norm of all legislation, the fundamental law governing all human relations.

Even among these thinkers of antiquity we thus encounter a twofold interpretation of the natural law. For the sophists natural law is based on *will, authority*; for Socrates, Plato, Aristotle, and the stoics, natural law is based on reason, truth. In opposition to the entire teaching of natural law we encounter the positivistic view of the skeptics and epicureans that natural law does not exist; all laws are merely *conventions, arbitrary pacts, positive laws*.

Christianity became the heir to the treasures of knowledge contained in the Old Law of the Hebrews. Among these treasures was the natural-law doctrine. *St. Paul*⁵ refers to the natural law as the law written by God in the hearts of men. Many of the early Fathers of the Church

used the doctrine of the natural law in order to convince the pagans of the truth of Christianity. *St. Augustine* (A.D. 354—430), in particular, explored the idea of the natural law within the framework of Christian ethics. The Church carried forth uninterruptedly the tradition of natural law. From the beginning of the Middle Ages, scholasticism took over the doctrine and developed the concept of natural law with speculative depth and brilliance. From the days of *Alexander of Hales* (died 1245) and *St. Thomas Aquinas* (1224 [or 1225]—1274), through all the centuries up to the present, the concept of the natural law has been expounded and defended by scholastic philosophy as the cornerstone of natural ethics. St. Thomas, following the lead of Aristotle, saw in natural law an ordinance primarily of reason, not of will. *William of Occam* (about 1280—1349) and his followers reversed this position, but the scholastics in general accepted the position of St. Thomas. It is the common doctrine in the neo-scholasticism of our day. The dissolution of Christian solidarity through the reformation brought in its train a widespread defection from traditional Christian principles and the subsequent rise of deism and secularism. As a result, the concept of the natural law has been attacked in many quarters.

Hugo Grotius (1583—1645) marks the turning point from the metaphysical aristotelian-thomistic view of natural law to the rationalistic view, according to which the autonomous human reason is the sole source of the natural law. Theoretically he is in accord with the scholastic interpretation that natural law is a 'dictate of right reason'; however, in seeking to vindicate the absolutism of King

James I, he maintained that morality is determined by the will of God. In doing this, he grounded natural law on will and not on reason.

From this point on, *individualism* and *rationalism* conspired to formulate a new concept of the natural law. Instead of beginning the examination of natural law with the unalterable essence of human nature as its foundation, it became customary to deduce rationalistically the natural law in detailed form from the supposed, and often merely imagined, 'pure state of nature' in which man existed prior to the establishment of any sort of communal or political life with its positive laws. In the pre-political or pure state of nature, *Hobbes* (1588—1679) contended, men lived merely as individuals, not as social beings, and life was 'a war of all against all'; out of self-interest, for the sake of mutual peace and defense, all had to reduce their wills, through voluntary agreement, to the will of either one man (a monarch) or an assembly of men. Such is the origin of society and the political state, and natural law becomes identified with positive law, so that the positive will of the legislative power is the supreme norm of justice. According to *John Locke* (1632—1704), the primitive state is one of good will and mutual help among individuals; the state is only the utilitarian product of the pooling of individual interests, the result of a voluntary contract among individuals for their mutual benefit. *Jean Jacques Rousseau* (1712—1778) conceived the original state of man as a paradise in which each individual enjoyed fullest liberty and equality. The political state came into existence through a free contract of all concerned; but the political state cannot abolish

individual rights and the right to revolution, if the citizens desire to assert their inalienable individual rights. This doctrine did much to bring about the French revolution. *Samuel von Pufendorf* (1632—1694) maintained that man in his natural state is not an essentially 'social' being, but merely a 'sociable' being, namely, one who has the impulse to live in society with others for his advantage. Once, however, the governmental authority is established by means of a voluntary contract, the government must be obeyed; all positive laws then become a part of the natural law. Natural law is reduced to God's will. For *Christian Thomasius* (1655—1728) the individual's temporal happiness is the basic principle of the natural law. Even Pufendorf's natural impulse for society is abandoned, so that the state is looked upon as the result of a social contract from motives of utility; law and morality are divorced. *Immanuel Kant* (1724—1804) made the freedom of the autonomous human will the sole source of duty and law. Individualism and rationalism here reached its highest peak; the practical reason, or the will, is supreme, and the legal order is deprived of all moral character. Kant's system is the proclamation of *independent morality*.

The rise of *empiricism* and *utilitarianism* on the one side and of *romanticism* on the other now brought on an attack on the very idea of a natural law. Both tendencies opposed the rationalism of the Age of Enlightenment and with it the doctrine of the natural law.

The skeptic empiricism of *Hume* (1711—1776) apparently did away with the very possibility of rational knowledge, because he restricted all cognition to that of the

senses. Man became nothing but a bundle of perceptions, and pleasure and pain the supreme end of conduct. He and his followers could find no place in such a system for a natural law based on the unknowable nature of man. The *utilitarians*, likewise, rejected the concept of the natural law. The *evolutionists* who, like Spencer, looked into the future state of society to find their norms of laws, and who saw man in the past as an evolutionary product of the animal world, had no use for an unalterable natural law as the expression of man's unalterable essence.

Romanticism and its offspring, the *historical school of law*, were a reaction against the arid deductions of the individualistic, rationalistic concept of the natural law. The exponents of the historical theory of law were unaware of the aristotelian-scholastic tradition, because scholasticism had fallen into disrepute and played no role in public affairs and in the secular schools of learning. The historical school turned its attention in a spirit of conservatism to the historical past of peoples. Laws, they contended, do not originate from metaphysical reflections but from the common convictions of the people. Since all law originates in the obscure depths of national consciousness, there is, as *F. J. Stahl* (1802—1861) pointed out, no law but positive law; and this law possesses an absolute binding force, even though its commands be unjust or unreasonable. Natural law, as something over and beyond the positive law, does not exist. The vital questions whether anyone may disobey laws contrary to God's commandments, and whether some higher principle is required as a rational basis for the binding force of positive law, must be referred to conscience

and ethics; in doing this, the romanticists actually conceded, unwittingly of course, the possibility of the existence of a natural law as fundamental to positive law. Their general position, however, was such that the will of the people, not reason, is the source of law.

The empiricism of science led to *positivism*, the doctrine that knowledge gained through external experience is alone true knowledge. Positivism was the logical outcome of the agnosticism of the age of science. Applied to the problem of natural and positive law, it repudiated the concept of natural law as being 'metaphysical,' and therefore unintelligible, and maintained that the philosophy of law must restrict itself to an analysis of positive law as it actually exists in the statutes. The only law is the enforceable law of the state, of the power in authority to enforce its will upon others. It would be useless to look for any norm of the inherent justice or legitimacy of any given law of the state, because that would be, from the viewpoint of agnostic positivism, a leap from the solid ground of reality into the clouds of metaphysics. The moral relativism underlying legal positivism, prevalent in all too many law schools, soon brought forth its poison fruit in the doctrine of *state omnipotence*, as could be seen clearly in nazism, fascism, and sovietism. These pernicious systems of *totalitarianism* represent the final development of the positivistic concept that the will of the state is the sole source of law and morality.

Fortunately, the concept of a natural law, grounded on reason and the natural objective order, cannot be entirely obliterated from the minds of men, nor has it been really

missing in theory and practical procedure. On the theoretical side, many modern philosophers of the theory of law criticize the positivistic doctrine; if they oppose the natural-law doctrine, they mean the natural law as explained by individualism and rationalism. Men like von Jhering, Stammler, Jellinek, Nicolai Hartmann, Hauriou, Duguit, Krabbe, von Gierke, Kelsen, Laski, von Liszt, and others, advocate principles which are a definite approach to the natural law of reason as the objective norm of all positive law. On the practical side, judges and courts often discover gaps in the promulgated law and decide issues on the basis of natural equity and inherent justice; the implied appeal is not to the letter of the positive law, even if such exists, but to the natural law behind the positive law. Another instance of the return to the natural law doctrine can be observed in the efforts to establish equitable legislation of a social nature to take care of social conditions not provided for by existing positive laws. The condemnation of 'aggressor nations,' so pronounced in World War I and World War II, the safeguarding of the right of minority groups and smaller nations to an autonomous existence, the organization of the United Nations for the solution of international problems, the attempts to formulate a code of international laws on justice and right — all are indications that positivism has failed, that the will of the state is no longer considered to be the sole source of law, and that there exists an objective order (natural law) to which both nations and individuals must conform. All the while, the doctrine of the natural law was being taught in scholastic circles. Among scholastics one need but mention

Suarez (1548—1617), Bellarmine (1542—1621), Liberatore (1810—1892), Schiffini (1841—1906), Kleutgen (1811—1883), Gutberlet, Th. Meyer, Gathrein, Lehmen, Donat, Sertillanges, Gilson, Maritain, Mercier (1851—1926), Jos. Rickaby, Cronin, Brosnahan, Miltner, and John K. Ryan.

Existence of the Natural Law

The term ‘natural law’ is taken here as defined above, namely, as ‘the moral law, manifested by the natural light of reason, demanding the preservation of the natural order and forbidding its violation.’ We are now ready to prove the following proposition:

THE NATURAL LAW EXISTS FOR AND IN MAN.

There is an *eternal law*. All beings were ideally present in God’s mind from all eternity, just as the plan of an intended house is present in the mind of the architect before the house is actually built. Among all the possible worlds God’s wisdom selected our world, and His omnipotent will gave it existence. Each creature received its own specific nature from God, and each nature was endowed with definite inclinations and propensities, so as to enable each one to realize the perfection of its being. This perfection of being is the intrinsic end and purpose inherent in each creature, because that is the end toward which each one naturally tends throughout its existence; the means to attain this end are the inclinations and propensities with which each nature is endowed. By

following these natural inclinations and propensities, the creature realizes the perfection of its being according to the plan of God's wisdom and thereby also realizes the ultimate end of the world, namely, the glorification of God. So far as their nature is concerned, creatures have no choice in this matter; they act through the necessity of their given nature, for such is the *law of their being* impressed upon them by the wisdom and will of God. Viewed from the standpoint of God, this plan of His wisdom is the eternal law governing and directing all creatures toward their proximate and ultimate end; viewed from the standpoint of the creatures, this eternal law, embodied in their nature, is the natural law.

Now, man occupies a unique position among the creatures of the world. Many inclinations and propensities of his nature are beyond the control of his reason and free will; their functions are 'acts of man' and belong under the force of the natural law in the same way as do the functions of physical bodies, plants, and brutes. 'Human acts,' however, are subject to the control of his reason and free will; man can perform them or omit them, as he freely wills. Nevertheless, such 'human acts' also have as their *natural end* the perfection of the nature of man and the glorification of God, just as much as the 'acts of man' performed through the irresistible necessity of his nature. While not necessitated to perform his 'human acts' for the perfection of his being and the glorification of God, this natural end of man's free 'human acts' still remains in full force according to the demands of the eternal law as prescribed by the wisdom and will of God regarding all created beings: God

wills that the *natural order*, established by Him for the common good of all, be preserved and realized. Since the free will of man cannot be compelled by the force of physical law to carry out the natural end of his 'human acts,' the free will, enlightened by a reasoned understanding of the dictates of the eternal law, can only be *directed by reason* to carry out the prescriptions of the eternal law concerning 'human acts' by means of a *moral obligation*. He 'can' violate this obligation, but he 'ought' not violate it. On the contrary, he 'ought' to perform all such acts in accordance with the demands of the eternal law; and this moral obligation is a natural obligation, because it flows from his very nature as a creature of God. It is a dictate of our human reason that we conform to the dictates of God's reason, because only in conformity to the eternal law will we find our temporal and eternal happiness. The dictates of God's reason constitute the eternal law; the dictates of human reason constitute the *natural law in and for man*. The natural law, therefore, is neither more nor less than the eternal law as recognized and promulgated by the natural reason of man: the natural law in and for man is simply man's participation in the eternal law of God by means of his reason and free will. Consequently, the natural law exists.

Content of the Natural Law

Since the natural law is an ordinance promulgated by man's natural reason, an important problem arises and must be

solved: What precisely is the *content of the natural law* which the light of human reason makes known to man?

There are *three classes of precepts* in the natural law, some of which are self-evident, and some of which are known with varying degrees of certainty.

The *first class* includes the most general moral precepts which regulate human conduct, without any particular specification of situations or objects. St. Thomas⁶ compares the practical reason of action with the speculative reason of truth and states: "That which first falls under apprehension [i.e., the specific object of the speculative reason] is being, the understanding of which is included in all things whatsoever a man apprehends. Therefore the first indemonstrable principle is that 'the same thing cannot be affirmed and denied at the same time,' which is based on the idea of 'being' and 'not-being': and on this principle [of contradiction] all others are based. . Now as 'being' is the first thing which falls under the apprehension absolutely, so 'good' is the first thing which falls under the apprehension of the practical reason, which is directed toward action (since every agent acts for an end, which has the nature of 'good'). Consequently, the first principle in the practical reason is one founded on the nature of 'good,' namely, that 'good is that which all beings desire.' Hence this is the first precept of law, that *good is to be done and promoted, and evil is to be avoided*. All other precepts of the natural law are based upon this; so that all the things which the practical reason naturally apprehends as man's 'good' belong to the precepts of the natural law under the form of things to be done or avoided." As soon as human reason

understands what is meant by 'good' and 'evil,' it spontaneously perceives as a self-evident precept or principle of action that 'the good ought to be done and the evil ought to be avoided.' Equally self-evident is the principle next in line. Since 'good is that which all beings desire,' it is obvious that the objects of man's natural inclinations, viewed in their hierarchical order, are naturally apprehended by reason as being 'good' for man, while the objects contrary to man's natural inclinations are naturally apprehended as being 'evil' for man. Hence the practical precept, which at bottom is identical with the first precept or principle just mentioned by St. Thomas, that *man should observe the natural order which befits his rational nature.*

To the first class of precepts of the natural law thus belong these most general precepts: 'Do the good and avoid the evil'; 'live in a manner as befits your human (rational) nature'; 'never do unto another what you would not want him to do unto you'; and similar precepts of a very general character.

The *second class* embraces the immediate applications of these most general precepts to the most *basic relations* of man in his life. Man is an individual for himself, a social being living in union with other human beings, and a creature of God; these relations flow naturally and necessarily from his human nature. Hence the precepts of the natural law as prescribed in most of the commandments of the decalogue:

'Thou shalt adore God alone'; 'thou shalt honor father and mother'; 'thou shalt not kill'; 'thou shalt not commit

adultery'; 'thou shalt not steal'; 'thou shalt not bear false witness against thy neighbor'; 'render to everyone his due'; 'be just in all your dealings'; 'observe moderation'; and so forth.

The third class contains all precepts which are applicable to *specific situations* and *individual actions* discoverable by human reason, in so far as they represent valid deductions and conclusions from the principles and precepts contained in the foregoing two classes. The closer these precepts stand to the general precepts of the first and second class, the greater is their certainty; the more remote they are, the less is their certainty and the greater is the possibility of error. For example. It is clear that one must respect another's property; however, what about the person, in danger of death by starvation, who appropriates the surplus food of another? It is clear that the bombing of military objectives is permissible in a just war; but is it permissible to practice 'obliteration bombing'? Workers have the right to strike in order to obtain a just wage; but is a 'sit-down strike' justifiable on that account? A murderer should be punished; however, is private revenge justified? Much deliberation and reasoning by expert moralists will be required to answer such questions.

Whatever can be discovered by natural reason to be obligatory for man; belongs to the natural law. It is the purpose of philosophical ethics to discover as many precepts of the natural law as the frailty of human reason will permit. Subsequent discussions will reveal a large number of them.

Natural Law and Positive Law

A *positive* law is a law enacted by legitimate authority, such as the state, supplementing the provisions of natural law and made in view of the special needs of the community. Although the content of the natural law, strictly as such, embraces all the necessary prescriptions required for good moral conduct, only the general principles or precepts are self-evident to human reason; the detailed prescriptions must be deduced from the general principles by means of a process of reasoning, and most persons are incapable of making the necessary deductions. And yet, these detailed prescriptions are the very things which regulate conduct in everyday life. To remove doubt, uncertainty, misunderstanding, the state often must supplement the general prescriptions of natural law with positive laws which will give a greater *specification and determination* to the contents of the natural law. This is true particularly of the complicated conditions and relations of *social life*; to permit social conduct to be decided by the conflicting opinions of individuals would lead to dissension and turmoil, to endless disorders and disturbances of the peace. Consideration also must be given to the question of *sanctions*, that is to say, reward for the observance of the law and punishment for its violation. Everybody is aware that without proper sanctions, very many persons would not hesitate to violate the law, because they could do so with impunity; that, however, would ruin the very fabric of society. The sanctions of the natural law, such as they are, would be insufficient of themselves to enforce the

observance of the law, and violations would abound. Hence, positive laws, implemented with proper sanctions, are a practical necessity for the preservation of the social order.

Mere advice or counsel would be inadequate to preserve the social order, because there is no obligation to follow an advice or a counsel. To insure the common good of all persons united in society, there must exist a government empowered with the *authority* to make *laws* in the strict sense of the word, *binding the wills* of its subjects to a uniform manner of living and threatening with punishment all who injure the common good.

SINCE ALL HUMAN POSITIVE LAWS ARE ENACTED THROUGH THE WILL of the legislator or of the legislative body, the problem immediately arises: What is the *source of the right or authority* of the legislator to impose an obligation on the wills of other persons? After all, legislators are only human persons, and the mere fact that they represent the government does not make their human nature superior to the human nature of their subjects. Notwithstanding this obvious fact, however, all nations recognize the right and authority of the properly constituted government to impose an obligation on other persons through the medium of positive laws. Whence this right and authority?

It should be clear that the legislators possess *no personal prerogatives* which entitle them to the right and authority of enacting such laws. Their nature is no different from that of other human beings; with respect to human nature, all men are equals. Only *God*, the Creator of the

human race, can lay down the conditions necessary for man to realize his supreme end and purpose, whether as an individual or as a social being. If, then, legislators have the right and authority to make laws which are truly binding (and no one but an anarchist or nihilist doubts their right and authority), then the binding force of positive laws must have its ultimate source in the *authority of God*. The authority of the human legislator is thus derived from the authority of the Supreme Legislator, provided God has promulgated His will that men must submit their wills to the authority of the legislator and of his laws. God did promulgate His will in this respect through the *natural law*. The natural law demands that man, as a naturally social being, live in an ordered society; in other words, it is the will of God, promulgated through the natural law, that man live in an ordered society. An ordered society, however, cannot exist without a properly constituted government and the enactment of positive laws. And since a government, through the legislator, cannot enact laws without the proper right and authority derived ultimately from the authority of God, it is evident that God, through the natural law, conferred the right and authority upon the legislator to enact positive laws. But if the legislator has this right and authority, the subjects have the natural obligation to accept and obey such laws, because a law that need not be obeyed is useless; God, however, does not command anything that is useless. Consequently, the legislator has the right and authority to enact positive laws for the common good of society, and the subjects have the obligation, in virtue of the natural law, to obey.

Legislators do not have the right and authority to enact laws arbitrarily; they, too, must be directed in their legislation by the natural law. In order that laws be genuine laws, with the power morally to obligate the wills of subjects, they must possess the following *qualities*. Human positive laws must not be contrary to the prescriptions of *divine or natural law*; otherwise they exceed the competence of the authority vested in the human legislator. These laws must be *just* and directed to the *common good*, because that is the purpose of the enactments of civil government. They must be of such a nature that it is *physically* and *morally possible* to fulfill them, for laws that cannot be obeyed are senseless and cannot impose an obligation on the wills of subjects.

Unjust and sinful laws are invalid laws, and subjects may not obey them. Human legislators have no right and authority to enact laws contrary to natural or divine law; obedience to them would mean disobedience to God, and in such a case we must obey God rather than man. Unduly restrictive laws and laws enacted in favor of a class are not for the common good; so long as they are not sinful they may be obeyed until repealed, and oftentimes there will be the obligation to obey them until repealed, because of the natural-law duty not to oppose the legitimate authority except for very grave reasons.

Eternal law, natural law, and positive law are closely related. They have their ultimate source in the reason and nature of God. Without the eternal and natural law, positive law would lack a rational foundation and would have no power to enforce obedience on the part of the human will.

Because man is a rational being, a social being, and a creature of God, he has the natural and moral obligation to submit his will to the precepts of the eternal, natural, and positive law.

Summary of Chapter IX

The concept of the norm of morality leads to the concept of the *moral law*.

1. *General Concept of Law*. In its ethical and strictest sense, a 'law' means the rule or norm governing the free actions of man which have a *moral obligation*.

2. *The Nature of Law*. A law is an ordinance of reason directed toward the common good and promulgated by the one who has the care of the community.

3. *Kinds of Laws*. From the standpoint of *obligation*, laws are affirmative, negative, permissive, or punitive. From the standpoint of the *legislator*, there are divine and human laws. From the standpoint of *promulgation*, we distinguish between natural and positive law. From the standpoint of *duration*, law is either eternal or temporal.

4. *The Eternal Law*. The *eternal law* is the plan of divine wisdom considered as directing all actions and movements of creatures to their proper end. As applied to *rational* creatures, the eternal law is the will of God commanding the preservation of the natural order and prohibiting its violation.

5. *The Natural Law*. In a *general* sense, a natural law is a participation in the eternal law on the part of creatural beings, based on the 'nature' of creatures urging them by means of natural tendencies and impulses to realize the supreme end of their being according to the plan of divine wisdom. In a strict sense, as applied to rational man, the natural law is defined as the *moral law, manifested by the*

natural reason, demanding the preservation of the natural order and forbidding its violation.

6. *Natural Law in History.* The Greeks were the first to develop the philosophy of the natural law. Among those who discussed the problem were Heraclitus, the sophists, Epicurus, Socrates, Plato, Aristotle, the skeptics, and the stoics. There existed a twofold interpretation of the natural law. For the sophists, natural law is based on will, authority; for Socrates, Plato, Aristotle, and the stoics, natural law is based on reason, truth. For the skeptics and epicureans all laws are *conventions, pacts, positive laws*; natural law as such does not exist.

Christianity and *scholasticism* generally defended the natural law and developed the doctrine.

After the reformation, *individualism* and *rationalism* conspired to formulate a new concept of the natural law, using as the starting-point the supposed 'pure state of nature' in which man existed prior to the establishment of communal or political life with its positive law. Hobbes, Locke, Rousseau, von Pufendorf, Thomasius, and Kant represent this period.

The rise of *empiricism* and *utilitarianism* on the one side and romanticism on the other opposed rationalism and with it the very idea of a natural law. The empiricism of science led to positivism; it repudiated the concept of natural law as 'metaphysical' and maintained that there is no law but the positive law as it exists in the statutes. Positivism led to the state omnipotence of *totalitarianism*.

Theoretically and practically, however, the doctrine of the natural law remained alive, especially in *scholastic*

circles.

7. *Existence of the Natural Law.* Human acts, though free, have as their 'natural end' the perfection of the nature of man and the glorification of God, and God wills that the *natural order*, established by Him for the common good of all, be preserved and realized. Since 'human acts' are free, the free will, enlightened by reason, can only be *directed by reason* to carry out the dictates of the eternal law concerning 'human acts' by means of a moral obligation. This obligation is a natural obligation, because it flows from man's nature as a creature of God. Man, therefore, has the natural obligation to observe the dictates of the eternal law, and' that is the *natural law*: the natural law for and in man is man's participation in the eternal law by means of his reason and free will.

8. *Contents of the Natural Law.* Three classes of precepts are contained in the natural law. The *first class* includes the most general precepts, without any particular specification of situations or objects. The *second class* embraces the immediate application of these most general precepts to the most basic relations of man in his life. The *third class* contains all precepts which are applicable to specific situations and individual actions discoverable by human reason, in so far as they represent valid deductions and conclusions from the principles contained in the foregoing two classes.

9. *Natural Law and Positive Law.* A positive law is a law enacted by the legitimate authority, such as the state, supplementing the provisions of the natural law and made in view of the special needs of the community.

The source of the right or authority of the legislator to impose an obligation on the wills of subjects cannot be derived from the person of the legislator, because all men are equals; it can only be derived from the *Creator* of man, provided God has promulgated His will – that men must submit their wills to the authority of the legislator and of his laws. God promulgated His will through the *natural law*, because He created man as a social being who must live in an ordered society, and an ordered society cannot exist without a properly constituted government and the enactment of positive laws. Hence, the legislator has the right and authority to enact positive laws, and the subjects have the natural obligation to accept and obey such laws.

Chapter 10

OBLIGATION AND SANCTION

LAW AND CONSCIENCE ARE 'DIRECTIVES' OF MORAL CONDUCT; they show how human conduct must be regulated in order to lead man to his ultimate end. Where no law binds, freedom of action is permitted. Where a law binds, however, action is either commanded as good or forbidden as evil. It is a peculiarity of conscience, therefore, that its declaratory judgments often appear as 'dictates' or 'mandates.' In such instances the judgments of conscience are peremptory, so that they impose an 'obligation' on man. And 'obligation' suggests 'sanction.' *Obligation* and *sanction* are important ethical factors worthy of special consideration.

The Concept of Obligation

Obligation is an essential element of law. The 'formal effect' of a law is the imposition of an obligation upon the human will to obey the law and carry out its injunction. Unlike a 'counsel' or a 'wish' or a 'plea,' which merely indicate some proper and appropriate action for the will, the *law* places a *necessity* upon the will to follow a course of action prescribed by the law. 'Obligation' always involves a relation

between a will (person) and some definite action, so that a person is constrained to do something or omit something. This necessity placed upon the will constitutes 'obligation.'

From the standpoint of *language*, obligation is expressed by words like 'shall' or 'ought.' For example: 'Thou *shalt* honor thy parents, thou *shalt not* kill a person without just cause'; 'you *ought* to pay your honest debts, you *ought not* tell a lie.'

Language, of course, is an imperfect medium of communication, and the same words oftentimes are used in diverse meanings. 'Shall' and 'ought' are such words, and they do not always imply a 'moral' obligation of any kind. For example:

'You ought to see this wonderful motion picture'; 'You shall all die.' Obviously, the meaning is not that the persons addressed have the moral obligation to see the picture or to die; the difference *between* the former and the latter sentences is quite apparent. The context will show whether the statement implies the obligation of a law or not.

The necessity of action which the obligation of the law imposes on the will is not that of 'compulsion' or 'coercion.' This necessity, in other words, must not be such as to make it impossible for the will to act contrary to the law, if the will so desires. It is characteristic of moral obligation that it places an 'ought' on the will, but not a 'must.' Moral obligation leaves the will free in its decisions, but furnishes a motive in virtue of which the will feels constrained to follow the prescription of the law with perfect freedom: it can act against the prescription of the law, but it *ought* to

act in accordance with it. The will is thus 'bound' by the law, but not 'forced' to obey the law.

Another term used to designate moral obligation is *duty*. The term 'duty,' however, may be taken in a twofold sense. In one sense it means the inner necessity imposed on the will by the law, which meaning is identical with 'moral obligation.' In the other sense duty means the actions themselves to which the will is obligated by the law; thus we speak of the various kinds of 'duties,' such as the duties toward God or our neighbor. 'Duties' in this latter meaning will be treated later. Here we are interested in the first meaning of 'duty,' as a moral obligation arising out of the prescription of the law binding the free will to a definite action.

In order to have a solid foundation for this discussion, *moral obligation* is defined here, in a provisory fashion, as *the necessity, based on intelligent motivation, of obeying the prescription of a law*. Only after the origin of obligation has been determined will it be possible to define its nature in a more accurate manner.

Theistic Origin of Obligation

Very few persons have seriously doubted the *existence* of moral obligation as an observable fact. The fact is established by each individual's personal *experience*. Each one of us is aware of the fact that he feels bound to perform certain acts and omit others, while many acts are of such a nature that they are neither commanded nor prohibited. That this experience is universal among men is clear from

the *history* of all peoples, whether civilized or uncivilized. The undeniable fact that we cannot rid ourselves of this conviction of moral obligation, but feel bound to the observance of the moral order *against our natural inclinations*, is a cardinal fact of ethical experience which demands an adequate explanation. Any theory which cannot give a rational account of the origin and existence of moral obligation is thereby branded as an inadequate system of moral philosophy. The age-old system of theism derives the origin of moral obligation from God; modern non-theistic systems derive it from some other source.

A comparison of the theistic and non-theistic systems will show that *theism alone* can furnish us with an adequate explanation of the origin and existence of moral obligation. We accept the existence of God, the Supreme Being, as a postulate. An atheist, of course, will be forced to deny the cogency of the argument, but he will also be forced to find a substitute for it.

MORAL OBLIGATION DERIVES ITS ORIGIN FROM GOD.

Moral obligation denotes a certain necessity imposed on man's will. This necessity can conceivably be one of two kinds: 'physical' necessity, which has its source in external compulsion, or 'moral' necessity, which has its source in the binding power of a precept.

That the obligation to moral action is not the result of *physical necessity* or external compulsion, is clear. Man is not driven to perform moral acts through blind impulses and instincts like the brute animals. He is a rational being,

endowed with intellect and will. His will is free and cannot be forced to act through external compulsion. Hence, the necessity imposed upon the will to perform certain moral acts is not a physical necessity resulting from external compulsion. Consequently, moral obligation does not have its source in external compulsion. This conclusion is confirmed by the universal conviction of men that they cannot be held responsible for acts which they were forced to perform by coercion; responsibility is present only when an act is performed through the free decision of the will.

Since compulsion is excluded as the source of obligation, it follows that the necessity involved in obligation is of the second kind, namely, a *moral necessity* which has its source in the *binding power of a precept*. The intellect proposes a good to the will, together with the implicit or explicit declaration that the will must decide in favor of a certain action *if* it would attain to this good. The intellect perceives that the will *should* (ought to) strive for this good, although it lies within the free choice of the will to reject it. Now, every good is the 'end' of an action in conformity with the rational nature of man. Hence, the necessity in question consists in this, that man becomes aware through his intellectual knowledge that the observance of the order befitting his rational nature is necessary *if* he is to attain a certain good, or end, demanded by his nature. This good, or end, being a *practical demand* of his rational nature, the attainment of this good, or end, is not a matter of convenience or discretion, but presents itself through the intellect to the will as a precept, or law, which ought to be complied with. The *precept, or law*, therefore, exerts its

influence on the will, not as compulsion or physical necessity, but by binding it to the voluntary observance of the moral order. And it is this binding power of the precept or law which is the essence of the moral necessity called *obligation*.

The question then arises: What is the *nature of the good or end* for which the will must strive through the observance of the moral order? It is not a good which depends on our whim or a good of our own choosing. Such a good would exert its binding influence only so long as we decided to make it the object of our decision and desire. Moral obligation, however, as we all know from personal experience, often runs counter to our inclinations and impulses. Moral obligation is independent of our will, because we are subject to the binding power of the precept or law under all conditions and circumstances, whether we will it or not: we simply cannot shake off the domination of the precept or law, no matter how much we try. Moral obligation is *all-embracing* in its power, and no single earthly good or type of goods is so extensive. The good which is the end of moral action cannot be a merely earthly and temporal good. The reason is simple. Under the pressure of moral obligation, man must, at least in exceptional circumstances, be willing to sacrifice every earthly and temporal good, even *life itself*. Such instances occur when a police officer dies in the defense of the life and property of the citizens, when a virtuous girl gives up her life in the attempt to preserve her chastity against the assault of a rapist, when the martyr permits himself to be tortured and killed rather than deny his religious

convictions, and when the soldier attacks the enemy of his country out of devotion to duty with the certain knowledge that his life must be forfeited. In such and similar cases the highest earthly and temporal good, namely, life, is sacrificed to duty. There must, then, be a good as the object of duty or obligation which lies *beyond life and time*, a good greater than life and all other goods to be found on earth and in time. This good can only be God, the supreme objective good, or eternal *happiness*, man's supreme subjective good. Moral obligation, therefore, which imposes on the will the necessity of observing the moral order, is inextricably linked to man's ultimate *end and good*. Nothing less can explain the universality and inexorable stringency of moral obligation or duty.

Does obligation consist formally in the necessary connection with man's *subjective* ultimate end and good (complete and eternal personal happiness) or *objective* ultimate end and good (God, the supreme good)? Either one could apparently serve as the foundation for an all-embracing obligation to observe the moral law.

Some authors, among them Tongiorgi and Taparelli, seem to favor the *first* view. This opinion, however, confuses *obligation and sanction*. Man will obtain his eternal happiness if he observes the moral order, and lose it if he neglects to live according to the dictates of the moral law. But the gain or loss of eternal happiness as a result of the observance or nonobservance of the moral law is tantamount to reward or punishment, and that is of the nature of 'sanction.' Why the sanction? Because man either fulfills or does not fulfill his 'obligation' to observe the moral

law. Sanction, therefore, presupposes obligation as prior to sanction. Hence, man's subjective ultimate end and good is not the foundation of obligation.

The *second* view, that obligation consists formally in the necessary connection with man's *objective* ultimate end and good, solves the problem of the foundation of obligation adequately. The binding force of any law comes from the *will of the lawgiver*. Only if the lawgiver intends to impose an obligation on the will of his subjects, does obligation exist. Since all men possess a nature which is essentially the same and equal, it is clear that no human authority is competent *of itself* to impose an obligation upon all individuals and all generations of men. The binding power of human positive laws proceeds from the natural law, and the natural law has its binding power from God, the eternal *Lawgiver*. God created all things, man included, for Himself and His glory. Having done so, He could not be indifferent to the promotion of His glory or to the welfare of man. Hence, the eternal law and the natural law were decreed by His will. The observance of the moral law thus became a moral necessity for man, because God, the eternal Lawgiver, willed that man should achieve his supreme end through the observance of the moral law. Man, in observing the moral law, promotes God's glory (man's objective ultimate end) and thereby obtains his own eternal happiness in union with God (man's subjective ultimate end) at the same time.

Only *God's will* has the requisite *authority* to decree laws whose binding power imposes an obligation on the wills of *all men* at all times and under all circumstances, even

demanding the sacrifice of life, so that every individual is conscious of the inviolable necessity, notwithstanding the freedom of his will, to obey the natural moral law.

The eternal law, decreed by God in creating the world, controls all creatures. The natural law is the eternal law applied to rational and free man. The irrational world is regulated by the 'physical' necessity of mechanical and biological laws; rational man, because he has a free will, is regulated in his human acts by the 'moral' necessity of duty or obligation. God's will decreed the moral law for man and with it the obligation to obey the moral law. Since the natural law would be ineffective without obligation, God in decreeing the natural law also gave it binding power or obligation. Hence, obligation is the formal effect of law. Without God there could be no universal law, and without universal law there could be no *universal obligation*.

Duty or moral obligation thus derives its *origin from God*.

Rationalists and Obligation

Immanuel Kant divorced morality from religion and God. He was the great protagonist of modern independent or *autonomous morality*.

Kant admits the existence of a natural law and of the unconditional obligation of obeying the natural law. His entire moral philosophy is based on the unconditional character of moral obligation. He denies, however, that God is the source of the law and its obligation.

According to Kant, man's practical reason or will (for Kant both are identical) is *nomothetical* and *autonomous*; that is to say, man's practical reason or will is the sole author of all moral law, and it is independent of any and all external authority. An action is morally good only then, when it is performed out of *pure respect for the law* and not merely in conformity with the law.

To maintain that God is the source of natural law and its obligation, would be 'heteronomy.' To obey the law out of love of God or out of obedience to His will would destroy the 'autonomy' of man's practical reason and make him subject to external authority; and that, Kant contends, is contrary to the very essence of true morality. The life and death of Christ, motivated as it was by love of man and obedience to God, would not, according to Kantian principles, be 'morally good' in any true sense of the word.

Since *obligation* or *duty* belongs to the very essence of the law, Kant was forced to place the *origin* of obligation or duty in the *practical reason* of man, because practical reason is the sole lawmaker for human conduct. Obligation finds its expression in the *categorical imperative*.

Many modern authors, following in the footsteps of Kant, have advocated an autonomous and independent morality. Among them one might mention E. von Hartmann, A. Dorner, Th. Lipps, and A. Adickes. The Societies for Ethical Culture, founded by F. Adler and W. M. Salter, are based on the fundamental principle of an independent morality.

Evaluation. Kant's theory, that duty or obligation derives its origin from man's autonomous practical reason, is indefensible.

For one thing. The practical reason or will, says Kant, is *nomothetic*, meaning that the human will is the maker of its own laws. Obligation, Kant admits, flows from law. It follows, then, that the human will imposes obligations upon itself by making its own laws. Such a doctrine destroys the very *concept of the moral order*. Morality, then, is not objective but purely subjective. If the practical reason can make a law, it can also abrogate it; and if the law is abrogated, there is no obligation. Then why should man restrict his freedom of action by making any laws at all? Or, if he was foolish enough to make laws, why does he not abolish them when they turn out to be contrary to his convenience and pleasure? It is a plain matter of fact that we are not conscious of having made the laws of our moral conduct through the free decision of our own will; on the contrary, we feel *subject* to the law as something *beyond our control*. We may desire to be free from laws and obligations, but we are incapable of escaping their binding force; and this fact would be inexplicable, if Kant's doctrine were true. On the other hand, if it were claimed that man's will is *not free* to make and unmake its own laws, man's will would be determined by an *inner necessity* to make its laws and abide by them. Whence this necessity? Certainly not from the free will of man, because where there is freedom there is no necessity, and where there is necessity there is no freedom. Hence, this necessity could only originate through some *outside agency*. This agency would have to be a rational being, because moral law and moral obligation belong to the rational order. Only God, the Creator of rational beings, could impose such a necessity upon the

wills *of all men*. In that case, however, law and obligation derive their origin, not from the will of man, but from God. According to Kant's teaching of the nomothetic will, obligation is eliminated.

Moreover, if Kant's theory of the origin of law and duty were true, the *foundations of the social order would be destroyed*. Society is the union of a number of individual persons forming an organized group for the purpose of pursuing common interests and ends. It is characteristic of human society that it consist of a governing body which has the authority to rule and impose obligations and also consist of subjects which are ruled and have the duty to obey the laws laid down by the governing body. Some, therefore, have the authority to rule and others the duty or obligation to obey. But *whence this authority*? Kant's theory of personal autonomy cannot account for social authority, and as a consequence it cannot account for social obligation. The mere fact that a majority has the power to impose its will on others does not constitute legitimate authority; otherwise a mob of bandits would have the legitimate authority to rob and plunder. Might is not necessarily right. According to Kant, each person's will is autonomous and nomothetic and each person's will is its own end; an action is not morally good if directed toward an end outside the person's individual will, because the laws which each one must obey originate in his own will. Each individual is supreme in his own right and each is autonomous. No individual, therefore, can make laws for another and demand obedience from him; obedience to another would serve an outside interest and end and that would be

immoral. That such a doctrine undermines the foundation of the entire social order is clear, because it *destroys the authority of society* to make laws and demand obedience. Just as a series of zeros, no matter how many they may be, will never result in a positive number, so the mere summation of mutually autonomous wills can never give rise to authority in society where the will of the majority would have not only the might but the *right* to impose laws on the rest. The social order rests precisely on this, that the individual feels *bound in conscience to obey* the superior will of society because society has the *inherent right* to demand obedience to its legitimate authority. Such authority can originate in natural law, and natural law can have its authority from God as the author of the natural law, but Kant does not admit that natural law or any law derives its binding force from God. Under the conditions set forth by Kant, no rational account can be given of 'social obligation,' because the autonomy of the individual wills is not the adequate source of social rights and duties.

In dissociating duty from God and religion, the defenders of an independent morality committed a grave error. *Ethical culture* may appear inspiring in polite debating societies, but it will never succeed in assisting men to lead a moral life in the hard reality of a temptation-filled world.

Empiricists and Obligation

Kant and his followers sought to explain moral obligation deductively from the nature of human 'reason'; for this reason the painful consequences of acts. Spencer merely

pushes the origin of duty by means of association into the dim past of evolutionary development, while Mill placed the origin in present associations. The principle is the same. At first, certain acts became associated with definite consequences, because the consequences always followed the acts. The maxim of conduct then was: 'Do (omit) this act or you will suffer these painful consequences.' Conduct was thus originally based on a disjunctive 'either — or.' Man became habituated to the idea, through association, that dire penalties would follow the performance or omission of certain untoward acts. Later on, the penalties dropped out, and the second half of the 'either — or' no longer prevailed, leaving only the first part of the disjunction, namely, 'Do (omit) this act.' Because of the previous association, however, the memory of the acts as 'forbidden' still remained in full force. From their 'authoritativeness' and coerciveness arose the 'dread' and 'vague sense of moral compulsion' which is *obligation*. Such is the empiricistic, positivistic origin of duty or obligation according to Spencer and the evolutionists — a compound of the elements of *authoritativeness* and *coerciveness* derived through evolution by means of the *association* of the ideas of penalties with the ideas of the performance or omission of certain acts.

Evaluation. First. When Spencer describes the origin and genesis of duty from external and internal restraints, he merely gives a picture of what might or could conceivably have been the process of developing moral consciousness and moral obligation. Analysis is not proof. No one knows what the original condition of prehistoric

man actually was like; the far-distant past is shrouded in impenetrable mystery, so far as science is concerned. Yet Spencer confidently *assumes* that his imaginary description pictures the factual process. This procedure is another instance, so common among evolutionists, of the *genetic fallacy*.

Furthermore. Materialistic evolutionists, like Spencer and his positivist followers, talk continuously about 'morality,' 'moral consciousness,' 'duty,' 'obligation,' 'justice,' 'social virtue,' etc. One naturally presupposes that these and similar terms are used by them in the same sense that they are used by the generality of men and moralists. Such, however, is not the case. According to evolutionary principles, an unbroken line of *genetic descent* exists from the lowest forms of animal life, such as the protozoa, through the higher forms, such as the mammals, up to man in the highest stage of civilization. Man differs from the brute only in degree, not in kind. In fact, most evolutionists claim that the primitive savage is closer to the brute animal than he is to the civilized human. In no case is there an essential difference between man and brute; there is, and can be, no clear-cut line of demarcation between the two. Man, therefore, does not possess a nature which is in any way radically different from that of a brute. The conclusions from such premises are inevitable. The distinction between the *physical* and *moral orders* is wiped out completely. Man has no spiritual soul with spiritual powers. All that he possesses is a more highly organized brain; man is completely and solely a physical-vegetant-sentient organism. He stands merely one degree higher in the scale

of organic beings than other social animals, like the bees and ants, horses and elephants. Human conduct is a product of the social habits and instincts found among such animals in a more undeveloped stage; there is no radical difference between them, and animal conduct and human conduct is essentially the same. Man and the animals are controlled by the same physical and biological laws throughout their entire being, and these are the only laws that control their conduct. Obviously, then, either real morality must be attributed to the higher types of animals, if it is found in man, or real morality must be denied in man, if it is not found in the higher types of animals. And on what valid grounds should a distinction be made between higher and lower types of animals, from protozoa to man? Where should a line be drawn between them? Bees and ants manifest social instincts of a much more specialized character than are found in many types of mammals. Such being the case, we should apply to the animals the same code of morals regarding theft, assault, adultery, murder, etc., which we apply to man, or, if it cannot be applied to them, then man also should be exempt from this code. Ridiculous? Perhaps, but such is the conclusion which inevitably follows from obliterating the distinction between the physical and moral orders.

Finally. According to the principles of evolutionism, man is but a small segment of nature, the product of genetic descent from the animal kingdom. The only forces at work in his entire being are the general forces operative throughout the universe. Now, the forces of nature operate with necessity; determinism rules the world in every phase

of its activities, including the actions of man. Evolutionists are very insistent on this point. Hence, there is *no free will in man*. Such a doctrine, however, if consistently maintained, means the collapse of morality. The moral order consists of certain definite laws expressed in commands and prohibitions, which are supposed to be binding on the human will. But such commands and prohibitions imply that man can either obey or disobey them; in other words, they *imply freedom of action* dependent on the choice of the will. They presuppose that man does not necessarily have to act as they prescribe, but can act in accordance or not in accordance with their prescriptions, as he desires and chooses; without freedom of the will such commands and prohibitions would be senseless and superfluous, because, if man is 'determined' in his actions, he simply must do as he does and cannot do otherwise. The moral order, therefore, is based on the proposition that man 'ought' to observe the law, but that he 'can' violate it; it lies completely within his power to do the one or the other. It follows, too, from the premises of evolution that there can be no such thing as *imputability* and *responsibility*. How can one be responsible for an act that one could not possibly avoid? Imputability is incompatible with necessity, because acts are imputable only if one has free control over them. But without imputability and responsibility there can be no moral order.

Hence, the principles of evolution, as expounded by Spencer and his followers, *destroy the foundations of morality*.

When confirmed evolutionists of the materialistic type speak of 'morality' and 'moral obligation,' they do not use

these terms as they are understood and used by men in general. They realize, of course, that they cannot contradict the universal conviction of mankind openly; so they use the same terms, but substitute meanings which nullify the terms completely. Their language is simply camouflage. Their 'morality' is a glittering sham.

The Nature of Obligation

Independent morality, whether rationalistic or empiricistic, cannot survive the acid test of reason. It cannot sustain man in his endeavor to lead a moral life. When passions clamor for satisfaction, no one will hesitate to ignore the 'categorical imperative' and break the law made by his own will as the sole legislator. And when present desires demand fulfillment, no one will resist them for the sake of the problematical good of an evolutionary utopian state that may or may not come into existence in the millennia of the future. Without God and His will as Supreme Legislator of the eternal and natural law, morality has no solid foundation and obligation has no lasting binding power. Obligation or duty has its source in God who created man and gave him a destiny which extends beyond the limits and limitations of this earthly life. Nothing else can give an adequate explanation for the origin and universality of obligation as experienced by all men at all times.

God created man, so that he might know Him, love Him, and serve Him through the conscientious observance of the moral order. Whoever fulfills the will of God faithfully and devotedly, through free choice and free decision, becomes

an object of God's infinite love and he will, upon the completion of his time of preparation here on earth, be united to Him most intimately and blessedly as the *summum bonum*, the Supreme Good. But whoever consciously and deliberately fails to do this, deprives himself of the love of his infinite Father, becomes an object of God's infinite displeasure, and thereby frustrates the purpose of his existence and runs the serious risk of remaining separated from his ultimate end and goal in the life to come.

We are now in a position to give an exact *definition of obligation or duty*. *Obligation is the moral necessity to do the good and avoid the evil, based on the knowledge that God, our Supreme Good, demands the observance of the law and forbids its deliberate violation.*

Sanction

The term 'sanction' has a number of meanings. In popular parlance it means 'approval' or 'ratification,' as in the statements, 'The board of directors sanctioned the sale of the bonds,' or 'President Truman gave his sanction to the dropping of the atom bomb on Hiroshima.' In ethics the meaning is different. In connection with the natural law and moral obligation, sanction is used in the *sense of the rewards or punishments ordained by a legislator for the observance or transgression of the law.*

A law is a restriction of man's freedom of action. By nature man has a free will, and freedom of action is a natural prerogative of free will. 'Obligation' is the moral necessity to do the good and avoid the evil, according to the

prescriptions of the law, because God demands that we obey the law; to disregard the law is to disregard God's authority. Sanction presupposes obligation. The two are quite distinct. Sanctions are added to the law, so that, if the mere fact of the obligation itself is not sufficient to impel man to observe the law, the hope of reward and the fear of punishment will act as *effective motives* for its observance. Rewards are an incentive for virtue, punishments a deterrent against vice.

A sanction is *adequate or inadequate*, depending upon whether or not it affords a sufficiently powerful motive for observance of the law. A slap on the wrist for assault with the intent of inflicting great bodily harm, a fine of one dollar for highway robbery, or a month's imprisonment in jail for murder are obviously inadequate sanctions. An adequate sanction is *absolutely or relatively adequate*. It is absolutely adequate if it furnishes a truly effective motive for all persons at all times, in all places, and under all conditions; otherwise it is only relatively adequate. If a sanction is absolutely adequate, the reward is such that it outweighs all the sacrifices and inconveniences attached to the observance of the law, and the punishment is such that it surpasses all the pleasures derived from transgressing the law.

The Need of Sanctions

Since both the natural law and its obligation have their source in God, the Supreme Lawgiver, it would seem that knowledge of the law and its obligation would be a

sufficient incentive for man to obey the natural law and that sanctions are therefore superfluous. On the face of it, this view seems to express a profound truth. What it really expresses is an ideal which, unfortunately, does not correspond with reality. Man knows the natural law in many of its prescriptions, and he also recognizes his obligation to obey the law. Yet violations, as we are all aware, occur frequently. It is, therefore, by no means sufficient for man to know the natural law and its obligation in order to induce him to live in accordance with its prescriptions. More is needed, namely, *sanctions*, rewards and punishments, if the purpose of the natural law is to be fulfilled. The reason is plain.

The natural law was given to man by God, not as an end in itself, but as a means for him toward the realization of his ultimate end. God, being infinitely perfect, created all things, including man, for His glory. The supreme purpose of man, therefore, is to live in such a manner that his conduct will promote God's glory, and it is the purpose of the natural law to assist man toward this ultimate end of his being. God cannot be indifferent in this matter, because He loves His infinitely perfect nature with an infinite love. God must, therefore, efficaciously will that man live in accordance with the precepts of the natural law, so that he will actually strive for the glorification of God and thus achieve his ultimate end. But if God's will is really efficacious, the realization of this ultimate end must be *unconditional* and could not be made dependent on man's decision or caprice. Now, it is obvious that those who transgress the law with malice aforethought, flout God's

authority and do not promote His glory. Such persons, as far as they are concerned, frustrate God's will and their own ultimate end. If they could do so with impunity, God's will would not be really efficacious. In giving man a free will, however, *God cannot force the will of man to do His bidding*. So long as man is man, his will is free: freedom and compulsion are incompatible. Hence, the only way in which God can induce man to observe the natural law is to place adequate sanctions on the observance or violation of the law. In this manner the glorification of God will be realized both by the just and the unjust — by the just through their good life and its reward, by the unjust through the punishment meted out to them for their wicked life. Sanctions, therefore, are necessary.

And still the question persists: Why the *necessity* of sanctions? Could not God have made man so good that he would feel more inclined to observe the natural law than violate it? Why does man find it so difficult to lead the good life? We are here face to face with one of the major mysteries of human existence. The Christian theologian has the answer to these questions. God did create man good. In the beginning man felt more inclined to observe the law than to violate it. A complete harmony existed between man's sentient and rational powers, so that the former did not rebel against the latter. But then came the Fall. Man succumbed to a temptation directed toward his intellect and will by an outside intelligence. As a result of his sin, the harmony of his being was disturbed: his intellect was darkened, his will was weakened, and his passions made imperious demands for satisfaction. Man is a fallen

creature. The philosopher, of course, is not a theologian, and he cannot take direct cognizance of the truths of Revelation for the solution of his problems; he must attempt to find the solution on the basis of reason alone, without having recourse to revealed religion. Taking all things into consideration, however, the moral philosopher marvels at man's proclivity to evil and leans strongly toward the view that man in his present tendencies might not be the being he was when he issued from the creative hand of God. Be this as it may, the moral philosopher, taking man as he is, gives the following explanation of man's proclivity to evil. Man is a *composite of body and soul*. All knowledge begins in the experience of the senses. Sense knowledge is immediate, direct, intuitional. Intellectual knowledge is acquired through abstraction from sense knowledge; it is mediate, indirect, abstractive. It is natural, therefore, that the objects of the senses and passions will have a greater and more vividly emotional appeal than the objects of purely intellectual and moral worth. The objects of the senses and passions will, therefore, exert a powerful attraction on man's desires, whether they agree or disagree with the moral law; and quite frequently they disagree, so that they are physically good but morally evil. Hence man's proclivity to evil and the perennial conflict between the things of sense and the things of the spirit.

Without a doubt, it would be more proper for man, as a rational and moral being, to observe the natural law from a sense of duty and out of love of God. Many persons do just that. But the bulk of mankind does not seem capable of elevating itself to the height of this ideal. The average

person is a frail vessel indeed. He needs more than just the law and God's decree to keep him on the straight and narrow path. He finds it so hard to walk the stars and so easy to slip into the mire. Man, being what he is, requires an incentive for doing the good and a deterrent from doing the evil. The natural law is given *for all* without exception; not only for the few who would follow its prescriptions for the love of God, but also for the many who would neglect their remote ultimate end for the sake of the ever present enjoyment of pleasure.

God must will that man strive for his ultimate end. The natural law was given as a means to achieve this end. God must insist, therefore, that man observe the natural law. Knowing man's natural weakness, like a wise father he attached sanctions to the natural law to insure its observance on the part at least of those who have a general good will, so that the hope of reward and the fear of punishment will aid them in overcoming their natural weakness and in making the necessary sacrifices which the law demands. Obviously, these sanctions must afford an *efficacious motive* to obey the law; otherwise they would be disproportionate to the effect intended. God, however, never uses disproportionate means. The sanctions, therefore, must be adequate.

Imperfect Temporal Sanctions

Sanctions are of two kinds: temporal and imperfect, and eternal and perfect.

In order that sanctions be 'absolutely adequate,' they must be adequate for all persons, at all times, in all places, and under all circumstances. If any of these elements are missing, the sanctions are only 'relatively adequate.' The sanctions attached to the natural law here on earth are 'relatively adequate' because they are *temporal and imperfect*. What are some of these temporal, imperfect sanctions?

It is a matter of common experience that the habitual observance of the natural law brings in its train many *natural benefits*. Among these are the consoling knowledge of good deeds well done, an undisturbed conscience, enduring peace of mind, and the constant inclination and facility of performing good acts. These are personal benefits which those who have experienced their possession esteem more highly than health, wealth, honor, and fame. The faithful observance of the law is the solid foundation of family happiness, because, when parents and children are virtuous, there is peace and harmony, understanding and tolerance, love and joy. The faithful observance of the law is also the best guarantee for the preservation and perfection of society, because the citizens live together in order and tranquillity, with respect for the rights and duties of others, for mutual advancement and prosperity. On the other hand, it is also a matter of common experience that the habitual violation of the natural law produces *dire evils*. The consequences for the individual are the rebellion of the passions against the rule of reason, dissatisfaction of the soul, remorse of conscience, and the ascendancy of vice in every direction. One profligate member in the family is

usually the cause of much discord, grief, and misery. A lawbreaking citizenry and a corrupt officialdom loosen all the bonds of society, while the excessive ambition and pride of governments frequently plunge nations into war and immeasurable suffering. These benefits and evils are the *natural* consequences which result from the observance or violation of the natural law. Since they are natural, they must have been intended by God as sanctions. Virtue is indeed its own reward, and vice its own punishment.

That the sanctions just mentioned are *temporal and imperfect*, is all too clear. They are neither permanent nor universal. Many temporal evils befall those who observe the law, while evildoers often meet with comparative success. The wicked, through their very violations of the natural law, frequently amass fortunes and achieve honors which the just people, because of their conscientious regard for the rights of others, must forego. The observer of the natural law must sacrifice many illicit pleasures and suffer many inconveniences which the wicked in following the bent of his perverse inclinations enjoys. Life is not all happiness for the good, nor all misery for the evil. Consequently, the sanctions of the natural law here on earth, though they afford a powerful motive for the faithful observance of the law, are by no means perfect and absolutely adequate. More is needed for the observance of the total law; the ultimate sanction must be meted out in the life after death.

Perfect Eternal Sanction

Since every wise legislator adapts his sanctions to the purpose which he intends to achieve by the law he passes, it is evident that God attached an 'adequate' sanction to the natural law. And since the natural law is such that God intended it to be observed by all men, at all times, in all places, and under all circumstances, the sanction of the natural law had to be 'absolutely adequate,' or it would not fulfill its purpose. In other words, the sanction of the natural law has to afford an *efficacious motive* which will be an inducement powerful enough for all men, at all times, in all places, and under all circumstances, to observe the natural law faithfully and refrain from violating its prescriptions. But it has just been shown that the sanctions of the natural law during man's life here on earth, though real, are only temporal and imperfect; that is to say, these sanctions are only 'relatively adequate,' not 'absolutely adequate.' Consequently, the perfect or *absolutely adequate* sanctions of the natural law must find their final application in the life after death, *in eternity*. This is particularly true in the case of those who sacrifice their life out of love of God in the performance of duty.

As pointed out in a previous chapter (Chap. 6), the ultimate objective end of all human conduct is the glorification of God, and the *ultimate subjective end* of man is *beatitude* or supreme happiness resulting from the intimate union with God, the absolute good. But man achieves his ultimate end by living in accordance with the moral order or natural law. Hence, beatitude or supreme happiness will be the reward for living in accordance with the moral order or natural law. It was also pointed out there

that beatitude must necessarily be eternal in duration, or it would not really be 'beatitude.' Consequently, *eternal beatitude* is the reward or sanction for the just in the life to come. That eternal beatitude is a perfect, absolutely adequate sanction for living the good life, is clear, because it far outweighs any and all sacrifices, inconveniences, and discomforts which the faithful observance of the divine law entails. Whoever, therefore, dies in the friendship and love of God will receive eternal beatitude as a reward.

WHAT WILL HAPPEN TO THE WICKED WHO FLOUT GOD'S AUTHORITY and die in their wickedness? Unless they have renounced their wickedness before death, they enter eternity in the displeasure and enmity of God. What will be the sanction for them?

The theologian, following revealed truth, gives the definite answer that the wicked will be condemned to an eternal life of misery, just as the good will enjoy an eternal life of beatitude. Here again, however, the moral philosopher must forego the definite answer of the theologian, because he is restricted in his research to the truths attainable by human reason alone. There are four *possibilities*: the wicked might obtain immediate eternal beatitude; they might be punished temporarily and then obtain beatitude; they might be annihilated; they might be condemned to eternal misery.

Will the wicked obtain *immediate eternal beatitude*? Assuredly not. If they did, the just and the wicked would be treated alike; both would enjoy supreme happiness for all

eternity. Under this supposition, God would place a premium on the violation of the law, for the wicked person could indulge in the perverseness of his evil desires to his heart's content on earth and still attain eternal happiness after death. In that case, the natural law would be useless. God's justice certainly cannot reward both the faithful observance of His law and the iniquitous indulgence in debauchery with eternal beatitude, as if it made no difference to Him whether man strove to achieve his ultimate end or not. The very thought is blasphemy.

Will the wicked suffer *temporary punishment* after death and then finally obtain beatitude? At first, this seems a satisfactory solution of the problem of sanction after death for the wicked. After all, their life of wickedness was comparatively short, and a temporary punishment would seem sufficient to atone for their temporary waywardness. This view deserves serious consideration.

God is a wise legislator. A wise legislator, however, must implement His law with an adequate sanction. That is to say, God must supply man with a motive so powerful that, upon due consideration of this motive, man will clearly understand the imperative necessity of observing the law under all conditions and the utter futility of violating it for the sake of any advantage to be gained therefrom. Now, temporary loss of beatitude would not be a sufficiently powerful motive to accomplish this purpose. For the following reasons. The good life, though it has many compensations, is a continuous struggle against the allurements of pleasure and passion, a ceaseless privation of comfort and convenience, a never ending resistance

against the enticements of a world that promises riches and honors and every type of advancement. To preserve virtue is difficult at all times; to succumb to vice is delightfully easy at any time. Nor is this all. It not seldom happens that the will to observe God's law demands the sacrifice of very important earthly goods and advantages, perhaps even of the most precious of all earthly possessions, life. And the fact must not be overlooked that earthly pleasures and pains press with vivid clarity upon the senses and imagination, while beatitude and punishment after death seem extremely remote and nebulous. Besides, the temporary loss of beatitude, as the result of sin, might possibly be only of short duration, with an eternity of joy and happiness to follow. In view of man's frailty, the temporary loss of beatitude would hardly be a sufficiently powerful motive for all men, at all times, in all places, and under all circumstances, to sacrifice everything, even life itself if required, in order to live the good life in accordance with the strict demands of God's law.

Will the wicked be *annihilated*, either immediately at death or after some temporary punishment? Let us analyze this possibility. God does not create a thing without a purpose to its being; and the purpose of a being is revealed by the kind of 'essence' which God has given it. Now, the essence of man's soul is spiritual, incorruptible, indestructible. Only God can create and only God can annihilate the spiritual soul of man. The very fact, however, that God created the soul as a naturally indestructible essence, shows that it was His purpose that the soul should live on forever after death. Since the purposes of God are

infallible in their power of execution, He had the intention that the soul should not cease to exist but live eternally. Of course, God could *annihilate* any of His creatures; He gives existence, and He can also take away existence. No creature has an indisputable and absolute right to existence. God, however, is not fickle and capricious. If He chose freely to create man's soul as an indestructible essence, so that by its very nature it is capable of living forever, the conclusion is justified that it is His *will* that the soul live eternally. That a man be just or wicked, is incidental to the essence of his soul and does not change it in any way. Hence, the conclusion is justified that the soul of the wicked will not be annihilated, even though, absolutely speaking, God has the power to do so. Would perhaps the *mercy* of God prompt Him to annihilate the soul of the wicked, so as to save it from being forever deprived of eternal beatitude? God is, without question, infinitely merciful. However, the mercy of God merely requires that He make it possible for man to follow the precepts of the natural law, so that he can achieve his ultimate end and attain beatitude; but the mercy of God does not require that He save the soul of the wicked from the disaster which he has deliberately and voluntarily brought on himself. God gave man a free will. If man decides of his own accord to use his free will for his own destruction, the fault is entirely and solely man's, not God's. God merely brings man's free decision to its logical and inevitable result. The appeal to God's mercy is inadmissible also for this reason that His mercy is identical with His holiness and justice, and His holiness and justice demand that the sanctions of the divine

law be 'absolutely adequate.' In the interests of an absolutely adequate sanction, therefore, God will not annihilate the soul of the wicked. The thought of complete annihilation is a rather welcome one to many persons steeped in iniquity, because they can do as they please on earth, and the loss of eternal beatitude will not be felt in a state of non-existence. We must conclude, therefore, that annihilation would make an absolutely adequate sanction, so necessary for the observance of the natural law, impossible.

Will, then, the wicked be condemned to *eternal misery*? The philosopher is always somewhat hesitant about attempting to pierce the veil of eternity and to plumb the depths of God's designs. The light of human reason is rather feeble in lighting up the labyrinthine ways of God in His dealings with men. It is difficult to gauge the influence of revealed truth and faith on philosophical judgments. From the standpoint of philosophy one must say that it is logical to conclude that God will leave the wicked in their state of voluntary separation from their ultimate objective and subjective end for all eternity. And this separation involves the eternal loss of beatitude. And the eternal loss of beatitude involves eternal misery. If there is to be an absolutely adequate sanction to guarantee the observance of the natural law, no other alternative seems possible. It is a terrifying thought — but that is what it is supposed to be. Man should simply not risk the eternal loss of beatitude for the sake of a passing, ephemeral, deceptive life of pleasure here on earth. Too much is at stake.

Total and Partial Frustration

The complete loss of eternal beatitude means the total frustration of a person and his life's destiny. The very purpose of his creation, according to the design of God, is nullified. This happens when a person separates himself altogether from God and enters eternity in that state of separation.

Does every violation of the natural law and its precepts involve complete separation from God and consequent total frustration? Or, are there violations which do not involve ultimate disaster? In other words, is it permissible to make a distinction between 'grave' and 'slight' derelictions of duty? The former would entail complete separation from God, deprivation of one's ultimate end, loss of eternal beatitude, and total frustration of life's destiny; the latter would involve the displeasure of God in a minor degree and merit some temporal punishment, but would still preserve the love and friendship of God and entitle a person to union with God in eternal beatitude after death. If the distinction is permissible, we must distinguish between *grave and slight matters in the precepts*, because reference is had here to 'voluntary' derelictions of duty.

The distinction is not only permissible, but *natural and necessary*, according to the universal conviction of all normal persons. Such is the distinction made between a white lie and perjury, between a slap given in peevishness and murder committed in cold-blooded malice, between the theft of a penny and a bank robbery, between a person starting a petty quarrel and a dictator engineering an

aggressive invasion, between one drink in excess and sottish drunkenness, between a mild flirtation and deliberate adultery, between luke-warmness in prayer and flagrant blasphemy, and so forth. A comparison of these alternatives shows clearly that the distinction is not arbitrary, but natural and necessary. Stealing a penny represents only a slight turning away from one's ultimate end and certainly does not merit the designation of 'total frustration' with eternal loss of beatitude and eternal separation from God. Love of God is still essentially present in the will guilty of violation of the law in a minor matter. Perjury is a serious dishonor toward God, but a white lie is obviously only a slight infraction of the law of truthfulness. The same is true of the other and similar cases. And since man has a free will, he can repent of his misdeeds during his life and return to God at any time before death, thereby restoring the proper moral order between himself and God.

Obligation and sanction are necessary elements of the natural law and reveal God's kindness and justice. They are intended for the benefit of man, to lead him to the attainment of his ultimate end.

Summary of Chapter X

Obligation and *sanction* are two important ethical factors involved in the natural law.

1. *The Concept of Obligation.* The law places an 'obligation' upon the will to follow a course of action prescribed by the law. In a provisory fashion, 'moral obligation' is here taken in the sense of 'the necessity, based on intelligent motivation, of obeying the prescriptions of a law.'

2. *Theistic Origin of Obligation.* The source of duty or obligation is not physical compulsion or necessity, but the *binding power of a precept*. Law prescribes an action, and the end of an action is some good. Moral obligation is all-embracing in its power and scope, and no single earthly good or type of good reaches so far in its power and scope. Even life itself must at times be sacrificed to duty. There must, then, be a good as the object of obligation which lies beyond life and time and is greater than life and all earthly goods. This supreme good can only be God or man supreme happiness.

3. *Rationalists and Obligation.* Kant is the protagonist of 'autonomous morality.' According to his teaching, man's will is *nomothetical and autonomous*. The will of man is the sole legislator and its own end. For the will to strive for external ends outside itself would be 'heteronomy,' and such actions are not morally good.

Evaluation. Kant's theory is untenable. For one thing. Kant's doctrine of the *nomothetic* character of the will

destroys the concept of the moral order. If man can make a law, he can also abrogate it; and if he can abrogate a law, there is no obligation. Moreover, Kant's theory destroys the *foundations of the social order*. The individual can make laws for himself, according to Kant, but not for others. In that event, society has no authority to make laws, and might becomes right. Kant, therefore, gives no rational account of the origin of obligation or duty.

4. *Empiricists and Obligation*. Empiricists attempt to derive the origin of obligation from experience, particularly through *evolution*. Spencer finds the factors, which originated duty, in certain political, religious, and social restraints (external factors) and in the natural consequences of actions (internal factor). The *authoritativeness* and *coerciveness* of these restraints gave rise to the feeling of obligation or duty through association.

Evaluation. Evolutionists are guilty of the genetic fallacy when they assume their description of the evolution of moral obligation to be a factual process. Again, since there is no essential difference between man and brute, evolutionism wipes out the distinction between the *physical and moral orders*. Finally, evolutionists destroy the foundations of morality, because determinism rules the world; where there is determinism, there is no free will and no imputability.

5. *The Nature of Obligation*. Obligation is the moral necessity to do the good and avoid the evil, based on the knowledge that God, our Supreme Good, demands the observance of the law and forbids violation of it.

6. *Sanction.* Sanction means the *rewards* and *punishments* ordained by a legislator for the observance or transgression of the law. They are in the nature of 'effective motives.' A sanction is either 'inadequate' or 'adequate'; the latter is either 'absolutely' or 'relatively adequate.'

7. *The Need of Sanctions.* Since God will not force the free will of man, He must, if His will is efficacious, place *adequate sanctions* on the observance of the law, because man is by nature weak and will not, as a rule, observe the natural law simply because he has the 'obligation' to obey it.

8. *Imperfect Temporal Sanctions.* Some sanctions are 'temporal' and 'imperfect.' The habitual observance of the natural law gives man many natural benefits in this life, just as the habitual violation produces *dire evils*. However, many evils are also the lot of the just here on earth, while the wicked often meet with success. These sanctions, therefore, are by no means perfect and absolutely adequate.

9. *Perfect Eternal Sanction.* Since God intended that the natural law be observed by all men, at all times, in all places, and under all circumstances, the sanction had to be *absolutely adequate*, or it would not afford an effective motive for man to observe the law and avoid its violation. But the sanctions here on earth are not absolutely adequate. Consequently, the absolutely adequate sanctions must be applied in *eternity*, where alone man achieves his ultimate end. By realizing his ultimate end, God's glorification and the possession of God, the *just man* receives eternal beatitude as his reward.

The status of the *wicked after death* admits of four possibilities: they might obtain immediate eternal beatitude; they might be punished temporarily and then obtain beatitude; they might be annihilated; they might be condemned to eternal misery. Since the wicked separate themselves voluntarily from God, it is logical to conclude that God will leave them in their state of voluntary separation from their ultimate objective and subjective end for all eternity. In this manner, the sanction for the just and the wicked would be *absolutely adequate*.

10. *Total and Partial Frustration*. The distinction between *grave* and *slight* matters in the precepts of the law is not only permissible, but natural and necessary.

Chapter 11

VIRTUE AND VICE

TO DESIGNATE A *PERSON* AS 'GOOD AND JUST,' OR AS 'BAD AND wicked,' more is required than one or the other good or evil act. Even a 'good person' may at times perform an evil act without thereby becoming a wicked person, just as a 'wicked person' may occasionally perform a good act and still not be a good person. We speak of a 'good and just person' only if his will is directed toward the morally good life in a constant and habitual manner; and we speak of a 'bad and wicked person' only if his will is directed toward the morally evil in a constant and habitual manner. Morally good or evil *habits* make the morally good or wicked person.

Morally good habits are *virtues*; and morally evil habits, vices. Virtues and vices play an important role in every individual's moral life.

Concept of Virtue

All virtues are habits, but not all habits are virtues.

A *habit* belongs to the general category of 'quality' and is defined as a comparatively permanent quality disposing a

thing well or ill in its being or operations. When it is stated that a habit is 'comparatively permanent,' the meaning is that it must be stable relative to the nature of the thing which has this habit. Stability of habit, of course, varies with different beings. The life, for instance, of some insects lasts but a week or even a day. Something may be relatively permanent in its short life, which would be relatively transient in the much longer period of life of some other being.

Habits are either entitative or operative. An *entitative* habit is one which disposes the general condition or entitative states of a being well or ill. Beauty and health affect the general condition of a being, and so do deformity and chronic illness; they are entitative habits. *Operative* habits are 'habits' in a stricter meaning of the term. They are stable qualities disposing a thing well or ill in the *operations* of its faculties. Such a habit gives a definite direction to the acts of a faculty, a determination in virtue of which the faculty *tends* to act in one manner rather than in another. Every repetition of the act increases this tendency and makes the subsequent operation of the same kind easier. What was done in the beginning as the result of conscious effort, now becomes almost automatic, and the faculties carry out their respective acts with little external stimulation or none at all. We perceive the working of operative habits in the complicated acts of walking, speaking, typewriting, playing a musical instrument, memorizing, etc.

Not all faculties are capable of being determined by habits. The very nature of habit as a quality 'determining' a

faculty to a definite mode of operation shows that habit presupposes a faculty which is *indifferent to a variety of actions*. It is only when a faculty is by nature indeterminate to various kinds of actions that it is capable of further determination from a habit. A faculty which is already determined by its very nature to act in such or such a manner can receive no further determination from a habit, because no inclination or tendency is as strong as one given through the necessity of a being's nature. Thus, the natural forces of inorganic bodies work forever in the same manner. Gravity, for instance, attracts the stone with the same force after the thousandth time as at the very first time; it gains nothing by repeating the action. So, too, plants and animals are determined in their operations by their very nature; under the same conditions they will, if left to themselves, act in the same way.

Hence, only such things can properly be the subjects of operative habits as are *free in their activities*, because they are intrinsically indeterminate. The *free will* is primarily capable of habits. The intellect is also capable of habit, in so far as the will can apply it in different ways to its object; we see this in the habit of knowledge. The sensitive powers of man, considered in themselves, are incapable of habit, because they have a necessary direction toward their respective objects. Since, however, they are under the control of the will to a great extent, they are, indirectly, capable of being perfected by habit. Through intensive exercising along certain lines, man can 'train' his eye, his ear, his imagination, his sense memory, and so forth.

Some habits are *given by nature* itself. It would be more correct to say that nature gives the 'beginning' of habits, rather than habits themselves. Such is the *habitus principiorum*, the 'habit of principles,' as present in the mind from the start; man's mind has a natural facility and inclination to understand and form fundamental *theoretical* principles of thought, like the Principles of Identity, Contradiction, Excluded Middle, and Sufficient Reason. Such also is *synderesis*, the native ability and inclination to understand and form fundamental practical principles of moral action, like, 'The good is to be done, and the evil is to be avoided.'

Other habits are *acquired* through the *frequent repetition* of the same acts. Once acquired, such habits are relatively stable. Examples are the habit of knowledge, language, writing, walking; in the field of human conduct we have the virtues, like kindness and temperance; and vices, like cruelty and drunkenness.

Among the natural habits, the moral virtues occupy a preeminent place. Since they are concerned with morally good actions, they are *operative habits*. Aristotle¹ gives the following definition of virtue: "The virtue of man will be the state of character which makes a man good and which makes him do his own work well." By "the state of character" Aristotle indicates the habit of virtue as being something relatively permanent. And virtue is a habit which "makes a man good," because man is a 'good man,' not through an occasional good act, but through virtue as a constant and habitual inclination toward the morally good life. At the same time, virtue "makes him do his own work

well”; this means that virtue is an ‘operative’ habit which disposes him well toward the performance of morally good acts. St. Thomas Aquinas² adopts the definition of St. Augustine: “Virtue is a good quality of the mind, by which we live righteously, of which no one can make bad use.” These definitions differ in their wording, but the meaning is the same. We can, therefore, define virtue as the *permanent inclination and facility to perform morally good acts*; or, more briefly, as the operative habit to perform morally good acts.

Virtue is not a habit given by nature, but is an *acquired* habit, the result of repeated actions which produce in man a permanent inclination and facility toward the good. The ‘habit of principles’ and ‘*synderesis*’ are not virtues in this sense, because they are not operative habits. Prolonged repetition is necessary to acquire virtue; once the habit is formed, prolonged neglect of the habit or repeated actions contrary to the habit are necessary to lose or destroy virtue.

The Subject of Virtue

Moral virtues are acquired habits. As such they demand a *subject* or *bearer* in which they reside. Since the moral virtues are operative habits directed toward action, they must reside in an operative power (or powers). Which operative power (or powers) is the subject or bearer of the moral virtues?

St. Thomas³ gives the answer when he says:

“The subject of a habit which is called a virtue absolutely can be only the will, or some power in so far as it is moved by the will. And the reason for this is, that the will moves to their acts all those other powers that are in some way rational... Therefore, if man do well actually, that is because he has a good will. Therefore, the virtue that makes a man do well actually, and not merely the aptness to do well, must be either in the will itself, or in some power as moved by the will.”

All moral virtues, being operative habits directed toward morally good conduct, are acquired through the repetition of good acts. But only *human acts* can be morally good acts, and human acts are only such acts which are performed either by the will itself or under the control and direction of the will. The reason for this is obvious. Human acts are essentially *free* acts. Now, only the will is in itself free; other powers participate in freedom only in so far as they participate in the freedom of the will. The will is the directing agency controlling all the powers subject to the will in any way. Hence, if man, as a rational being, performs morally good acts, the reason is to be found in the fact that his *will* is good. That is why St. Thomas⁴ says: “If a man do well actually, that is because he has a good will.” Consequently, the moral virtues reside either in the will itself or in some other power controlled by the will.

The *sensuous appetency*, considered strictly as such and independent of the will, is incapable of virtue in the strict sense of the term. Virtue, as distinct from vice, is always

directed toward that which is 'morally good.' Sensuous appetency, however, is directed toward the physical or sensuous good, and such a good may be in agreement or disagreement with the norm of morality; that is to say, the sensuous good may be morally good or morally evil. Hence, the aptitudes or permanent inclinations of the sensuous appetency are in themselves not virtues, independent of the will, even if they are in agreement with the norm of morality; they become virtues only when directed by the good will toward that which is morally good. Thus, a miser may be habitually temperate in food and drink; this temperance, however, is not a virtue because he is abstemious only out of miserliness, and miserliness is a vice. On the other hand, the habitual temperance of a saintly person is the result of a morally good motive on the part of his will seeking to curb the sensuous appetites and subject them to the control of reason, and that is a virtue. With regard to the aptitudes of sensuous appetency, therefore, everything depends on the will: if the will is morally good in their regard, they are virtues, and if the will is morally evil in their regard, they are vices. Taken by themselves, it is clear, they are not virtues in the strict sense of the term, because virtues can never be directed toward moral evil; if they are directed toward moral good, as is the case with the virtue of temperance, they are directed by the will acting in conformity with the moral law. Hence, even when the aptitudes of non-free faculties have an essential part in moral virtue, for example, in temperance, they receive their *moral character* only from the direction of the will.

Nothing, therefore, in the non-rational part of man's nature has, of itself, *moral worth*. Moral worth is derived from the good will which *loves* the moral good and directs all actions and natural aptitudes toward the moral good. The good will's love of the moral good is the key to all virtue, whether this virtue be in the will itself or in some other power under the control of the will.

The Cardinal Virtues

The primary subject or bearer of virtue is the will. However, other powers of man are also involved in virtuous conduct. All must be habituated to the good before anyone can be said to be a truly good person. There are, then, various kinds of virtue.

Among all the virtues, four are considered to be the principal ones, the chief among several groups of virtues. For this reason they are called cardinal virtues, and they are prudence, justice, temperance, and fortitude. The Greek philosophers, notably Plato and Aristotle, mention and discuss them. That their knowledge was the common heritage of antiquity, is clear from the fact that the Hebrews made the same enumeration.

We read, for example, in the Book of Wisdom (8:7): "She [Wisdom] teacheth temperance, and prudence, and justice, and fortitude, which are such things as men can have nothing more profitable in life."

Prudence is the intellectual virtue which enables the intellect to judge correctly in matters pertaining to the moral order. *Justice* is the moral virtue which inclines the

will to render unto each one his due. *Temperance* is the moral virtue which makes a person ready to submit the desires for sensible pleasure to the control of reason. *Fortitude* is the moral virtue which regulates man's sensible nature to the demands of reason in the face of obstacles which endanger the moral good.

If we inquire into the *grounds* of this fourfold division of the moral virtues, St. Thomas⁵ gives the following explanation: "Things may be numbered either according to their formal principles or according to the subjects in which they are; and in either way we find that there are four cardinal virtues.

"For the formal principle of the virtue of which we speak now is the good as defined by reason. The good can be considered in two ways. First, as existing in the consideration itself of reason, and thus we have one principal virtue called *prudence*. Secondly, according as the reason puts its order into something else, and this either into operations, and then we have *justice*, or into passions, and then we need two virtues. For the need of putting the order of reason into the passions is due to their thwarting reason; and this occurs in two ways. First, when the passions incite to something against reason, and then they need a curb, which we thus call *temperance*; secondly, when the passions withdraw us from following the dictate of reason, e.g., through fear of danger or toil, and then man needs to be strengthened for that which reason dictates, lest he turn back, and to this end there is *fortitude*.

“In like manner, we find the same number if we consider the subjects of virtue. For there are four subjects of the virtue of which we now speak, *viz.*, the power which is rational in its essence, and this is perfected by *prudence*; and that which is rational by participation, and is threefold, the will, subject of *justice*, the concupiscible power, subject of *temperance*, and the irascible power, subject of *fortitude*.”

Each of the cardinal virtues represents the *most important* of a group of similar virtues. These latter are related to their respective cardinal virtue as *parts*, forming a dynamic unit of moral action along a certain line. St. Thomas⁶ distinguishes *three types* of such parts, depending on the relation of a particular virtue to the cardinal virtue to which it belongs. Some virtues are *subjective* parts; they are species under the cardinal virtue as a genus. Some are *integral* parts; they lend assistance to the cardinal virtue and complete its activity in some way. Some are *potential* parts; they are derived, cognate, annexed virtues that regulate certain activities regarding which the cardinal virtue cannot develop its full activity because of the peculiar character of the object involved.

Having considered the cardinal virtues as to their position in the general scheme of moral conduct, we must now turn our attention to each one in particular.

Prudence

Prudence is defined as that *virtue of the intellect which enables man to judge correctly in each individual case what the moral order demands of him.*

Prudence is a habit of the practical intellect. Prudence shows the will how it must regulate its activity here and now, so that it will be morally good. The object of prudence is exclusively that which is morally good and evil. It is concerned with the adoption of the proper means required to realize the ends of man *as man* in all his relationships, particularly in his relationship to the 'ultimate end' of his existence. With regard to the means to be used, it is always a question of selecting among a number of means the one best suited to realize the end desired; only when the means are not determined and necessary, but *manifold* and *contingent*, does the virtue of prudence exert its influence in making a proper selection. Prudence, therefore, *inquires* into the nature of the end sought and the various means capable of realizing it, *judges* as to the best means under the concrete circumstances of the case, and then *commands* the will to employ these means with precision and promptitude for the realization of this end. Of these three characteristic acts of prudence, the commanding or moving of the will to adopt the proper means is obviously the most important for moral living, because only that man is prudent who not only knows what he is supposed to do but is ready and willing to do it.

The term 'prudence' has, of course, a much wider application in human affairs than is here assumed in its ethical definition. A man, for example, is prudent in business matters, if he is well versed in business

transactions and knows how to use the proper means to make his business a success; a builder is prudent, if he is shrewd in employing labor and materials to the best advantage in erecting a building. Such instances of prudence have nothing to do with the *virtue* of prudence. The latter is concerned with the morality of human life. A morally prudent man may be a very imprudent businessman, and a prudent businessman may be a morally very imprudent human being. Worldly prudence must often be condemned by moral prudence as being in opposition to moral principles of justice.

Since prudence is an *intellectual* habit or virtue, one might wonder why it is numbered among the moral virtues of justice, temperance, and fortitude. The reason is that prudence is directed toward moral action and as such is a virtue which has as its object, not simply truth, but the proper ordering of human life in relation to man's ultimate end. Hence, prudence is a virtue of the 'practical' reason, not of the 'theoretical' reason. Even the moral virtues of justice, temperance, and fortitude need regulation on the part of prudence, so that they may not go astray either through excess or defect. Prudence, therefore, is the most important of the cardinal virtues.

Following the lead of Aristotle, Cicero, and other philosophers, St. Thomas gives a list of the subordinate virtues or *parts* of prudence.

The *subjective* parts, or *species*, of prudence are personal prudence and prudence in the direction of others, depending upon whether prudence is concerned with individual good or the good of others.

There are a number of *integral* parts or auxiliary virtues relative to prudence. *Remembrance* (*memoria*) recalls past items which contribute to the judgment of a moral action. *Intelligence* (*intelligentia*) pertains to present items which contribute to the judgment. *Docility* (*docilitas*) is responsiveness to outside instruction concerning right means. *Sagacity* (*solertia*) helps a person in making a quick perception of the proper means. *Reason* (*ratio*) assists a person in the comparison and valuation of different things. *Foresight* (*providentia*) arranges everything necessary for the attainment of the end. *Circumspection* (*circumspectio*) considers the circumstances attending an action. *Caution* (*cautio*) avoids difficulties and obstacles. These virtues serve the purpose of preparing the way for a prudent judgment and of assisting in its execution.

Prudence also possesses *potential* parts, or cognate, annexed virtues. *Eubulia* is proficiency in discovering the proper means to the end. *Synesis* is proficiency in clear, decisive judgments, following the inventive reflection of eubulia, in those common cases where ordinary principles are sufficient for prudence to arrive at a practical decision. *Gnome*, or higher judgment, is proficiency in finding the proper solution in extraordinary and difficult cases according to principles of a higher order which demand exceptional insight or perspicacity of judgment.

There is considerable dispute among the erudite as to whether and in how far these various virtues differ in reality from prudence and among themselves. Some consider the distinction between them to be real, others admit only a virtual distinction. In as much as these habits

or proficiencies do not reach the same point of development in all persons, there is probably a real distinction between at least some of them.

This observation is valid also for the cardinal virtues that follow.

Justice

Justice is that moral virtue which *inclines man's will to render unto each one his due*. Considered in its widest sense as rendering unto every one without exception all that is his due in every conceivable respect, justice embraces all virtues and means 'perfection' or 'sanctity.' The term is often used by the Sacred Scriptures in this sense. As a cardinal virtue, however, the term 'justice' is here used in the *restricted sense* of rendering unto *other* rational beings that which they have the right to demand of us as their due, such as life, health, bodily integrity, reputation, and property.

Even in this restricted sense, 'justice' can be taken in two meanings. In one meaning justice is the virtue which extends to all cases where something is rendered that is due to another. In this meaning, justice would include, for example, worship due to God, obedience due to parents, gratitude due to benefactors. In the other meaning, justice as a *special* moral virtue has as its object the due which can be rendered in the equivalent of value. The latter is justice properly so called.

General or legal justice regulates the actions of the individual in his relations to the *commonwealth* or

community to which he belongs as a member. Every person, as a member of society, owes to society that which is necessary for the common good, and the virtue of general or legal justice inclines the person's will to render unto society its due. Justice in this sense is termed 'general,' because the common good of all members may require practically all virtues from its members, depending on conditions and circumstances. It is termed 'legal,' because it is a matter of legislation to determine and prescribe what the individual members shall render unto society toward the realization of the common good.

Particular justice regulates the actions of an individual in his relations to *private* persons and inclines his will to render unto everyone his due in the equivalent of value. Here debt and payment form a sort of equation — so much for so much. There are two kinds of particular justice, commutative and distributive. *Commutative* justice orders the dealings of one individual with the other individual and sees to it that each one receives strictly what is his own. A purchaser, for instance, who agrees to pay one dollar for an article, is bound by commutative justice to pay the dollar; a person who has stolen one hundred dollars is bound to make restitution in that exact amount to the one from whom he has stolen the sum. *Distributive* justice orders the dealings of society toward its members and inclines those in government to distribute equitably the common goods and burdens among the members of the commonwealth and inclines the latter to be contented with their share of the social goods and burdens assigned to them. It would not, for instance, be in accord with distributive justice to exempt

the rich from the burdens of taxation and place the burden of main taxes on the poor; nor would it be just to derive the bulk of tax money from the necessities of life and exempt luxuries from taxation.

Commutative justice seeks to give each his due in *arithmetical* equivalence, article for article and penny for penny or their equivalents, according to a strict valuation. Distributive justice, on the other hand, aims to distribute common goods and burdens in *geometrical* equivalence, i.e., seeks the equality of two ratios or proportions, by giving public honors and offices to citizens in proportion to their services rendered to the commonwealth and by placing the public burdens on the citizens in proportion to their ability to carry these burdens. The immediate measure of justice rests on the equality of *things* which are due to someone. But if we ask why morality demands particular justice, the deeper reason is found in the fact that man is by nature a 'social being' and the norm of morality, based on man's *social nature*, demands that he give to each his due, otherwise social life would be impossible.

In the strictest sense of the term, only particular justice can be considered a *cardinal* virtue, because only in particular justice is perfect equality possible between person and person and thing and thing. According to common teaching, every cardinal virtue has a special, determinate object, one which meets a special, determinate need or difficulty. General or legal justice, however, demands many types of virtues from the members of the commonwealth. Hence, since general or legal justice lacks a

special, determinate object, it is not a cardinal virtue. It is only fair to remember, however, that many authors reckon legal justice as a part of the cardinal virtue of justice.

Although both commutative and distributive justice are subjective parts or species of justice in the strict sense, *commutative* justice embodies the concept of justice in a *more perfect degree*. A person acts justly or unjustly toward another person, not toward himself. This complete separation of person and person does not occur in distributive justice, because the relation of the commonwealth to its members is not that of one private person to another private person, but rather that of the whole to its component parts; justice is not so rigorous between whole and part as it is between person and person.

In cases where injustice has been done, only *commutative* justice imposes the obligation of *restitution*. Justice demands that each be given his due. What belongs to a person is his, and others must respect his right to what is his. If, then, someone deprives him of what is his through theft, he still retains the right to his property, and the thief is bound to restore the object or, if the object no longer exists, its equivalent. Similarly, if someone unjustly damages another in his property, the damaged property must be restored in full. Justice remains violated until restitution is made, because the owner is deprived of his due so long as the damage is not repaired and equality restored.

Restitution is impossible in *distributive* justice, when it is a question of the proper distribution of public goods, be they honors or offices. The goods in question become the

property of those to whom they are given, even if they were not properly merited. The injustice occurs in their being given to undeserving persons; however, since they are *public* goods, they do not belong in strict right to any individual, and so no individual is damaged in his own individual ownership. It is presupposed, of course, that only distributive, not commutative, justice has been violated in the case; if commutative justice has also been violated in the transaction, then restitution must be made in this respect. An official, therefore, who is guilty of the violation of distributive justice alone, commits an immoral act; he must, of course, repent of his unjust act and resolve to conform to the precepts of distributive justice in future transactions, but no restitution need or can be made.

In a similar manner, no restitution can be made in violations of legal justice considered strictly as such. Whoever does not render to the commonwealth what is its due under the given circumstances, cannot make restitution for the injustice done on the basis of legal justice, because the opportunity is past and will not occur again as the same opportunity. Duties of legal justice are determined by the law according to time and circumstance; once they are violated, they no longer exist, and so strict restitution is impossible. A draft-dodger, for example, violates his duty as a citizen; he can and should repent of his action, but he cannot recall the opportunity which is past.

Due to the complexity of present-day social life, ethicists frequently include in this classification the division of 'social justice.' *Social justice* is justice with particular reference to

the economic and social welfare of society in the co-operation of the various social groups and classes active within the framework of the state. The obligations of such groups and classes pertain to natural justice, not merely to legal justice, and such obligations have as their goal the due share of all in the fruits of their socio-economic co-operation. In particular, social justice should guide all employers and workers in the negotiations and conclusions of collective labor agreements. The object of social justice is the ordering of the social economy.

The *subjective* parts or *species* of the cardinal virtue of justice are *commutative* and *distributive* justice. Those who consider 'general' or 'legal' justice to be a part of justice proper will, of course, add it as a third part.

There are *no integral* parts or auxiliary virtues of justice in the strict sense of the term.

Justice has a number of *potential* parts or cognate, annexed virtues which resemble it in some, though not all, of its characteristic features. *Three things* are required for justice. The virtue must be directed toward another person; must render unto this other what is strictly his due; there must be a real equivalence between what is due and what is rendered. Many virtues approach, but do not meet, these requirements in full measure.

Because the *second* requirement is not fully met, the following virtues belong to justice only as potential parts or cognate virtues. *Love of moral truth* inclines the will to act toward others in word and deed as we actually are. Love of truth manifests itself in 'truthfulness' and 'faithfulness.' *Gratitude* inclines the will to be mindful of favors received

and to seek to render favors in return. *Liberality* inclines the will to give gladly of one's earthly goods to others. *Affability* regulates man's external conduct with others, so that he behaves toward them in a becoming manner. Fairness, similar to gnome or superior judgment, inclines the will to overlook the mere letter of the law in man's dealings with others, whenever higher considerations of justice so demand. The natural virtue of *neighborly love* inclines the will to be benevolent toward one's fellow men because they have the same human nature and ultimate end.

The following cognate virtues lack the *third* requirement of real equivalence. Three virtues are based on the relation of man to God. *Love of God* inclines the will to love God for His own sake and to prefer Him as the Supreme Good to all temporal goods. *Hope* in God enables man to expect confidently that he will always obtain the means necessary to achieve ultimate happiness. The virtue of *religion* inclines the will to render honor unto God and to submit to the yoke of His commandments. *Piety* or *dutifulness* (*pietas*) urges proper respect and obedience unto parents (including relatives) and *country*, because they give existence and sustenance. Those who do not consider 'legal justice' to be a part of the cardinal virtue of justice in the strict and proper sense, place it under love of country or parallel to it. *Observance* (*observantia*) inclines the will to render honor and submission unto those who occupy positions of authority in the commonwealth.

Justice, it will be noticed, covers an extensive portion of moral conduct, especially in the field of human relations.

Temperance

Temperance is the moral virtue which *orders the desire for sensible pleasure within the limits of right reason.*

Man is a composite of body and soul, a rational animal. He has his animal nature, with all its sensuous capacities and tendencies, in common with the brute. But he has also a rational intellect and a free will, and these powers are distinctively human and represent a higher level of being. The rational part of man's nature lifts him above the instincts of the brute. Man, therefore, has the obligation to live primarily as a rational being, not as an animal; or, rather, as a human being whose animal appetites must be regulated and moderated in such a manner by reason that they do not conflict with his ultimate end. It is the purpose of the cardinal virtue of temperance to do this.

Sensible pleasures are not in themselves morally evil. They are part and parcel of man's organic being as created by God in His infinite wisdom and goodness. The theory of the Stoics, that it is unworthy of man to indulge at all in pleasure, is totally wrong. God had a definite purpose in uniting pleasure with many natural activities, especially with the activities necessary for the *preservation of the individual and of the race*. Pleasure should act as a stimulus inducing man to perform these acts. If food and drink were not accompanied by pleasure, man would curtail the nourishment of his body and his health would suffer. And if the function of sex were not pleasurable, few people would feel inclined to accept the duties of parenthood, and the race of man would inevitably die out.

Pleasure, therefore, is not to be despised. Under circumstances it should even be desired and sought. It must not, however, be made an end in itself, because to do so would be a distortion of the proper order. Man must use pleasure only as a means to a higher end, as is befitting a rational being, so that *reason*, and not instinct and impulse, is the guide for human conduct. Not suppression, but moderation and regulation are the keys to the proper use of sensible pleasure. And *temperance* is the virtue which inclines the will to curb the excessive desire for pleasure and place it within the limits dictated by right reason.

The pleasures of the *palate*, namely, of food and drink, and the pleasures of *sex*, are the ones which have the greatest natural attraction for man and which easily lead him to excesses. They must be brought into reasonable subjugation. A number of virtues assist temperance in this difficult task.

On the basis of the threefold pleasures just mentioned, temperance consists of three *subjective* parts or species. Temperance in the use and enjoyment of food and non-intoxicating drink is *abstinence*. In the use and enjoyment of intoxicating drink, it is *sobriety*. In the use and enjoyment of the legitimate functions of sex, it is *chastity*. Chastity also includes the virtue of natural reserve, but 'reserve' is in all probability nothing more than chastity in its phase of external behavior.

The *integral* parts or auxiliary virtues of temperance are two in number. *Propriety* (*honestas*) is love of the beauty which is found in the temperate use of pleasurable things. The *sense of honor and shame* (*verecundia*) is the anxiety to

avoid the personal shame and disgrace which follow the unbecoming and excessive enjoyment of pleasures. Propriety and the sense of honor and shame, however, hardly seem to be virtues in the true sense of the term; the former is more in the nature of an inclination than a true virtue, and shame is an emotion rather than a habit.

There are a number of *potential* parts or cognate, annexed virtues which assist temperance, such as self-restraint, humility, meekness, clemency, and modesty. *Self-restraint* is the virtue which enables the will to resist the most powerful emotions of sensible desires for pleasure which run counter to the norm of morality. Some persons are naturally disposed to restrain their passions, so that they find it easier than others to control themselves. But this is a disposition, not a virtue. The disposition becomes a virtue only then when the 'habit' of self-restraint is acquired through the repeated exercise of controlling the more powerful urges of instinct. *Humility* inclines the will away from seeking greater honor and estimation than one deserves. Humility recognizes the fact that of ourselves we are nothing and that everything we possess comes from God; as a consequence of this fact, the humble person will not exalt himself unduly over his fellow men, but will curb his ambitions within the limits of what is just and proper. *Meekness* moderates anger and the desire for revenge, so that we may avoid vindictiveness. *Clemency* inclines the will to forgive the faults committed against one's self by others and to exact a lesser punishment (within the demands of reason) than the strict letter of the law requires. *Modesty* regulates our external deportment and makes us strive for

becoming behavior in movement, speech, posture, dress, and amusements.

Temperance is directed mainly against gluttony, drunkenness, and lust; but its general purpose is to moderate the inner emotions and the personal actions of man in such a way as to avoid the extremes of both deficiency and excess. Temperance, as a cardinal virtue, thus stresses moderation in all things and has a much wider significance than is frequently associated with the term as denoting moderate usage of, or complete abstention from, intoxicating beverages. It is not the use, but the abuse, that is wrong. Ordinarily, moderation will suffice. Hence, people should be educated to bring their appetites under the control of reason and to practice moderation in the legitimate use of all pleasure, thereby forming the habit and virtue of temperance.

Fortitude is the moral virtue which inclines the will *to overcome grave danger and sustain severe hardship in the pursuit and maintenance of the moral good*. It enables a person to remain firm, for the sake of the moral good, in the presence of great fear, especially when in danger of death. The danger of death makes the greatest demands on the courage of an individual; conspicuous examples are combat service in time of war and martyrdom as a testimony of faith.

The moral life of man is a continuous battle against evil in all its forms; it goes on uninterruptedly from the age of discretion in childhood until the last moment of life. Since he is by nature weak and inconstant in the struggle for moral supremacy, and since many and grave dangers beset

his moral life both from within and from without, man needs the strength of the virtue of fortitude to overcome all difficulties and gain final victory.

Fortitude is opposed to rashness and cowardice. *Rashness* is false courage which presumptuously takes unnecessary and dangerous risks, contrary to the counsels of prudence and right reason; it is an excess of fortitude, prompted by too much reliance on one's overestimated natural strength in the face of very grave difficulties. *Cowardice* is the lack of proper courage in the presence of danger and difficulties; it is a defect of fortitude, resulting from underestimation of one's powers of resistance. Cowardice shows itself even in the ordinary affairs of daily life, when a person is afraid to defend his moral and religious principles from the attacks of scurrilous and vociferous adversaries. God gave man definite, though limited, powers to do the good and avoid the evil, and He will not permit anyone of good will to be tested beyond his strength in his endeavor to observe the moral order. Hence, there is no reason for cowardice, nor is there any place for rashness. Fortitude befits both our weakness and our strength. When fortitude is required in our struggle for moral goodness, provided we have practiced it constantly and faithfully in the smaller affairs of life, it will not be lacking in the graver dangers and difficulties.

Fortitude has *no subjective* parts or subordinate species; and it has also *no integral* parts or auxiliary virtues in the strict sense.

There are, however, a number of *potential* parts or cognate, annexed virtues which support fortitude.

Confidence inclines a person to be calm and collected in approaching dangers and difficulties. *Magnanimity* inclines a person to be generous-hearted in undertaking difficult assignments. *Magnificence* inclines the person of wealth to carry out large projects for the alleviation of distress and the promotion of human welfare, such as the establishment and support of charitable, religious, and educational institutions. *Patience* inclines the will to accept with resignation the existing trials and sufferings. *Perseverance* inclines the will to go steadily forward in an undertaking, notwithstanding all the difficulties which endanger it from without. *Endurance* inclines the will to steel itself in the struggle for the moral good by faithfully overcoming all the difficulties which arise from the very nature of the struggle.

The cardinal virtues of temperance and fortitude have as their object the regulation of the tendencies and emotions of man's sensuous nature; temperance in the sphere of pleasure, fortitude in the sphere of pain. Both together seek to subject man's lower nature to the control and direction of reason in accordance with the norm of morality.

Vices

A *vice* is an *operative habit inclining the will to acts at variance with right reason*. Vice is the opposite of virtue. Much of the analysis of virtue can be applied to vice by a reversal of concepts. Our discussion of vice, therefore, can be brief.

Many people labor under the impression that vices and passions are identical. While the passions contribute in

great measure to the formation of vices, they are by no means, in themselves, vices. Passion, or emotion, is an affective state of the animal organism, following the cognition of an object or situation, characterized by strong feeling, by an impulse to action, and by physiological changes in bodily function. The objects and situations occasioning them on the 'objective' side, the cognitive and appetitive factors, both sensory and rational, and the bodily resonances accompanying them on the 'subjective' side, are manifold and variable in kind, quality, and degree. The passions are the result of the activity of the *concupiscible* and the *irascible* sensuous appetency; in other words, they are the result of man's propensity to enjoy and his propensity to fight. The concupiscible appetency gives rise to the passions of love, hatred, desire, aversion, joy, and sadness; the irascible appetency, to hope, despair, courage, fear, and anger. The former refer to normal situations, while the latter are concerned with emergency situations.⁷

The passions are a part of the natural sensuous equipment of man's organism and as such are neither morally good nor morally evil. The vices are stable tendencies toward evil and reside in the will as well as in the sensuous appetency. Just as the virtues always facilitate morally good acts, so the vices always facilitate morally evil acts. Like the virtues, they have their origin as habits in frequently repeated acts. The passions, being a part of man's nature, cannot be completely suppressed or destroyed, but must be *regulated* and made subject to the norm of right reason. Vices, on the other hand, are always morally evil in their tendency and must be *uprooted*.

The existence of vices as evil operative habits poses an interesting philosophical problem. Philosophy⁸ assures us that 'evil' is never a positive reality or being of any kind. Nor is it a mere absence of being. Evil is the absence of a reality due a thing and which ought to have it, but does not. Evil is a *defect*, the *privation of a required good*. Therein, however, lies the problem. Vices are supposed to be evil operative habits. They either exist or they do not exist. If they exist, they are positive realities, and as positive realities they cannot be an evil. If they do not exist, they are nothing, and as nothing they cannot be an evil. Yet, vices exist, and they are morally evil. But how can this be?

The problem is not as difficult as it seems. Since evil is essentially a privation or defect of entity, it is obvious that it cannot exist for itself but always *presupposes an existing subject* which *lacks* something which the subject ought to have; as such evil is always something *relative*, i.e., relative to the individual nature in which the defect is found. For example. A soldier receives a severe arm wound in battle; as a result he has a 'lame arm.' Two things are necessary for a 'lame arm.' There must be an 'arm,' and the arm, so far as it is an existent reality, is a good. The arm, however, is 'lame' because it lacks the normal capacity of movement, and 'lameness' is a defect in the arm and as such is an evil. The evil of 'lameness' is thus relative to the good of the existing 'arm'; lameness, therefore, is a defect (evil) in an existing arm (good). While the evil is itself not a positive reality, the good in which it is a privation is a positive reality; without an existing good there could be no evil.

The application to *vice* is apparent. The habit of vice, considered as the facility of a faculty to act in a definite manner, resides in a faculty, and the faculty as such is good. But the acts, for which the habit contributes facility and readiness to the operative faculty, deviate from the norm of right reason and as such are unbefitting to man's rational nature because they *turn him away from his proper end*. Therein lies the *defect* of vice; it deprives man of the right order in his acts by inclining his will in the wrong direction. What physical evil is in the physical order, moral evil is in the moral order —the privation of a required moral good in man. The vices, therefore, considered as 'operative habits,' really exist, but these habits suffer from the defect of turning the will away from its proper end and goal.

The *division* of vice into its species or kinds can be made from different standpoints. Some authors differentiate the vices according to the laws which they violate; others, according to the virtues to which they are opposed; others, according to the nature of the vices themselves. The last method is convenient, because one can restrict the enumeration, as was done with the cardinal virtues, to those vices, which are the roots of all particular vices.

The *capital vices*, from which practically all evil deeds derive their origin, are seven in number: pride, covetousness, lust, anger, gluttony, envy, and sloth. They are the chief sources of moral evil in the world.

Pride is excessive esteem of one's own self and failure to attribute all excellencies to God rather than to one's own person. *Covetousness* is excessive desire of worldly goods. Lust is excessive desire of sexual enjoyment. *Gluttony* is

excessive love of the pleasures of the palate. Anger is excessive desire of revenge or an unreasonable opposition to a person or thing. *Envy* is displeasure over another's good qualities or good fortune because it lessens one's own glory and importance. *Sloth* is laziness of body and mind, causing one to neglect the obligations involved in the pursuit of moral goodness.

The *ground* for this division lies in the consideration of the kinds of goods which man either seeks or flees in an inordinate manner. There are four types of earthly goods which man *seeks inordinately*. He may seek inordinately: (1) goods which, in a certain sense, are spiritual, such as glory, honor, fame — this is 'pride'; (2) personal, bodily goods which may be necessary for the preservation of the individual, such as food and drink — this is 'gluttony'; (3) goods which refer to the preservation of the species, the functions of sex — this is 'lust'; or (4) goods which are external and material, such as wealth and other earthly possessions — this is 'covetousness.' There are two types of goods which man flees inordinately. He may flee his *own personal* moral good because of the trouble and difficulty connected with its attainment; this is 'sloth.' Or the good of another because he considers it as a lessening of his own excellence; this is 'envy.' Finally, if the good of another becomes an obstacle in our path, and we resent its presence, react with emotional violence to it, and seek to remove the obstacle, we are guilty of 'anger.'

It is imperative to distinguish between evil *habits* and evil *acts*. Single, isolated acts do not constitute a habit: they must be repeated frequently before they engender the

constant inclination toward the respective evil acts which we call 'vice.' Conversely, the fact that a person has a vice does not necessarily mean that he always performs the acts associated with the habit; if the constant inclination to perform the acts is present, because the frequent repetition of this type of act has formed a deep-seated and permanent tendency to perform them, the vice, even when not exercised, is present. A person, therefore, may have the firm resolution to extirpate a vice to which he is addicted, but this resolution alone will not put an end to the vice immediately; he must counteract the vice by the frequent repetition of the acts of the opposing virtue. In this way the vice will gradually fade out as the opposing virtue grows and gains ascendancy.

Virtues and vices are the great driving forces of moral conduct for good and evil. Vices debase man to subhuman levels; virtues raise him to superhuman heights. Man's temperament is due to nature, his virtues and vices are due to nurture; the former is given, the latter are acquired. Virtues and vices, superimposed on temperament so as to form a consistent unity, establish a person's *character* in the sphere of morals.

Virtues and vices can make or mar our whole life.

Summary of Chapter XI

Virtues and *vices* play an important part in every individual's moral life.

1. *Concept of Virtue.* A 'habit' is a comparatively permanent quality disposing a thing well or ill in its being or operations. Operative habits dispose a thing well or ill in its operations. Only such things can properly be the subjects of operative habits as are *free* in their activities, because they are intrinsically indeterminate. *Acquired* operative habits are formed through the frequent repetition of habits. *Moral virtues* are acquired operative habits. Virtue is the *permanent inclination and facility to perform morally good acts*.

2. *The Subject of Virtue.* Only 'human acts' are morally good acts, and they are *free* acts. Consequently, the moral virtues reside either in the will itself or in some other power controlled by it.

3. *The Cardinal Virtues.* Cardinal virtues are the principal virtues among several groups of virtues. They are *prudence, justice, temperance, and fortitude*. They may be accompanied by other virtues considered as *parts*; these parts are either 'subjective,' integral,' or 'potential.'

4. *Prudence.* 'Prudence' is that virtue of the intellect which enables man to judge correctly in each individual case what the moral order demands of him. Prudence is a habit of the practical intellect.

Subjective parts: personal prudence and prudence in the direction of others. *Integral* parts: remembrance,

intelligence, docility, sagacity, reason, foresight, circumspection, and caution. *Potential* parts: eubulia, synesis, and gnome.

5. *Justice*. 'Justice' is that moral virtue which inclines man's will to render unto each one his due.

General or legal justice regulates the actions of the individual in his relations to the 'commonwealth.' *Commutative* justice orders the dealings of one individual with the other individual and sees to it that each one receives strictly what is his own. *Distributive* justice orders the dealings of society toward its members and inclines those in government to distribute equitably the common goods and burdens among the members of the commonwealth and inclines the latter to be contented with their share of the social goods and burdens assigned to them. In cases of injustice, only commutative justice imposes the obligation of restitution.

Subjective parts: commutative and distributive justice. Some authors also include legal justice.

Integral parts: none. *Potential* parts: love of moral truth, gratitude, liberality, affability, fairness, neighborly love; love of God, hope in God, religion; piety and observance.

6. *Temperance*. 'Temperance' is the moral virtue which orders the desire for sensible pleasure within the limits of right reason. Sensible pleasures are not in themselves evil, but they must be used as means to a higher end; they must be regulated by reason and brought into reasonable subjection. This is done by *temperance*.

Subjective parts: abstinence, sobriety, and chastity. *Integral* parts: propriety and the sense of honor and shame.

Potential parts: self-restraint, humility, meekness, clemency, and modesty.

7. *Fortitude*. 'Fortitude' is the moral virtue which inclines the will to overcome grave danger and sustain severe hardship in the pursuit and maintenance of the moral good. It is opposed to rashness and cowardice.

Subjective parts: none. *Integral* parts: none. *Potential* parts: confidence, magnanimity, magnificence, patience, perseverance, and endurance.

8. *Vices*. A *vice* is an *operative habit inclining the will to act at variance with right reason*. 'Vices' and 'passions,' though related, are not identical; vices are always directed toward what is morally evil, but the passions, since they are natural equipment of man, can be directed toward either good or evil. As an 'evil,' habits are essentially a *defect*, a *privation* of a required good. Their defect consists in that they turn man away from his proper end.

The *capital* vices are seven: pride, covetousness, lust, anger, gluttony, envy, and sloth.

Chapter 12

RIGHTS AND DUTIES

PRUDENCE, JUSTICE, TEMPERANCE, AND FORTITUDE ARE THE four cardinal virtues heading the various groups of virtues which make one a truly 'good person.' They are so many skills or habits which give the will and its subordinate powers the readiness and proficiency necessary for the ordering of human conduct in accordance with the norm of morality. Though a person may excel in one or the other of the cardinal virtues, all four are interdependent in a great measure and render mutual assistance.

Among the four cardinal virtues, *justice* is of special importance, because it is essentially a *social* virtue and man is by nature a social being. Justice is the moral virtue which inclines the will to render unto each one his due. Because something is 'due' to a person, he has the 'right' to demand what is his due, and others have the 'duty' to render unto him what is his due.

Rights and *duties* are the warp and woof of the social fabric of human relations. Without justice, and without the rights and duties which issue from justice, the social life of man would end in chaos.

Concept of Right and Duty

The term 'right,' as used in *moral philosophy*, has a twofold meaning in its basic use. As an *adjective*, 'right' has a meaning identical with 'morally good' and is used in opposition to the term 'wrong' or 'morally evil.' We thus speak of human acts as being 'right' or 'wrong,' and the meaning is that they are 'morally good' or 'morally evil.' As a *noun* the term 'right' is used in a juridic sense as pertaining to law and justice. In a *juridic* sense the term 'right' may have a threefold meaning. It may mean the law itself, as in the statement, 'Natural right entitles him to perform this action.' Or it may mean *just dues*, as when someone says, 'He has the right to the property because he bought it.' Or it may mean the *moral power* or *faculty to exact* his just dues against others, as when the principle is enunciated that, 'Every person has the right to defend his life against an unjust aggressor.'

In the present chapter we are not concerned with the use of the term in its adjectival form meaning what is 'morally good.' 'Right' in this sense has been treated in previous chapters.

Here we treat of 'right' in its *juridic* sense. The use of the term in the sense of 'law' is now rather unusual in the English language; common usage favors the term 'law' in the first of the juridic meanings mentioned above, so that we speak of 'natural law' rather than of 'natural right.' When the term *right* is the correlative of duty it is commonly used either in its second or third juridic meaning, namely as the 'just dues' to be exacted or the

‘moral power to exact one’s just dues.’ As ‘just dues’ the term is taken *passively*, and as the ‘moral power it is taken *actively*. If someone has the ‘right’ to exact his just dues, someone else has the ‘duty’ to render unto him his just dues, and this is a matter of justice.

Law is not the same thing as ‘right.’ Law is the source and root of right, and right is the effect and consequence of law. Because there exists a natural law imposing upon parents the *duty* to support and educate their children, the children have the *right* to support and education. Rights and duties always go together as a consequence of law.

Just dues presuppose a certain equality of proportion between thing and thing, and in this sense *right* is the proper object of justice. Justice always implies strict equivalence and imposes the strict obligation or duty to maintain or restore this balance of equality between thing and thing on the part of one person and another. When employer and employee, for instance, have agreed upon a definite wage for a day’s labor, the employee, having rendered his services, has the ‘right’ to the stipulated wage and the employer has the ‘duty’ to pay the wage. The wage in this case is a just due and as such a right on the part of the laborer.

Not all virtues embody this relation of *strict equality*. For example, man must practice the virtues of religion toward God, and these virtues entail a strict obligation on the part of man. Yet, because God is an Infinite Person and man a finite person, man simply cannot render unto God His due in full measure according the demands of strict justice; the equality between right and duty cannot be upheld in such a

case, since the distance in dignity between God and man is infinite.

Similarly, some virtues, though intimately related to justice, cannot be said to impose a *strict obligation*. Such virtues are, for example, gratitude for alms received, amiability, magnificence in the distribution of one's wealth, clemency, and friendship. Virtues of this kind go beyond the strict demands of justice; no one can claim that he has a strict 'right' to them as his just due, just as little as the other has a 'duty' in their regard from the standpoint of strict justice. Such virtues, according to St. Thomas,¹ are only potential parts of justice and are in the nature of a 'moral due' to which one is bound in respect of the rectitude of virtue; strict justice, on the other hand, gives rise to the 'just due' or 'legal due,' in as much as one is bound to render this due by reason of an obligation as the result of the natural law or of a positive law. As the proper object of justice, 'right' thus implies both equality and a strict obligation.

Right in this sense of just dues is therefore defined as *something which is due to someone according to strict equality because of a strict obligation*. This is 'right' in a passive sense.

In an active sense 'right' means the legitimate power or faculty of claiming something as strictly one's own in relation to other persons. Only then can this something be a 'just due.' Powers, however, are of two kinds, physical and moral. *Physical* power or faculty is nothing more than the physical force or ability which enables one to attain a certain end. A robber, for instance, can force a person at

the point of a gun to give up his valuables; he has the physical power to take someone's valuables, but he obviously has not the 'right' to take them and the victim has not the 'duty' to hand them over. Physical power alone and as such, therefore, does not constitute 'right'; otherwise robbery and similar acts of physical violence would be justified. Moral power or faculty is a power which binds a person's will and imposes on it an obligation; moral power appeals to a person's will through knowledge and in the final analysis is based on the moral law. *Right* is thus defined as the *moral and inviolable power vested in a person to do, hold, or exact something as his own*.

The items in this definition of 'right' in the active sense deserve careful consideration. As just explained, right consists in a *moral*, not in a physical, power to claim something as one's own. The mere fact that a person lacks the physical power to enforce his claim does not invalidate his right. When the soldiers of an aggressor nation, in an unjust war, invade a city and take away the personal jewelry of the citizens as loot, the citizens lack the physical power to retain or reclaim their jewelry, but they still have the 'right' to their jewelry, and the invading soldiers have the obligation to respect this right; the right to have their jewelry as their own remains intact in the original owners as a 'moral power.' Right is a 'moral and *inviolable* power.' Every right in one person involves a corresponding duty in others to respect this right and not to violate it. Any violation of a right is morally wrong, and the restoration of the violated right becomes a matter of strict justice binding in conscience. Right is a 'moral and inviolable power *vested*

in a person. This follows from the fact that every right is a 'moral' power, because such a power makes its appeal through knowledge to the free will. Only a rational being or person has an intellect and free will, and therefore only a 'person' is capable of rights in the true sense of the word. Right is a 'moral and inviolable power vested in a person to *do, hold, or exact something as his own.*' Right is a matter of justice, and justice pertains to the 'mine' and 'thine' of persons. It may be something to do, or to hold, or to exact; whatever it is, it is a just due, a 'mine,' and it belongs to a person as 'his own' and not to another.

Such is the meaning of 'right' as distinguished from 'duty.' 'Duty' is the correlative of 'right.' The meaning of 'duty' should be clear from the meaning of 'right.' Duty in this sense is the *moral obligation to do something or to omit something in favor of another according to the demands of strict justice.* It will be noticed that 'duty' as the correlative of 'right' has a far more restricted meaning than it has as a synonym of 'obligation' (see Ch. 10). 'Duty,' as here defined, is taken in an active sense and corresponds to 'right' taken in an active sense. 'Duty' in a passive sense means the *action or omission of an action to which one is obligated by justice.* In a passive sense we speak of *duties*, just as we speak of *rights*, in the plural. If one person has the right to do, hold, or exact something, another person has the duty not to interfere with this right; rather, he has the obligation to perform or omit an action corresponding to the other's right, and this obligation arises from strict justice. Only in this manner can the equality between thing and thing and

between person and person, which is the essence of justice, be established and maintained.

The Nature of Right

A right does not exist for its own sake. It has a purpose in the sphere of human conduct.

The *purpose* of rights is the establishment and maintenance of the social order among human beings, as befits their rational nature, with respect to the realization of their ultimate end and of their special intermediate ends. In the field of *legal* justice the purpose of right is to secure the existence of society and to provide the means which are necessary for society to fulfill its task. In the field of *distributive* justice right has the purpose of safeguarding the members of society in relation to society as a whole in the things which belong to them, so that public burdens and goods are distributed equitably among all according to their merit and capacity. In the field of *commutative* justice right has the purpose of securing the freedom and independence of the individual members of society among themselves in the things that are their own. And as justice is most complete in commutative justice, so right is most complete in the field of commutative justice. The establishment and maintenance of the social order can only be procured when the individuals have a proper amount of free activity for themselves and still restrict themselves in this activity to such a degree that all may live together as members of society in an orderly and harmonious manner. The individuals must work for the common good of all

within the framework of society; since, however, society is not an end in itself but is subordinated to the good of all, the individuals not only retain their rights as individuals but also in relation to society itself.

There are *four elements* which are essential in the constitution of a right: the subject, the object, the title, and the term.

A right always pertains to someone; it requires a subject. The *subject* of a right is the *person* who is vested with the moral power or faculty to do, hold, or exact something as his own. The person in question may be either a physical or a moral person. A 'physical' person is any individual human being as he exists in nature, for example, John Jones, Joe Louis, Douglas MacArthur, John Jones, having paid the price for an automobile and received a bill of sale to that effect, is now the owner of the automobile and has the right to its use. A 'moral' person is any legitimate group of persons acting as an organized unit, for example, a legal partnership in business, a society, a veterans' organization, a labor union, an industrial corporation, a state. The Ford Company makes a contract with a steel corporation for the delivery of a certain amount of steel per month to its factories; it has the right to this amount of steel and may demand the shipments as stipulated in the contract.

The *object* or *matter* of a right is that to which a person has a right. The object or matter may be threefold: to do, to hold, or to exact (something). A person may have the right to *do* something, namely, either to perform an action or to refrain from performing an action. A landlord, for instance, has the right to live in his house or not to live in it; to let it

out for rent or not to let it out for rent; to demolish it or not to demolish it. Or a person may have the right to *hold*, i.e., possess and use, something that is a good for him. Such a good may be 'personal,' like the members and powers of the body and the faculties of the soul, so that a person has the right to the integrity and proper use of these things; or the good may be some 'external' and 'real' good, like property and money, so that he has the right to keep them and use them as his own. Or, again, a person may have the right to *exact* something from another, namely, that this other person perform or omit a certain action. An employer, for examples has the right to demand an honest day's work from an employee for a day's honest wage; a man paying for the building of his home has the right to demand that the contractor erect the structure according to the specifications agreed upon in the contract.

The *title* of a right is the *objective ground* upon which the right is based, so that a person has the moral power or faculty to do, hold, or exact something as his own. Two things are required in the title. One is the *general principle of a law*, either natural or positive law, which empowers a person to consider something as his own. Natural law, for example, gives to a person the right to his life and bodily integrity; positive law gives the right to acquire property by inheritance or purchase. The other requirement is some *contingent fact* which is the proximate cause which determines the right in a particular individual and actuates the right. For instance, the will of a deceased man names his brother as the heir of his estate; here the will of the deceased man is the contingent fact which gives his brother

the title to his estate. A person signs a contract with another for the purchase of a house; the contract is the contingent fact which makes the person the owner of the house and gives him the right to it.

The *term* of a right is the *person* in whom is found the *duty* which corresponds to the right of the subject. Every right in one person implies a corresponding duty in another person. If one person has the right to 'do' something, other persons have the duty not to interfere but to permit him to do it; if one person has the right to 'hold' or possess something, other persons have the duty not to violate his possession; if one person has the right to 'exact' something from another, this other person has the duty to perform or omit the action as demanded.

Subject, matter, title, and term — the four elements which enter into a right — must always be present, if a person is to have a 'right' in the strict meaning of the term.

Brute Animals and Rights

From the nature of rights, as just explained, it should be clear that a brute animal is *incapable* of being the *subject of rights*.

Rights and duties always go together. *Duty* involves the concept of responsibility, obligation. Duty is the restriction of the free will through the prescription of law. Duty, therefore, is a moral entity pertaining to moral conduct; it is an 'ought,' but not a 'must.' Now, brute animals, since they have no intellect, cannot have a knowledge of law and its prescriptions; and since they lack free will, they cannot be

bound by moral obligations. Hence, the necessary character of brute action precludes the possibility of such action being regulated by duties.

The same argument applies to *rights*. If the brute is incapable of duties, it must also be incapable of rights. It would be preposterous to have rights and no duties; because, if one brute has a right, other brutes have a duty corresponding to such a right. A right presupposes rationality. A right is a *moral* power to do, hold, or exact something from another; and this power rests, not on physical force, but on the force of a rational law which gives one will freedom of action while it binds the other wills to respect this freedom of action. Only a rational being can know anything about 'law' and 'will' and 'freedom of action' and 'duty.' A brute, however, is not a rational being and so it cannot have either the required knowledge or the required freedom of the will with its corresponding freedom of action. Where there is no reason, there is no free will. Hence, brute animals are incapable of having rights.

Brutes are *things*. As such they can be, and frequently are, the property of human beings. Whoever injures or kills a brute animal belonging to someone does not violate any right of the animal, but he violates the owner's right, unless he has a sufficient reason in his own personal right for doing so. When a brute animal is the property of someone, it is neither the subject nor term of a right, but merely the *object* or *matter* of a right. To torture an animal may be cruelty unworthy of the rational nature of man, but it is not a crime against the *animal as such*. If brutes were capable of being the subject of rights, they would, like man, have

the most basic of all natural rights, namely, the right to life and to the integrity of their bodily members. In that case, however, no animal could be slaughtered to serve as food for man or beast. On the face of it, this statement is obviously ridiculous and contrary to the universal conviction of mankind; and the reason for this universal conviction and usage lies in the fact that animals are irrational beings, not persons, and as such have no rights which man is bound to respect.

What about *vivisection*? Vivisection is the operation on living animals, especially for biological and physiological study. Here we do not have reference to the cutting, poisoning, or otherwise injuring of animals for the sake of observing their reaction to pain, when this is done out of mere curiosity and without a truly scientific purpose. The scientific purpose being granted, is vivisection morally justifiable? Notwithstanding the constant barrage of propaganda directed against it, scientific vivisection is *morally justifiable* in principle and practice, so long as it is performed for a sufficiently grave reason and only so much pain is inflicted on the animal as is needed for the success of the scientific investigation. Vivisection would be morally wrong only on the supposition that the operators would thereby violate some duty toward God, toward other persons, toward themselves, or toward the animals. Under the conditions as given, however, no such duty is violated.

The *proof* is simple and clear. Scientific vivisectionists do not violate a duty toward *God*. According to the universal scheme of nature, as ordained by God, the lower creatures are destined for the use and benefit of plants; the plants for

the animals; and all for man. The only limitations placed by God on man in the use of irrational things are the prescriptions of the natural law; and natural law requires that man have a rational purpose in his use of things. Vivisection, however, when performed for serious scientific study, especially when vivisection is practically the only means for obtaining valuable knowledge, serves a rational purpose. Therefore, vivisection does not violate a duty toward God. Scientific vivisectionists do not violate any duty toward other persons. Justice is not violated, because vivisectionists do not operate on animals belonging to *other persons*. Charity is not violated, if the operations are performed in the relative seclusion of the laboratory and not before the eyes of unauthorized persons or the general public. They violate no duty *toward themselves*, because it is presumed that they will not inflict any more suffering on an animal than is required for the success of their experiment and the acquisition of pertinent knowledge. They violate no duty *toward the animals*. Animals, since they are irrational creatures and not persons, have no rights which man has the duty to respect.

That vivisection can be, and actually is, of great *advantage to science*, especially to biology, physiology, surgery, and the treatment of internal diseases, is obvious. In very many cases, experiments cannot be made on human beings without the danger of serious harm and even death. All the brute animals in the world cannot measure up to the dignity of a single human being; and if the sufferings of these animals help to alleviate human pain and save a single human life, they have achieved a destiny far superior

to that of their natural existence. Hence, the conclusion is inevitable that scientific vivisection is morally justifiable in principle and in practice.

Right and the Use of Reason

Rationality is the basis of rights. Only a rational being can have rights and duties. Then what about *children* before they reach the age of discretion, *idiots*, and the *insane*? Do they lack rights? Such persons cannot apparently be termed 'rational.' Some of those who defend animal 'rights' appeal to these instances to prove that 'rationality' is not a requisite for rights; these persons, they claim, are for all practical purposes on a par with brute animals.

A distinction must be made between the *possession* and the *exercise* of reason. This distinction is of extreme importance.

Every human being possesses a spiritual soul with definite spiritual *powers* or *faculties*. These powers are *reason* and *free will*. Once the human soul comes into existence, it possesses reason and free will, and it possesses them as long as it exists. The intellect or reason demands proper development of the human organism for its own proper functioning. Any defect in this development will bring about a lack of the proper sensory data for the intellect in the exercise of its own power. Infants have a sensory system which is still in the process of development; idiots have a sensory system which is arrested in its development; insane persons have a defective or maladjusted sensory system. Every human being, therefore,

since it has a spiritual soul, possesses the *power or faculty* of rationality as an integral part of its rational constitution and as such possesses the full dignity of a human person capable of rights; but some persons lack the exercise of their essential rational power. The 'exercise' of rational powers is not essential to man, nor does the lack of this exercise deprive a person of his basic rights, because otherwise a sleeping, drunken, comatose, or anesthetized person would have no rights while deprived of the use of reason. If the latter still retain their basic rights as human beings, then so do infants, idiots, and insane persons. All possess the remote or *radical* power of self-determination essential to the human person, even if they are temporarily or permanently deprived of its use. Rights are determined by what is natural and essential; not by what is accidental and exceptional.

Brutes possess neither the power nor the exercise of rationality. Infants, idiots, and insane persons possess the power of rationality, but they lack its exercise; they are, therefore, true persons with all rights inherent in man.

The Division of Rights

The enumeration of the various *kinds of rights* admits of considerable latitude, depending on the standpoint of division and the purpose of the one making the division. The following are some of the main rights enumerated by ethicists.

From the standpoint of the *law* which gives rise to a right, we distinguish between 'natural' and 'positive' rights.

A *natural* right is founded on the natural law. This right includes everything that is a just due and which a person can therefore claim as his own in virtue of the conditions of nature. Among such rights are, for example, a person's right to his life, his health, his bodily and mental integrity; a husband's rights toward his wife, and *vice versa*; a child's right to support; a person's right to his reputation, to the legitimate products of his labor or business. A *positive* right is one which is founded on the positive law. Positive rights are conferred on persons by private or public pacts or by the ordinance of legitimate authority. Ultimately, of course, all positive rights are based on the natural law of 'mine' and 'thine,' since it is in virtue of the natural law that everyone must render unto another his just dues in strict justice; but positive law gives a greater clarification and specification to the general rights embodied in the natural law. Among such positive rights one might mention the respective rights of labor and industry, rights of inheritance and contracts, and rights of tax exemption. Positive rights may be either divine, ecclesiastical; or civil, depending on whether they are grounded on divine, ecclesiastical, or civil law.

From the standpoint of *origin*, rights are 'connatural' or 'acquired.' A *connatural or congenital* right is one which belongs to man because of his very nature as a person, without any action on his part or on the part of any other person in his behalf. Such rights are the right to life and liberty, the right to marry, the right of parents over their children, the right of liberty of conscience, the right to acquire some property, etc. An *acquired or adventitious* right is one which comes to a person, not through his very

existence as a human being, but through some specific action of his own or some action in his behalf on the part of someone else. Such rights are the right to a house or car or anything which he purchases, the right to property given to him through a donation or legacy, and so on. Connatural rights are always based on natural law, whereas acquired rights may be based either on natural or positive law.

From the standpoint of the *subject* of rights, rights are either 'public' or 'private.' A *public* right inheres in the state or in private persons against the state. Its end is the common good. Such rights on the part of the state are the right of taxation, the right to set up courts for the administration of public justice, the right of eminent domain, etc.; on the part of individuals against the state, the right not to be condemned without due process of law, the right against unfair confiscation, the right to seek redress in the courts, etc. Public rights may be either civil or ecclesiastical. A *private* right inheres in private persons as against private persons. Its end is the individual good. Such rights are the right existing between employer and employee, the right to possess an article purchased from another, etc.

From the standpoint of their *connection with the subject*, rights are either 'inalienable' or 'alienable.' An *inalienable* right cannot be renounced or transferred because it is necessary for the fulfillment of man's purpose of being and essential duties. An inalienable right can, therefore, neither be ceded or superseded. The American government is founded on the doctrine of inalienable rights, as we can see from the famous statement in the Declaration

of Independence: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain inalienable rights, that among these are life, liberty, and the pursuit of happiness." Among the inalienable rights are the right to life and the right to liberty of conscience, etc. An *alienable* right can be renounced or transferred for sufficiently grave reasons, because it is not an essential requirement of human nature. Alienable rights, for example, are the right to marry, the right to form a labor union, the right to drink alcoholic beverages, the right to free speech, free assembly. No one can or may renounce an inalienable right; but one may, for sufficiently grave reasons, refrain from exercising such a right, as when a martyr permits his persecutors to carry out their evil design upon his life.

From the standpoint of their *relation to physical force*, rights are either 'perfect' or 'imperfect.' A right is perfect which is based on strictly commutative justice and is so determined as to object (matter) and subject that one may resort to physical force to exact it. Such, for example, are the right to life and bodily integrity, the right to the possession and use of one's exclusive property, the right to a just compensation. An *imperfect* right is based on some virtue other than commutative justice and is not so determined as to object and subject that one may resort to physical force to exact it. Such rights refer to 'moral dues,' not to 'just dues.' Among imperfect rights are, for example, the right of a poor person to alms, the right of a person to a reward for saving a wealthy man's life, the right of a man to his wife's affection and vice versa, the right of parents to

the respect and love of their children, the right of a child to a higher education. Imperfect rights, therefore, are not strict 'rights,' but rather 'claims.' Obviously, from a moral standpoint, many imperfect rights or claims have an inviolability just as great as, and in some instances even greater than, rights based on commutative justice; everything depends on the circumstances of the particular case.

From the standpoint of their *relation to civil law*, rights are either 'moral' or 'legal.' A *moral* right is any right which is based on the moral law and appeals through knowledge to another's will; as such it is identical with 'the moral and inviolable power or faculty vested in a person to do, hold, or exact something as his own.' A moral right is a genuine right, whether it be recognized by civil law or not. The rights mentioned above are moral rights. A legal right is determined and enforced by an enactment of the civil authorities. The state, of course, does not include in its laws all the moral rights of man. However, all legal rights, if they are rights in the true sense of the term, must be also moral rights, because the legal authority of the state is based on natural law and exists to enforce the natural law. The natural law is often obscure to the average individual, and so it behooves the state to clarify and specify the particular rights and duties, implicitly contained in the natural law, by acts of legislation in the interests of peace and order. The state, therefore, does not create rights, but merely determines and declares them. Every legal right is a moral right, but not every moral right is a legal right.

From the standpoint of the *object*, a right is either 'real' or 'personal.' A *real* right (in this meaning 'real' is used in a sense similar to 'real estate') is one which gives to a person power in or over his own objects (*jus in re*). The thing itself is the person's property and belongs to him as his own and as something bound to him. The person who has a real right over a thing can retain and use it or dispose of it or recover it wherever found. Such are, for example, the rights based on purchase, like a car, a house, clothes, cattle, and other articles which have been turned over to a person after purchase. A *personal* right gives to a person power to exact something from another person, so that this something may become his own (*jus ad rem*). Here the right is directed primarily against the person who is supposed to render a service or hand over an object, as in the case of keeping a promise or paying a debt. One who has a personal right of this sort is not as yet in actual possession of the object but is entitled to it and can give action against the personal debtor, so as to obtain it.

'Right' and 'duty' are correlatives. Every right in one person presupposes a duty in another person. Hence, the division of *duties* corresponds to the division of rights. No special enumeration, therefore, is needed. All of us have a rather strongly developed sense of our rights, but we should also develop in ourselves an equally strong sense of our duties. Only when our sense of rights and our sense of duties are properly balanced, will an orderly and harmonious life in society be possible.

Rights and Coaction

There are *three properties* attributed to perfect rights, namely, 'coaction,' 'limitation,' and 'collision.' They will now be treated in this order.

Coaction or coercion is that property or quality of a right in virtue of which a person may use physical force, if necessary, to exact his just dues from anyone who seeks to prevent him from exercising his right. Coaction does not mean that one can compel another's will; such compulsion is impossible, because the will is free in its internal acts and cannot be forced to give its consent. Coaction, therefore, can only mean that one may use physical force to compel another to perform imperate actions, so as to comply with one's own rights. A perfect right thus not merely imposes a 'moral' bond upon another's will, but carries within itself the right of coercion to exact that to which one is entitled. Two things are involved in the power of coercion: *defense* of a right, so that it can be preserved from violation; *vindication* by the infliction of the proper penalty, so that the violated right can be restored. The right remains, even if the power of coaction cannot be, or is not, exercised for some reason. It may happen, for instance, that a man cannot defend his right, as when he is robbed by armed bandits, or that he thinks it more prudent not to exercise his right, as when a father refrains for pedagogical reasons from punishing his child guilty of theft in the home.

Primarily, the *power* of coaction belongs to the person who possesses the perfect right. *Secondarily*, the power of coaction belongs to those persons in authority who

represent the primary possessor of a perfect right, such as the father in his family and the public authority in the state. So far as the *exercise* of the power of coercion is concerned, it pertains *primarily* to the public authority of the state, because the state has the obligation to promote the common good and safeguard the juridical order among its subjects. Only *secondarily* does the exercise of coercion pertain to the individual possessor of a right. The reason is clear. The order of society demands that the defense and vindication of right be exercised by the constituted authority through proper legal procedure rather than by the personal effort of an individual who may be prejudiced by self-interest and blinded by passion. Only in cases of urgent and instant necessity may the individual exercise his power of coercion without waiting for the intervention of public authority, or in cases where the power of public authority has lost its efficacy in the defense and vindication of individual rights.

Nations with an autonomous government are moral and legal persons and have rights. Like individual persons, they have the power of coercion to defend and vindicate their rights. Unless there be an international court capable of upholding their rights, national governments may, when necessary, have recourse to physical force to defend and vindicate their sovereign rights against unjust aggression on the part of other sovereign nations. A war, therefore, may be a just means for a nation to exact its just dues, if every peaceful method has failed to bring about the required adjustment. Strict rights would be useless if nations did not possess the coercive power to repel an

invasion of their rights and restore the rights to which they are entitled.

The power of coercion is a necessary property of a perfect right.

All perfect rights, since they are based on justice, are grounded on, and receive their binding power from, the natural law. The purpose of the natural law is to regulate human actions in such a manner that man can attain his immediate ends and his ultimate end as a rational being. Such is the design of God in establishing the natural law. Now, perfect rights are *means necessary* for the realization of the purpose of the natural law. Hence, it must be possible for man to use his perfect rights as a necessary means for realizing the purpose of the natural law. But this purpose would be frustrated if perfect rights had only moral binding power and not also the power of coercion attached to it. Moral binding power suffices for persons of good will; but many persons are actuated by a perverse will and by malicious self-interest, and they are inclined to disregard the rights of others unless compelled to respect these rights. Under these conditions, the power of coercion is necessary for the defense and vindication of perfect rights, or the purpose of the natural law could not be efficaciously obtained. Hence, the purpose of the natural law demands the use of the power of coercion, if necessary, for the defense and vindication of perfect rights against the evil designs of violators. Since, therefore, the power of coercion is necessarily connected with the very concept of perfect rights, it is a necessary property of a perfect right.

It would be *erroneous*, however, to identify a perfect right and its power of coercion with the *efficacious exercise* of this power of coercion. The efficacious exercise of the power of coercion does not constitute the very essence of right, and a right does not cease to be a right whenever the possessor of a right lacks the physical force needed for the actual defense and vindication of his right. The efficacious exercise of the power of coercion depends upon many external conditions, and these *external conditions* may hinder the efficacious exercise of the power of coercion through no fault of the possessor of the right. An unborn child, for example, has a perfect right to life. Yet the child cannot efficaciously defend its right to life, and all too often the public authorities are incapable of bringing the murderers to justice because of the impossibility of producing sufficient evidence of the crime. Under the circumstances, neither the child itself nor the public authorities can efficaciously exercise the power of coercion to protect the child's right to life. But this accidental lack of efficacious exercise certainly does not invalidate the child's inherent right to life, because the right to life is a natural and inalienable right which each human being possesses by the very fact that it is rational.

A number of *absurd consequences* are involved in the view that a perfect right requires the efficacious exercise of the power of coercion. *First*, it is absurd that rights in their very essence and existence should depend upon the external, accidental conditions connected with the actual exercise of this power. Rights flow from the nature of man and remain with the nature of man, whether or not they can

be actually defended and vindicated by physical force. *Second*, it is absurd that a person could be deprived of his rights, and rights cease to be rights, by the mere fact that the possessor of such rights would not be able to prevail against the superior force of malefactors. Under such circumstances, there would be a premium on physical force as against justice, and the entire moral order would be disrupted. *Third*, it is unthinkable that physical force and its actual exercise, no matter how employed, should be the source of right. Might would then be right, and aggressor nations, if they succeeded in their evil designs, would be justified in absorbing weaker nations. *Fourth*, it is contrary to reason that no rights should exist for legitimate governments and individual citizens in times of civil war and, even more so, during a period of anarchy. If this were not the case, evil would be superior to the natural law. The fact is simply that the actual efficacious exercise of the power of coercion presupposes the power itself, and the power presupposes the right. The right is by *nature prior* to both the power of coercion and its efficacious (or inefficacious) exercise and remains *intact and inviolable* as a moral force binding the wills of others, whether the possessor is capable of enforcing it or not. Any view which places the essence of a right in the actual possibility of its enforcement makes a mockery of justice and of the natural law and of God.

It should be clear, therefore, that the theory advanced by C. Thomasius, I. Kant, R.V. Jhering, R. Stammier, and many modern writers, that the *essence* of a right consists in its *coerciveness* or power of efficacious coercion, is erroneous.

Rights and Their Limitation

The only logical foundation for rights is the existence of the natural law and of God as its author. Without this foundation it is pointless to speak of rights and duties. Man is not his own supreme master. He may not take what he can get, irrespective of the feelings and claims of others. Granted the existence of the natural law and of God, one can understand that rights exist and are inviolable and that duties exist and must be fulfilled. No man has only rights or only duties; rather, he has both rights and duties, and his duties limit his rights.

The *limitation of rights* is that property whereby the exercise of one right is curtailed by some other right. Only God has absolute, unlimited rights. Man's rights are participated rights which, by their very nature, are limited. Because the world is an ordered universe, made according to the plan of divine wisdom, every creature has an independent existence, yet is limited in its activities by the definite end or purpose it is destined to fulfill. This truth applies also to man. Since man is a rational being, he possesses certain natural rights proper to himself; but since he is also a social being and a creature of God, he has certain duties toward other men and toward God which limit his rights.

The limitation of rights is derived from *two main sources*: a right is limited by the 'end' for which the right has been granted; a right is limited by the 'duties' which the possessor of the right is bound to fulfill.

The purpose or *end of man's existence* is to live in accordance with his rational nature, so as to attain his ultimate goal, namely, the glorification of God and his eternal happiness. Whatever is conducive to this ultimate end is an intermediate end. To obtain this end man was given certain rights as necessary means. But all men have this same end and therefore also the same basic rights. Man, therefore, in exercising his own rights, must have due regard for the rights of others, for all must strive to reach the same goal. It follows, then, that the rights of all men are limited by the end for which the rights were given. Each individual right is also given for a *particular purpose or end* and is limited by it. Wealth, for instance, is a physical good, and man has the right to strive for it and possess it; but this right is limited by his ultimate end, and he may neither strive for it nor possess and use it in a manner which would turn him away from his final goal. Man has the right to food and drink; but the purpose of these things is proper sustenance of the body for health and strength, and this purpose limits the use of this right, so that he acts immorally if he uses them to the excess of gluttony and drunkenness. Man has the right to the use of speech; since, however, it is the purpose of speech to communicate one's thoughts to another, this right is limited by this purpose, so that man must use speech for the expression of truth as it exists in his mind and not for falsehood.

Furthermore, man's rights are limited in their exercise by *duties*. Because man has certain duties toward himself, toward his fellow man, and toward God, it is obvious that the fulfillment of his duties will limit the unrestricted use of

any rights which would interfere with his duties. Similarly, others have duties, and these duties also may limit the exercise of rights in another person, in so far as he may interfere in the proper discharge of duty on the part of someone else. The rights of public officials, for example, are limited by their duty to exercise their powers for the promotion of the common good of all citizens. The right of a person to drive a car is limited by his duty not to endanger his own life and limbs and the life and limbs of others. The right of a tavern-keeper to dispense liquor is limited by the duty of his patron not to become intoxicated. The right of a person to food and drink is limited by his duty to have proper regard for his own health, and this duty forbids him to take those kinds of food and drink which would injure his health. Every person has the right to his own life, but his duty to the Creator limits his right, so that he must use it in a manner conformable to the superior rights of God. A man has the right to the use of his wealth, but he may not use it to hinder another from discharging his bounden duties.

Rights and Their Collision

A collision of rights is an apparent conflict of rights which cannot be satisfied simultaneously. This occurs when rights apparently are equally founded.

The term 'apparent' is added to 'conflict' advisedly in the definition. There can *never* be a *real* conflict between rights, when rights are considered objectively. True rights are based on the natural law and derive their binding force from the natural law, either directly or indirectly; and

natural law is an expression of the wisdom and will of the Creator ordering the universe and the life of man to their proximate and ultimate end. True rights, therefore, have their origin ultimately in the wisdom and will of God. Were a real conflict or rights possible, one would be compelled to assume a conflict or contradiction in the wisdom and will of the Supreme Legislator. But a conflict or contradiction in the wisdom and will of the Supreme Legislator is impossible. Therefore, a real conflict between true rights is impossible. Consequently, such a conflict is not real but apparent.

How, then, does an apparent conflict of rights arise? Through *imperfect knowledge* of the natural law and of the rights which flow from it. No human being has absolute rights. Every right is limited in some way by other rights and duties. There exists a *hierarchy of rights* in the life of man, somewhat after the manner of the hierarchy of functions in the human organism. All members and organs of the body have their proper function; but each function imposes a limitation on other functions to some extent, so that together they may co-operate toward the general welfare of the organism. Some functions are more important than others, and it frequently happens that certain subordinate functions must be curtailed or even temporarily suspended in favor of a more important function. So, too, with rights. In the hierarchy of rights, some are more important than others and have preference over them. When there is an apparent conflict, the more important rights prevail over the less important rights.

Through his imperfect knowledge of the natural law and of the hierarchy of rights, aggravated by prejudice and self-interest, man often finds it difficult to decide which of the apparently conflicting rights shall *prevail* and which must be *subordinated* or even *suspended*. Only one of the colliding rights is the true right; the others are mere claims or apparent rights. The solution of the difficulty lies in a thorough study of the entire situation, so as to determine which right has preference under the circumstances. That this is not always an easy task, is clear from experience.

Due to ever changing conditions of human living, it is practically impossible to draw up a set of rules and principles which are universally applicable. However, *three general rules and principles* should prove helpful. *First*. In a conflict of rights, that right should prevail which is grounded in a higher law or has a more genuine title or has a more necessary bearing on the common good. It follows, then, that a clearly defined natural right prevails over one granted by positive law; a connatural right prevails over an acquired right; an inalienable right prevails over an alienable right; a perfect right prevails over an imperfect right; a public right prevails over a private right, and so on. *Second*. The superiority of a person usually carries with it a superiority of rights. Thus, the rights of God have preference over the rights of other persons; the rights of self have preference over the rights of others; the rights of relatives, in the order of their relationship, have preference over the rights of friends and strangers, and so on. *Third*. Rights which concern nobler, more universal, or more necessary matter should prevail over those pertaining to

less noble, less universal, or less necessary matter. According to this standard, rights pertaining to the soul prevail over those pertaining to the body; rights pertaining to the body prevail over those pertaining to physical goods; rights pertaining to physical goods necessary for life prevail over those pertaining to comfort and enjoyment, and so on.

The average person, of course, is incapable of drawing complicated conclusions from general principles; he must seek the advice of the experts. Nevertheless, good common sense often enables him to distinguish between various types of rights in the order of their importance and to decide which should prevail.

Rights and the Moral Order

It is a common doctrine of present-day secular schools of jurisprudence that rights have merely a *legal, not a moral*, character. In other words, rights do not belong to the moral order and entail no moral obligation; they belong merely to the legal order and entail an obligation merely in the courts of the positive law of the state. The state, they claim, is the sole author of human rights.

Present-day false theories on the basis of rights and of the juridical order come from two main sources.

The *one source* is the theory that the juridical order with its rights is derived from the *free will*. Kant and Fichte are the chief representatives of this doctrine. According to Kant, the moral order is distinct from the juridical order. All actions which proceed from the internal motive of morality belong to the moral order; all external actions which

proceed from external motives belong to the juridical order. The purpose of the former is to give internal liberty; the purpose of the latter is to give external liberty, and external liberty exists through legislation on the part of the state.

The *other source* is the theory that the juridical order with its rights is derived from the *coercive power* or *physical might* of the state. Hobbes claimed that the original condition of man was a war of all against all, and as a consequence the state was formed by mutual consent. Might was right in the original condition of nature, and now the might of the state is the source of all right and duty. Rousseau followed in Hobbes's footsteps, except in the contention that man originally was nonsocial, not antisocial. The state was formed through a social contract, and all rights are the result of legal enactment. Spencer considered all rights to be the product of biological factors. The individual is absorbed through biological necessity by the state, and the law of necessity is the source of all rights and duties; there are no individual natural rights. Hegel deduces all rights from the evolution of the impersonal absolute reason into the omnipotent state which is the "terrestrial divinity." The state is the personification of the principle that might is right.

Whatever the source, all these theories agree in the fundamental tenet that *all rights proceed from the state* and that the moral and juridical orders are independent. In no case is the juridical order a part of the moral order.

In opposition to these theories we maintain *that the juridical order is a constituent part of the moral order*.

For one thing. Right, without question, belongs to the juridical order based on 'just dues,' on the 'mine' and 'thine.' Unless, however, we wish to identify 'right' with sheer might, arbitrariness, violence, and tyranny, we must correlate it with *duty* and *obligation* on the part of others who are bound in their will and conscience to *concede* and *respect* this right. But if there is duty and obligation, and not mere cringing servitude in the face of superior might, then others *ought* to concede and respect the other person's right and not interfere with its exercise, even if they have the power to do so. Such an attitude of 'oughtness,' however, is a moral, not a purely legal, attitude.

Again. *Just dues* are the object of rights. Just dues refer to the 'mine' and 'thine' to which one has a legitimate *title*, and this title is more than the physical force capable of wresting something from another and keeping it in one's own possession. Every civilized code of laws recognizes this fact. 'Just dues,' therefore, pertain to *justice*, not merely to legal possession. Justice, however, is a *moral virtue*. And since justice as a moral virtue is a constituent part of the moral order, the juridical order to which rights and just dues belong as a part of justice must also be a constituent part of the moral order.

Furthermore. The *general character* of the attitude of the state in its laws concerning human actions is not purely 'legal,' but definitely *moral*. Criminal law, for example, always seeks to measure the punishment according to the *guilt* of the person committing the crime. Judges and juries treat murder far more severely than homicide, because

murder is committed with malice aforethought, while the latter is done in a sudden burst of passion; in other words, although in both cases somebody's life has been unjustly taken, and a life is a life in the legal sense, murder involves greater 'guilt' and therefore deserves greater punishment. Manslaughter, too, is gauged according to the *degree of culpable negligence*, even when no direct intention of killing is involved, and punishment is meted out accordingly. In cases of civil rights, contracts very frequently are interpreted according to the *intention* of the contracting parties and not according to the mere letter of the contract. Laws made by the highest legislative body are not seldom declared void and *unconstitutional*, because they curtail natural and inalienable rights and are therefore *unjust*. All of which involves 'moral' considerations of a very definite kind that belong to the 'moral order.'

Again. Some rights exist *prior in nature to the state* and are as such independent of the legal power of the state. Such rights are, for example, the right of ownership, the right to life and bodily integrity, the right to marriage, the rights of husband and wife. It is the purpose of the state to safeguard, defend, enforce, and vindicate these and similar rights, but the state *does not create such rights*. Similarly, that the state may demand and expect *obedience* toward legitimate authority, is not the result of its physical power of force; obedience is a 'moral' factor without which the state could not long exist. The entire structure of the state presupposes the binding power of the natural law as the foundation upon which it is based. Take away the *natural law* and the state is nothing more than the *legalized*

tyranny of a police state. The natural law, however, is a moral law.

Finally. Men are by nature *social* beings. The family is a social unit. Men unite into various social groups or communities for the mutual promotion and protection of the common good of all. This *common good* includes bodily, mental, and moral goods of the individuals, families, and other groups. Many laws of the state pertain to the safeguarding of public decency and good morals. But *public decency* and *good morals* are a constituent part of the moral order as well as of the juridical order of the state. Hence the juridical order and the moral order are not completely distinct orders in the life of man; the juridical order is a part of the moral order.

The tendency to separate the juridical order from the moral order is one of the pernicious errors of our time. It was this tendency which gave birth to the disastrous doctrines of nazism, fascism, and communism.

Some Basic Human Rights

God created man as an individual person with an independent existence and a social being in the unity of the family and of the state. In each capacity man is endowed with certain natural basic rights. These rights² are as follows.

Basic Human Rights

The Rights of the Human Person

1. The right to life and bodily integrity from the moment of conception, regardless of physical or mental condition, except in just punishment for crime.
2. The right to serve and worship God in private and in public.
3. The right to religious formation through education and association.
4. The right to personal liberty under just law.
5. The right to the equal protection of just law regardless of sex, nationality, color or creed.
6. The right to freedom of expression of information and of communication in accordance with truth and justice.
7. The right to choose and freely to maintain a state of life, married or single, lay or religious.
8. The right to education suitable for the maintenance and development of man's dignity as a human person.
9. The right to petition the government for redress of grievances.
10. The right to a nationality.
11. The right of access to the means of livelihood, by migration when necessary.
12. The right of association and peaceable assembly.
13. The right to work and choose one's occupation.
14. The right to personal ownership, use, and disposal of property, subject to the rights of others and to limitations in the interest of the general welfare.
15. The right to a living wage.

16. The right to collective bargaining.
17. The right to associate by industries and professions to obtain economic justice and the general welfare.
18. The right to assistance from society, if necessary from the state, in distress of person or family.

The Rights Pertaining to the Family

1. The right to marry, to establish a home and beget children.
2. The right to economic security sufficient for the stability and independence of the family.
3. The right to the protection of maternity.
4. The right to educate the children.
5. The right to maintain, if necessary by public protection and assistance, adequate standards of child welfare within the family circle.
6. The right to assistance, through community services, in the education and care of the children.
7. The right to housing adapted to the needs and functions of family life.
8. The right to immunity of the home from search and trespass.
9. The right to protection against immoral conditions in the community.

The Domestic Rights of States

1. The right to enact just laws binding in conscience.

2. The right to establish courts of justice and to enforce the observance of law with adequate sanctions.
3. The right to demand of its citizens respect for the rights of minorities.
4. The right to tax by adequate and equitable means in order to carry out its proper functions.
5. The right to exercise eminent domain when demanded by the common welfare.
6. The right to require that its people receive an education suitable for citizenship.
7. The right to defend itself against domestic violence.
8. The right to watch over, stimulate, restrain, and order the private activities of individuals and groups in the degree that is necessary for the common good.
9. The right to regulate operations of international economic groups functioning within its own boundaries.
10. The right to adopt in time of emergency special measures necessary for the common good.

The Rights of States in the International Community

1. The right to exist as a member of the international community and to be protected in its national life and integrity against acts of aggression by any other state or states.

2. The right to independence in the determination of its own domestic and foreign policies in accordance with the principles of morality, and subject to the obligations of international law.
3. The right to juridical equality with other states in the family of nations.
4. The right to membership in the organized international community and to the benefits of international co-operation.
5. The right to the assistance of the international community in securing the fulfillment of the terms of a just treaty or agreement.
6. The right to obtain from the international community redress of grievances arising from unjust treaties imposed by force.
7. The right to the revision of treaties which are no longer in accord with fundamental justice.
8. The right to recourse to the procedures of pacific settlement established by the international community for disputes which diplomatic negotiations have failed to settle.
9. The right to maintain political, economic, and social intercourse with other states upon equal terms.
10. The right of access, upon equal terms, to the markets and raw materials of the world necessary for its own life as a people.
11. The right to protect its own natural resources and economic life from unjust exploitation.

12. The right to the assistance of the international community in time of economic or social distress.
13. The right to grant asylum to refugees from injustice.

These are some of the basic human rights. They are predicated on the natural law and flow from the rational nature of man as a person, as a social being, and as a creature of God. In these basic rights and their corresponding duties the high dignity of man is made the foundation of individual, social, religious, and international ethics. On the security of this foundation rests the peace and welfare of the world.

Summary of Chapter XII

The moral virtue of justice necessarily embodies *rights* and *duties*.

1. *Concept of Right and Duty.* *Right* in the passive sense of 'just dues' is something which is due to someone according to strict equality because of a strict obligation. *Right* in an active sense is the moral and inviolable power vested in a person to do, hold, or exact something as his own.

Duty in an *active* sense is the moral obligation to do something or to omit something in favor of another according to the demands of strict justice. *Duty* in a *passive* sense means the action or omission of an action to which one is obligated by justice.

2. *The Nature of Right.* Every right has a purpose, and the purpose of rights is the establishment and maintenance of the social order. There are four elements in every right: the subject, the object or matter, the title, and the term.

3. *Brute Animals and Rights.* Brutes are *incapable* of being the subject of rights. They are incapable of *duty*. Duty implies responsibility, and only a rational being, endowed with intellect and free will, can be responsible. They are incapable of *rights*. Rights and duties go together. Hence, if brutes are incapable of duties, they are also incapable of rights, because they cannot have either the required knowledge or the required freedom of will with its corresponding freedom of action.

Vivisection for serious scientific study is morally justifiable, because no duties are violated and it is of great advantage to science and humanity.

4. *Right and the Use of Reason.* Infants, idiots, and the insane have a spiritual soul with the spiritual powers or faculties of reason and free will. Due to the imperfection of their nervous system, they lack the proper exercise of these powers. Since they are true human beings, they are capable of rights.

5. *The Division of Rights.* From the standpoint of *law*, rights are either 'natural' or 'positive.' From the standpoint of origin, they are either 'connatural' or 'acquired.' From the standpoint of the *subject* of rights, they are either 'public' or 'private.' From the standpoint of their *connection with the subject*, they are either 'inalienable' or 'alienable.' From the standpoint of their *relation to physical force*, they are either 'perfect' or 'imperfect.' From the standpoint of their *relation to civil law*, they are either 'moral' or 'legal.' From the standpoint of the *object*, they are either 'real' or 'personal.'

6. *Rights and Coaction.* There are three properties attributed to perfect rights: coaction, limitation, and collision.

Coaction is that property of a right in virtue of which a person may use physical force, if necessary, to exact his just dues from someone who seeks to prevent him from exercising his right. Two things are involved in coaction: *defense* and *vindication*.

The power of coaction is a *necessary property* of a perfect right. Rights are a necessary means for realizing

the purpose of the natural law. But this purpose would be frustrated, if perfect rights had only moral binding power and not also the power of coercion attached to it, because evil persons would not otherwise respect these rights. It is the power, *not the efficacious exercise* of the power of coercion which constitutes the essence of a perfect right.

7. *Rights and Their Limitation.* The *limitation* of rights is that property whereby the exercise of one right is curtailed by some other right. This limitation is derived from two main sources: the *end* for which the right has been granted; and the *duties* which the possessor of the right is bound to fulfill.

8. *Rights and Their Collision.* A *collision* of rights is an apparent conflict of rights, so that it is impossible to satisfy them simultaneously. Collisions arise through imperfect knowledge of the natural law and the rights which flow from it. In the *hierarchy of rights* the more important must prevail, and the others must be subordinated or suspended.

9. *Rights and the Moral Order.* Many authors claim that rights have merely a *legal, not a moral, character*. They place the basis of rights either in the free will of man or in the coercive power of the state. In either case, rights proceed, in their contention, solely from the *state*, and so the juridical and moral orders are *separate orders*.

We contend that the juridical order is a *constituent* part of the moral order. Rights presuppose *duties* and *obligation*; and this implies an 'oughtness,' which is a 'moral' concept. Rights refer to 'just dues,' and just dues pertain to justice which is a 'moral' virtue. The *general character* of the attitude of the state is not purely 'legal,'

but definitely 'moral.' Some rights exist *prior in nature* to the state and belong to the natural law, and the natural law is a 'moral' law. Many positive laws of the state refer to *public decency* and *good morals*; these things pertain to the moral order.

10. *Some Basic Human Rights*. Some basic rights pertain to the individual human person; others, to the family; others, to the state in its domestic affairs; others, to the state as a member of the international community.

PART II
SPECIAL ETHICS

Chapter 13

GOD AND MAN

GENERAL ETHICS, THE FIRST PART OF MORAL PHILOSOPHY, treats of those general and universal concepts and principles which serve as the *foundation* of morality.

Having established the concepts and principles of the proximate and ultimate end of man, of the norm of morality, of the natural law, of obligation and sanction, and of rights and duties, we must now *apply* these concepts and principles to the various situations of life in which man finds himself, so as to define and determine his rights and duties more in detail. Because of this function which it performs, Special Ethics is frequently referred to as *Applied Ethics*.

The method employed in General Ethics is to a great extent, though not exclusively, analytical and inductive. In the following chapters of Special or Applied Ethics, the method is mainly synthetic and deductive. The entire moral conduct of man is based on the all-encompassing general principle: 'Do the good and avoid the evil.' This principle is expressed more specifically in the formula or axiom derived from the proximate norm of morality: *Observe the order of conduct which befits you as a rational human being*. In this

principle, as in a matrix, all the rights and duties of man are contained implicitly.

Now, man is above all a creature of God; he is also an autonomous individual or person; he is finally a social being. As a social being, he must live among other individuals as an individual; in the family as a member; and in the state or commonwealth as a citizen. These basic situations in the life of man bring with them certain rights and duties. Rights and duties are correlatives. The basic rights of man have been enumerated in the last chapter. To these rights there correspond basic duties. Man, therefore, as a *creature*, has certain *duties toward God*; as an individual *person*, he has certain *duties toward himself*; as a *social* being, he has certain *duties toward others, toward the family, and toward the state*. This classification of man's rights and duties constitutes the division of the subject matter to be treated in Special or Applied Ethics.

First of all, then, we must examine the duties which man, as a creature, has toward God.

Natural Religion

Man is a rational being endowed with intellect and free will. As such, he is made in the image and likeness of God.

It is a postulate which ethics accepts from the philosophical department of theodicy that He exists, that He is a person of infinite power and perfection, that He is the uncaused cause of the universe and everything in it, that He is, therefore, the *first cause and the last end of man*. Existence and nature, whatever he is and has, man owes to

the loving kindness of God, his Creator. Because of this transcendent fact, man is absolutely dependent in all things on God. Accordingly, man's *relation* to God as his first cause and last end is *absolute, natural, and essential*.

The *facts* or *truths*, then, upon which this relation of man to God are based, are these: God is the Supreme Being, of infinite perfection and excellence, worthy of all honor and homage; He is the Creator of the world, man's first cause and therefore his absolute Master; He is man's ultimate end and goal, in whose possession he is destined to find consummate happiness for all eternity. Because of these facts and truths, man has certain specific *obligations or duties* toward God: due to God's infinite perfection and excellence, man owes Him all honor and homage; due to his creation by God, man owes Him acknowledgment of his dependence and complete service; due to the fact that God is his ultimate end and goal, man owes Him complete love and devotion and the dedication of his entire life here on earth. This absolute, natural, and essential relation of man to God, and the obligations which flow from this relation, are the foundation of *natural religion*.

WHAT IS RELIGION?

In its *primary* meaning religion is the worship extended by men to an extramundane and supra-mundane personal being, on whom they believe to be dependent in their lives and fortune and whom they seek to make propitious by special observances. Whether this honor and homage be directed toward one or more such personal beings, is of

minor importance, so far as the general concept of 'religion' is concerned. This definition, it will be noted, embraces all religions of all peoples, whether they be monotheistic or polytheistic; they all agree in the common factor that they are a 'religion.'

'Worship' is the *honor* and *homage* given to someone in proportion to his worthiness. 'Honor' signifies the recognition on our part of the excellence of another. Honor is more than mere knowledge of excellence; it implies that the will, through an act of its own, refers this knowledge or recognition to another person. 'Homage' or 'reverence' signifies the acknowledgment of superior dignity and power in another. Here, too, the will plays its part by referring this acknowledgment to another person.

Divine worship, then, is the honor and homage rendered to God in proportion to His excellence, dignity, and power. By rendering 'honor' to God, we recognize His infinite excellence as the Supreme Being. By rendering 'homage' or 'reverence' to God, we acknowledge His infinite dignity and power as the Creator of all things who, through His loving kindness, gave us being and existence and is deserving of all our love and devotion. It is a natural consequence of this love that we seek, positively, to please Him in our conduct and, negatively, not to displease Him through infractions of His laws. Divine worship, considered in the abstract, consists in this honor and homage as such; *in the concrete*, it consists in the acts of honor and homage which man renders to God.

Again, the term 'religion' is used in a *secondary* sense to signify the sentiment or *virtue* which inclines man to render

honor and homage to God as the Supreme Being, the first cause and last end of man. The virtue of religion is an eminently personal matter and is the flowering of love in the mind, will, and heart of man toward God, his Lord, Master, and Father. The virtue of religion prompts man more and more to know God, to love Him, and to serve Him in all the vicissitudes of life. When an individual possesses this personal virtue of religion, we speak of him as being 'religious.'

Finally, the term 'religion' is used in a *third* sense to signify all the *truths* which underlie the relation of man to God and all the duties which pertain to man in consequence of these truths. In this sense we speak of 'religious truths,' 'religious doctrines,' 'religious duties,' 'religious institutions,' 'religious feasts,' etc.

THE CLASSIFICATION OF RELIGION.

We distinguish between 'true' and 'false' religion. The *true* religion is the honor and homage which is rendered to the One God, the Creator of all, who is all-wise, omniscient, omnipotent, without beginning and without end, the Alpha and Omega of everything that exists and is possible; it is also the honor and homage which is worthy of God in His excellence, dignity, and power. A *false religion* is one which renders honor and homage to a being other than the true God or in a manner unworthy of His excellence, dignity, and power. Since there is only one true God, there can be only one true religion; there may, however, be innumerable false religions.

We also distinguish between 'objective' and 'subjective' religion, although it would be more accurate to say that we distinguish between religion in an objective and in a subjective sense. *Objective* religion consists of the objective truths which underlie the relation of man to God and of the objective duties which pertain to man because of this relation. These objective truths and duties are independent of man's knowledge or ignorance and of his likes or dislikes. Since they are 'objective,' man must acknowledge them as a standard for his conduct in relation to God; they are based on the nature of God and the nature of man, and as such they have an immutable content. *Subjective* religion is the personal sentiment, inclination, and practice of worship, by means of which an individual renders honor and homage to God. Subjective religion naturally admits of degrees, both as to extent and as to intensity, so that it can increase or decrease within the individual.

We distinguish, finally, between 'natural' and 'supernatural' religion. *Natural* religion is based on the truths and duties which man knows through the aid of human reason alone. Human reason, through its natural capability, can acquire considerable knowledge of the nature of God and man, of man's relation to God, and of the duties which flow from this relation. The worship or cult based on this rational knowledge is natural religion. *Supernatural* religion, on the other hand, though it presupposes the truths and duties of natural religion, is based essentially on the voluntary revelation of God. Supernatural religion adds new truths to the fund of truths acquired by means of rational investigation; obviously, such

revealed truths may induce duties beyond those imposed by natural religion.

Necessity of Natural Religion

Every morally good act is an 'indirect' act of worship, because an act is morally good when it is in conformity with the law of God; as such, it tends to glorify God, and the actual glorification of God is, at least indirectly, an honoring of God and thereby also an act of worship. In this connection, however, we are interested in the *direct worship* of God, namely, in those acts of man which have as their aim and purpose the honor and homage of God, so that man *deliberately intends* through them to honor and reverence the Supreme Being. Direct worship may consist of either 'interior' or 'exterior' acts or of both types. *Internal* acts of worship have no outward expression, but occur in the intellect and will; for example, intellectual acts of praise, thanksgiving, prayer, and adoration. *External* acts of worship are acts which have an outward expression, so that they are perceptible to the senses in some manner; for example, vocal prayers, hymns, rites, and sacrifices.

NATURAL LAW OBLIGATES MAN TO INTERNAL WORSHIP.

The obligation to perform internal acts of worship follows immediately and evidently from man's essential relation to God as his first cause and last end. Man's dependence on God, both in his essence and existence, is absolute. Now, internal worship is the deliberate

acknowledgment, by means of internal acts of the intellect and will, that man owes his essence and existence to God. As a rational being, knowing that he owes his essence and existence to God, man must acknowledge his dependence on God; to refuse to make this acknowledgment is tantamount to denying that he owes his essence and existence to God. God, as the Creator of all things and as the ultimate end of man, certainly has the right to demand that man consciously recognize his dependence and consciously strive for his ultimate end. Such conscious recognition and striving, however, require internal acts of intellect and will deliberately directed toward God. Hence, if God has the right to these acts of man, man has the duty, in virtue of his rational nature and the natural law based on it, to render this acknowledgment. Consequently, natural law obligates man to 'internal worship.'

NATURAL LAW ALSO OBLIGATES MAN TO EXTERNAL WORSHIP.

Many ethicists, while they admit the necessity of internal worship, consider external worship to be entirely superfluous and valueless. They are wrong. Man is a psychosomatic being, a composite of body and soul which are essentially united to form a single nature or principle of activity. Because of the psychosomatic character of man's unitary nature, bodily conditions naturally affect the mind, and mental conditions naturally affect the body. Joy and sadness, love and hate, elation and anger never remain purely mental states, but inevitably communicate themselves to the bodily organism and express themselves

in bodily manifestations. The body is the mirror of the soul, reflecting in its appearance and emotion the affective states of the soul. Man is not an angel but a *rational animal*, and sensible manifestations are the natural complement of his internal mental conditions. These sensible manifestations are so spontaneous that man must exert violence upon himself to suppress them. It is, therefore, natural for man to give expression to his internal worship by acts of external worship. Now, what is natural to man is intended by God, because God is the Author of man's nature; and whatever is intended by God is legitimately assumed to be demanded by God. Whatever is demanded of man by God, however, is a *duty* for man in virtue of the natural law, provided this demand is based on man's nature. Such being the case, we must conclude that natural law obligates man to *external worship* as well as to internal worship.

The relation of man to God is like that of a child to its parents. Just as the child must, and actually does, give external expression to its internal filial sentiments of love and reverence toward its parents by external acts, so man, too, must give expression to his sentiments of honor and homage toward God in acts of external worship. God, of course, derives no benefit from the worship of man, whether this worship be internal or external, and worship adds nothing either to His glory or His happiness. But internal and external worship is a *natural requirement of right order* and a necessity for man. Hence, God demands worship, and man has the natural duty to accede to this demand. Excessive puritanism and spiritualism, therefore, is contrary to human nature and not in accord with the

precepts of natural religion. Man is bound to render honor and homage to God in his whole being, not merely in a part of it. External worship, devoid of internal sentiments, is mere externalism, and mere externalism in worship is an insult to God as an Intelligent Supreme Being; but external worship, animated by genuine sentiments of internal worship, is a true expression of the whole man as God created him and as such worthy of man and of God.

Natural law, therefore, obligates man to a natural religion which consists of internal and external worship.

The statement that natural law obligates 'man' to natural religion is interpreted by many authors to mean that man as an 'individual' has the duty to practice religion, but not society or the state. This pernicious error is particularly prevalent in modern times. It is a very common opinion that religion is a 'private matter,' and that public worship as a collective function of *society* or the *state* is neither necessary nor advisable. We maintain that *public* worship, *per se* and *in principle*, is incumbent on all men, whether they be taken individually or collectively.

That natural law obligates the individual to the practice of religion has just been shown; the reasons adduced apply at least to the individual person. However, they apply with equal force to society and the state.

Man is by *nature* not only an autonomous person, but a member of *society* and of the *state*; he is by nature a 'social being,' and he must fulfill his destiny as an integral member of the family and of the state. There is in man the natural aptitude, inclination, and need to form the social unions of the family and of the state. To be a member of these

organizations, is, therefore, a requirement of his nature as a human being and consequently a mandate of the *natural law*. Since the natural law derives its binding force ultimately from God, it is evident that the family and the state derive their origin from God as their Creator and Supreme Legislator. In other words, the family and the state exist in a *relation of dependence* with reference to God. Therefore, the family and the state, like the individual, have the obligation, based on the natural law, to acknowledge this dependence and to render honor and homage to God. Natural religion, therefore, is a duty incumbent on the family and the state. And since the family and the state are visible organizations, the worship prescribed by natural religion must also be expressed in a visible manner by the family and the state. But such a worship is public worship. Consequently, public worship is a duty incumbent, at least *per se* and *in principle*, on the family and the state, i.e., on society. Exceptional circumstances may at times make public worship morally impossible for the family or the state, but the general conclusion as given is not invalidated thereby.

Ever since nations and leaders of nations have banned religion from public life and relegated it to the homes and to the individuals, international affairs have become largely dominated by a policy of expediency and national aggrandizement. The result was inevitable. Respect for moral principles waned and international law was breached by aggressor nations with such flagrancy that global wars became the only means to restore peace and order. Unless

nations and governments return to God and religion, the end will be catastrophic.

Supernatural Religion

Supernatural religion is religion founded on supernatural revelation. In general, *revelation* is the manifestation of something hidden. In a more restricted sense, revelation is the manifestation of hidden or unknown truths. Such unknown truths, if revealed by God, constitute 'divine revelation.' Divine revelation is *natural*, if God manifests truths through His works of nature; supernatural, if He manifests truths which man cannot acquire by his reason in the contemplation of nature, but which lie beyond the powers of man's reason and are manifested either by God or His messengers by sensible signs or speech.

It is beyond the scope of philosophical ethics to establish the fact of supernatural revelation and of supernatural religion; this belongs to the province of apologetics. But it lies within the scope of philosophy to inquire whether supernatural revelation is *possible* and furthermore, if revelation occurred, to determine whether man has any *obligation* in its regard.

A SUPERNATURAL REVELATION IS POSSIBLE.

If a supernatural revelation were impossible, the impossibility would have to lie either in God or in man or in the truths to be revealed. However, revelation is possible

from the standpoint of God and of man and of the truths to be revealed.

There can be no difficulty from the standpoint of *God*. God is *omniscient*, while man is very limited in his knowledge. Hence, God knows many truths about Himself and about things which would remain forever hidden from man, if man attempted to acquire a knowledge of these truths through his reason alone. God is *omnipotent*, and He can devise ways and means of communicating the knowledge of these truths to man. It is also consonant with God's *wisdom* to reveal hidden truths to man in his earthly life; there would only be required a sufficiently worthy purpose for making the revelation. There are conceivably many worthy purposes which God might have. If God, for example, destined man for a supernatural end as a reward for a life of good conduct, a revelation of this fact would be a practical requirement for the attainment of this end. A supernatural revelation, therefore, is possible when viewed from the standpoint of God.

Similarly, there can be no difficulty from the standpoint of *man*. All that would be needed on the part of man is the certitude that God has actually revealed Himself. God alone can work real miracles. Hence, if God, or His representatives acting with His authority and power, were to perform miracles as a visible guarantee of the veracity of the revelation, man would have everything necessary for certitude. Or, God could manifest Himself so clearly to man during the revelation that man could have no reasonable doubt as to the divine source of the truths revealed. In

either case man would have certitude as to the supernatural character of the revelation.

Finally, there can be no difficulty from the standpoint of the *truths* themselves. The only thing man's mind cannot accept is contradictions. But truth is truth, whether man discovers them by the power of his own reason or whether they are revealed by God. The mere fact that some or all revealed truths contained mysteries beyond the understanding of man would be no valid reason for refusing consent. Mysteries are not contradictions; they simply exceed man's capacity of comprehension. God cannot contradict Himself. Hence, if man is certain that God has revealed Himself, he is also certain of the truth of the revelation, because God can neither deceive nor be deceived.

Granted the fact of a divine revelation, natural law obligates man to accept supernatural religion.

God is *all-wise* and *all-truthful*, because His intelligence is infinitely perfect and embraces everything knowable. He cannot, therefore, be deceived in any manner, nor can He fall into any kind of error; and He cannot deceive man, because to deceive someone is to lie, and a lie is contrary to perfection. Hence, if God reveals anything to man, it is, and must be, the purest truth. It is equally evident that God, if He issues a revelation of truth, *desires* that man accept the revelation and believe the revealed truth. This follows from His wisdom. If a revelation of unknown truths is made by God to man, His wisdom can have no other purpose than to enlighten man's mind by making these truths known to him; this is the intrinsic purpose of a revelation. The only way,

however, that man's mind can be enlightened by these revealed truths is to accept them and believe them. God, therefore, in revealing such truths, desires that man accept them and believe them. God, obviously, also has the *right* to exact man's assent to these revealed truths, because He is man's Lord and Master. And man has the duty to give his assent, because a rational being cannot refuse assent to truths revealed by God without committing the gravest crime of disobedience and presumption. The rational nature of man, and the natural law based on man's rational nature, therefore demands that he accept without reservation the truths revealed by God. Now, supernatural religion is the religion founded on supernatural revelation. Consequently, granted the fact of a divine revelation, natural law obligates man to accept supernatural religion.

In case of *doubt* as to the fact of revelation, man has the duty to *investigate*. He cannot ignore the probable fact of revelation; to do so would be to insult God who may intend to impose an obligation on man and would involve the serious risk of frustrating his eternal destiny. After the investigation, if the fact of revelation is clear, man must in all humility submit his intellect and will to God and must accept the truths revealed and the supernatural religion founded upon them. Any other attitude would be immoral.

UNDER NO CIRCUMSTANCE IS INDIFFERENTISM JUSTIFIABLE.

Practical indifferentism is the actual *neglect* of one's religious duties. People may become so engrossed in temporal affairs or so enmeshed in sensuality, that they fail

to give proper attention to God and His service. This neglect is voluntary, directly or indirectly, and as such imputable and grievously sinful. Practical indifferentism is spiritual starvation which weakens the entire moral life of the individual. Theoretical indifferentism is the mental attitude and conviction that a person can fulfill his religious obligation in any type of religion. *Theoretical* indifferentism usually is embodied in the oft-repeated statement: "All religions are equally good." If pressed to its logical conclusion, the statement means that polytheism is as good as monotheism, that the adoration of idols is as good as the adoration of the one true God, that the religious orgies of pagans are as good as the high spirituality of Christian saints. The statement is obviously erroneous. The all-holy God cannot be indifferent as to how He is honored or dishonored. Nor can it be left to the discretion of the individual to select a religion at his own good pleasure. As there is but one true God, there can be but one true religion.

Main Acts of Religion

Every morally good act and every virtuous act is, in a sense, an act of worship, because God is, at least indirectly, honored thereby. However, when we speak of 'acts of religion' we mean those acts of worship which proceed *immediately* from the *virtue* of religion and have the honor and homage of God as their *direct* purpose.

The *source* of these acts of religion is the love of the will for the worship of God as a moral good and the heartfelt

desire to render unto God the honor and homage that is His due. Whoever is animated by this love and desire will naturally feel the urge to acknowledge his reverence toward God by *expressions of honor and homage*. Such expressions may be manifold. Some expressions are individual and subjective in character, the result of the individual person's particular inclination and devotion. Others are acts of cult which are universal in character, because they, by their very nature, are specially suitable as expressions of the honor and homage man owes to his Sovereign Lord and Master; for this reason they are found to exist among practically all nations and peoples. Customary acts of worship, universal in character, are *adoration, sacrifice, and prayer*; exceptional acts of worship are *vows and oaths*.

Adoration. Adoration is an act whereby man expresses his acknowledgment of God's infinite greatness and majesty and of his utter dependence on God as his Creator and Master. This acknowledgment is not based primarily on emotion, but on the intellectual knowledge that God is the first cause and ultimate end of all being and therefore the absolute Lord of the universe. In consequence of this truth, man clearly perceives that he is utterly dependent on God in everything and that he has the strict duty to give expression to this dependence in some practical form. Adoration is thus man's *humble, voluntary affirmation of dependence on God*. Adoration should be the spontaneous expression of the loving heart of a child toward its father, not the cringing servility of a slave toward his taskmaster.

So long as these acts of worship are purely mental, adoration is *internal*. Man, however, since he is by nature psychosomatic, will express his mental states almost involuntarily in some bodily form. Internal adoration, therefore, usually becomes *external* and manifests itself in a devotional posture involving various members of the body. The exact manner of this manifestative expression is regulated to a great extent by custom. With us, it may be a respectful attitude, a bowing of the head, kneeling, folding of the hands, and similar acts. That such external expressions are natural to man, can be seen from the courtesies we extend to persons who hold high offices in the state or who have done heroic deeds for the defense of the country. Adoration is the innermost core of all religious worship.

Sacrifice. A sacrifice is the offering of a sensible, relatively valuable object to God and its actual or symbolic destruction, in order to acknowledge that God is the Creator and Lord of all things. By means of the actual or symbolic destruction of the object, man intends to signify externally that which he acknowledges through the internal act of adoration, namely, his utter dependence on God and God's absolute sovereignty over man's life and possessions. When man is conscious of sin, this victim which is to be destroyed has a vicarious function for man himself; man confesses thereby that he is guilty of death in the eyes of God and should himself be sacrificed.

Practically all peoples have sacrifices of some sort. Usually the sacrifices consist in offerings of food, such as vegetables, fruits, and domestic animals, because food is

necessary for sustenance and represents life. Even human sacrifices have been offered by some nations, thereby giving literal expression to the concept of sacrifice. Most nations, however, have realized that human sacrifices are not required, but that some substitute for man himself suffices for this supreme act of adoration and atonement.

Prayer. Prayer is the lifting of our minds and hearts to God; more specifically, it is conversation with God for the purpose of honoring Him. We pray to adore God, to thank Him for benefits received, to obtain pardon for our transgressions and remission of the punishment due to them, and to request blessings for ourselves and others. Like worship, prayer may be either internal or external. *Internal* prayer or meditation is the type of prayer whereby we unite our mind with God while thinking of truths pertaining to Him. *External* or vocal prayer is the type of prayer which proceeds from the mind and is uttered by the lips. Some authors define vocal prayer as prayer that is cast in a set formula of words, and mental prayer as prayer that is made up spontaneously while meditating mentally on religious truths.

Prayer is without doubt one of the most suitable and important means of worship. When we adore God, praise Him, and thank Him, we glorify Him, and the glorification of God is the primary purpose of our existence. Our essential and absolute dependence on God finds its clearest expression in the prayer of petition, because thereby we acknowledge in the most practical way that God is infinitely powerful and good and that we are in need of constant assistance and support.

Some philosophers consider prayer to be useless and superfluous, particularly so far as the prayer of petition is concerned, except perhaps for its subjective and psychological effect. Nietzsche stated that it was a disgrace to pray. Certainly, prayer is not required to acquaint God with our needs. But God can very well demand our prayers as the *condition* for granting benefits. Prayer presupposes humility and submission to the will of God; and these are important factors in the practical school of life, because they remind man forcefully of his essential relation to God as his ultimate end and the source of his eternal happiness.

Vows. A vow is a voluntary promise made to God whereby a person binds himself to do the better good, i.e., something which is more pleasing to God than its omission. A vow is more than a mere resolution, because a resolution does not involve the concept of an obligation, while a vow is a promise whereby a person voluntarily obligates himself to perform a better good otherwise not binding. The object of a vow must be something more good, and therefore more pleasing to God, than its omission.

St. Thomas,¹ with his usual clarity, puts the matter very neatly: "A vow is a promise made to God. Now a promise is about something that one does voluntarily for someone else since it would be not a promise but a threat to say that one would do something against someone. In like manner it would be futile to promise anyone something unacceptable to him. Wherefore, as every sin is against God, and since no work is acceptable to God unless it be virtuous, it follows that nothing unlawful or indifferent, but only some act of virtue, should be the matter of a vow. But as a vow denotes

a voluntary promise, while necessity excludes voluntariness, whatever is absolutely necessary, whether to be or not to be, can nowise be the matter of a vow. For it would be foolish to vow that one would die or that one would fly.

“On the other hand, if a thing be necessary, not absolutely but on the supposition of an end — for instance, if salvation be unattainable without it — it may be the matter of a vow in so far as it is done voluntarily, but not in so far as there is a necessity for doing it. But that which is not necessary, neither absolutely, nor on the supposition of an end, is altogether voluntary, and therefore is most properly the matter of a vow. And this is said to be a greater good in comparison with that which is universally necessary for salvation. Therefore, properly speaking, a vow is said to be about a better good.”

Vows have a great value and are pleasing to God in a special manner. The act performed in consequence of a vow is a virtuous act in itself and also an act of religion at the same time. Whoever vows something to God, becomes subject to God not only with regard to the single acts, but also with regard to the power to act; it is as if someone gave not only the fruit of the tree, but both the fruit and the tree. By means of the vow a person fixes his will more firmly upon the good and directs it to God in a more permanent manner than the person who merely performs isolated virtuous acts; such a person practices religion in an

outstanding way that cannot but be pleasing to God the Eternal Father.

Oaths. An oath is the calling upon God as a witness to the truth of a statement or of the intention to fulfill a promise. Calling upon God as a witness to the truth of a statement concerning present or past events is a 'declaratory' oath; and calling upon Him as a witness in confirmation of something we intend to do in the future is a 'promissory' oath.

In order that an oath be morally permissible, a number of *conditions* are required. As St. Thomas² says:

"An oath is not good except for one who makes good use of it. Now two conditions are required for the good use of an oath. First, that one swear, not for frivolous, but for urgent reasons, and with discretion; and this requires judgment or discretion on the part of the person who swears. Secondly, as regards the point to be confirmed by oath, that it be neither false nor unlawful, and this requires both truth, so that one employ an oath in order to confirm what is true, and justice, so that one confirm what is lawful. A rash oath lacks judgment, a false oath lacks truth, and a wicked oath lacks justice."

While St. Thomas in his analysis speaks of two conditions, other authors mention three, namely, discretion, truth, and justice.

Oaths are taken in confirmation of *doubtful* or *contingent* facts which demand witnesses for the

establishment of their truth. The truth of speculative propositions is established by a process of reasoning from evident principles which are known naturally and are necessarily true; here no witnesses are required. The case is different with the truth of practical propositions based on contingent facts; what a person has done in the past or is doing at present or will do in the future, since they are contingent facts depending on the free will, cannot be known with certainty through a process of reasoning from evident principles but must be established by the statement of reliable witnesses. Not all persons, however, are reliable witnesses. Some are prone to lying, others are lacking in proper knowledge of the facts. Hence, a mere statement is often insufficient to establish the truth of contingent facts. Yet it may be very important to know that a witness is telling the truth or that he has a proper knowledge of the facts. In such instances recourse may be had to an oath, calling upon God as a witness to the truth of one's statement, so that the necessary confirmation be obtained. In important matters of this nature, an oath is morally permissible and lawful.

A *rash* oath is morally wrong, because it is reprehensible to appeal to the omniscience of God to verify trivial matters, even though they be true. It would be a rash oath on my part, for example, if a friend doubted my statement that I had steak for dinner (which I did) and I answered: "Honest to God, I did." A *false* oath or perjury is a serious crime against the majesty of God, because the perjurer impugns the veracity of God and virtually declares Him to be a liar. To knowingly make a false statement under oath in court,

for example, is perjury. A *wicked* oath is also a serious crime against the majesty of God, because God is all-holy, and it is a grievous offense to call upon Him as a witness that one intends to commit a deed that is morally wrong and therefore displeasing to Him. That would happen, for example, if I assured someone by means of an oath that I would assist him in robbing a store or in committing some other felony.

Adoration, sacrifice, prayer, vows, and oaths are important acts of worship. To perform them in a superficial or mechanical manner would be hypocritical and unworthy of God; but to perform them devoutly, so as to render honor and homage to God, is a genuine practice of religion.

Irreligion and Superstition

Reverence toward God is an obligation of man, and it binds under all circumstances because man is by nature a creature of God. Against this reverence man may fail either through *defect* or through *excess*. Defect of necessary reverence occurs in irreligion; excess of necessary reverence occurs in superstition.

Irreligion takes place when a person refuses to render unto God the reverence which is His due or when a person dishonors Him. *Direct* irreligion dishonors God Himself; *indirect* irreligion dishonors God by dishonoring things or persons dedicated to Him in some special manner.

Tempting or *testing God* is one form of 'direct' irreligion. We tempt or test God if we say or do something which has as its purpose to prove the perfections of God or to procure

a manifestation of God through signs and wonders, without sufficient reason. If the reason for this procedure lies in presumption or vanity, it is obviously not as wrong as if the reason lies in a doubt or disbelief in God's perfections or existence. In either case, however, tempting or testing God in this manner without sufficient reason is a grave violation of the reverence due to God.

Blasphemy, another form of 'direct' irreligion, is contempt for God expressed in insulting thoughts or words. Any thoughts, words, or actions which contain an expression of contempt for God are blasphemous, so long as one is voluntarily conscious of the fact, even though one has not the direct intention of insulting God. To have the direct intention of blaspheming God, is one of the gravest sins that man can commit, because it is the supreme purpose of man to love and glorify God. It would be blasphemy, for example, to voluntarily think or assert that God is cruel or unjust, since God's infinite perfections would be implicitly denied. Insulting thoughts, words, or actions against holy persons or things, in. so far and because they are specially dedicated to God and His service, would also be blasphemy. Hatred of God is the most grievous of all crimes.

Among the forms of 'indirect' irreligion, particular mention must be made of sacrilege and simony. *Sacrilege* is the unworthy and offensive treatment of persons, places, and things dedicated to God and His service. Mistreatment of them involves disrespect for God Himself; by dishonoring them, one dishonors God. An insult to, or mistreatment of, an ambassador, an embassy, and things pertaining specifically to an embassy, is considered to be an insult to,

or mistreatment of, the nation they represent; so, too, the unworthy or offensive treatment of persons, places, and things, dedicated to God and His service, means an affront to the majesty of the Most High.

Simony is the voluntary attempt to buy or sell spiritual things for money or the equivalent of money. An effort is made to establish a parity or equivalence between spiritual and temporal things, as if they had an equal purchase value for purposes of barter. Simony thus implies a vilification and contempt of things pertaining to divine worship and thereby also of God Himself.

ONE FAILS AGAINST THE NECESSARY REVERENCE DUE TO GOD BY *excess* through the practice of superstition.

Superstition is the attribution to a creature of some power which belongs to God alone. It is a false or wrong religious cult which exaggerates in some manner the powers inherent in creatures, so that they are falsely assumed to partake of divine efficacy. Superstition, therefore, seeks preternatural or supernatural help from the things *themselves* rather than from God; for this reason superstition is an offense against God, since it places confidence in things which should be properly placed in God alone or only in things to which He has communicated divine efficacy in a special manner. The chief forms of superstition are idolatry, divination, and magic.

Idolatry is the giving of 'divine honor to a creature. The creature concerned in idolatry may be a manufactured article, such as an idol; or it may be a natural object, such

as the sun, the stars, a river; or it may be a living being, such as a bird, a snake, a cow, a man. No creature is worthy of adoration. To confuse a creature with the Supreme Being is obviously an affront to the Living God. Pagans, in their ignorance, may not be responsible for their error, but idolatry, whether voluntary or involuntary, is a false cult and a superstitious practice.

Divination is the attempt to foretell or to acquire knowledge of future events by evidently insufficient means. The scientist who predicts the future actions of physical bodies through an accurate knowledge of the laws of nature does not practice divination, because he bases his predictions on scientific data; the actions of physical bodies are necessary in character, determined by nature, and a thorough knowledge of these bodies will thus enable the scientist to foretell their course of action. The future actions of men, however, and the events dependent on them, are the result of the choice of their free will, and no one, except the Omniscient Intelligence, can know what these actions and events will be. Therefore, to seek a foreknowledge of future events, contingent on the free will, from anyone other than God, means to attribute to creatures knowledge which belongs exclusively to God. To seek knowledge in this way is divination and an offense against God, because it virtually places a creature on a level with God. God can communicate His knowledge of free future actions and events to man, if He so decides, and this communication can take place in whatever ways God chooses. But man has no right to this knowledge, and to seek it from creatures is superstition. Divination appears in many forms. The most

common forms of divination are the reading of cards, tea leaves, dreams, and stars, fortune-telling, and the superstitious practices of spiritualistic mediums.

Magic is the endeavor to produce effects transcending human powers by inadequate means or by some means other than the power of God. These effects may be of a harmful or beneficent nature. Charms and spells, when actually believed in, are forms of magic, because one thereby attributes powers to them which man does not possess himself and which they, by nature, cannot possess. In practicing magic, one either attributes divine powers to creatures or virtually appeals to evil spirits to produce preternatural effects. In either case, magic is an offense against God. To believe that the number 13 is unlucky, that Friday is an unlucky day, that a rabbit's foot or some other 'luck piece' will bring good fortune, etc., is equivalent to ascribing magical powers to ordinary things. Hexing and voodoo rites are more malicious in intent and involve an appeal to Satan and the evil spirits to lend their superhuman powers to human designs. That such magical practices are morally wrong, should be obvious; they represent an invasion of the rights of God and manifest a woeful lack of reverence and love for God who is all-powerful and all-kind.

When people become morally corrupt and lose their practical belief in God, they inevitably turn to superstition as a substitute. If they refuse to accept the true religion, they invariably accept a false religion. Man simply cannot live without religion of some kind, true or false.

Religion and Morality

Ever since Kant divorced morality from religion, it has become the pet theory of *independent morality* that man can lead a truly moral life without natural or supernatural religion. Religion and morality, these theorists claim, are 'closed systems' and are not interrelated. The theory is convenient. If morality has no intrinsic and essential relation to God and religion, morality can be tailored to suit each individual's desires, convictions, and ambitions, because there is no one to whom he must render an account for his deeds but himself. Independent morality endeavors to give a scientific basis to indifferentism.

Independent morality is a *false theory*.

Religion must be said to have an essential relation to morality.

Religion is the sum of the *duties* which obligate man to render honor and homage to God as the Supreme Being and Creator of man. Man, considered adequately in the totality of his being, is an individual, a social being, and a creature of God. Because of these essential states of his being, he has definite rights and definite duties. He can no more cease to be a creature of God than he can cease to be an individual or a social being. The rights and duties which flow from these states constitute the entire field of morality. Hence, the duties of man toward God as the Supreme Being and Creator of man are an *integral part* of morality. These duties, however, constitute a part of religion. Consequently, religion is an integral part of morality.

Religion is the sum of the *truths* pertaining to the relation of man to God. These truths are the very foundation of the moral order, for without them there would be no moral order. The moral concepts of 'obligation' and 'sanction' are unintelligible, if the concepts of God and man's essential relation to God are deleted from the moral order. Nothing would be left as the foundation of obligation and sanction but the policeman's club and the soldier's rifle. Physical force can control the external actions of men, but it can never engender the sense of obligation which is a constitutive part of moral life and which directs the internal actions of the will, even in the absence of physical force. When public officials are inducted into office and when people are placed on the witness stand in court, they are made to take an oath, calling upon God to witness the honesty of their intentions. The oath is thus made the foundation of civil society, and the oath has no meaning except on the supposition that God exists and is the Supreme Judge who will eventually punish the perjurer.

George Washington, in his Farewell Address, stated in clear words the intimate relation between religion and morality, when he said: "Of all the dispositions and habits, which lead to political prosperity, religion and morality are indispensable supports. In vain would that man claim the tribute of patriotism, who should labor to subvert these great pillars of human happiness, these firmest props of the duties of men and citizens. The mere politician, equally with the pious man, ought to respect and to cherish them. A volume could not trace all their connections with private and public felicity. Let it simply be asked, where is the

security for property, for reputation, for life, if the sense of religious obligation desert the oaths, which are the instruments of investigation in Courts of Justice? And let us with caution indulge the supposition that morality can be maintained without religion. Whatever may be conceded to the influence of refined education on minds of peculiar structure, reason and experience both forbid us to expect that national morality can prevail in exclusion of religious principle.”

The morality of an action is determined by its end or purpose. Where there is a multiplicity of ends, one of them must be the *ultimate end*. Now, as was shown, the ultimate end of man is God. Hence, to exclude God (religion) from morality is to destroy morality. The truth of this conclusion has been confirmed all too clearly in our times in nazi Germany and communist Russia. In both countries the official government acted on the principle that the state is an end in itself, independent of God. The result was disastrous. Obligations were flouted, rights ignored, treaties broken, and injustices of the most revolting sort committed. When governments deny God and disregard religion, man becomes a mere slave of officialdom, and national and international crimes become commonplace occurrences. Without religion there can be no genuine morality, and without genuine morality nations are doomed to eventual destruction. Such has always been the verdict of history.

Religious worship is man’s first and foremost duty. It is man’s greatest privilege to know God, to love Him, and to

serve Him in this life, so as to be eternally happy with Him in the next. A truly religious man is a truly moral man.

Summary of Chapter XIII

Man, as a creature of God, is the subject of very definite *duties toward God* his Creator.

1. *Natural Religion*. God is the first cause and the ultimate end of man. Man is absolutely dependent in all things on God. Accordingly, man's relation to God as his first cause and ultimate end is absolute, natural, and essential. Because of this *relation*, man has certain specific *duties* toward God. This relation and the obligations which flow from this relation are the foundation of *natural religion*.

In its *primary* meaning, religion is the worship extended by men to an extramundane and supra-mundane personal being, on whom they believe to be dependent in their lives and fortunes and whom they seek to make propitious by special observances. Divine worship is the honor and homage rendered to God in proportion to His excellence, dignity, and power. In its *secondary* sense, religion signifies the sentiment or virtue which inclines man to render honor and homage to God. In a *third* sense, religion signifies the *truths* which refer to the relation of man to God and the duties which pertain to man in consequence of these truths.

In *classifying* religion, we distinguish between 'true' and 'false' religion, 'objective' and 'subjective' religion, 'natural' and 'supernatural' religion.

2. *Necessity of Natural Religion*. Natural religion is based on the truths and duties which man knows through the aid of human reason alone.

Natural law obligates man to internal worship. Internal worship is the deliberate acknowledgment, by means of internal acts of intellect and will, that man owes his essence and existence to God. Man has the duty, in virtue of his rational nature and the natural law based on it, to render this conscious acknowledgment.

Natural law also obligates man to external worship. Man is a psychosomatic being, and sensible manifestations of his affective states are the natural complement of his internal mental conditions. It is, therefore, natural for man to express his internal worship by acts of external worship. But a natural demand belongs to the natural law.

Public worship, *per se* and *in principle*, is incumbent on all men, individually and collectively. Man is by nature also a member of *society* and of the *state*. The family and the state exist in a relation of dependence with reference to God. Therefore, the family and the state, like the individual, have the duty, based on the natural law, to acknowledge this dependence and to render honor and homage to God.

3. *Supernatural Religion*. Supernatural revelation is possible, whether viewed from the standpoint of God or of man or of the truths to be revealed.

Granted the fact of supernatural revelation, man has the *duty to accept* it. If God reveals Himself, He evidently desires and intends that man accept the truths revealed. Man then has the duty to give his assent because a rational being cannot refuse assent to God without disobedience and presumption. Hence, *indifferentism* is a serious offense against God, whether it be 'practical' or theoretical.

4. *Main Acts of Religion.* These acts are adoration, sacrifice, prayer, vows, and oaths.

Adoration is an act whereby man expresses his acknowledgment of God's infinite greatness and majesty and of his utter dependence on God as his Creator and Master. *Sacrifice* is the offering of a sensible, relatively valuable object to God and its actual or symbolic destruction, in order to acknowledge that God is the Creator and Lord of all things. *Prayer* is conversation with God for the purpose of honoring Him. A *vow* is a voluntary promise made to God whereby a person binds himself to do the better good. An *oath* is the calling upon God as a witness to the truth of a statement or of the intention to fulfill a promise; to be permissible, discretion, truth, and justice are required as conditions.

5. *Irreligion and Superstition.* *Irreligion* occurs when a person refuses to render unto God the reverence which is His due or when a person dishonors Him. *Direct* irreligion dishonors God Himself, as in 'testing' God or in 'blasphemy.' *Indirect* irreligion dishonors God by dishonoring things or persons dedicated to Him in some special manner, as in 'sacrilege' or 'simony.'

Superstition exaggerates in some manner the powers inherent in creatures, so that they are falsely assumed to partake of divine efficacy. Chief among superstitious practices are 'idolatry,' 'divination,' and 'magic.'

6. *Religion and Morality.* *Independent morality* claims that man can lead a truly moral life without dependence on natural or supernatural religion, because both morality and

religion are 'closed systems' and are not interrelated. The theory is false.

Religion is an integral part of morality. Man is an individual, a social being, and a creature of God, by his very nature. The rights and duties which flow from these states of man constitute the entire field of morality. Now, the duties of man toward God, based on his state of being a creature of God, are 'religion.'

Religion, i.e., the truths and duties pertaining to the relation of man to God, is the very foundation of the moral order. The concepts of 'obligation' and 'sanction' are unintelligible, if the concepts of God and of man's essential relation to God are deleted from the moral order; nothing would remain but physical force. The morality of an act is determined by its end or purpose. But the ultimate end of man is God. Hence, to exclude God (religion) from morality is to destroy morality. History confirms this conclusion.

Chapter 14

DUTIES OF LOVE

MAN IS A CREATURE OF GOD. GOD, THEREFORE, HAS CERTAIN rights with reference to man, and this relation of creature to Creator entails some very definite duties on the part of man toward God. Having received existence, man is a self-contained, autonomous being, a person, whose body and soul are his own. As such, man can have no duties of justice toward himself, because justice is essentially a virtue which seeks to give 'another' his just dues. The question therefore arises: Can man have any duties at all toward his own person?

Ever since C. Thomasius discussed the problem, many authors have denied the existence of man's duties toward himself. Prominent among them are the utilitarians and, of course, the materialists; the former, because their norm of morality consists in the social effects of conduct, and the latter, because of their doctrine that man is the supreme lord of his being and accountable to no one but himself.

While it is true that man can have no duties of justice toward himself, man has *duties toward himself* which arise out of *love*. And every individual has *duties toward others*, both from the standpoint of love and of justice.

Duties Toward Self in General

“Man is his own master.” In one sense, this axiom expresses a great truth. Man is not a thing, but a *person*. Because he is a person, man has a free will, capable of controlling, directing, and regulating his various powers and members and their actions according to ends and purposes of his own choice. Physical force may exert compulsion on his body, but it cannot invade the citadel of man’s free will and extort its consent. The axiom is thus an expression of the high and noble dignity of the human person.

In another sense, however, the axiom expresses a falsehood. The axiom often is used in the meaning that man is the complete lord of his own person, without duties of any kind toward himself; he is absolutely independent. We cannot admit the contention underlying the axiom used in this sense.

Man can and does have *duties based on the love* which he must have for his own person.

Self-love is an instinct implanted in man by his very nature. Self-love, therefore, is a dictate of the natural law. But self-love can be *ordinate* or *inordinate* and as such morally good or morally bad. It is ‘ordinate’ if it is in accord with right reason, and ‘inordinate’ if contrary to right reason. The natural law of self-love prescribes the proper manner in which man must love himself, so that he may live as a rational being. Such prescriptions represent the duties of man toward his own person.

The identity of man with himself is no obstacle for the duties of man toward himself. As was pointed out in a

former chapter (Chap. 7), a *hierarchy of powers* exists in man, and it is his duty to regulate the use of these powers in such a manner that their actions will conform to the *proper order* dictated by the rational nature of man. Because man is a person, he must observe the proper order *in himself* and *for himself*. God gave man his rational nature with its natural love of self, and He imposes on man the duty to live in accordance with the dictates of his rational nature, so that his self-love will not overstep the bounds of the proper order which should exist in his being.

The *supreme moral principle* states: 'Do the good and avoid the evil'; or, more concretely, 'Live in accordance with the dictates of your rational nature.' Applied specifically to the duties of man toward himself, the supreme moral principle assumes the form: 'Regulate your conduct toward yourself in a manner which agrees with your rational nature as a human person.' All the personal duties of man toward himself can be deduced from well-ordered self-love, so that the moral principle governing man's duties toward himself can be expressed in the following formula: Love yourself with a well-ordered self-love. This self-love will be well ordered when it is such as befits man's rational nature, both as to its object and as to the manner in which it is actuated.

Kant contended that any action prompted by self-interest (self-love) is not morally good; it must be performed out of pure love of the law, from a sense of duty for duty's sake. This is a one-sided view. In creating man, God placed in his nature an ineradicable love of self as the basis of self-preservation. It must, therefore, have been His design and

intention that man be actuated by self-love. Consequently, self-love must be something morally good, because it is *natural*.

In order that man's self-love remain morally good, it must be grounded on proper *self-esteem*. Man possesses the dignity of a 'person.' As a 'person,' he occupies the dominant position in the visible universe, so that all irrational creatures are at his service, while he himself is not in the service, as a means to an end, of any other creature. The self-love, which is the basis and source of his duties toward himself, is a love of *benevolence*. He must, and ought to, esteem himself because of this very fact that he is a 'person' and not a mere thing. So long, then, as man's love for himself is grounded on proper self-esteem and stays within the bounds of proper self-esteem, it is morally good. As soon, however, as man's self-love becomes exaggerated and oversteps the bounds of proper self-esteem, it becomes *selfishness* or *egotism* and is morally evil. There are, of course, motives for action which are nobler than the motive of self-love; such, for example, is the motive of the love of God, which should impel man to act in accordance with the norm of morality. Any act performed from the motive of the love of God is morally good in an eminent degree — this is obvious; but it is equally obvious that an act performed from the motive of a well-ordered self-love is also morally good: both motives are in agreement with right reason. The self-love which prompts man to strive in all things for his *true perfection* is a well-ordered self-love, which is something quite different from

the blind instinct of self-preservation and from the inordinate tendencies of selfishness.

Man, therefore, has duties toward himself, imposed by God on him in virtue of his rational nature, which flow from a well-ordered love of self. These duties refer either to his soul or to his *body* or to *external goods*.

Duties Referring to Man's Soul

The supreme object of all man's endeavors must be the attainment of his *ultimate end*, namely, the eternal possession of God and his own eternal happiness in the life to come. It follows as a necessary consequence that man's entire conduct must be directed toward this end and toward everything that is conducive to it. Proper self-love will prompt him to strive to reach his supreme goal, and this demands self-development and self-perfection, especially in those powers which are primarily concerned with moral conduct. These powers are the intellect and will.

Each person has the natural duty to develop his intellect and acquire the *knowledge* necessary for the fulfillment of the duties incumbent on him according to his particular station in life. First of all, man must acquire at least an elementary knowledge of *God* and of the *religious duties* based on his essential relation to God as a creature. Without this knowledge man could not lead a moral life, nor could he strive effectively for his ultimate end. Hence, he must seek this requisite knowledge either through personal study or through instruction from competent persons. In addition to this general knowledge required of everybody,

each one must strive to acquire the knowledge necessary for the fulfillment of the duties which pertain to the *state of life* in which he is placed. There are special duties for a husband, a wife; for a father, a mother, a child; for an employer, an employee; for a physician, a lawyer, a newspaperman, a builder, a banker, a merchant; for a public official, a ruler, a subject; and so forth. Man owes it to himself and to those with whom he must live to be acquainted with the duties which should govern his conduct in his state of life. Unless he fulfills these duties, man cannot achieve the ultimate purpose of his life on earth. Genuine self-love, therefore, demands that he use all ordinary means to acquire whatever knowledge is needed for the proper fulfillment of his various duties toward God and his fellow man.

A similar situation obtains with regard to the *will*. The free will is the primary factor of all moral conduct, because nothing has a moral character except in so far as it is voluntary and free. The first duty of the will consists in bringing its individual decisions and resolutions into conformity with the recognized norm of morality. In order that this may be done with greater ease and consistency, the will must strive to acquire the various *virtues* which are essential for leading a truly good life; without such virtues a person would always run the risk of succumbing to evil in the stress of temptations which constantly exert pressure upon the will of man and seek to divert him from his ultimate end. One of the greatest sources of temptation to evil lies in the inordinate tendencies of the lower instincts of man's complex nature, unless they are rigidly controlled

and regulated. It is, therefore, the duty of the will to direct these tendencies in such a manner that they are subject at all times to the dictates of right reason and become a help, rather than a hindrance, to man in his sublime effort to lead a moral life.

Duties Referring to Man's Body

Besides his soul, man also possesses a body. The body is as much an integral part of the human person as the soul. Together they form man's nature as a unitary substance and principle of action. Just as he has duties toward himself because of his soul, man also has duties toward himself because of his body. Man has the duty of ordinate love of his body and everything pertaining to the *proper welfare of his body*.

The duties of man toward his body are partly negative, partly positive.

NEGATIVE DUTIES.

No person is allowed to take his own life by committing suicide. *Suicide* is the direct, intentional destruction of one's own life. Suicide must not be confused with the indirect and unintentional surrender of one's life which may be permissible. Anyone performing a morally good act, knowing that his death will follow, provided he has a sufficiently grave reason for the act, does not commit suicide; he 'permits' the forfeiture of his life in a good cause for a sufficiently grave reason. The reader will recall the

case of the flier whose plane was partly disabled and who dove into the enemy aircraft carrier, seriously crippling the ship and dying in the explosion of his own bombs. This man did not intend to take his own life; his direct, intentional act was to stop the enemy from inflicting serious damage upon the forces of his own country. His cause was just, and his heroic act was morally good. His death was an indirect, secondary effect of his action which he permitted to occur; he did not want to die; and if he could have spared his own life under the circumstances, he would undoubtedly have done so. His action, therefore, was not suicide in the moral sense of the term. Actions of this kind must be judged by the principle of 'double effect' and may be, depending on the circumstances, entirely permissible.

Suicide is *self-murder*. A person has no more right to murder himself than he has to murder someone else. That person alone has the right to destroy a thing who has dominion over it. In order that an individual be permitted to destroy his own life, he must have dominion over it. But how can an individual have dominion over his life? He did not create it; he did not acquire it through his own effort and industry; he did not purchase it. Life is a gift. The soul is created by God, and the soul is the life principle of the person. God alone, therefore, has dominion over the life of a person. Since the life of an individual is an unearned gift, man is only the *steward* over his life, and he has the duty to manage and administer his life in the service of his Master. God alone has the right to take man's life. Consequently, if a person commits suicide he is guilty of invading the rights of God.

That suicide is an *unnatural act* is clear from the fact that the most fundamental and peremptory of all instincts in human nature is *self-preservation*. This instinct is a manifestation of the will of man's Creator that he preserve his life against all influences which threaten to destroy it. The preservation of one's life, therefore, is a demand of the natural law. Consequently, man has no right to take his own life intentionally and arbitrarily.

Even extreme misery and pain are no justification for suicide. The express or tacit *permission of God* alone could justify such an act. No one can prove that God gives His 'express' permission. And 'tacit' permission cannot be presumed, except under the supposition that suffering would make it impossible for man to attain his *ultimate end*. Man, however, can attain his ultimate end even in suffering. Suffering can give rise to the finest opportunities of virtue, and virtue is always glorification of God. Because of the difficulties involved in leading the good life under such adverse circumstances, the reward in the life to come will be all the greater.

Not only suicide, but also *self-mutilation*, intentional and unnecessary *exposure to serious danger*, and impairment of health are forbidden by the natural law. All bodily members are integral parts of the nature of man and as such fall under the dominion of God; they are no more the property of the individual, to be disposed of at his arbitrary discretion, than life itself. Each member of the human body has its own specific function, intended by the Creator for the general welfare of the human person. No one, therefore, has the right to mutilate his body, except it be for

the preservation of life and the promotion of general health. An operation, for example, is permissible, whenever the removal of a diseased member is necessary for the life of a person or for the restoration of his health. No one may risk serious danger to life or limb, except for a sufficiently grave reason. The seriousness of the danger is a relative matter. The danger may be serious for a tyro and slight for a skilled person. Thus, aerial acrobatics are permissible for the trained circus performer, but morally forbidden to a novice in the art until properly trained. Stunt flying for amusement's sake is morally wrong if the pilot endangers his life because he lacks the necessary skill or because his plane is defective; if there is little danger attached to the performance, a reasonably good cause is sufficient to permit the action. The stunt flying of a test pilot in an experimental plane is justified, provided he is not rash in his performance; the test pilot, it may be presumed, is highly skilled in handling a plane, and the tests are practically necessary for the common good and for the general advancement of aviation as a science and as a method of travel. Scientists may expose themselves to danger in their scientific investigations if the experiments are important for the general welfare and if they take precautions to minimize the danger as far as possible. Some occupations are always dangerous, but they are essential to the welfare of the government or of the general public. Since these occupational hazards are unavoidable, and since someone must do the work of the world, it is evident that it is morally permissible for some persons to enter these occupations; in all such cases, however, safety measures should be taken.

POSITIVE DUTIES.

Man also has 'positive' duties toward himself with regard to health and bodily integrity. He must strive to preserve life and health through the use of appropriate means. These means are either ordinary or extraordinary. Ordinary means are means commonly used by prudent persons which can be applied without too much difficulty. Extraordinary means are those whose acquisition or application involves difficulties beyond the capabilities of prudent persons. Among the ordinary means necessary for the preservation of health and general bodily integrity are food, drink, sleep, relaxation, moderate exercise, and ordinary treatment in times of sickness. Among the extraordinary means are to be reckoned very rare and expensive medicines, extensive traveling, protracted hospitalization, and severe and dangerous operations.

Health and bodily integrity are gifts of nature, designed by God and given to man for his benefit, so that he will be able to lead a life befitting the human person and perform the duties of his particular state in life, with the over-all purpose of attaining his ultimate end. Such being the intention of the Creator of man in bestowing health and bodily integrity, man is by nature bound to use those positive means which will enable him to preserve the efficiency of his body by applying at least the ordinary means required. Without the use of at least these ordinary means, man obviously would be delinquent in fulfilling the inherent purposes of his body and its members.

In general, the use of *extraordinary* means is not obligatory. God in His wisdom cannot be assumed to will that man be obligated to use means which exceed his ordinary powers. Exceptional circumstances, however, may require extraordinary means. Charity, for instance, may at times demand that a person use all means available to preserve his life and health. Thus, the father of a family may be sorely needed for the support of his small children; in such a case, he has the duty of charity to do everything within reason to have his health restored, in order that his family will not become destitute and his children suffer in their moral upbringing.

Duties Referring to External Goods

External goods are all those things which are not a part of the human person but are a benefit for the person in some manner. Chief among such external goods are a person's good name and earthly possessions.

A *good name* or a good reputation is the favorable opinion people hold concerning a person because of some natural or acquired excellence. A good name is an asset and, generally speaking, a necessity. One who enjoys a good reputation is usually anxious to retain the favorable opinion people have formed of him. Hence, he will seek to avoid misconduct, so as not to lose his good reputation. Furthermore, a good name is usually a requisite condition for every type of social activity, not only for those in public positions but also for those whose influence is restricted to the more common circles of friendship and business. A

person with a bad reputation is always considered a poor risk in any kind of enterprise. Since man is a social being and must live in a social world, he has the *natural duty* to obtain and retain a good reputation among his fellow men. This duty, however, extends only so far as a good reputation is required for the fulfillment of the moral obligations pertinent to his vocation in society. A public official, for example, whose honesty has been besmirched, may have the duty, for the sake of good government, to defend his good name against unjust attacks. So, too, a physician, falsely accused of malpractice, may be in duty bound to bring his defamer to justice.

Man has the duty of self-preservation and, if he has a family, the duty of supporting his family. For this he needs a reasonable amount of *earthly possessions*. These goods, however, are usually of such a character that they must be acquired by personal endeavor and initiative. Hence, the average person has the *natural duty* to acquire the amount of earthly possessions needed for the proper support of himself and his family, provided he has the ability and opportunity. It would be wrong, therefore, for a family man to neglect to work for a living, if his family were dependent on his wages for sustenance; but it would not be wrong for him to retire from active work, if he had acquired an amount of earthly goods sufficient for himself and his family, according to their accustomed standard of living, for the present and the foreseeable future.

Duties of Love Toward Others

The duties which every person has toward others are the duties either of love or of *justice*. The duties of love have their binding power solely in conscience and as such possess a purely moral character. The duties of justice, on the other hand, correspond to juridic rights and for that reason are subject to coercion.

The *general duty of love* will receive our first consideration. Man may love his fellow man from a triple motive. A man may love a person because of some advantage to be gained or because of the pleasure of his companionship. The love of one's neighbor under such circumstances partakes more of the nature of self-love than it does of love of the neighbor for his own sake. Or, a man may love his neighbor in order to please God. This kind of love is more properly love of God than love of one's neighbor. Or, a man may love his neighbor for the *neighbor's own sake*, because his neighbor has the dignity of a human person who, being endowed with intellect and free will, is created in the image and likeness of God and deserves on that account to be treated with honor and love in his own right. Such a love is a love of *benevolence* and *friendship*, and this type of love is a natural duty for everyone.

Man must love his neighbor, i.e., every human being, as *himself*. This does not mean that we must love others with the same measure or intensity as we love ourselves; it means that our love for our neighbor must be *genuine* and *true*, just as the love for ourselves is genuine and true. In other words, the model after which our love for our neighbor must be patterned is the love we bear for

ourselves. The *degree* of love is determined by the proximity or intimacy that exists between the persons involved. Each one is naturally closest to himself, because he is identical with himself; hence, the love each one bears toward himself is naturally stronger than the love he bears toward another. *Proper order* demands that we love others in proportion to their relationship to us: parents more than sisters and brothers; sisters and brothers more than other relatives; relatives more than friends; friends more than strangers. All, however, are 'neighbors' to us and must receive our love.

That everyone has the natural duty to love his fellow man follows from the very fact of the *nature of man*. We owe love to ourselves because we are creatures of God, endowed by Him with a rational nature, so that we are created in His image and likeness; our rational nature confers on us a dignity which surpasses all the other beings and powers present in the visible universe. *Right order* places upon us the duty, then, to love others as we love ourselves, because they, too, are children of God and possess the same human dignity that God has given to us. In the eyes of God all men are equal and form one great family, and we have the duty, therefore, to embrace in our love, not only ourselves, but every human being who, like ourselves, has the same nature and is destined for the same ultimate end in the possession of God. The 'brotherhood' of all men is not just an idle phrase; it is a fact of profound significance. Even if we leave aside every supernatural motive as being outside the province of natural ethics, the fact that all men are essentially equal among themselves and before God may

and should furnish the solid foundation of harmonious interracial and international human relations.

Duty of Truthfulness

Man has many duties toward his neighbor that spring from the fundamental duty of love. They differ from person to person to a great extent, depending on the conditions and circumstances in which each individual is placed in life. There is, however, one important duty, prompted by the love of neighbor, which is all-embracing, namely, the *duty of truthfulness or veracity*.

Truthfulness is the moral virtue which inclines the will to tell the truth. Truth is conformity between intellect and thing. We are here concerned with *moral truth*, and moral truth is defined as the *conformity between speech and mind or, more accurately, as the conformity between speech and the judgment of the intellect*. By 'speech,' in this connection, one understands not only 'words' but all external signs which are used to convey the ideas and judgments of one intellect to another, be the means of communication words, print, writing, gestures, or anything else.

The opposite of moral truth is the *lie*. A lie is the *telling of an untruth*, so that there is a contradiction between what a person thinks and says. If the person is conscious of this contradiction, so that he deliberately tells a falsehood, the lie is a *formal lie*; and if he is unconscious of this contradiction, the lie is a *material lie*. In telling a 'material' lie, the person is subjectively convinced of the truth of his

statement and has the honest intention of telling the truth; he is, however, actually mistaken about the state of affairs concerning which he is making his statement, so that, from an objective point of view, there exists a contradiction between his statement and the facts as they are in themselves: such a statement, therefore, is an error, but not a formal lie. In telling a 'formal' lie, the person knows that his statement disagrees with his personal conviction (whether this conviction is true or false in itself, is an indifferent matter), yet he consciously and deliberately makes a statement contrary to his convinced judgment. Thus, it may happen that a person tells a 'formal' lie (i.e., makes a statement contrary to his judgment and conviction), and yet, because of an error in judgment, his formal lie may (accidentally, and contrary to his conviction) agree with the actual fact and be 'materially' true. Ethics deals only with formal truths and formal lies. Since only those acts are human acts which proceed consciously from the free will, and since only human acts possess the quality of morality, it follows that only formal truths and formal lies possess the quality of morality and, as such, have moral significance. When, therefore, ethicists treat of truths and lies, they mean 'formal' truths and 'formal' lies. Consequently, a lie, from the viewpoint of ethics, is a *conscious and deliberate statement contrary to one's subjective judgment*, whether this subjective judgment be objectively true or false.

Four elements are distinguishable in a lie: (1) a statement in contradiction to the judgment of the mind; (2) the will to state something one is convinced is false; (3) the

will to deceive another by means of this statement; (4) the deception of another. The first two elements belong to the essence of the lie. The fourth element is the effect of the lie. Whether the third element is an essential element or only a necessary consequence of the lie is a mooted question among ethicists. Practically speaking, whoever tells a formal lie, by that very fact intends to deceive the person to whom the statement is made; otherwise he would not deliberately make a false statement.

A lie can be told in *four ways*: by affirming what one knows is not true; by denying what one knows is true; by asserting as certain that about which one is in doubt; by asserting as doubtful that about which one is certain.

From the standpoint of the *purpose* of telling a lie, there are *three kinds* of lies, namely, pernicious, officious, and jocose lies. A *pernicious* lie not only contains the moral delinquency of deliberately attempting to deceive another, but also seeks to inflict harm upon him by means of the lie. An *officious* lie is one in which a person seeks to gain some advantage or avoid some difficulty, be it for one's own self or for another, without thereby inflicting any harm upon another; this type of lie is often spoken of as a 'white lie.' A *jocose* lie is one made in jest, in order to amuse someone. In all these types, the intention to deceive must be present; otherwise it is no lie. To tell a 'tall story' in jest, therefore, with the knowledge or the reasonable supposition that the listeners do not believe it to be true, is not lying. On the other hand, if a person says an untruth with the intention of deceiving others, he tells a lie, even if they are not deceived

and do not believe his statement; actual deception, therefore, does not belong to the essence of the lie.

So far as the *morality of lying* is concerned, all authors agree in the general statement that lying in the strict sense of the term is morally wrong. But not all authors agree as to what should be considered a 'lie' in the strict sense of the term. Whether, for instance, an *officious* lie is absolutely and intrinsically wrong, represents a very difficult problem, due to the fact that secrets frequently cannot, or should not, be divulged. Plato and the stoics maintained that a lie is permissible to avoid a great evil or obtain a great good. In the Christian era, the priscillianists and semi-pelagians taught that a lie is not always morally wrong; Origen and Cassian held a similar view. St. Augustine defended the intrinsic immorality of lying, and Catholic theologians agree with him. Many Protestants follow the teaching of Hugo Grotius who distinguished between a *lie* (*mendacium*) and a *false statement* (*falsiloquium*). According to Grotius,¹ in order that a lie be a lie in the strict sense of the term, we must add to the definition the element of a "discrepancy with some existing and permanent right of the person to whom the words or signs are addressed." The *right* of such a person *to the truth* must be certain, before a formal falsehood is a lie; if the person has no right to the truth, the false statement violates no right of his and is not a lie in the strict sense of the term. A person's right to the truth may cease "either by the express permission of him with whom we deal... or by tacit permission, or by permission presumed on fair reason; or by the opposition of another right which, by the common opinion of all, is much more

important.”² As examples of the cessation of the right to the truth Grotius mentions the case of giving information to infants and persons of unsound mind, the case of the necessity of preserving an innocent person’s life, the case of hindering someone from committing a grievous crime, and so forth. Instead of the classic definition of a lie as being ‘speech contrary to the mind,’ some authors prefer the definition of a lie as being ‘the denial of communicable truth’; according to this revised definition, they claim, there would be no lie if one would not be allowed to communicate the truth to another.

We claim that a *formal lie*, i.e., a conscious and deliberate statement contrary to one’s subjective judgment, is *intrinsically wrong*.

First. That which is contrary to the *natural* purpose of speech is forbidden by the *natural law*. It is the natural, because intrinsic, purpose of speech, instituted as such by the Author of nature in giving man the power of speech, to manifest the judgments of one intellect to another intellect; in other words, God gave the power of speech to man for the natural purpose that he communicate his judgment about things and events to another. A formal lie, however, is contrary to this natural, intrinsic purpose of speech, because a formal lie does not manifest the judgments of one intellect to another intellect. Consequently, a formal lie is contrary to natural law and therefore intrinsically wrong.

It is no valid objection to point out that speech consists of conventional signs’ and therefore is only an artificial, not a natural, instrument of communication. It is true, of course, that words are conventional signs of ideas, and ‘language,’

therefore, is an artificial construct. However, the actual language used is only a means to the end of communication; on the other hand, the 'power of speech' is a *gift of nature* and of nature's God, and it is a 'natural' instrument intended by nature for the communication of ideas and judgments. The power of speech is essential to communication, while the actual language used to convey meanings is incidental.

Second. That is forbidden by natural law, which, if permitted, would redound to the *serious detriment of human society*. A moment's reflection will suffice to show that truth in speech is essential to society. All the functions of society rest on the intercommunication of ideas between mind and mind by means of speech. Whether this intercommunication be between individuals, in the family, in the nation, or between nations; whether it be in matters of social life, business, industry, commerce, or international affairs; whether it pertain to knowledge or morals in private or public dealings: this intercommunication between individuals and groups is essential to the functions of society. Now, since intercommunication is carried on only through speech, and since speech would be useless without truth in speech, it is evident that truth in speech is essential to the functions of society. However, that which is essential to the functions of society is demanded by the natural law. Truth in speech, therefore, is demanded by the natural law for the proper functions of society. Anything contrary to the proper functions of society redounds to the serious detriment of society. Hence, anything contrary to truth in speech redounds to the serious detriment of society and is

forbidden by the natural law. Consequently, formal lies, since they are contrary to truth in speech, redound to the serious detriment of society and as such are forbidden by the natural law; and since anything contrary to natural law is intrinsically wrong, formal lies are intrinsically wrong.

It is objected that mutual trust and confidence, so essential to the functioning of society, would not be seriously impaired if formal lies were permitted in *exceptional* cases and *for grave reasons*. But who should be the *deciding judge* in such matters? Obviously, one cannot submit each case to an investigating committee, so as to obtain an impartial verdict on the importance of the reasons for telling a formal lie. The matter would have to be left to the discretionary judgment of the individual, and no judge is competent in his own case. The telling of formal lies cannot be permitted under any circumstances, because formal lies are *essentially* the abuse of a natural faculty.

Third. Formal lies are contrary to the *nature of God*. God is infinite truth and holiness. He is true to Himself in every respect, because His truth is His holiness, and His truth and holiness are identical with all His infinite attributes. There would be a contradiction in His holiness, if He could tell lie, because there must be complete correspondence in His being. Hence, a discrepancy between His judgment and its expression is impossible. Now, man's rational nature is patterned after God's. A formal lie, since it is a discrepancy between judgment and speech, involves a corresponding discrepancy with man's rational nature and also a discrepancy with God's nature. But every human act which is a discrepancy with God's nature is contrary to the natural

law and as such intrinsically wrong. A formal lie, therefore, is intrinsically wrong.

A formal lie being 'intrinsically' wrong, it follows as a necessary consequence that it is never permissible to tell an outright lie, no matter what the provocation or the advantage may be, because it displeases God.

Mental Reservation

A person is not always allowed to divulge the truth. We have the duty to keep a secret, to avoid harming another in his reputation or person, to forestall a public calamity, and so forth. Then too, there are times when it would be permissible to tell the truth, but one has no obligation to tell it and prefers not to. In many instances it may suffice to remain silent or simply refuse to answer the question. However, sometimes the circumstances may be such that silence or the refusal to answer would indirectly reveal the very truth one has the obligation to keep secret; one must then seek some other means of hiding the truth.

Examples can be cited in abundance. Here are a few. Clergymen, lawyers, physicians, judges, and public persons frequently receive confidential information in their official capacity; such information is 'privileged' and must be held secret. If asked about it by some unauthorized person, silence or refusal to answer would immediately be construed as acknowledgment that they possess knowledge of the fact; if they did not possess this knowledge, they would not hesitate to say so. Another example. A number of thugs intend to assassinate an enemy or a dangerous

witness who, they have been informed, is hiding out in a friend's home, and so they call on this friend and inquire whether this person is in the house. Silence or a refusal to answer would be virtual admission that he is present and would mean his death. Again. A high-ranking government official is asked about some confidential information concerning important commodities, so that private speculators on the stock market could take an unfair advantage of their competitors. Here, too, silence or a refusal to answer may be all that is required as a hint about pending government action and could cause untold harm. Another example. The envoy of a country is asked privately by a foreign diplomat whether a decision was made by the envoy's country regarding certain important international matters. He cannot answer the question without violating his oath which pledges him to secrecy; but again, silence or a refusal to answer would indicate to the inquirer that a decision had been made, otherwise the envoy would not hesitate to give an answer denying the decision. A final example. An officer is captured by the enemy and asked whether it is not true that a certain date has been set for a general attack. The date is correct, and he cannot deny it; to remain silent or refuse to answer would be tacit admission that the enemy's information is correct, and the officer would be the indirect cause of the death of many comrades and of the loss of the impending battle.

What are persons supposed to do in such and similar situations? They may not lie, and they may not violate the confidences and secrets entrusted to them. If they were not permitted to conceal the truth in some way, the security of

social life would perish just as readily as through formal lies. Consequently, some means of concealing the truth must exist.

Some authors propose the *officious lie* or *false statement* as a means to conceal the truth. However, since a formal lie is intrinsically evil, we must reject it.

Others propose a *purely mental reservation*. A 'mental reservation' in general is a statement which 'reserves' the communication of knowledge from one mind to another by not efficaciously revealing the judgment present in the mind of the speaker. The reservation is *purely mental* when the statement does not reveal the judgment of the speaker's mind in any manner, either by speech or by the circumstances. The statement contains two parts; the one part, which would make the statement clear in its true meaning, is retained in the mind and is not revealed, while the other part, which is false as given in the light of the question, is spoken and is the only part understood by the hearer. For example. One soldier asks another: "Did you see action in the South Pacific?" The latter, although he never was in action, answers: "Yes, I saw action in the South Pacific," meaning: "Yes, I saw action in the South Pacific (in motion pictures)." Or, a mother asks her son: "There was some ice cream in the refrigerator; did you take it?" He answers: "No, mother, I didn't," meaning: "I didn't take it (within the last five seconds)."

A purely mental reservation is really a *formal lie*. The true part of the statement, retained in the mind, can in no sense be considered as *spoken* to another; and it is only this unspoken part which actually corresponds to the judgment

of the mind. The words, however, which are actually spoken to the listener, are false and necessarily lead him into error; the spoken words are directly intended to deceive and are 'speech contrary to the mind,' i.e., they are a lie.

Others propose a *broad mental reservation* as the proper means to conceal the truth from an unauthorized person without telling a formal lie. It is a statement which *limits the full meaning of the spoken words*, so that, although there exists some external indication of the limitation either in the spoken words or in the circumstances of the speaker, the listener will most likely *deceive himself* as to the actual meaning of the statement. For all practical purposes, the statement contains a *double meaning*, either in the words themselves (verbal equivocation), or because of the circumstance (real equivocation), and the listener is *permitted* to put a wrong interpretation upon the statement and thus deceive himself. The statement, however, must always be *true in itself*, even though it be *not the full truth*, and there must be some external clue, either in the words or in the circumstances, which would enable the wise listener to judge that an equivocation is being used. The speaker is the *occasion*, rather than the cause, of deception. These are fine distinctions, but they are valid and necessary.

The *principle* for the justification of the use of a broad mental reservation is formulated as follows: For a just reason we are allowed to use a broad mental reservation, except when the questioner has the right to know the truth; sometimes we are even obligated to use it. Each point of this principle must be given careful consideration.

That the use of a broad mental reservation is *sometimes allowed*, follows from the fact that it is *not a formal lie*. Such a statement contains a double meaning. One meaning is obvious in the words spoken; the other is not obvious, because it is retained in the mind. Since the obvious meaning is true, so far as it goes, the statement is not in itself 'speech contrary to the mind' and, therefore, no formal lie. It is not always required that the listener be apprised of the double meaning inherent in a statement, especially when one has the duty to keep certain information secret. If it were never permissible to make such a reservation, there would be no morally justifiable means of preserving a secret, and the common good of society would suffer tremendous harm. Hence, the use of this type of mental reservation must at times be allowed.

There must, however, be a *just reason* for the reservation. The equivocation involved in the statement is the 'occasion' for self-deception on the part of the listener, and this occasion is placed deliberately before the listener by the speaker. Some just reason must exist to do this; otherwise everyone would suspect ambiguity in the speech of others, and the mutual distrust thereby engendered in the minds of people would lead to definite harm for society. The 'just reason' required is some genuine good gained from the necessity of concealing the truth or the prevention of a real harm to one's self or others which would follow the revealing of the truth.

Furthermore, one is not permitted to use a mental reservation, if the questioner *has the right to know* the truth which is present in the mind of the person questioned.

If the questioner has the 'right' to know the truth, the person questioned has the 'duty' to reveal it, because rights and duties are correlative. In ordinary conditions and circumstances, for instance, parents have the right to the truth from their children about their associates and actions; public officials have the right to know the facts about the physical, mental, and moral qualifications of those who apply for positions or promotions; people about to enter an important contract with others have the right to know whether the other contracting party possesses the necessary legal and financial responsibility.

We are *obligated* to use a broad mental reservation when it would be *sinful* to reveal the truth about which we are questioned and when the questioner cannot be put off without some kind of an answer without revealing the truth indirectly by a refusal to answer. The reason is clear. Since we have the 'duty' not to reveal the secret to an unauthorized person, and since the only means to avoid the importunities of an unauthorized questioner under the circumstances is a statement containing a broad mental reservation, we have the 'duty' to use such a reservation in order to protect the secret entrusted to us. For a sufficiently *grave reason* a person may even make such a reservation *under oath*, namely for the sake of obtaining a great good or avoiding a great evil; the statement as such is true, and therefore God is not called upon to witness a lie. However, due to the ignorance and misunderstanding of the general public, such an oath should be avoided, unless strictly necessary; otherwise their faith in the sanctity of the oath may be unduly weakened.

The *difficulty* concerning the use of a broad mental reservation under the circumstances just outlined does not consist in its 'moral licitness.' Every intelligent person must concede that it is morally justified, whenever the situation is as described. The real difficulty consists in avoiding a purely mental reservation while attempting to make a broad mental reservation. That the matter is delicate is obvious. *Custom* and the *circumstances* of the case must decide what kind of an answer can or should be expected, in order that the answer be limited in its meaning by a 'broad,' rather than by a 'pure,' mental reservation.

Granted all the conditions outlined above, a broad mental reservation is *morally justified*. Three elements determine whether an action is morally good or bad. To be morally good, an action must conform to the norm of morality from the standpoint of the end of the agent, the end of the action, and the circumstances. But a broad mental reservation does this.

The *end of the agent* in a broad mental reservation is the legitimate concealment of confidential information, and that is a lawful end. The *end of the action* or object is the preservation of a secret to which the questioner has no right and the manifestation of which would violate a social trust placed in the speaker. But the speech used in a broad mental reservation protects the secret without the use of a formal lie, and that is justified from the standpoint of the end of the action. The *circumstances* which could make such a reservation unlawful are these: the reservation may be unnecessary to protect the privileged information; the questioner may be authorized by right or charity to know

the truth; the common good of society may demand that the truth be divulged. Under the conditions given, however, none of these circumstances obtain. Consequently, under such conditions a broad mental reservation is morally justified.

A FEW EXAMPLES WILL ILLUSTRATE THE USE OF THE BROAD MENTAL reservation.

Physicians, lawyers, priests, secretaries, magistrates, envoys, ambassadors, military personnel, and public officials of a nation can obtain knowledge of persons and events either as private individuals or in their official capacity as privileged persons. What they learn as private individuals is frequently communicable information, but what they learn in their official capacity is usually incommunicable information. When questioned by an unauthorized person regarding secret and privileged (incommunicable) information, they may answer:

"I do not know." The meaning is: "I do not know this in my capacity as a private individual, so that the information would be communicable as far as you are concerned." What they have learned in their official capacity they may not reveal, and as private individuals they have learned nothing and know nothing. Hence, in a perfectly true sense, namely, as *private individuals*, they can say: "I do not know." According to the same meaning, they could even give a flat "No" to some question asked by an unauthorized person, because the meaning would be: "No, so far as I know as a private person." Every intelligent person would take such

an answer of "No" in the sense that a manifestation of the information should not and cannot be given without violation of a trust.

If custom sanctions the usage, it is permissible for a secretary, maid, or subordinate to say that someone is "not at home" or is "not in," because the phrase is then accepted to mean that the person in question "will receive no callers."

A person arraigned in court may plead "Not guilty" to any charge preferred against him, even if the person has committed the crime mentioned in the arraignment. According to the procedure of American law, no one is to be considered guilty until he has been convicted in court after a fair trial. In pleading "Not guilty," the criminal merely indicates that he desires a fair trial in which his guilt must be proved by proper evidence.

A person passing through the customs office, when asked whether he has any goods subject to duty in his possession, may answer "No." Since the law in this case is a penal law which does not bind in conscience, the negative answer may mean either "I have nothing dutiable" or "I have nothing which I intend to declare." Customs officials understand this and never take such an answer of "No" at its face value.

If a nurse is asked by a patient what illness he has or how serious his illness is, she may answer: "I do not know." It is not within her province as a nurse to give this information it is the right and duty of the physician to inform his patient about the condition of his health. Her answer, therefore, simply means: "Ask your physician,

because I have no right to tell you.” Patients, as a rule, know that the ‘nurses do not talk’ and take their statement accordingly.

Parents often possess information which should be kept from their children, especially the younger ones. The same applies to superiors with regard to their subordinates. For a sufficiently grave reason, therefore, they may give evasive answers to importunate questions by using a broad mental reservation.

At first it may appear as if the answers given in these various examples are nothing less than lies. However, the explanation of these answers shows that they have a legitimate meaning and that the circumstances prompting the answers supply the clue which indicates to the listener that the person questioned may possibly possess some information not to be disclosed. In each case a broad mental reservation was used in a morally lawful manner and no formal lie was uttered.

Secrets

The use of mental reservations generally occurs when it is advisable or necessary to protect a secret. It will, therefore, be of considerable importance to know which secrets must be kept and when they may be divulged.

Subjectively, a *secret* is the obligation not to reveal some hidden thing or knowledge. Objectively, it is the hidden thing or knowledge which may not be revealed.

There are three kinds of secrets. A natural secret is one in which the obligation of secrecy arises from the very

nature of the matter without an existing contract; the matter is by nature such that justice or charity demands that it be not revealed to others. A *promised* secret is one in which the obligation of secrecy arises from a promise given after the knowledge is already obtained. A *committed* secret is one in which the obligation of secrecy arises from a contract or promise when a person receives knowledge of something previously unknown under the explicit or tacit condition not to reveal this knowledge. A committed secret will be 'private' when it exists between individuals as individuals and affects merely the private good of someone; it will be 'professional' when the secret is committed to someone in an official capacity for the sake of counsel or assistance and affects either the private good of someone or the common good of society.

The *violation* of a secret is governed by the following principles.

A *natural* secret obligates seriously in a serious matter, and the matter is considered to be serious when the manifestation of the secret causes grave harm or grave displeasure to the one who is affected by the disclosure. A natural secret may be divulged when it cannot be kept without serious inconvenience; this inconvenience must be proportionately greater, if the secret obligates from justice.

A *promised* secret obligates ordinarily only from fidelity, but sometimes it may obligate from justice, depending on the intention of the one who accepts the secret. The obligation is grave in a grave matter, light in a light matter. The obligation to keep a promised secret ceases when it cannot be kept without serious inconvenience either to

one's self or to another, unless an explicit promise was made to the contrary. It also ceases, whenever the circumstances are such that it would be illicit to withhold the information, even if a promise had not been exacted. The reason is that a promised secret always presupposes that the information has been obtained beforehand through some other source, and then the promise is exacted to keep this information secret; such a promise, therefore, entails no obligation, because no one is allowed to make a promise to do something wrong. Hence, if questioned by legitimate authority, the information of a promised secret must be revealed.

A *committed* secret obligates from justice, and the obligation is serious in a serious matter. This obligation arises from the necessity of preserving the common good of society. The common good would suffer serious harm if people could not consult others in their need for counsel and assistance without being in constant fear that their secret might be divulged. Naturally, a 'professional' secret imposes a more serious obligation than a 'private' secret. Much, of course, will depend upon the nature of the information obtained and upon the intention of the one giving the information; if the information is of a trifling nature, or if the attitude of the one seeking counsel or assistance shows plainly that he views the whole matter as of little importance, then the secret need not be considered as grave.

There are *four situations* in which a committed secret, even of a grave nature, may be revealed.

A committed secret loses its binding power whenever the keeping of the secret would cause great *damage to the common good*. Since the public welfare (common good) imposes the obligation to keep a committed secret, this obligation naturally ceases when the same public welfare requires the revelation of the secret. Hence, if anyone has learned through a committed secret that an unjust revolution is to be set afoot for the overthrow of the legitimate government, he may and must reveal his information to the proper authorities. Even if the secret concerns only an individual who intends serious harm to the state, a person holding the secret must denounce him to the authorities, if he cannot avert the harm by a personal appeal to the individual to desist from his criminal purpose.

The holder of a committed secret may reveal it whenever the one committing the secret intends to inflict unjustly *a grave injury upon an innocent third person*. Since this intention is criminal, charity demands that the innocent party be protected from the criminal act of the other. If John, for example, binds me to secrecy about his intention of murdering or severely injuring his employer, so as to force a favorable issue to the existing strike, then, if I cannot dissuade John from the crime, I must warn the employer or use my knowledge in some other way to protect him from harm. The obligation to keep a secret may cease only when a 'future' action is involved; if the action is past, I cannot avert the crime, and the obligation remains. If a young man contemplating marriage suffers from an active venereal disease, the treating physician must dissuade him from marriage until cured or induce him to

inform his fiancée of his condition; if the young man refuses and intends to marry her in his present condition, the physician may, and probably even must, issue a warning to the girl about the impending serious danger to her health.

The obligation to keep a committed secret also ceases when it is necessary to avert *grave injury to the one committing the secret*. It is presupposed that he will have no reasonable objection to the manifestation of the secret under such circumstances. For instance. A friend tells me under the pledge of secrecy that he intends to invest a substantial sum of money in a certain commercial enterprise. Subsequently I discover that this enterprise is financially very unsound, and I use his information to prevent him from making the intended investment.

Unless a person pledges himself to keep a committed secret even at the greatest personal inconvenience, he may reveal the secret in order to avoid a *grave injury to himself*, because he cannot be supposed to accept a secret which would cause grave injury to himself. An exception to this would be the case where grave harm would be inflicted on the public welfare through the manifestation of the secret information; the common good supersedes a private good, and a person may not prefer his own private good to the common good of all by the use of knowledge which he did not receive except by means of a secret. Thus, if a friend tells me under the pledge of secrecy that he has murdered someone and later on I myself am put on trial for this murder, I may reveal the information in order to free myself from the accusation and the punishment for the crime, provided there be no other way of avoiding the severe

penalty which is bound to follow a verdict of guilt; and this holds good, even if my friend thereby is put in jeopardy of his life.

In general, the obligation to keep a committed secret loses its power to bind, first, whenever it can be reasonably presumed that the one who committed the secret to another is satisfied, in view of the circumstances, that the secret information be used with proper discretion; second, whenever the one to whom a secret has been committed receives the information from some other source, or whenever the information committed to him becomes public knowledge, so that the information is no longer strictly secret.

Charity begins at home. But charity should not remain there. Hence, charity or love imposes duties toward one's own person and toward the person of others. The duties of charity or love proceed from the natural law and are thus binding in conscience.

Summary of Chapter XIV

Man has *duties of love* toward himself and also toward other individuals.

1. *Duties Toward Self in General.* Man can have no duties of justice toward himself, but he has *duties of love*. Self-love is a dictate of the natural law. A hierarchy of powers exists in man, and it is his duty to regulate the use of these powers in conformity with the proper order dictated by his rational nature as a human person. Hence, *ordinate self-love* is a dictate of the natural law and, as such, a duty and morally good.

2. *Duties Referring to Man's Soul.* Proper self-love demands self-development and self-perfection, especially in those powers primarily concerned with moral conduct, intellect and will.

3. *Duties Referring to Man's Body.* Man has the duty of ordinate love of his body and everything pertaining to the proper welfare of his body.

Negative duties. One is never allowed to commit suicide. God alone has dominion over man's life, and the individual is merely the steward over his life. Since man did not give life to himself, he has no right to take it. Suicide is an unnatural act, because it is contrary to the instinct of self-preservation. Also self-mutilation and intentional and unnecessary exposure to serious danger and impairment of health are forbidden.

Positive duties. Man has the positive duty to use the ordinary means of preserving his health and bodily integrity.

4. *Duties Referring to External Goods.* Among the external goods necessary for a well-ordered life are a good name and a reasonable amount of earthly possessions.

5. *Duties of Love Toward Others.* We have the duty of a love of *benevolence* and *friendship* toward other individuals, because they are also 'persons,' children of God, and destined for the same eternal happiness as ourselves.

6. *Duty of Truthfulness.* One of the duties of love toward our neighbors is truthfulness or veracity. *Moral truth* is the conformity between speech and the judgment of the intellect. A *lie* is the telling of an untruth, or 'speech contrary to the mind.' If a person who tells an untruth is conscious of the contradiction between speech and mind, it is a 'formal' lie; if unconscious of the contradiction, it is a 'material' lie. Lies are either *pernicious, officious, or jocose*.

A formal lie is *intrinsically wrong*. First, a formal lie is contrary to the natural purpose of speech, which is the power to communicate the judgment of one mind to another. Second, it is forbidden by the natural law, because anything which redounds to the serious *detriment of society* is contrary to the natural law. Third, it is contrary to the *nature of God* who is all-truthful and all-holy.

7. *Mental Reservation.* One may not always divulge the truth, because secrets must be kept; and one may not tell a formal lie. Hence, there must be a means of hiding the truth

which may not be revealed. Since an officious lie is a formal lie, authors recommend a mental reservation for concealing the truth and protecting a secret.

A *mental reservation* is a statement which does not efficaciously reveal the judgment present in the mind of the speaker. The reservation is purely mental when the statement does not reveal the judgment in any manner. Since the words as spoken necessarily lead to deception, such a reservation is a formal lie. A *broad mental reservation* is a statement which limits the full meaning of the spoken words, so that, although there exists some external indication of the limitation either in the spoken words or in the circumstances of the speaker, the listener will most likely deceive himself as to the actual meaning of the statement.

The principle: For a just reason we are allowed to use a broad mental reservation, except when the questioner has the right to know the truth; sometimes we may even be obligated to use it. The use of such a reservation, when not forbidden by the end of the agent, the end of the action, and the circumstances, is *morally justified*.

8. *Secrets.* Secrets are either natural or promised or committed. A *natural* secret may be divulged when it cannot be kept without serious inconvenience. A *promised* secret may be divulged when it cannot be kept without serious inconvenience to one's self or to another, unless an explicit promise was made to the contrary. A *committed* secret may be divulged in the four following situations: when the keeping of the secret would cause great damage to the common good; when the one committing the secret intends

to inflict unjustly a grave injury upon an innocent third party; when it is necessary to avert grave injury to the one committing the secret; when it is necessary to avoid grave injury to the holder of the secret.

Chapter 15

DUTIES OF JUSTICE

WHILE MAN CAN HAVE NO DUTIES OF JUSTICE TOWARD HIMSELF, he has, besides the duties of love or charity, duties of justice toward other individuals. As he has rights of justice with respect to others, he also has duties of justice with respect to them. For rights and duties between individuals always go hand in hand.

In the foregoing chapter, the duties of love of an individual toward himself and his neighbor were examined in their fundamental principles. Only the most important duties of love were considered. In the section on 'secrets' it was pointed out that the obligation to keep a secret sometimes proceeds from a duty of justice as well as from love. In this chapter the duties of *justice toward other individuals* will receive fuller treatment, particularly as related to their right to life, to bodily integrity, and to honor and a good name.

Murder

Murder is the intentional and unlawful killing of a person. Killing is 'intentional' when it is deliberately intended either

as an end or as a means to an end. Direct killing may be achieved either positively or negatively: positively, when the death of the person is brought about as the result of an action, such as shooting or stabbing; negatively, when the death of the other is brought about by withholding an action that ought to be set, such as starving a person to death. To be murder, the killing must be 'unlawful.' A killing may be unlawful in one of two ways. The person killed may be 'innocent'; that is to say, he has neither committed a crime nor is he in the act of committing a crime which is deserving of death. Or, he may be a 'criminal' deserving of death. As such he may be put to death by public authority, and this killing is lawful. Individuals, on their own private authority, have no right to put a criminal to death; to do so would be lynching (about which more will be said later) and unlawful. For the present, we are concerned with the intentional, unlawful killing of an innocent person.

Murder, according to the natural law, *is intrinsically wrong*. The same argument applies here as in the case of suicide.

Life is a gift of God. *God alone* has the dominion over man's life, because God is the Creator of man's soul, and the soul gives life to the body. Hence, God alone is the Lord of life and death. A person who directly kills an innocent person invades the supreme right of God over life and death. Every person has the *right to life* according to natural law, and he cannot forfeit this basic right except for a crime deserving of death. But an innocent person has neither committed a crime deserving of death nor is he in the act of committing a crime deserving of death.

Consequently, the direct (deliberately intended) killing of an innocent person, whether on private or public authority, is contrary to the natural law and therefore intrinsically evil.

In a case of 'first degree' murder, the death of the innocent is deliberately intended, so that he is killed, according to the classic legal phrase, 'with malice aforethought.' But when he is killed in the heat of passion, as in an argument or brawl, on the spur of the moment, the directly intended killing of an innocent person is 'second degree' murder. Killing is manslaughter, with various degrees of culpability, if it is *indirectly voluntary*, that is, if it is only intended in its cause by knowingly performing an act which by its nature involves the probability of killing an innocent person, provided one has no just reason for the action. It would be culpable manslaughter, for instance, to drive an automobile at a reckless speed in congested traffic and cause a collision, thereby killing someone; or, to throw tiles down from a building into the street without regard for the safety of the people below; or, to use explosives carelessly in a quarry or mine, without proper precautions for safeguarding the lives of the workers. Such actions are by their very nature dangerous to life, and anyone performing them knows the danger to others; unless, therefore, a person has a just reason for the action, he is responsible if death results, because he is guilty of *culpable negligence*. If a person is killed, notwithstanding the fact that every reasonable precaution had been taken, the death is *accidental* and involves no guilt.

The right to life is a matter of *strict justice*, not merely of charity. Hence, a murderer is bound to supply full

indemnification for the loss of support inflicted on the victim's family and also for all medical bills incurred while the victim, if he lived some time after the attack, was ill. If the death of an innocent person ensues because of 'culpable negligence,' indemnification must be made according to the degree of guilt. That such a decision will be difficult to make is obvious. The principle itself, however, is clear enough. In most instances, the courts will have to render the decision; if they fail to render a decision, the moral obligation still rests upon the conscience of the one guilty of causing the innocent person's death, provided he possesses the means of indemnification. The life of the dead person, of course, cannot be restored; hence, restitution for the life of the person killed is impossible and ceases for that reason to be an obligation. If the widow and children receive insurance money or public funds sufficient for their proper support, they suffer little or no loss, and the obligation of indemnification decreases in proportion. Whatever obligation exists also devolves on the heirs, because the heirs assume all financial rights and obligations of the deceased.

Euthanasia

Euthanasia is the art or practice of painlessly putting to death a person suffering from a marked deformity or from an incurable and distressing disease. Euthanasia is also called 'mercy killing.'

Mercy killing is advocated in the case of infants who are born with marked bodily deformities, especially of the

brain; in the case of idiots and imbeciles, sometimes also of morons, when it is presumed that they will become public charges or a permanent burden to the parents; in the case of the incurably insane; in the case of persons suffering from a very painful and distressing disease which will eventually end in death; and in the case of helpless and useless persons, such as the very aged or hopelessly crippled, who are no longer of any benefit to society. Persons afflicted with extreme pain sometimes request a death-dealing potion, so as to be put out of their misery in merciful unconsciousness. Under such conditions and circumstances, some physicians claim, death is a boon, and they should have the sanction of the law to put an end to the life of these unfortunates. The practice of mercy killing became quite common in nazi Germany before and during World War II.

Euthanasia or mercy killing is a practice contrary to the natural law and therefore *intrinsically wrong*. It is murder. It is presumed that these persons have not been guilty of any serious crime. But the deliberately intended killing of an innocent person is murder. Physicians, of course, do not intend to kill such persons for the mere sake of killing, as if killing were the direct end of their act. They simply intend to put these unfortunates out of their misery by accelerating their inevitable death. They are prompted to the act of killing by a sentiment of 'mercy.' Nevertheless, they *directly intend the killing* as a means toward the otherwise laudable end of terminating a pitiable condition. In other words, they directly intend the killing of an innocent person for the sake of achieving a good end, and

they tacitly assume that 'the end justifies the means.' This is a pernicious and immoral doctrine. One may never do evil in order to promote a good. Since God alone is the Lord over life and death, no human being has the right to take an innocent person's life; to do so is to commit *murder*. But murder is contrary to the natural law and intrinsically evil. Consequently, euthanasia or mercy killing is an invasion of the rights of God and intrinsically evil.

Some physicians believe that mercy killing is permissible when requested by the patient himself, on the grounds that 'no injury is done to one who is willing (*volenti non fit injuria*).' The principle is valid in cases of alienable rights, when the possessor can dispose freely of what is his own. Life, however, is not a thing which belongs to a patient as disposable property; hence, the patient cannot grant permission to anyone to take his life. Even if a public law permits euthanasia and a public official has *authorized* or *ordered* mercy killing, the physician must refuse to perform the act, because neither private nor public authority has the right to take an innocent person's life, since it is an intrinsically immoral act. It is one thing to pass a law permitting an act, and quite a different thing to make an act morally permissible by making it legal; a law permitting mercy killing would be an iniquitous law, which no conscientious person would be allowed to obey.

Therapeutic Abortion

Abortion is the expulsion of a living fetus from the mother's womb before it is viable. By 'viability' is meant the child's

capability to live independently of its mother after it has left her womb. Normally, a child is considered to be 'viable' at about the twenty-eighth week of its life or toward the end of the seventh month, although at present, due to improved medical facilities, this time limit may be lowered to some extent; whatever the situation, in order to be 'viable,' the child must have a fair chance to survive, once it is removed from the mother's womb.

When the expulsion of the fetus occurs through natural causes, abortion is *accidental* or *spontaneous*. When it is purposely induced as the result of a voluntary act, it is *intentional* abortion. Accidental abortion, since it is unintentional and involuntary, is devoid of moral significance. Intentional from killing a child whom they can see and hear and feel. Now, time and size and place are accidental realities, and they carry no weight whatever in judging the morality of intentional abortion.

On the basis of *natural law* and therefore before the tribunal of God, all men are created equal. A life is a life, whether it be one minute or one hundred years old, whether it be that of a mother or that of a child. Every human being possesses the *inalienable right* to its life, and no one may infringe on this right, because no one has dominion over the life of a human being who is innocent of any crime deserving of death. God alone, the Creator of the animating soul, has the right to take the life of an innocent person, and nobody can assume the right to kill an innocent person without the explicit permission of God to do so. That neither the parent of the unborn child nor the physician has received this explicit permission, goes without saying.

Without such permission, it is murder to kill an innocent person through a deliberately intended positive act. Abortion of whatever kind, however, is the deliberate killing of an innocent person, because the expulsion of the fetus from the womb before it is viable cannot be accomplished except by a voluntary positive act. Hence, abortion is unwarranted murder. That the physician may be prompted by the good motive to help the mother in mortal distress, does not justify the act, because murder is evil, and evil may not be done so that good may result from it: the (good) end does not justify the (evil) means.

We must now examine the *main arguments for abortion*, especially therapeutic abortion, with a view to their validity for the justification of abortion in the desperate situation mentioned above, involving the death of either mother or child or of both.

Some physicians, in seeking to justify abortion in this desperate situation, appeal to the well-known maxim: *Necessity knows no law*. The maxim may find valid application in certain human, positive laws, but it can find no valid application in matters pertaining to natural and divine law when this law is negative in its precept. A *negative precept* of the natural law binds everybody at all times. 'Necessity' will be either physical or moral. Necessity is 'physical' when it arises from force according to a law of physical nature, as when a bullet is discharged from a rifle through the explosion of the powder in the cartridge. It is 'moral' when it arises from an obligation binding the will in consequence of a precept of the moral law, as when a mother has the duty to provide for her child according to

the precept of the natural law. There is no 'physical' necessity for saving a mother's life by killing her child by means of abortion because the physician is certainly not compelled by physical force to kill the child. Hence, the necessity, if there is any at all, can only be 'moral,' in so far as the physician would be bound by a moral law to take the child's life in order to save the mother's. But by what moral law? Evidently the natural moral law. However, the natural moral law, as was just pointed out, does not prescribe the death of the child; on the contrary, the natural moral law forbids it. Hence, there is no necessity, neither physical nor moral, for the physician to commit abortion, and the maxim that 'necessity knows no law' is false and invalid.

Another argument frequently advanced to justify abortion in this desperate situation is contained in the statement:

Between two evils the lesser must be chosen, the supposition being that the death of the unborn child is a lesser evil than the death of the mother. The supposition is erroneous. The right to life is a basic, inalienable right inherent in every human person. Both mother and child possess the right to life, and this right is equal in both; the death of the child, therefore, is not a lesser evil, but an equal evil. Hence, the physician, who is only a private individual, has no authority to cause the death of either mother or child. The physician is confronted by the choice of *permitting* a physical evil to occur in the course of natural events or of *perpetrating a moral evil* for which he is personally responsible, namely, of causing the death of an innocent child through his own action. Hence, applying the

principle that 'between two evils the lesser must be chosen,' he must avoid the moral evil of abortion, meanwhile doing everything in his power to stave off the physical evil of death for both mother and child.

It is also argued: In a *conflict of rights the superior right should prevail*. Again the argument rests on the fallacious supposition that a mother's right to life is superior to that of her unborn child. However, the right to life is equal in everybody, and a mother's right to life, therefore, is not superior to that of the child. Of course, the mother and the physician can decide to take the life of the child, because the child cannot defend itself. But that means simply that the stronger can prevail over the weaker without fear of retaliation; in other words, might makes right, irrespective of morality.

Finally, the argument is made: *The child is an unjust aggressor against the mother*, and therefore the mother has the right to defend her own life by taking the life of the child. But on what logical grounds can the child be termed an unjust aggressor? To be 'unjust' the child would have to elicit a positive act of its will deciding voluntarily to launch an attack upon its mother's life. The child, however, cannot so much as exercise its will at this stage, because it is still unconscious. What is really meant is, that the child's mere presence in the womb endangers its mother's life. Undoubtedly it does, under the circumstances; but through *no fault of the child*. The physician should do everything possible to correct the defect of the mother's constitution and preserve her life, if he can, but he has no authority to kill an innocent child in such a situation, because the child

has done no unjust act in being where it is and living in the only place where it is capable of living at the time.

This doctrine may seem harsh, but only to those who prefer sentiment to reason and expediency to morality. *Two principles* must govern this difficult problem: 'murder is intrinsically wrong' and 'evil must never be done so that good may issue from it.' On the basis of these two inviolable principles we are forced to condemn even therapeutic abortion.

Intentional abortion, i.e., the deliberately induced expulsion of a living fetus before it has become viable, is always grievously immoral, even when done to save the life of the mother. In intentional abortion the death of the fetus is directly willed and brought about, so that the death of the fetus is the direct object of the intended action either as an end in itself or as a means to an end; the good that is intended *follows from the abortion* as an effect from its cause. Whether the methods used be direct or indirect is an indifferent matter, so far as the morality of the act is concerned; the abortion itself is a direct abortion, because it is directly intended and willed.

Indirect abortion is different and is sometimes permissible. An 'indirect' abortion is the secondary *effect* of an otherwise licit action which is the primary object of the intention. The situation occurs mainly in the case of a pregnant mother who suffers from a dangerous disease which is not the result of her pregnancy but which she has contracted some other way, although her condition may be aggravated by the pregnancy. For example, The mother may have a malignant tumor or cancerous growth in her

abdomen or uterus. Her life is in serious danger, and the tumor or cancer should be removed without delay, because delay will most probably mean death. Now, a malignant tumor or cancerous growth does not result from pregnancy, as can be seen from the evident fact that many persons are afflicted with a tumor or a cancer without being pregnant. If the woman in question were not pregnant, it would certainly be permissible to remove the tumor or cancer in order to save her life. Hence, it must also be permissible to remove these serious threats to her life, while she is pregnant, because they are not the result of her pregnancy and exist independent of her pregnancy. What is intended directly in such operations or treatments is the curing of her *personal disease* contracted independently of pregnancy, and she has the right to undergo such operations or treatments in order to save her life. If abortion should follow, it would be indirect, *unintentional*, and *incidental*. Her cure would not result from the abortion, but the abortion would result as a secondary effect from the cure.

Indirect abortion is an instance of the *double effect*, one good and one bad, which must be judged according to the principles of the *indirect voluntary* (Chap. 3). In order that any treatment or operation resulting in indirect abortion be licit, the four conditions of the indirect voluntary must be fulfilled. *First*. The principal action must in itself be a morally good or indifferent act. Here, the removal of a cancerous uterus endangering the mother's life is in itself a morally good or indifferent act, not an evil act. *Second*. The good effect must result directly from the principal action

and either precede the evil effect or be at least simultaneous with it. Here, the good effect of saving the mother life is produced by removing a diseased organ and not by expelling the fetus; the death of the fetus follows the removal of the cancerous uterus, but does not precede it. *Third.* The intention must be directed toward producing the good effect while the evil effect is not intended but merely permitted to happen. Here, the intention is directed toward the curing of a diseased condition, which is a good effect, and not toward the killing of the fetus; the death of the fetus is merely permitted as something unavoidable under the circumstances. *Fourth.* The good effect must be more important than the evil effect, or at least of equivalent value. Here, the life of the mother is equivalent in value to the life of the fetus. Hence, it is *morally licit* to remove the cancerous uterus of the mother in order to save her life, even if the loss of the fetus is foreseen. The same principles apply, if it is a question of necessary medical treatment rather than of a surgical operation.

Naturally, everything must be done to save the life of the child. If it can be done by postponing the cure of the mother until the child is at least viable, the cure must be postponed. But if the danger to the mother's life is serious, and the cure cannot be delayed, the physician may proceed with the cure. In proceeding with the cure, if there is a choice of equally effective drugs, treatments, or operations, and one of these drugs, treatments, or operations involves less danger for the life of the child, the less dangerous method obviously must be chosen. Just how dangerous the situation is for both mother and child, and what method will remove

or reduce the imminent danger of death for the mother, must be left to the conscientious judgment of the medical profession.

Some may see little difference between *direct* and *indirect* abortion in such desperate situations, because the child loses its life in either case. There is, however, the difference between *directly willing* and *indirectly permitting* the child's death —the difference between placing a gravely immoral act and a good act.

Self-Defense

The right of an innocent person to his life is sacred and inviolable, so that no one has the right to deprive him of his life. But what about *killing an unjust aggressor*? Before we answer this question, we must clarify our terms.

An aggressor is a person who *attacks another* with the purpose of depriving him of his *life, bodily integrity, or property*. In order that a person be termed an 'aggressor,' the attack must be *actual*, in the sense that he is in the very 'act of attacking' or is doing something which is by its nature the 'proximate preparation' for the act of attacking. It would be, for instance, an 'act of attack' if a man lunged at another with a drawn knife; it would be the 'proximate preparation' for the act of attacking if he started to pull a gun out of his pocket: in either case the attack must be called 'actual,' so that he can legitimately be termed an 'actual aggressor.' The mere 'planning' of aggression does not constitute actual aggression; it is only remote

preparation which may, or may not, lead to actual aggression.

In the question here considered, the aggressor must be *unjust in his attack*. In other words, he has no right to make an attack on another's life, bodily integrity, or property, but invades the other's right in an unlawful manner. If the attack were just on the part of the assailant, resistance would be unjust. It is presupposed, therefore, that the assailant has no right to make the attack, so that his attack is 'unjust aggression.' Unjust aggression may be either formally or materially unjust. Aggression is *formally unjust* if the assailant makes his attack with full knowledge and consent, so that his act is a truly 'human act.' It is *materially unjust* if the assailant is not in possession of his rational powers at the time of the attack, so that his attack is not a truly 'human act,' as would occur, for instance, if the assailant were insane or drunk or under the dominant influence of a powerful drug. Even under such conditions the aggression is 'unjust' (although the assailant may not be directly responsible for his action), because, as a matter of fact, he is invading the just right of another.

Three conditions must be fulfilled for self-defense to be lawful. *First*, the assailant must have proceeded to actual attack. After the actual aggression is past, one can no longer speak of 'self-defense.' *Second*, the attack must be formally or materially unjust. If the attack is just, resistance as self-defense would be unjustifiable; a robber, for instance, cannot resist a policeman on the plea of self-defense, because the policeman is in the right. *Third*, proper moderation must be observed in self-defense, so

that one does not use means greater than necessary to repel the attack of the unjust aggressor. Hence, if the danger to one's life can be avoided by fleeing or shouting, this should be done, if not too inconvenient; if wounding the assailant suffices to ward off the danger to one's own life, one must choose wounding rather than killing, provided one can conveniently make the choice under the circumstances.

These three conditions having been fulfilled, the *general principle* holds that an innocent person has the right to defend his life against an unjust aggressor, even to the extent of *killing the aggressor if necessary*. However, to exceed the limits of 'proper moderation' would be revenge; not 'just self-defense.' One cannot actively and effectively repel an unjust aggressor's attack without inflicting some loss upon him. If it is impossible to repel the assailant's attack upon one's life except by taking his life, killing the unjust aggressor is morally lawful; but if it is possible to repel his attack by inflicting an injury on him less than life, killing the unjust aggressor is not morally lawful.

The right to life is a *basic* and *inalienable right*, and it does not cease when a person is unjustly attacked by another. Every basic and inalienable right, however, possesses co-active *inviolability*, because it is a right given to each individual by the natural law. But such a right would not possess co-active inviolability if it could not be defended up to the point of effective preservation. Now, the effective preservation of life against an unjust aggressor may be impossible without killing the unjust aggressor.

Consequently, under such conditions the defense of one's life would justify the killing of the unjust aggressor.

The only valid reasons one can give that the innocent defendant's right to life would cease under an unjust attack would be: that the aggressor's right to life is greater than that of the defendant's; that the innocent defendant's right to life was nullified by the aggressor's unjust attack; that the innocent person must cede his right to life to the aggressor's right to life. It should be obvious, however, that none of these reasons are valid. The unjust aggressor can save his life by ceasing to attack the life of the defendant; but the defendant cannot save his life by ceasing to defend himself. Hence, the right to defend one's life against an unjust aggressor does not cease under attack, whereas that of the unjust aggressor does.

We arrive at the same conclusion when we consider the *welfare* and *security of human society*. If the innocent person were not permitted to repel the unjust aggressor's attack, even at the expense of the assailant's life, criminals would have a tremendous advantage and would not hesitate to ply their nefarious trade without fear. They could and would threaten other people's lives without danger to their own. As a consequence, they would inflict the greatest damage upon orderly society. Of course, society has the obligation to establish the necessary police and military force to protect the rights and lives of the citizens, and the citizens, whenever possible, must seek the aid of the government when their rights and lives are threatened. Criminals, however, are not in the habit of advertising their plans in advance, so that an appeal to the authorities would

be effective. Since the danger to the innocent person's life is immediate and instant, without the possibility of recourse to the public authorities, each person must be permitted to defend his life to the best of his ability at the moment the attack is made; otherwise the welfare and security of society cannot be adequately maintained.

On the same grounds and for the same reasons it is morally lawful to *defend the life of others* against unjust attack. What an individual is allowed to do for himself, he is allowed to do with the help of another. Hence, he may solicit the aid of another, and the other may offer his aid. Even if the innocent defendant is not in a position to solicit aid from another, he has the right to do so, and it is presumed that he would do so if he had the opportunity. Hence, one may come to the assistance of the innocent defendant without waiting to be asked. Since, however, the killing of another person, even if he is an unjust aggressor, is an extreme measure, one has *no duty to assist the defendant*, unless it be that one is obligated to render this assistance on the special grounds of *piety* or *official position*. For example. If the defendant were a person whose life is needed for the preservation of the public welfare, and there is good hope of success, legal justice would demand that one come to his assistance; or, if the person attacked were a member of one's immediate family, piety would impose the duty upon the other members of the family to defend the life of the one assailed; or, if one had the official duty to protect other people in their life and property, such as a guard, a policeman, or a soldier, he would be in duty bound to

defend them, even at great inconvenience and considerable danger to himself.

Although an innocent defendant has the 'right' to defend his life, even to the extent of killing the unjust aggressor, if necessary, he has *no duty to kill* his assailant. The natural law demands that each person use all 'ordinary' means to preserve his life, but he need not use 'extraordinary' means. Now, the killing of another is certainly an 'extraordinary' means of preserving one's own life. Hence, one need not use such means, but may permit the aggressor to carry out his threat. There are *two exceptions*. The innocent person must defend his life, if his life is necessary or very useful for the public good, or if his soul is in a state of grievous sin and he thus runs the serious risk of losing his eternal happiness.

Bodily integrity and material *possessions*, like life, are rights based on strict justice, and as such they have *co-active inviolability*. These goods are necessary for the individual for the proper ordering of his life in society. No one has the right to deprive an innocent person of these goods, and the innocent person has the right to defend these goods against an unjust aggressor. If these goods are of *considerable value* and importance, the innocent defendant may protect them against the unjust aggressor even to the extent of killing the assailant, if they cannot be preserved in any other manner. Charity does not demand that one prefer the higher good of another (the life of the assailant) to one's own goods of a lower order (integrity and possessions), except in the case where the other's life would be jeopardized unnecessarily or without just cause. In

defending one's bodily integrity or possessions against an unjust aggressor, justice is evidently on the side of the innocent defendant, not on the side of the aggressor; hence, there is a just cause for defending these goods. Nor can it be rightly said that the unjust aggressor's life is jeopardized unnecessarily, because he exposes his life voluntarily and all he would have to do to avoid the danger of death would be to desist from his act of unjust aggression.

The goods in question must be of 'considerable value and importance,' because charity demands that no one inflict the extreme penalty upon another for something which is only a slight offense. The standard, according to which the value and importance of these goods are to be judged, depends largely on the person assailed; something may be of minor value to one person and of great value to another, depending upon conditions and circumstances. A very wealthy man, however, may defend his possessions against an unjust aggressor and kill him, if necessary, even if the loss would not entail any serious privation for him personally; here the standard would be the welfare and security of society, because society would soon be disrupted, if a criminal could deprive a wealthy man of his possessions with impunity. The wealthy man in such a case would be defending the welfare and security of society while defending his own possessions, and that is a just and sufficient reason to repel the aggression of his assailant. So, too, a woman may defend her chastity against attack and kill the would-be rapist, if flight or screaming would be of no avail, because she is defending a good which is of

greater value than earthly possessions; however, if she is forced to submit to the attack under threat of death or bodily harm, it is well to remember that chastity is not lost without personal consent.

Provided, then, that the innocent defendant observes proper moderation, he has the right to defend his life, bodily integrity, and possessions against the attacks of any unjust aggressor.

Dueling

A *duel*, in the juridical sense, is a *conflict between two individuals, undertaken by mutual agreement and fought with weapons capable of inflicting serious wounds or death.*

In order that a conflict between two individuals be really a duel, it is essential that they enter into a mutual agreement as to the place, the time, and the type of weapons, so that an interval exists between the setting of the conditions and the actual conflict. It would not be a true duel, therefore, if two individuals provoke each other to anger in a quarrel and forthwith proceed to fight, even if they use lethal weapons. The weapons used in a duel must be such that they are, of their very nature and not merely by accident, capable of producing serious wounds or death; such weapons, for instance, are pistols, sabers, and rapiers, but not sticks, fists, etc.

Duels may be 'private' or 'public.' It would be more accurate to say that duels are undertaken either on *private or public authority*. In a 'private' duel the participants seek to settle their individual differences by means of an armed

conflict. In a 'public' duel the participants represent their respective nations and states and fight in the name and with the authority of the respective governments.

Duels undertaken on the *private authority* of individuals are always morally *wrong*. It is contrary to natural law to intend to kill or severely wound another and to expose one's self to the same danger. Neither of the participants has the dominion over his own life or that of his opponent, so that he would have the right to cause his death or inflict severe wounds. Hence, in agreeing to a duel they assume a right which is not theirs, but God's.

Duels undertaken by *public authority* are licit if they are fought for the common good which could otherwise not be obtained except through the consequent shedding of much blood. If an army can fight against another army at the behest of public authority, in order to reach a decision, certainly the decision can also be sought by selecting two individuals to represent their respective governments, so long as these governments agree to rest their decision on the outcome of the individual conflict. The only *legitimate reason*, however, which may prompt the governments to seek the solution of their differences in this manner, would be to avoid a just war or to terminate a just war, so that the blood of many may not be needlessly shed. If governments can settle their differences by arbitration or by an appeal to an international court, even the duel by individual representatives would not be permissible, because the outcome of a duel by no means always coincides with the right.

Lynch Law

Lynch law is the practice or act of meting out punishment by private persons to guilty or suspected persons without due process of law. 'Lynching' is said to derive its name from Charles Lynch (1736—1796), a justice of the peace in Virginia, who used such methods against the Tories of his day.

It is one of the functions of organized society with its properly constituted public authority to protect the rights of the citizenry and administer justice through the medium of courts and law-enforcement agencies. In organized society no private individual or group of individuals is allowed to *usurp the functions of public authority*; to do so would be an act of violence and a species of anarchy.

In communities which are an integral part of society, lynching is done either before the court has handed down a verdict or after. If *before*, lynch law is employed on mere suspicion of guilt or, if guilt is certain, before the court has declared the accused guilty of a crime deserving of punishment. To lynch an accused person under such conditions is to deprive him of his life without due process of law and is contrary to the welfare and security of society. If *after*, the verdict of the court was either 'guilty' or 'not guilty.' If 'guilty,' lynching is an arbitrary usurpation of public authority on the part of a private individual or group of private individuals, and such an act is also contrary to the welfare and security of society, because it is the right and duty of society to bring a convicted criminal to justice according to the statutes of law. If 'not guilty,' the citizens

are obligated to abide by the decision of the court, because the very purpose of legal processes would be frustrated if lynching were permissible. Even if the accused were known on private information to be guilty, lynching would be morally wrong, because it is better in the interest of society as a whole that one criminal go without due punishment than that the processes of law be frustrated through the usurpation of public authority on the part of private individuals. Lynching, if permitted, would give free rein to blind passion and partisanship, and the abuses inherent in lynching would threaten the common good through mob violence. The remedy is worse than the cure.

Lynching may be *morally permissible in exceptional circumstances*. In frontier regions, where society with its legal processes is not yet properly established, individuals and groups of individuals may execute the law against known criminals for their own protection; otherwise there would be no adequate deterrent against crime. Under such conditions the natural law is the only law in force, and law-loving persons and groups have the right to enforce the natural law against evildoers for the good of all concerned. Such were the genuine Vigilante Committees in the Far West before the various states were founded and organized. Theoretically speaking, it would be morally lawful for citizens to employ the lynch law in cases where the machinery of the law is used by corrupt judges and courts to perpetrate constant miscarriages of justice, in order to put an end to such abuses. The judges derive their authority from God through the community and act in the name of the community; hence, if they are unfaithful to

their trust, and if no other remedy is available, the community itself may administer justice for the sake of the public welfare. In practice, however, even in such extreme cases, lynching is in itself so serious a menace to orderly government that it cannot be justified except as a last resort, because it permits violence and mob rule to take the place of public authority. In most instances, the laws of society provide for the correction of abuses on the part of judges and courts, and it is necessary to have recourse to every legitimate means before the community would be justified in taking the law into its own hands.

All in all, therefore, lynching is morally unlawful, except in places where the laws of organized society are not enforceable.

Eugenic Sterilization

Sterilization in general is the mutilation of the sexual power in man or woman so as to render conception impossible. It permits sexual intercourse, but hinders conception. If performed for the purpose of hindering the conception of undesirable and physically or mentally unfit children, it is called *eugenic sterilization*. Sterilization is *voluntary*, when a person wills and requests it for himself; it is involuntary or compulsory, when performed by order of the public authority of the state. Eugenic sterilization is advocated by many for persons convicted of serious crimes and persons afflicted with social diseases or grave physical or mental defects, such as syphilitics, lepers, idiots, imbeciles, and insane persons.

Voluntary eugenic sterilization is *intrinsically wrong*, because it is contrary to the natural law. Every kind of sterilization is serious mutilation of a natural power and frustrates a natural function. The intrinsic purpose of the sexual function, as intended by the Creator, is the propagation of the race, and the propagation of the race is intrinsically dependent on conception. Whoever, therefore, hinders conception by a positive act, such as a surgical operation, frustrates the intrinsic purpose of the sexual power, as intended by the Creator, and thereby acts contrary to the natural law which is based on human nature and its natural functions. But everything contrary to natural law is intrinsically immoral. Consequently, voluntary sterilization, even when requested for an apparently good purpose, is intrinsically wrong, because a good end does not justify immoral means.

Compulsory eugenic sterilization is *intrinsically wrong* when ordered by public authority in the case of *innocent* persons, even when these persons are afflicted with congenital, inherited, or acquired incurable diseases or defects. The state exists to protect the natural rights of citizens; it may not deprive them of natural rights. Thus, for example, the individual's right to life is a natural right, and it would be murder on the part of public authority to put an innocent person knowingly to death. Similarly, the right to bodily integrity is a natural right, and it would be criminal on the part of public authority to invade this natural right by ordering the sterilization of a person not guilty of a serious offense, because sterilization, even when performed for eugenic purposes, is a serious mutilation. The purpose

of the state in legalizing eugenic sterilization is to permit individuals to have sexual relations, but to hinder conception. Since, however, the natural and intrinsic purpose of sexual powers and sexual relations is the conception of children, according to the law of nature, the frustration of this function by means of compulsory sterilization in an innocent person is a positive act contrary to a natural law. A positive act contrary to the natural law is intrinsically evil. Hence, the compulsory sterilization of an innocent person is intrinsically evil.

The very essence and existence of the state is based on the natural law. Once the state permits itself a nullification of the natural law, it undermines the very foundation of its own security and existence. The state is a legal and moral person composed of individual persons and, like the individual persons of which it is composed, is subject to the rigorous prescriptions of the natural law. And just as individual persons may not voluntarily submit to the mutilation of eugenic sterilization without seriously violating the law of nature and of nature's God, so, too, the state may not compel its innocent subjects to submit to the mutilation of eugenic sterilization without seriously violating the natural law and invading God's absolute dominion over man's members and functions. The state would have the right to order the compulsory sterilization of its innocent subjects only on the supposition that the state is superior to the natural law and the source of all human rights and duties. Such a theory, however, is identical with the totalitarian doctrine of *state absolutism*, as taught and practiced by nazism and communism. The

right to enter marriage and beget children *existed prior to the state* and as such must be protected, not abolished, by the state. In legalizing compulsory eugenic sterilization for innocent persons, therefore, the state arrogates to itself a right which it does not legitimately possess.

Defectives, such as cripples, idiots, morons, and insane people, and *diseased*, such as tuberculars, syphilitics, lepers, are not guilty of serious crime in a legal sense; they are 'innocent' persons in the eyes of the law. Hence, the state has no right to impose eugenic sterilization upon them, especially since acquired or accidental characteristics are not hereditary.

Even *criminals* have natural rights, among them the right to bodily integrity, of which they may not be deprived by the state. Since sterilization is nothing but a form of *positive contraception*, and contraception is the frustration of a natural power and its function, compulsory sterilization, even when performed on criminals, contravenes the natural law and is intrinsically immoral. The state, therefore, has no right to perform compulsory sterilization on criminals. The state may, for just cause, *prohibit the use* of a natural function, and the state actually does condemn criminals to a life of celibacy while they are imprisoned. Those criminals who are sentenced to life imprisonment for very grave crimes cannot make use of their marital rights, if they are married, nor can they have extramarital relations with anyone during their incarceration; since they cannot have offspring, sterilization is unnecessary in their case. Those criminals who have not committed a crime deserving of death or life imprisonment

have expiated their crime and paid their debt to society at the expiration of the sentence, and any other penalty is unjust. Since they are now restored to membership in society, they have the right to the use of all natural rights, the same as all other citizens in good standing. Hence, to deprive them of the very possibility of having offspring through compulsory sterilization is to impose a penalty upon them far in excess of the nature of their crime. If they are sane, their former crime will not produce defective children, and there is not even a eugenic reason for their sterilization; if they are insane, they should be permanently institutionalized in a hospital for the criminally insane, and in that event there is again no need for sterilization. Since sterilization is not merely temporary or permanent prohibition of the use of a natural power and function, but permanent and serious mutilation, the state is guilty of violating the natural law in ordering compulsory eugenic sterilization for criminals, and this is intrinsically wrong.

A treatment or operation necessary to preserve a person's life or restore the general health, is morally permissible, even if sterility results as a secondary or coincidental effect. The restoration of the health of the person is intended, not sterility. The case is similar to that of infected eyes which must be removed because of danger to the whole body. The loss of sight is not intended, but permitted to follow the operation as an unavoidable result, in order to restore general health. The principle of double effect applies. In compulsory eugenic sterilization, however, the treatment or operation is intended directly and immediately to prevent conception; the social or eugenic

good, namely, a better breed of human beings by hindering the conception of undesirable and unfit children, is the result obtained by the immoral means of frustrating a natural power and its function. The desire for a better human race is in itself laudable. But the advocates of eugenic sterilization lower human beings to the level of a human stud farm. It is one thing to strive for the betterment of the race; it is quite another to do so by violating true morality. Eugenic sterilization is a measure of expediency, but *expediency* is by no means a valid norm of morality.

If the time should ever come that marriages by defectives, because of the increasing number of defective children, seriously threaten the welfare of society, the state has the authority to *segregate the unfit* and thereby *indirectly* procure the betterment of the race, without the immoral means of sterilization. The common good of society will justify this segregation as an extreme remedy, just as the state now segregates those who are a constant menace to their fellow men. In this manner the public welfare is preserved and the moral order is upheld.

Honor and Good Name

Besides the right to life and bodily integrity, each individual ordinarily has the right, based on strict justice, to honor and a good name.

A good name or a good reputation is the esteem in which a person is held by others because of natural or acquired excellences. *Honor* is the manifestation of esteem rendered

to someone in an external manner, as by speech, actions, or other signs.

Honor and a good reputation, whether founded on natural or acquired qualities, are of great value to the individual for a successful life in human society. Hence, each person has the duty to exercise reasonable care in acquiring and preserving his good name among his fellow men. From this duty arises the right of each individual to demand of others that they do not unjustly hinder him from acquiring a good reputation and honor and that they do not unjustly injure the good reputation and honor once acquired. Correspondingly, others have the *duty to respect* the good name and honor of their neighbor and *not to injure him unjustly* in these important goods.

Honor and a good name are far superior in value to material possessions. And just as one has the right in strict justice to possessions received by inheritance or acquired through personal Initiative and industry, so one has the right in strict justice to the honor and good name obtained naturally or as the result of personal activity. Each person has a *connatural right* to the esteem which is accorded people because of their natural dignity as human beings and because of the gifts and qualities nature has bestowed on them. Thus, every person has the right to be esteemed as good until proved to be bad. And each person has the connatural right to acquire *special* honor through extraordinary personal achievement, so long as his endeavor does not violate the rights of others or harm the common good of all. Similarly, each person has the acquired right to retain the honor and good reputation he has been

able to build up for himself among his fellow men as a consequence of his personal achievements.

These rights are *perfect* rights and as such they possess *co-active inviolability*. Hence, they may be defended against unjust attack by suitable and legitimate means and reparation exacted for the damage inflicted, as is frequently done in libel suits in courts of justice.

Unjust internal injury is done to another's good name by *rash judgment*, which is firm assent to a supposed defect defamatory of one's neighbor without sufficient cause, and by *rash suspicion*, which is suspicion of such a defect without sufficient reason. Unjust injury is done externally to another's good name by *detraction*, which is the manifestation of a hidden fault or defect of another without sufficient cause, and by *calumny*, which is the false attribution of a defect or fault to him. The injury will be grave or slight, depending on the person injured and the nature of the defect or fault.

At times it *may be lawful* to reveal the hidden defects or crimes of another, namely, for a proportionately grave reason. A *just cause* would be the common good of the community or of society. It would also be a just cause if the manifestation were necessary for the private, personal good either of the one making the manifestation or of those to whom the manifestation is made or of the one about whom the manifestation is made. Two *conditions*, however, must be fulfilled in order that the manifestation of another's hidden defects or crimes be morally permissible: the good to be gained must be at least equal in gravity to the harm done to the one whose faults are revealed; the harm done

must be minimized as much as possible. It would, for instance, be lawful for me to reveal the hidden faults of someone who is bent on unjustly ruining my good name, if he could not be deterred from his action in any other way. It would be lawful to reveal the hidden defects and crimes of a candidate for public office if these defects and crimes make him unworthy of the office to a notable degree or hinder him from properly fulfilling the duties of his office.

When the good reputation of another has been unjustly damaged, strict justice has been violated, and *proportionate restitution* must be made to repair the damage.

Paramount among the basic personal rights of man, to be respected by all in strict justice, are the right to life, to bodily integrity, and to honor and a good name. Another basic personal right is that of proprietorship; it will be considered next.

Summary of Chapter XV

This chapter treats of the *chief duties of justice toward other individuals* as related to their right to life, to bodily integrity, and to honor and a good name.

1. *Murder*. Murder is the *intentional and unlawful killing* of a person.

Murder is *intrinsically wrong* according to the natural law. Whoever kills directly an innocent person invades God's supreme right of dominion over man in his life and death. Every person has the right to life according to the natural law, and he cannot forfeit this basic right except for a crime deserving of death. A murderer is bound to supply full indemnification for the loss inflicted.

2. *Euthanasia*. It is the practice or act of painlessly putting to death a person suffering from a marked deformity or from an incurable and distressing disease. Euthanasia is also called 'mercy killing.'

Euthanasia is *intrinsically wrong*, because it is the direct killing of an innocent person and therefore murder. Even though the motive be good, the (good) end does not justify the (evil) means.

3. *Therapeutic Abortion*. Abortion is the expulsion of a living fetus from a mother's womb before it is viable. Intentional abortion is the deliberately induced expulsion of a living fetus before it has become viable. Abortion deliberately induced to save the mother from danger of death brought on by the pregnancy is called therapeutic abortion.

Intentional abortion, even therapeutic abortion, is *intrinsically wrong*. The right to life is equal in all persons, and it is an inalienable right; the right to life on the part of the mother has no preference with respect to the life of the child. God alone has absolute dominion over man's life. Without His permission, which may not be presumed, to kill an innocent person is murder. In abortion an innocent person, the unborn child, is directly and deliberately killed. This act is murder, and murder is intrinsically wrong. The arguments commonly advanced are invalid.

In direct abortion occurs as the secondary effect of an otherwise licit action which is the primary object of the intention; indirect abortion is indirect, unintentional, and incidental to the licit action, and is an instance of the *double effect*, one good and one bad, according to the principles of the *indirect voluntary*. For a proportionately grave cause it is permissible.

4. *Self-Defense*. It is permissible to kill an unjust *aggressor* in self-defense, provided there is an 'actual' attack and the attack is 'formally' or 'materially' unjust, due regard being given to 'proper moderation'.

The right to life is a *basic* and *inalienable* right, and it does not cease when under an unjust attack by another. The coactive inviolability of such a right presupposes its effective preservation against an unjust attack; hence, the defense of one's life would justify the killing of an unjust aggressor, if necessary for self-preservation. For the same reason it is permissible to defend another's life against an unjust attack. Even *bodily integrity and material possessions of considerable value* may be defended to the

point of killing the unjust aggressor, if they cannot be preserved in any other way. In all cases, however, *proper moderation* must be observed, so that one does not use means greater than necessary to repel the attack.

5. *Dueling*. Dueling is a conflict between two individuals, undertaken by mutual agreement and fought with weapons capable of inflicting serious wounds or death.

When undertaken on *private authority*, dueling is morally wrong. It is contrary to natural law to intend to kill or severely wound another and to expose one's self to the same danger.

When undertaken by *public authority* to avoid a just war or to terminate a just war, so as to prevent the consequent shedding of much blood, a duel between two official representatives of the respective nations or governments is permissible.

6. *Lynch Law*. This is the practice or act of private persons of meting out punishment to guilty or suspected persons without due process of law. In organized society no private individual or group of individuals is allowed to *usurp the functions of public authority*. Lynching may be morally permissible, when society is not yet properly established, or when, in extreme cases, corrupt judges or courts perpetrate constant miscarriages of justice and no other remedy is available.

7. *Eugenic Sterilization*. Eugenic sterilization is the mutilation of the sexual power in man or woman for the purpose of hindering the conception of undesirable and physically or mentally unfit children.

Voluntary sterilization is intrinsically wrong, because it involves the frustration of a natural power and function and as such is contrary to the natural law.

Compulsory sterilization is *intrinsically wrong* for the same reason, both in the case of innocent persons and criminals. Sterilization is a form of positive contraception and as such is contrary to the natural law. The (good) end does not justify the (evil) means.

8. *Honor and Good Name*. Each person has the natural right to the esteem which is accorded people because of their natural dignity as human beings and because of the gifts and qualities nature has bestowed on them. And each person has the acquired right to retain the honor and good reputation he has built up for himself through personal effort.

‘Internally,’ unjust injury is done to another’s good name by rash judgment and rash suspicion; ‘externally,’ by detraction and calumny. A ‘just cause’ is required for the revelation of the hidden defects or faults of another; otherwise justice is violated and restitution must be made.

Chapter 16

RIGHT OF OWNERSHIP

MAN IS A SELF-CONTAINED, AUTONOMOUS BEING, A 'PERSON.' Because he is a person, he has definite basic rights, among which are the right to life, to bodily integrity, to honor and a good name. Man, however, is not an angel, but a psychosomatic being, a rational animal. Being an animal and having a material part in his nature, man must use material things.

It is recognized by all peoples, civilized as well as uncivilized, that the use of material things brings with it the *right of ownership*. Included in this right is the right to *private* ownership. There can be no question about the universal fact of private ownership; the fact itself is admitted by everybody.

The question of property rights, as represented in the system of capitalism and in the system of communism or socialism, is the great ideological problem of our age. To pass an adequate judgment on its legitimacy, we must understand 'private ownership' in its nature and applications.

Nature of Ownership

Ownership is a form of dominion, and *dominion* is the right to dispose of certain persons or things. The right to rule certain persons as subjects is called the 'right of jurisdiction'; we are not concerned here with this type of dominion, except indirectly. The dominion over things is the *right of ownership or proprietary dominion*, and it is defined as the *exclusive right to control and dispose of some thing as one's own according to one's will*.

Ownership is an 'exclusive right' over a thing. The thing 'belongs' to this particular person. There is such an intimate connection between this person and this thing that no one else may have it or use it without his permission, because he is the 'owner' of the thing.

Ownership is the 'exclusive right to *control* and *dispose*' of a thing. To 'control' and to 'dispose' of a thing means to possess it, to use it, to sell it, to change it, to give it away, to destroy it, or to do anything else with it. The owner has the right to do any of these things, without violating commutative justice against any other person. He might violate the virtue of charity or the virtue of piety with respect to his family, but he cannot be said to violate commutative justice in controlling and disposing of the thing in any of the ways just mentioned, because the thing is 'his' and not another's.

Ownership is the 'exclusive right to control and dispose of *some thing*.' The term 'thing' is taken here in a very broad generic sense as material and immaterial goods. Money, land, houses, cattle, machinery, etc., are material

things; good will (in business), the right to an invention or to an inheritance, etc., are immaterial things. Any of these goods are 'things' that may fall under the ownership of a person, so that he has the exclusive right to control and dispose of them.

Ownership is the 'exclusive right to control and dispose of some thing at *one's own*.' The thing belongs to him as his property, so that he has the *jus in re* over it. This is the distinctive characteristic of proprietary dominion in the strict sense, because it indicates that the owner actually possesses the thing in question and may control and dispose of it.

Ownership is the 'exclusive right to control and dispose of a thing as one's own *according to one's will*.' Since the thing belongs to him and is his own, he can control and dispose of it to his own interest in any way he sees *fit*. He need consult no one but himself, because he is the owner of the thing and the thing is strictly 'his.'

Such is the nature of private ownership in its most fundamental form. *In the concrete*, proprietorship often exists with a *limitation or restriction* either upon the right of ownership itself or upon its use. It would be a limitation on the right itself, for example, if a father willed the ownership of a house to his son, but conferred the right to live in the house on his daughter; again, for the public welfare, the state may restrict the building rights on certain landed properties. The use of a certain right may be limited either on 'moral' or 'juridical' grounds: on moral grounds if this use would be contrary to some virtue, as is the case, for instance, when a person is prohibited from using his wealth

for immoral purposes; or on juridical grounds, as when a minor is prohibited from using his property until he is of age.

Unless, therefore, some limitation is imposed on the right or its use, private ownership by nature is 'the exclusive right to control and dispose of a thing as one's own according to one's will.'

Kinds of Ownership

The two main *divisions* of ownership are the right of eminent domain and of private domain.

The right of *eminent domain* is the superior dominion of the state over all property whereby it has the authority to appropriate and dispose of the property of its subjects, adequate compensation being made to the private owners whenever possible, for the necessary purposes of public welfare. Strictly speaking, the right of eminent domain is not a dominion of proprietorship, but a dominion of 'jurisdiction.' The sovereign state does not 'own' the property of its subjects, but under certain conditions it may confiscate such property, force the subjects to sell their property through a process of legal 'condemnation,' and so forth, provided the common good requires such action.

The right of *private domain* is proprietary dominion or the right of private ownership in the strict sense of the term, as explained in the foregoing section. Private ownership is either perfect or imperfect. It is *perfect* when the owner of a thing may dispose at will over the thing's substance and over its use and fruits. It is *imperfect* when

the owner of a thing may dispose of either its substance or its use and fruits. Imperfect ownership is either direct or indirect. It is *direct*, or radical, when a person has the proprietorship over the substance of a thing, but not over its use and fruits. It is *indirect* when a person has the proprietorship over the use and (or) fruits of a thing, but not over its substance. *Use* is the right to employ someone else's property for one's own purposes, but without the right to dispose of its substance; a man, for instance, who rents a house from the owner, has the right to live in it, but he may not sell it. *Usufruct* is the right to employ someone else's property and also take its fruit, but is without the right to dispose of its substance; a man, for instance, who rents another's farm in its entirety, has the right to till the soil and take the apples growing in the orchard, but he has no right to dispose of the farm itself. The real owner of the house or farm has 'imperfect direct' ownership, because the substance of the house or farm is his property; but he cannot live in the house or operate the farm, because he has given up the use and usufruct of these things to another. The one who has the right to the use or (and) usufruct has 'imperfect indirect' ownership, because he has acquired the proprietorship over the use and (or) fruits of the house or farm through rental; however, since he lacks imperfect direct ownership, he has no right over the substance itself of the house or farm. In order that a person have 'perfect' ownership over a house or farm, he must not only have the proprietorship of the substance of the house or farm but also retain the proprietorship of the use and fruits thereof, so that he has the right to dispose of both the

substance and its use and fruits; he is, in other words, the complete master of the thing itself and of everything pertaining to it.

Object and Subject of Ownership

The *object* of ownership is anything over which man may exercise dominion, so that he is its master and can control it and dispose of it. Such objects are called goods.

Goods, as objects of ownership, are of *three types*, internal, external, and mixed.

Internal goods are objects which are a part of man's being or proceed from his being and its activities. Some of these internal goods are part and parcel of his very nature, so that they are not distinct from man himself, as his life, his body, his members, his powers and faculties. They belong to him as his own, to be used for his own interest and benefit; but they are not his to dispose of at will. Over these types of internal goods God alone has absolute dominion, direct dominion; man has only a 'beneficial dominion' over them, as a steward and administrator who can utilize them to his own advantage. Other internal goods are distinct from man's nature, although they proceed from it, such as the operations of his powers and faculties and their effects. Over these types of internal goods man has control and can dispose of them at will, so that he has 'direct dominion' over his actions and all goods produced by them; a person, for instance, has direct dominion over the activities of his hands and everything made by them, provided, of course,

that he also owns the materials he uses to fashion something.

External goods are things external to man's person over which he can exercise control in some manner, so that they become his property. Not all external goods, of course, can become a person's private property. Some external goods are for the common use of everybody, for example, the atmosphere, the sea, the light for the sun, the rain; some belong to the sovereign state, for example, streets, roads, public buildings; others are owned by the organization of the church, for example, temples, schools, cemeteries. Other external goods, however, may become the private property of individuals. Among such external goods we distinguish between *movable* and *immovable* goods. The former are goods that can be transferred from place to place without destroying their substance, such as cattle, crops, money, automobiles, machinery; otherwise they are immovable goods, such as houses, mines, woods, lakes, farms. External goods are either *interchangeable* or *non-interchangeable*. Interchangeable goods are goods for which a substitution can be made by articles of the same quality and quantity, for instance, money, grain, oil, fruit, wire; interchangeability is determined not so much by the article as by equivalence in value. Non-interchangeable goods are goods which are so important in themselves that they are owned and retained as such, for instance, cattle, houses, orchards, farms. Some external goods are *consumable* in first use: they are destroyed when used, or their substance is radically changed, for instance, food, coal, gas, wine. Others are *non-consumable*: their

substance may deteriorate through use, but their substance is not thereby destroyed or radically changed; examples are houses, furniture, machinery, automobiles, boats.

Mixed goods occupy a position between internal and external goods; examples are honor and fame.

The *subject* of ownership is any person capable of having proprietorship over things. This person may be either a physical or a moral person.

A *physical* person, capable of being the subject of ownership, is *any living human being*, even if this person be an unborn child or a person permanently bereft of the use of reason. The foundation of ownership is the rational nature of man. Because man is rational, he has the power to dispose of things as his own at will. It is not essential to the concept of ownership that a person actually dispose of goods; it suffices that he have the power, inherent in his rational nature, to do so. Hence, the unborn infant, the child before it reaches the age of discretion, the idiot, and the insane person possess the capacity of acquiring and retaining ownership as long as they live, because they have a rational nature. An act of the will is required for the actual *exercise* of ownership, but not for ownership itself. For this reason children and insane persons cannot actually dispose of their property. In principle, therefore, any individual who has the use of reason is capable of possessing and exercising property rights. For the sake of public welfare, however, the sovereign state often enacts positive laws restricting the exercise of these rights in various ways. A *dead* person ceases to have dominion over goods of fortune. External goods are intended by the

Creator for the benefit of man in his earthly life, and so at death a person is no longer capable of being a subject of ownership.

A *moral* person is any *society* or organized group of persons capable of ownership. Absolutely speaking, any society established for an honorable purpose is capable of ownership. For reasons of public welfare, however, the state recognizes only those societies as capable of ownership which are *juridical* persons, that is, which are capable of rights and duties and as such are responsible before the law. The main juridical persons capable of ownership are *ecclesiastical* and *secular societies*, together with their respective subsidiary organizations which enjoy the status of juridical persons. Chief among the secular societies is the sovereign state itself. Secondary societies within the state are of different kinds, depending on the organization existing within the sovereign state, such as individual states, counties, cities, villages, universities, and minor societies. A city, for example, is the owner of parks, buildings, lands, and many types of immovable and movable property. Ecclesiastical and secular societies, the sovereign state included, own their properties in virtue of private dominion; the right of 'eminent domain,' as was pointed out earlier, is not real ownership, but merely the right of 'supreme jurisdiction' over the private domain of its subjects.

The ownership of a society as a 'moral person' must not be confused with *co-ownership* or *con-dominion*. Co-ownership, or con-dominion, is the simultaneous ownership of the same thing by two or more persons. A number of

persons may form a partnership or corporation, so that the property belongs to them conjointly, and each one shares in the losses and gains. Similarly, two or more persons may be co-heirs of the same business or industry; in this case, too, the property belongs to them conjointly, and each one shares in the losses and gains of the business or industry. But with respect to a 'moral person,' the individuals composing the society gain nothing and lose nothing personally, because the property is vested in the society as a society and not in the individuals as physical persons with joint dominion.

Origin of Ownership

The earth existed before man. The earth is a vast storehouse of material wealth in manifold forms. Up to the time when man made his appearance, the material things existing on and in the earth evidently belonged to nobody. The actual appearance of man made no change, at least in the very beginning, in this general situation. All material goods were common goods.

The material things existing on and in the earth are adapted to the use of man, so as to supply the means to satisfy his diverse needs. Man must live. To live, he needs *food, clothing, and shelter*. Plants and animals are admirably adapted to serve man's need for food, and man cannot sustain and develop his life without them. Plants, animals, and many sorts of inanimate things are necessary to man for the purpose of providing adequate clothing and shelter; without them man would soon succumb to the

dangers to health and life which surround him on all sides. To procure the necessities for health and life, man must make and use various types of *tools*; and here, too, plants, animals, and inanimate things supply him with the means required to fashion tools of all kinds.

Since man is neither an angel nor a brute, but a *rational animal*, he is subject to the natural law as an individual person, as a social being, and as a creature of God. In accordance with this nature of man, natural law imposes certain obligations and also confers certain rights, so that he can live the sort of life which befits him in these essential relationships. To live a life befitting his nature as a rational animal in these essential relationships, he needs the material goods of this earth in a great measure. But if he needs them for self-preservation and self-perfection in accordance with his rational nature, he has the duty to use them for that purpose.

God made both the earth and man. And if man needs the goods of the earth, and if the goods of the earth are adapted to the needs of man, the conclusion is legitimate that *God intended* the earth and its goods for the use of man. And if man cannot exist and live according to his rational nature without the use of these goods, the conclusion is legitimate that God intended to place the *moral obligation* on man to actually use them. However, duty necessarily implies *right*. Man, therefore, has the *right to use the external goods of nature* for his self-preservation and self-perfection.

The very existence of man on earth is thus seen to be the *foundation* of man's right to use the external goods of

nature. And since all individuals have the same human nature, every human being has an *equal right* to use the external goods of nature. These external goods, viewed absolutely, are *negatively common*, in the sense that they belong to whoever uses them, because nature itself has made no definite allocation to one person rather than to another. Hence, speaking absolutely again, the external goods of nature are such that no one, in the beginning, had a *determinate* right to allocate to himself any particular thing. Who should use what, particularly and concretely, had to be determined by the need, usefulness, and opportunity of the individuals taken singly or collectively; in other words, the *exigencies of life* among men would make the right to use particular goods *definite* and *determinate*. St. Thomas¹ is very clear on this point. He says: "If a particular piece of land be considered absolutely, it contains no reason why it should belong to one man more than to another; but if it be considered in respect of its adaptability to cultivation, and the unmolested use of the land, it has a certain commensuration to be the property of one and not of another man."

In order, then, that the external goods, which by nature are common to all men, be allocated to particular persons, so that they have the definite, determinate, and *exclusive* right to use them, something more is required, namely *another right* which entitles the individual person to allocate to himself determinate goods for his personal determinate use.

THE GENERAL, INDEFINITE RIGHT OF ALL MEN TO THE USE OF THE external goods of the earth is insufficient for the preservation, development, and perfection of man as intended by nature and nature's Creator. Man does not exist as a general, indefinite entity, but as an individual, definite person with *specific, determinate needs* which can only be satisfied by *specific, determinate goods*. It is impossible for individual persons to use specific, determinate goods in an orderly and unmolested manner except under the supposition that these goods become his permanent and exclusive property. Individual persons, therefore, must have the permanent and exclusive *right of property or ownership* over specific, determinate goods.

First. By nature man has the general right to use the external goods of the earth for the satisfaction of his needs. This right, however, presupposes the power to exclude others from the use not only of the things which he needs and actually uses at any given moment, but also of the things which he will need in the *immediate future*. To restrict any individual to the momentary and actual use of a thing would make his 'right' to the use of an external good illusory. The time element of actual use is certainly not the most important matter in the right to use these goods. Why should the right of use be restricted to the food an individual is actually putting into his mouth or to the clothing he actually wears on his body or to the shelter he actually occupies at the moment or to the tools he actually employs with his hands here and now?

In order to lead a *well-ordered* life as befits his rational nature, the individual must not only provide for the needs of

the moment; he must make reasonable provision for his *future needs*. These needs change considerably for individuals and entire groups according to season and locality. The wise man will see the necessity of storing foodstuffs against the contingencies of winter, drought, floods, and crop failures; of having the proper clothing and shelter for the change in seasons; and, most of all, of providing for the time when illness and age curtail his ability to till the soil or hunt game. These needs extend over a considerable period of time and must be taken care of. The mere right to the immediate, momentary use of things will not suffice. Man must have the *right to the acquisition* of external goods which are required for an *indefinite future*. And he must be able to consider such acquired goods as his own, so that he has the exclusive right to control and dispose of them in his own interest. It would be unreasonable to expect him to labor for his future security, if any other person had the equal right to take and consume the goods he had toiled to gather for his future sustenance and convenience. In order, therefore, that his future security be assured, he must have the *right of ownership or proprietary dominion*, i.e., the exclusive right to control and dispose of goods as his own according to his wishes.

Furthermore. Man as an individual person cannot fulfill his natural destiny without the right of private ownership. As a *social being* he needs this right even more. The basic unit of society is the *family*. For a well-ordered family life the right to private property is indispensable. In virtue of the natural law, father and mother have the strict duty to support and educate their children in a manner befitting

their nature as rational beings. Therefore, they are by nature entitled to all the means necessary for the fulfillment of their duty. The general right to the use of the common goods of nature, however, is insufficient for the accomplishment of the purposes of parenthood. A man simply cannot raise a family properly on an hour-by-hour, or even on a day-by-day, basis. The raising of a family is of necessity a long-range proposition extending over years and decades. Parents, therefore, must have the permanent and exclusive right to acquire, control, and administer many types of external goods, such as food, clothing, shelter, and tools, and these goods must be obtained and kept in readiness far in advance of their actual use; otherwise the orderly existence and security of the family will be seriously jeopardized. The *social welfare* of mankind thus makes the right to own private property a necessity. The exact amount of private property to be acquired is not determined thereby, being dependent to a great extent upon circumstances of time, place, opportunity, and initiative; but that man has the right to some amount of private property, is evident. Whether this amount be small or large, is of minor importance. What is of great importance, however, is the *principle* of the right of private ownership. Once the principle itself is established and acknowledged as founded on the nature of man and on the nature of external goods, the *application* of the principle can be regulated by mutual agreement and positive law.

Finally, *History* is witness to the fact that all nations at all times have lived under a system in which the right of ownership in private property has been recognized in

principle and in practice. Customs and laws have protected this right and regulated its application. Nomadic tribes, because they are always on the move, lack immovable goods, but they have private ownership in movable goods, such as herds of domesticated animals, weapons, tools, clothes, foodstuffs, and other items. Except in small communities and in a limited degree, collective use of goods is found nowhere; and even in such instances, the ownership of personal articles is customary. Private ownership is thus seen to be a universal phenomenon among both civilized and uncivilized peoples. This fact shows definitely that the system of private ownership is based on the very *nature of man* whose personal and social needs cannot be satisfied except by external goods which have become the private property of individuals and groups.

Hence, the conclusion is inevitable that the right to private ownership is a *natural right* of man. *Absolute communism*, the doctrine which bans ownership of property in every form and which advocates the simple use of all goods, is thus seen to be contrary to human nature and therefore false.

The Primordial Title

In the beginning, the earth and its wealth consisted of negatively common goods: they were destined by the Creator for the benefit of man, but they belonged to no one in particular. Man, however, in virtue of his needs, has the right to ownership, so that he can turn at least some of

these common goods into his private property. The abstract, general right to ownership is practically valueless. Man's needs are concrete and specific and can be satisfied only by concrete, specific goods. Hence, man's right to property must enable him to appropriate concrete, specific goods. In order, however, that concrete, specific goods be appropriated and become private property, the general right to ownership must be actuated by some *title*. Barter, purchase, donation, inheritance, etc., are titles to ownership. Since in the beginning and by nature all earthly external goods were 'negatively common' and ownerless, there must be, both from the viewpoint of nature and of time, some title which precedes all others and is the foundation for all others. This first and most fundamental title for the acquisition of private property, is termed the 'primordial title.'

What, then, is the *primordial title to private ownership* which is the original foundation of specific proprietary rights?

The primordial title must be some *fact*, and it must be a fact which is not only 'suitable' to settle the general right of ownership upon a definite object, but is also of such a nature that it is 'prior' to all other titles. This fact is occupation or the *effective seizure and possession of an ownerless object with the intention of making it one's property*.

Occupation is by nature suitable to settle the general right of ownership upon a definite object. Originally, the earth and its goods belonged to no one in particular; they were 'negatively common' for all men. Each individual had

the general right to take for himself what his needs required, and he could exercise this right by designating some particular ownerless objects as his own and by taking possession of them. These objects thus became his private property. Nothing more was required. He violated no other person's prior right, because all persons were on an equal basis in the face of ownerless objects. No other method was available in the beginning to establish private ownership.

The *objection* is made that occupation cannot be the primordial title, because one cannot assume that simple occupation of objects, especially lands, should entitle anyone to possess them forever.

The *answer* to this difficulty is obvious. The simple occupation of ownerless objects does not, of itself, produce perpetual ownership. Every title demands a *subject* in whom it exists. The owner may transfer his title to another person through sale, donation, bequest, or some other way; in that case, the title itself has changed and is no longer the primordial title of occupation. If the original owner, who acquired the property by occupation, does not transfer his title to someone else, the property becomes ownerless again at his death, because his title to it ceases to exist when he dies.

Another *objection*. In thinly populated territories some enterprising person might claim vast expanses of land, even half a continent, as his own by the simple procedure of occupation. A few persons could thus gain ownership over almost the whole earth, while the masses of people, notwithstanding their natural capacity for ownership, would be excluded from acquiring any landed property.

Answer. The difficulty is more imaginary than real. Mere intention or declaration of ownership does not constitute a real, legitimate title. Ownerless lands can be acquired by occupation; but occupation means *effective* seizure or possession. 'Effective seizure' on the part of an individual or family, or on the part of a group of individuals or families, can occur only when the amount of land occupied actually or potentially is capable of *satisfying their human needs*; anything beyond that does not constitute 'effective seizure.

False Theories

Not all philosophers agree with the thesis just proposed and proved. A number of divergent theories have been advanced by various philosophers in the course of time.

Hobbes maintained that all titles to ownership are derived from the sovereign power of the *state*, because the state is the sole source of all rights, including property rights. His *legal* theory of the origin of property rights followed as a necessary consequence from his general doctrine that the principles of morality and of law have validity and binding power exclusively from the state. Other prominent authors also subscribed to the 'legal' theory, notably Montesquieu, Trendelenburg, Fichte, and Kant. Kant must be placed among their number in so far as he defended the view that the right to property in the strict sense of the term is dependent on the protection of the co-active power of the state. The *positivist* school of law also derives all rights from the state.

We maintain that the right of private ownership *cannot be the creation of the state*. The right to private property had its origin at the time when private property became a necessity for man. This necessity, however, arose long *before* the formation of sovereign states and their positive laws. Since the right to ownership existed *before* the formation of the sovereign state, the sovereign state cannot be the source of property rights as such.

History is of no help in determining the primordial right of ownership. All recorded history reports ownership as already existing. However, a somewhat *analogous situation* prevails on many islands and in many isolated sections of the globe, where tribes have not as yet banded together to form a sovereign state. Individuals, families, and groups of families possess private property. These people obviously did not receive their right to private ownership from the supreme authority of the sovereign state, for the simple reason that a sovereign state, in the accepted meaning of the term, does not exist in these localities, for instance, among the Eskimos in the arctic regions. A similar situation must have prevailed among men in the beginning before sovereign states were formed.

GROTIUS AND *PUFENDORF* CLAIMED THAT THE RIGHT TO PRIVATE property originated by means of a mutual pact between people. History, of course, tells us nothing about such a mutual pact whereby people agreed among themselves to establish private ownership of property. The only way to

prove such a theory would be by rational deduction. Rational deduction, however, rather proves the opposite.

If this theory were correct, it could be so only on the supposition of an original *collective ownership* of all earthly goods. The first families could not make a partition of all goods among themselves unless they formed a closed community and as a closed community had collective ownership over everything, because they could not make a pact to turn goods into private ownership if they did not possess them in the first place. The supposition of collective ownership on the part of these original families, however, is an *arbitrary assumption*. Since the geographical horizon of these first families was undoubtedly extremely limited, it is unreasonable to assume that they intended to partition the whole earth and *everything it contained* among themselves. That a certain amount of communal ownership of *land* existed, may be assumed as probable. Even if the primitive peoples were hunters and fishermen rather than agriculturists, they probably considered certain tracts of land as being the common property of the tribe to which they belonged. But how did the tribe acquire this land in the first place? Evidently by simple seizure, by occupation. Whether, therefore, land was communally or privately owned, the primordial right to it was based on occupation, not pact.

Furthermore, if in the beginning hunting and fishing were the primary method of earning a livelihood, instead of agriculture, then the *necessary implements* for hunting and fishing had to be fashioned out of *raw materials* of some sort. These raw materials, whether of wood or stone or

metal, belonged to nobody; hence, they could be appropriated wherever found and fashioned into implements. But this means that the primordial right to property had its origin in occupation.

LOCKE CONTENDED THAT ALL PROPERTY RIGHTS ARE REDUCIBLE TO the right of *labor*, namely, that man has the right to call the fruits of his labor his own. *Henry George* made a similar claim in his famous book *Progress and Poverty*. In our day the *socialists* and *communists* are the ones who proclaim the priority of labor to any other title. Socialism and communism will receive special treatment in a later chapter. The followers of Henry George were concerned mainly with landownership, but their argument from labor applied actually to ownership in general. The *argument* runs somewhat as follows: Man's sole primordial right is the right to exercise his own faculties; the exercise of his faculties, which is labor, produces values and alone produces values; man has the right to possess what he produces; hence, labor is the original title to property and the only right to property. Since man does not produce land, he has no right to own land.

The argument is *fallacious*. It is true, of course, that man has the right to exercise his faculties. Such a right, however, is a right to *action*, not a right to possess property. It is also true that man produces values by the exercise of his faculties, namely, by the expenditure of productive labor on some external object. There are, however, two factors to consider in productive labor: the *original object* to which

the labor is applied, and the value created by productive labor in this original object. Labor admittedly produces the added value, but it does not produce the original object or material to which the value has been added. In consequence of his labor, the workman may be entitled to the value superadded to the original object or material, so that this value becomes his property; but what about the original *object*, the *material*? Since he did not produce the original object or material through his labor, he cannot, according to Henry George's own principle, become the owner of the object or material. But object and value are inseparable. If he is not the owner of the *object itself*, neither is he the owner of the produced value, because the value is inseparably attached to the original object. To be the owner of the value, he must also become the owner of the *total object*. How can he, however, become the owner of the original object or material upon which he expends his productive labor? The object or material exists prior to his labor. Either, then, he cannot become the owner of the total object through his labor or he must become the owner of the original object or material through a *title other than labor*. But again, if labor is the primordial title to private property, how can he acquire the original object or material? He must acquire it through some title, or his labor is futile.

One man walks along the seashore, picks up an oyster shell, opens it, and finds a valuable pearl. Another strolls over the veld in South Africa, picks up a stone, and discovers that it is a magnificent diamond. Another walks along a water bed in desolate Klondike, sees something

yellow and shining, and suddenly realizes that he has found a pocket of gold nuggets. Such and similar objects have a commercial value *prior to*, and *independent of*, any labor expended on them to give them added value. Yet they certainly belong to the finder as the first occupant. Occupation, therefore, not productive labor, is the primordial right which entitles a person to the ownership of private property.

Neither the authority of the sovereign state nor the mutual pact nor productive labor can explain the origin of ownership and be the primordial title to private property. The requirements of the primordial title are found only in occupation.

Limitations of Ownership

The nature and needs of man require the system of private ownership of external goods. Almost all moralists and sociologists agree to this. Because things are privately owned, the owner has the exclusive right to control and dispose of his goods at will.

Man, however, has *no absolute dominion* over temporal goods, even if they are his private property. There are *limitations* on ownership and use.

God alone has absolute dominion over all created things. The earth and its wealth were intended by Him for the sustenance of *all people*. The *primary* purpose for the creation of these temporal goods, therefore, is the life and welfare of every human person, so that man may have the necessary means for the attainment of his immediate and

ultimate ends. Consequently, every man has the natural primary right to the use of the goods of nature for the attainment of the purpose of his being as a human person. This primary right to the common goods of nature remains intact even after the division of these common goods into private property; the right to private property is only a *secondary* right, always subject to the primary general right of all persons. St. Thomas² expresses this important truth as follows: “Two things are competent to man in respect to external things. One is the power to procure and dispense them, and in this regard it is lawful for man to possess property. . . . The second thing that is competent to man with regard to external things is their use. In this respect man ought to possess external things, not as his own, but as common, so that, to wit, he is ready to communicate them to others in their need. . . . A man would not act unlawfully if by going beforehand to the play (theater) he prepared the way for others; but he acts unlawfully if by so doing he hinders others from going. In like manner a rich man does not act unlawfully if he anticipates someone in taking possession of something which at first was common property, and gives others a share; but he sins if he excludes others indiscriminately from using it.”

St. Thomas hereby stresses the principle, so often overlooked, that all private property has an *individual* and a *social* character. Man naturally has the right to possess temporal goods as his own; whoever violates this right violates commutative justice. On the other hand, many persons have the same right, and God created the temporal

goods not only for the benefit of individuals and their families but also for the benefit of all people; hence, proper order must be observed in the use of temporal goods, both from an individual and a social stand point, so that the *common good* of all will be served. Because of the 'individual' character, each individual has the right to possess private property and to dispose of it as his own; because of the 'social' character, the form of distribution and the use of temporal goods must always be such as to be of benefit to others and to the common good. The use of private property, therefore, is not absolute, but limited, because the possession and use of private property involves certain obligations.

There are *individual obligations*. Everyone has the obligation, binding in conscience in virtue of commutative justice, to render to each one his own and not to violate the legitimate rights of others.

There are *social obligations*. Granted the general right of disposing of one's temporal goods at will, private owners have the *duty of social charity*, according to the amount of their means, of assisting others by means of almsgiving, liberality, and benevolence. A very wealthy family, for instance, should try to use its extensive superfluous income to provide the opportunities of labor for common working people, so that the latter may be able to acquire the means of a decent living.

More important is the *duty of social justice*, namely, the duty to use one's right for the common good as dictated by justice. Some rights are of such a nature that their excessive use would restrict others in the use of the same

right or even bring about a definite domination over others. Among such rights is the right to acquire wealth, the right to make contracts, the right to work, the right to form associations of various kinds. Obviously, such rights can be used and abused and can bring great good or great harm to people. Rights, as was stated many times, always involve corresponding duties. The rights just mentioned, for example, involve the strict *negative* duty of justice not to hinder another, either by force or fraud, from exercising his own just rights. It is an *affirmative* duty to assist others by offering them the opportunity to acquire private property; but this affirmative duty is not directed toward any specific person, as if everyone had the strict duty to procure a job for a particular individual or see to it that a particular individual obtained the opportunity of making large profits in some business. The common good requires that no injustice be done at any time; but the common good does not require that a particular individual or group of individuals be given the opportunity to accumulate temporal goods. However, when *broad classes* of society are hindered from making a decent living through the accumulation of excessive wealth in the hands of a relatively few persons, the 'common good' of all is definitely endangered, and the government has both the right and the duty to regulate the use of such proprietary rights for the good of its subjects in general. That is why we speak of *social* rights and duties, because they pertain to the 'common good' of all the members of society. Great wealth, therefore, imposes social duties which must be discharged conscientiously, notwithstanding the rights of private

ownership, because private ownership is a right secondary to the primary right of all men to the goods of nature necessary for their sustenance.

The right of individuals to the things *necessary for life* is paramount, but it is not the same for each individual. Whoever can work has the right to acquire the things necessary for life by his labor; to hinder him permanently from earning his living, whether by force or fraud, would violate strict justice. Whoever is incapable of work, has the moral and legal right to obtain what is necessary for life either from the state or from the superfluous goods of the wealthy. If the state is unable to support him, and if he is placed in *extreme necessity* (as happens after a devastating war, for example), he is allowed to take from the superfluous goods of the wealthy whatever is necessary to sustain life; in such a case the necessity to preserve one's life has priority over the secondary right of private ownership. The wealthy person, in such a case, has no strict duty to offer his superfluous goods to the indigent person, but he has the strict duty *not to hinder* a person in extreme necessity from taking what he needs to preserve his life.

In this manner the right to private ownership and the right of all men to proper sustenance are brought into harmony.

Summary of Chapter XVI

All peoples recognize the fact and principle that the use of material things brings with it the *right to private ownership*.

1. *Nature of Ownership*. The *right of ownership* or proprietary dominion is the exclusive right to control and dispose of something as one's own according to one's will.

2. *Kinds of Ownership*. There is 'eminent domain' and 'private domain.' *Private domain* is ownership in the strict sense, while eminent domain is a domain of jurisdiction. The right of private domain is *perfect* when the owner of a thing can dispose at will of its substance and of its use and fruits; it is *imperfect*, when the owner of a thing can dispose of either its substance or its use and fruits. Imperfect ownership is *direct*, when the owner has proprietorship only over the substance of a thing; *indirect*, when he has proprietorship over its use and (or) fruits, but not over its substance.

3. *Object and Subject*. The *object* of ownership is the goods which man owns. They are *internal* if these goods are a part of man's being or proceed from his being and its activities. They are *external* if they are things external to his person. External goods are either 'movable' or 'immovable,' 'interchangeable' or 'non-interchangeable,' 'consumable' or 'non-consumable.' They are mixed, if they occupy a position between internal and external.

The *subject* of ownership is any person capable of having proprietorship over things. The subject is a *physical* person

when it is a living human being; moral, when it is a society or organized group of persons capable of ownership.

4. *Origin of Ownership.* In the beginning all external goods were 'negatively common' and intended by the Creator for the use of all men. Man needed them for food, clothing, shelter, and tools. Man thus had the *moral obligation* and the *right* to use the external goods of nature for his self-preservation and perfection. In virtue of his human nature, man has the right to acquire and use specific and determinate goods for his exclusive use, because in no other way can he satisfy his *present* and particularly his future needs pertaining to the welfare of himself and his family. As an *individual* and as a *social being*, therefore, man has the right to make the common goods of nature his private property.

5. *The Primordial Title.* Ownership must be actuated by some title. Among all the titles one must be the *primordial title*, i.e., the one which is by nature and in time the original title and the foundation for all others. This primordial title is occupation or the effective seizure and possession of an ownerless object with the intention of making it one's property.

6. *False Theories.* Hobbes and others, including the legal positivists, maintain that the right to private ownership is derived from the sovereign *state*. This theory is false, because private ownership existed prior to the formation of the state.

Grotius and Pufendorf derive it from a *mutual pact*. This theory presupposes that original ownership was collective ownership, which is an arbitrary assumption. Collective

ownership in lands may have existed, but even communal lands could have become the property of a community only through occupation. Hunters and fishermen needed implements of various kinds, and they could have taken the raw materials for these implements only through occupation.

Locke, Henry George, and others claim that labor is the primordial title. Before labor can be expended on an object or raw material, the object or material must first be acquired. Ultimately, these must be acquired by occupation. Many things have value without labor, such as pearls, gold, and diamonds.

7. *Limitations of Ownership.* Man has no absolute dominion over things; there are *limitations* on ownership and use. The *primary purpose* of the earth and its wealth is the life and welfare of every human person; the right to private property is therefore only a *secondary* right. All persons must be able to make a livelihood from the goods of the earth. Every owner of private property, therefore, has *individual* and *social obligations* in the acquisition and disposition of his earthly goods; these social obligations are obligations of charity or of justice.

Chapter 17

TITLES TO PROPERTY

ALL THE GOODS OF THE EARTH WERE OWNERLESS IN THE beginning and 'negatively common.' To serve their purpose adequately as a means to satisfy the specific needs of individual persons and groups of persons, especially of families, man had the natural right to appropriate as much of these goods as he needed, thereby making them his private property.

In order to acquire dominion or ownership, a person must have a *title*, i.e., a cause must exist which of itself is suitable and sufficient to confer ownership of a specific, determinate thing on a person. Without a title there can be no ownership.

Titles to property are either original or derived. An *original* title is one in virtue of which a vacant or ownerless thing becomes the property of a particular person. A *derived* title is one in virtue of which one person succeeds another to the ownership of something. Original titles are occupation, accession, and labor; derived titles are prescription and contract. Occupation, accession, and labor have their force and validity from the natural law; prescription, from the positive law of the sovereign state;

contract, from the intention and will of the individuals making the contract. These are the acknowledged ways or modes of acquiring private property.

Occupation

Occupation, as the primordial title to ownership, was treated in the preceding chapter. It is the fundamental title.

Three conditions are required in order that occupation may be a legitimate title: (1) that the thing have no owner at the time of occupation, otherwise an injustice would be done to the owner by taking it; (2) that the thing be really and truly seized; (3) that there be the intention of making it one's own. In civilized countries, at least in those that are thickly populated, about the only things which can still be acquired by means of occupation are *animals* and *found articles*.

Among the animals some are domesticated, some are tamed, and some are wild animals. *Domesticated* animals are so habituated to human beings and their habitation that they live peacefully with their owner and show little or no tendency to return to the freedom of the wild state. Examples of domesticated animals are horses, cows, pigs, dogs, chickens, ducks. Domesticated animals, even when they stray, still belong to their owner, unless the owner turns them loose or does not consider them any longer as his own. *Tamed* animals never really become domesticated and are always inclined to seek the freedom of movement characteristic of the wild state, though at the moment they may have been trained to stay and even return to an

enclosure. Examples are bees in a hive, birds in a cage, fishes in an aquarium or pool, and various kinds of animals (such as monkeys, deer, elephants) in a pen or cage. Tamed animals are the property of their master and owner so long as they remain in his custody; once they escape and are free, they are ownerless and become the property of whoever captures them. Animals which have acquired the habit of returning to their enclosure are considered to have freed themselves from this habit if they fail to return after a few days. *Wild* animals abhor and avoid all association with man and enjoy complete freedom. Examples are fishes in large bodies of water and birds and animals which live constantly in forests and open spaces. They belong to no one, even if the forests and the fields are someone's property.

They become the property of the person who captures them and remain his property so long as he effectively retains them; or they become the property of the one who kills and takes them. Civil law frequently makes regulations for fishing and hunting; since these regulations are made for the common good of all, they should be obeyed, but as a rule such regulations are only penal laws.

The *finding* of hidden and forgotten treasures, or relinquished or derelict objects, and of lost articles is a species of 'occupation,' and the general principles of occupation apply to them. *Hidden and forgotten treasures* and *relinquished or derelict objects*, generally speaking, have no real owner and therefore become the property of anyone who discovers and appropriates them; it must be remembered that it is not the one who sees them first who

becomes their owner, but the one who seizes them first. However, the civil authority may have laws regarding the disposition of such finds. *Lost articles* belong to some unknown owner and do not pass over automatically into the proprietorship of the finder. “Finders—keepers, losers—weepers” is not a sound moral principle. Whoever finds a lost article is bound in justice to locate the rightful owner if the article possesses any value. His efforts to locate the owner must be in proportion to the value of the article, all circumstances being considered. The expenses of the search must be borne by the owner, and the finder is permitted to deduct his expenses and demand any reward promised for the return of the object. If the owner cannot be located after a reasonably diligent search, the finder acquires ownership in virtue of the title of occupation.

Accession

Accession is the acquisition of ownership by means of some addition to one's property. This addition may be natural or industrial or mixed.

Natural accession is the addition to one's property as the result of natural agencies alone, without assistance on the part of any person. It is either *fructification*, as when privately owned trees and soil bring forth their natural crop; or birth, as when the animal belonging to an owner brings forth young; or *alluvion*, as when the gradual action of a stream, brook or lake leaves deposits of earth on the shore of a man's land and thereby increases his acreage in the course of time. This natural increase becomes his

property, according to the legal axiom: *A thing fructifies to the owner (res fructificat domino)*.

Industrial accession is the addition to one's property as the result of a person's industry and skill. It is termed *specification* when a thing receives a specifically new form through the work expended upon it; cloth, for example, is fashioned into a garment, flour is baked into bread, wood is carved into a figurine, steel is forged into a tool. When the owner of the original material and the one who is the author of the specification are two different persons, ownership of the gain or increase goes to the principal, i.e., to the one who contributed most to the value of the complete article. Industrial accession is termed *junction* or union when one thing is added to another in such a manner that both form a single unit; for example, a jeweler sets a precious stone in another man's ring, or an artist paints a picture on another's canvas. When the two things form an inseparable unit, the ownership belongs to the principal. Industrial accession is termed *mixture* when two or more substances commingle and form a unit; for example, two measures or grades of wine are blended into one, two bushels of wheat are poured together, or a bushel of wheat and a bushel of barley are mixed together. If the parts are separable, they must be separated, and each part belongs to its respective owner; if two items of the same kind are mixed together, the entire quantity is divided among the owners according to the part contributed; if one part can be considered to be the principal part, either because of quantity or quality or both, the owner of the principal part is entitled to the whole thing, but he must reimburse the

other owner for his portion. Industrial accession is termed *building* when one person erects a building on his own land with materials belonging to another, or when one person erects a building with his own materials on the land belonging to another. The building belongs to the owner of the land, because the ownership of land is a prior right; the owner of the land, however, must reimburse the builder, unless the latter acted in 'bad faith' and therefore tried to cheat the owner of the land. In solving the problems resulting from industrial accession, the decision is made according to the legal axiom: *The accessory follows the principal (accessorium sequitur principale)*.

Mixed accession is the increase of one's property or gain as the result partly of natural agencies and partly of industry. It occurs when someone sows seeds or places plants in another's land. Everything which grows on a person's soil is his property as the principal owner.

In as much as it will frequently be difficult to decide who is the principal owner in many instances, the *civil law*, for the sake of the common good, can and does often render decisions in these matters; these decisions, once rendered, must be followed, because the civil power has the authority to make the general provisions of the natural law more determinate and specific.

Labor

Labor is human industry which produces goods of some sort. It is immaterial whether this labor is bodily or mental or whether it produces goods immediately or mediately; the

important point is that the work expended is by its nature capable of producing something which is of use and value to the individual or the community.

Labor is a legitimate mode of acquiring dominion. Every person is the master of his powers, be they bodily or mental, and the application of his powers to the production of something is 'labor.' Whoever expends his energies upon *his own property* and thereby produces in it some new form is the proprietor of the *entire thing*, both of the original substance and of the new form produced in it. The original substance naturally belongs to him, because it is his property already; the new form of the substance belongs to him, because he has the natural right to the fruits of his labor. Whoever expends his energies upon *another's property* does not thereby become the proprietor of the thing, because the original substance, in which he produces a new form, belongs to this other. Since no one is allowed to alter something owned by another without the owner's permission, everything will depend on the agreement made between the owner and the workman. If the owner of the original substance and the workman have formed a *partnership*, each one becomes a *partial proprietor* in the newly formed article. If, however, the workman has only *given his labor for hire* in the service of another, he acquires no dominion over the fruits of his labor; he is neither the owner of the entire article nor a part owner of the article. Since the real owner of the original substance hired the workman's labor and the workman hired out his energies to the real owner, the workman, in virtue of this 'contracts between himself and his employer, is entitled to a

just wage for his labor. More will be said about this in the treatment of the wage contract.

Viewed from the standpoint of a *title*, labor, if expended in the seizure and possession of an ownerless thing, participates in the title of 'occupation'; if expended on one's own property, it amounts to the title of 'usufruct'; if expended on someone else's property, it is reduced to the title of 'contract.' Only with respect to its *own proper fruits*, therefore, can labor be regarded as a natural and original title of dominion.

Prescription

Prescription is the acquisition of ownership or the discharge of a debt by the continuous possession of a thing for the time and in the manner prescribed by positive law.

The legal profession knows and enumerates many types of prescription. Basically, all types are reducible to two: 'acquisitive' and 'extinctive.' *Acquisitive* prescription is the operation of the law conferring a title on someone through the continued exercise of corresponding powers; for example, someone acquires the right to use a path or roadway over another's land because he has been allowed to do so without hindrance by the owner for a number of years. *Extinctive* prescription is the operation of the law extinguishing someone's right through the prolonged failure to exercise corresponding powers; for example, the law frees someone from the obligation of paying a debt because the creditor has failed for a long time to demand payment from the debtor. Just how much time must elapse

before prescription becomes effective depends upon the civil laws, and the laws differ from country to country and from state to state.

Prescription is a *legitimate title* to ownership. In virtue of prescription the prolonged possession of a thing, provided the proper conditions are present, transfers the ownership of the possessed thing to the possessor. The transfer is made through the power of the *positive law*. The sovereign power of civil authority has the right of 'eminent domain' and therefore can transfer the ownership of a thing from one person to another without the consent of the original owner, whenever *grave reasons* affecting the common good demand such an action. There are a number of grave reasons for prescription, prompted by the common good of society. For 'acquisitive' prescription the following reasons are given: that the ownership of a thing may not be uncertain for a long period of time; that lawsuits may be avoided or may at least be more easily brought to an end; that doubts of conscience regarding the lawful possession of a thing may be removed and the fear of losing a possessed thing may be allayed; that people may be spurred on to be more careful in protecting their property and in exacting their rights. For 'extinctive' prescription the following reasons are advanced: it can be legitimately presumed that the debtor has fulfilled his obligation, because creditors as a rule do not wait long in demanding the payment of a debt; it is unreasonable to require anyone, especially a large business concern, to keep receipts of payment on file forever so as to avoid double payment of the same bill.

CONDITIONS FOR ACQUISITIVE PRESCRIPTION.

Five conditions are required for the validity of acquisitive prescription: aptness of the object; good faith; a title; continued possession; proper time.

Aptness of the object is the quality of an object making it a fit object of ownership. Not all objects are prescriptible. Some are not apt for dominion, either because of their very nature or because of a natural or positive law. Such objects, for example, are sunlight, air, ocean lanes for boats; public highways, bridges, parks; at least so far as private persons are concerned, marriage rights.

Good faith is the erroneous judgment which gives a person the moral certitude that something in his possession is really his property, although as a matter of fact it belongs to someone else. It is evident that no one can make a thing his own, when he is conscious of the fact that it is not really his; the possessor acts unjustly against the real owner, if he keeps an object of this sort and does not return it to the owner. This possessor is in 'bad faith' and is not allowed to profit thereby. Even if the civil authority enacted a law declaring an object held in bad faith prescriptible, the possessor acting in bad faith is in conscience bound to restore the object to the rightful owner. A thief, therefore, can never acquire the ownership of the stolen object through prescription, because he knows that the object does not belong to him. If a person purchases a stolen object in good faith, prescription begins then and there; if he finds out later that the object was stolen, prescription is

interrupted at that point; but if he begins to doubt, and a reasonable effort does not resolve the doubt, prescription continues. The good faith of a predecessor always counts in favor of the successor if the latter is also in good faith; hence, the periods during which the object is possessed in good faith are included in the computation of the time required by the law for prescription. If the bad faith of a predecessor is definitely established, the civil law frequently will not count this against the successor who receives the object in good faith; in such matters one must consult the provisions of the prevailing laws of the locality.

The *title* of prescription is the cause or reason why the possessor of an object judges it to be his own. Obviously, the title involved in prescription is not a true title, namely, a title which would truly transfer ownership; if it were a true title, there would be no need for prescription. The title, therefore, can only be an *apparent* title. An apparent title of some kind is naturally required, in order that the possessor be in good faith and actually believe that the object is his own; otherwise he would be in bad faith, and prescription could not even begin. In a case of extraordinary prescription a 'presumptive' title suffices; the very fact that an object has been in one's possession for a very long time becomes, in the eyes of the law, a presumption that a legitimate title to the object has always been present.

Possession is the very foundation of prescription. It consists in the actual keeping of an object in one's power or in the actual exercise of a certain right. Since a time limit is set for prescription, possession must be continuous for the time set. Prescription may be *dormant* because of some

impediment laid down by the law; for example, in the case of minors or wards, when their property is administered by another, or in the case of a revolution, when the processes of law do not function. During this dormant period prescription is suspended, but is resumed after the dormant period is passed. Prescription is *interrupted* or *ceases* altogether whenever an essential flaw appears; this happens, for example, when the possessor ceases to be in good faith, or when the actual owner appears and claims ownership.

The *time* necessary for prescription to be effective depends on the civil law. The time differs according to different civil codes and according to different kinds of objects.

When all these conditions have been fulfilled, the law declares that the possessor has a sufficient claim to ownership and transfers the object to the dominion of the possessor. If the former owner should appear and claim the object, his claim need not receive consideration from the possessor after the period of prescription time has elapsed; the possessor is now the rightful owner.

CONDITIONS FOR EXTINCTIVE PRESCRIPTION.

The conditions required for an extinctive prescription to be legitimate are similar to those required for an acquisitive prescription. The *right* or *debt* must be prescriptible. A prescriptible 'right,' for example, would be the right of way through another's property, in order to enable someone to conveniently connect his farm with the highway; or the

right to maintain a privately constructed dam on a stream of water. A prescriptible 'debt,' for example, would be taxes owed to the commonwealth or a loan one believes is already paid.

Another condition is the *non-use of a right*. For instance, a person has the right to start action in court against another for the purpose of claiming a right or exacting payment of a debt, but he fails to do so.

Good faith is also required. 'Good faith' is *positive* when a person is subjectively convinced that he has no duty in a particular matter or that he is not under the obligation of a debt with respect to another. He may, for example, have forgotten his obligation, or he may believe that the debt has already been paid. 'Good faith' is *negative*, when he is conscious of his duty or debt, but believes that he has no moral obligation to discharge his duty or pay his debt until such time as he receives notice or a lawsuit is started against him. It may, for example, be a case of damages inflicted by him upon another through an unavoidable collision; having incurred no moral guilt, he can decline paying damages until ordered to do so by the court.

The *time* required for prescription to take effect depends on the provisions of the law. In order that extinctive prescription extinguish a right or a debt in *conscience* and not merely before the law, much depends on the intention of the legislator. If the law stipulates a *long* period of time before the extinction of a debt can be effective, it is commonly assumed by moralists that the legislators intend the debt to be actually extinguished, so as to avoid delay in lawsuits and the necessity of having testimony available for

an indefinite length of time. But if the stipulated time be three years or less for the validity of prescription, the moralists are not in accord; if it can be shown that the legislators probably intended a debt to be extinguished after such a brief period, a person in good faith can take advantage of the doubt and consider himself rid of his obligation.

Since prescription is founded on positive law, the legislative power of the community or state has the right to establish or alter the conditions required for its validity.

The Nature of Contracts

A *contract* is the agreement between two or more persons to transfer a right to do or not to do something. When it is said to be an agreement 'to transfer the right to do or not to do something,' the 'doing' may refer to a thing or to an action. One person, for example, may make a contract with another to sell or not to sell an article, to go on an expedition or not to go on an expedition; in the first case the contract revolves around a 'thing,' and in the second case around an 'action.'

Four conditions are essentially necessary for a valid contract: suitability of the matter; competence of the contracting persons; mutual consent; and cause of the consent.

The *matter* of a contract is anything that can be the object of dominion, namely, a thing or action or the omission of an action. The matter of a contract, to be suitable, must possess certain qualities. It must be *possible*, both

physically and morally. No one can obligate himself to do something which is physically impossible for him to do, because he cannot keep his part of the contract. No one, it is reasonably assumed, intends to obligate himself to do something which is morally impossible for him to do, unless a stipulation to that effect is expressly included in the contract. The matter must be *existent* either in reality or at least, according to a sound probability, in the future. It is obvious that one cannot transfer to another the right to a thing that neither exists nor is expected to exist; but he can transfer to another the right to a future reality, such as, for instance, the crop of apples he has reason to expect will grow on his apple trees. The matter must be the *property of the contracting party*. If a thing belongs to another and not to the contracting party, the latter obviously has no right to dispose of it; but he may make a contract about something belonging at present to another, if there exists a solid ground for believing that the thing will some day become his property. The matter of the contract must also be something *honorable* and *licit*. If it were dishonorable and illicit, he would be obligated to avoid the action; in that case, however, he certainly cannot obligate himself by a contract to perform the act. Hence, a contract to murder someone, to rob or steal something, to cheat in a business deal, etc., is invalid. Finally, the matter of the contract must have some *appreciable value*, namely, it must be of a nature that it is something laborious or inconvenient for the one party and something useful or pleasurable for the other. Contracts, therefore, about useless or valueless things are not binding.

The *competence* of the contracting persons means that they have the use of their reason; otherwise they could not give valid consent and assume an obligation. So much is certain from the standpoint of the natural law. Hence, those are incapable of making a contract who cannot give perfect consent, such as infants, insane persons, idiots, and persons who are completely or nearly completely drunk or under the influence of a very strong hypnotic or narcotic; their acts are not human acts. *Positive law* often declares certain types of persons incompetent, for example, minors or wards under guardianship; in some states or countries the wives are declared incapable of making contracts without the husband's consent. Many laws *limit* the power of contract for such persons.

That the *consent of the contracting parties* is necessary for the validity of a contract, is evident from the fact that the contracting parties assume an obligation; an obligation, however, presumes a voluntary act, since a person binds himself through the mutual agreement of a contract and mutual consent is involved. This consent, therefore, in order that the contract be valid from the standpoint of natural law, must possess certain qualities. It must be *true* consent; that is, it must be actually given by the will; otherwise no obligation is assumed. Hence, feigned and fictitious consent vitiates a contract. However, if a person feigns consent, but expresses his consent externally to the contract, he is guilty of deceit and must repair all damages resulting to the other contracting party from the invalid contract; if he cannot repair the damage except by fulfilling the contract, he is bound in conscience to fulfill the contract. For the same

reason, consent must be *free* and *deliberate*; only a contract made with proper advertence, deliberation, and freedom can induce an obligation in the will. The consent must also be *mutual*, so that the contracting parties consent to the same juridical object; no one can transfer a right to another unless the latter is willing to accept it, and no one can be obligated to transfer a right unless he is willing to be obligated. This holds good even in unilateral contracts, such as gifts and promises; the contract is not completed by the mere offer to transfer a right, but only when the offer is accepted. As a result a gift or promise always may be withdrawn before the one to whom the offer is made consents to accept the offer. Bilateral contracts, by their very nature, demand the consent of both contracting parties. For the validity of a contract the consent must be *manifested in a sensible form*, because all contracts have social implications and, since society is a sensible and visible organization, contracts can have validity only if expressed in a sensible form.

Error, deceit, and fear may render a contract invalid or at least rescindable, because they contravene the freedom of the will and therefore *vitiate consent*. An error is a misapprehension caused by one's own self; deceit is a misapprehension caused by a person in another with the intention of misleading him. Error and deceit are either substantial or accidental. They are *substantial*, when they pertain to the substance of the thing about which the contract is made, as when a jeweler sells someone a synthetic ruby in place of a natural stone; or when they pertain to a quality which is the basis of the contract, as

when a person intends to buy a genuine Murillo painting and receives only a copy; or when they pertain to the substance of the contract itself, as when a person thinks he is given the loan of a machine and then finds out that he has unwittingly contracted for the purchase of it. *Accidental* errors, which leave the substance of the contract in its full vigor, do not vitiate the consent; otherwise very few contracts could be made, and society would suffer as a result. 'Substantial' errors, however, vitiate the consent in its very essence and render the contract invalid. But accidental errors, induced antecedently to the contract through 'deceit,' render the contract rescindable, because of the injustice committed by the deceiver. A contract is said to be made out of *fear*, when fear is a determining factor in the making of a contract to such an extent that the contract would not be made otherwise. Fear, of itself, does not invalidate a contract, because a consent given out of fear is a truly human act, unless fear is so great as to deprive a person temporarily of the use of reason. However, if the fear is the result of an *unjust* act on the other's part, the contract is rescindable, because no one is obligated to live up to his side of the contract when the other party has been guilty of an injustice in the very making of the contract; the guilty party is bound to remove the injustice, and that, in this instance, involves the contract itself if the innocent party so desires.

The *cause of the contract* is the reason why one person transfers a right to another. In gratuitous contracts the cause is the will to do good to someone; in onerous contracts it is the utility one expects to derive from the

thing that is the object of the contract. If the motivating cause of the contract is the commission of a *criminal act* the contract is void. Hence, either party may refuse to fulfill his part of the contract before the crime has been committed; in fact, both parties are bound in conscience to withdraw from the contract. If the contract has not as yet been carried out and the price paid, the price must be restored; but if the contract has been carried out, the price may be demanded and retained, unless the civil law ordains differently. Not all authors, however, agree to this; some contend that a criminal contract is simply invalid, and payment, therefore, need not be made.

Valid contracts, except the contract of a gratuitous promise, bind in conscience in virtue of *commutative justice*. It belongs to the very essence of a contract (except a promise) that the contracting parties have the will to bind themselves in justice to the fulfillment of the contract; otherwise there would be no sense in making a contract. Hence, they also bind themselves to all the rights and duties which are naturally connected with the terms of the contract as intended by the contracting parties.

Kinds of Contracts

There are many types of contracts, and a division can be made from many viewpoints. The following are the main divisions.

From the standpoint of their *effect*, contracts are either unilateral or bilateral. A *unilateral* contract imposes an obligation upon only one of the contracting parties. The

contract, for instance, to make a donation obligates only the giver, not the receiver. A *bilateral* contract imposes an obligation on both contracting parties. Both the buyer and the seller, for instance, have obligations in virtue of their contract.

From the standpoint of their purpose, contracts are either *gratuitous* or onerous. In a gratuitous contract the one party intends generosity, while the other party receives a favor, as when a patron promises a scholarship to an indigent student. In an onerous contract both parties intend to obtain something to their advantage, as when an employer hires a workman to render some service and the workman gives his service for a price.

From the standpoint of their *mode* or *manner*, contracts are either consensual or real. A consensual contract is one which is made essentially by the mere consent of the contracting parties, as a promise. A real contract is one in which the contract is not essentially completed until some object has passed from the hands of the one contracting party to the hands of the other, as in a loan.

From the standpoint of their *matter*, contracts either pertain to a certain event or chance. A contract *based on a certain event* is one according to which something is to be done or given in dependence on a definite event, as in renting a house. A contract of chance is one according to which something is to be done or given in dependence on some fortuitous event, as in gambling.

From the standpoint of *conditions*, contracts are either pure or qualified. In a *pure* contract, no condition or

modification is added. In a *qualified* contract, some condition or modification is added for validity.

While the number of special contracts is rather large, all can be placed under three distinct headings; unilateral contracts; bilateral contracts based on a certain event; and contracts based on chance. Under the heading of *unilateral contracts* we distinguish between three, namely promise, donation, and testament. These unilateral contracts will be treated first.

Promise

A *promise* is an act by which one person obligates himself gratuitously to another to do or omit something, and the promise is accepted by the one to whom the promise is made.

A promise is not valid without the following *conditions*: the promisor must have the intention of binding himself by the promise, and this intention is always implied in a seriously given promise; the promise must be manifested exteriorly in some manner, and the promisee must accept the promise. Before acceptance, therefore, the promisor may revoke his promise.

So far as *obligation* is concerned, the following points must be considered. Whether the promisor is obligated from fidelity or justice depends entirely on his intention. Ordinarily, promises are not made with the intention of binding one's self under the rigorous demands of justice. If, however, a promise is made with exceptional solemnity, for instance, in writing or before witnesses or under oath, the

civil courts presume that the promisor intended to bind himself in justice; lawsuits for 'breach of promise,' especially in nuptial engagements, are based on this presumption. So far as conscience is concerned, everything depends on the intention.

Promises *cease to obligate*: if a considerable change in circumstances occurs; if the main or sole motive for making the promise no longer exists; if the execution of the promise, through no fault of the promisor, becomes impossible or illicit or useless; if the other party, in the case of a mutual promise, does not keep his promise.

Donation

Donation is an act by which one person gratuitously transfers the perfect dominion of all or part of his property to another.

From the standpoint of *natural law*, a donation is *valid* if the donor actually transfers the dominion of the thing to the donee and the donee accepts the dominion. The acceptance must be manifested by the donee externally in some recognizable form; otherwise the donation still is only the offer of a gift and can be revoked by the donor. Civil law frequently prescribes definite forms for the validity of donations, so as to avoid unnecessary litigation; hence, through the force of positive law, donations may be revocable either entirely or in part, and the donor may take advantage of the decision of the judge. However, donations contrary to the prescriptions of the positive law may be considered valid and binding *in conscience*, before the

court renders a verdict, because the donations are then consensual contracts which depend for their validity on the wills of the contracting parties.

Testaments

A *testament* or *last will* is the act of a person by which he ordains what disposition shall be made of his goods after his death.

In virtue of the natural law the descendants of a person possess the right of hereditary succession to the property of the deceased. Civil society is composed of families, and its existence is inextricably bound up with the existence of its component families. Now, families come into existence and are kept in existence through the biological process of generation. By the very law of nature, therefore, parents have the natural obligation to provide for the welfare of their children. This obligation is one of the main reasons for the legitimacy of private property, because parents must also provide for the *future* welfare of their children. The conservation and propagation of families and provisions for the welfare of children would be impossible without the transmission of family goods, at least in its major portion, from one generation to the other. Consequently, *nature itself* demands that the descendants of a person possess the *right of hereditary succession* to the goods of the family at the death of a parent. So much is clear from natural law. There are, however, many other points about hereditary succession which must be more accurately determined, for instance, the manner of succession, the amount of

inheritance for each of the descendants, the degree of relationship entitling a person to a portion of the inheritance. These points are defined and decided by civil law.

‘Hereditary succession’ is the right to succeed to the property and rights of a deceased person. Hereditary succession may be either *testamentary* or legal. It is termed testamentary, when the right of succession to the property and rights of the deceased is determined by the ‘last will and testament’ of the deceased made before death. It is termed legal, when the deceased has made no last will for the disposition of his property and rights, but dies ‘*intestate*’; the disposition is then made according to the statutes of civil law.

When the death of the testator occurs, the heir does not automatically obtain his inheritance. He must express his *acceptance* if he desires to receive the inheritance. If he accepts, he becomes the rightful heir to all the goods and rights of the deceased, and he must also assume all the obligations and debts of the deceased within the limits of the amount of the inheritance; ‘personal’ rights and obligations, however, namely, those which the testator had and which can be carried out only by himself, cease with his death. The heir, of course, need not accept the inheritance; if he refuses, the civil law decides what is to be done with the inheritance.

Absolutely speaking, a person has *no obligation to make a testament*, because his descendants will succeed to his property even if he dies *intestate*. At times, however, there may be an obligation to make a will. In particular, a person

may be bound in conscience to make a will in order to satisfy an obligation of restitution, or to fulfill a promise of justice, or to prevent discord and litigation. The duty of natural law demands only that his *children* receive so much of his goods as is necessary for them to live according to their proper state of life; if the children are unworthy, he may cut them off from their inheritance, except for the minimum amount prescribed by civil law. By natural law the testator, after providing for his children, is seriously bound in conscience to provide also for his wife, brothers, and sisters sufficiently to relieve their grave poverty, if the inheritance is large enough for this assistance; but if these persons are able to support themselves, the testator has no strict obligation to remember them in his will.

Promises, donations, and testaments are unilateral contracts. Among these the last will and testament is obviously the most important in its social effects.

Bilateral contracts imply an obligation binding on both contracting parties. They are based on a certain event or on chance. Bilateral contracts based on a *certain event* are deposits, commodates, commissions, loans, buying and selling, hiring, partnership, and exchange.

Deposits

A *deposit* is a contract by which something is taken over by a person to be guarded and to be returned later to its proprietor in its natural condition.

The *custodian* has certain obligations with respect to the deposit. He must guard the deposit with as much diligence

as he would his own property of equal value. To use the deposit for his own benefit, he must have the expressed or the tacit or at least the reasonably presumed permission of the owner. He must return the deposit to the owner whenever the request is made, unless a definite time for the return has been stipulated in the contract. He also has the obligation to repair any damage which may have occurred to the deposit while in his custody, if the damage occurred through his fault.

The *depositor* also has obligations. It is his duty to pay all expenses which the custodian incurs in guarding the deposited object. It is also his duty to indemnify the custodian for all damages which he suffers while guarding the object; this indemnification must be made before the sentence of the court if moral guilt is involved, but after the sentence if only legal guilt is involved. Thus, if John stables his cows in Peter's barns, John must pay for their keep; and if Peter's cows become infected with tuberculosis through contact with John's cattle, John must indemnify Peter for the damage.

Commodates

A *commodate* is a contract by which a thing is turned over to someone with the right to use it for a certain time and with the obligation to restore it to the owner after use. A commodate is a 'gratuitous' contract; if a price were demanded and given for the use of the thing, the contract would be a contract of hiring, not lending. The object is of

such a nature that it is not consumed by use, because the object itself must be returned.

The *borrower* has *obligations* concerning the borrowed object. He may not use the object except for the purpose specified; otherwise he violates justice. He must pay all ordinary expenses connected with the use of the object. He must take proper care of the object while it is in his possession; if damage is done to it through his fault, he has the duty to indemnify the owner. Since the object is given for use for a specified time only, the object must be returned promptly after the expiration of this period of time. Any expense incurred by damage to the object because of use not mentioned and intended by the contract must be borne by the borrower.

The *lender* also has obligations. He must make known to the borrower any harmful defects existing in the object; if he acts in bad faith, he is bound to restitution for any losses incurred by the borrower. Ordinary expenses must be borne by the borrower but extraordinary expenses by the lender. He may not reclaim the object before the expiration of the time specified except in an important and unforeseen contingency. If the object should perish during the specified time of the contract, through no fault of the borrower, the owner, strictly speaking, must bear the loss, because the object belongs to him.

Commissions

A *commission* is a contract by which one person accepts the agency to do business in the name of another. It is either a

gratuitous or an onerous contract. If the agent is paid for his service, the contract is 'onerous'; if not, it is 'gratuitous.'

The agent or broker *accepting* a commission has definite obligations. He is bound to exercise as much diligence and fidelity in transacting the business entrusted to him as if the business were his own; and more, if he accepted payment for the work. The terms of the contract must be rigorously fulfilled; any losses resulting from his failure to do so must be borne by the agent himself. All profits go to the person who gave the commission, unless otherwise agreed upon. The agent must repair all damages resulting from his culpable negligence in handling the commission.

The person *giving* the commission has the following obligations. He must fulfill all obligations lying within the scope of the contract. He must pay all necessary expenses connected with the execution of the commission, according to the terms of the contract. He must also reimburse the agent for all damages sustained without his fault, but not for damages brought on by some accident.

A *loan* is a contract by which the ownership of an object consumable in first use is transferred to another with the obligation that an object of a similar nature and quality be returned at some specified time. The loaned object is consumable 'in first use.' This element may be taken in the sense that the object is destroyed physically when used, such as grain or wine; or in the sense that it is used in a way which makes it impossible that the identical object be returned, such as money for purchasing or cloth for making a garment. In a loan the ownership of the object is transferred, because the object is destined to be consumed

in first use and only an owner has the right to destroy an object.

Charity demands that one person come to the assistance of another person in distress; hence, charity may demand that the *loan* of an object be granted to a person in need of it, and that *without compensation* for the loan. It follows that one is obligated by charity to make a loan to an indigent person, if the latter needs the loan and is able to repay it later, and if it can conveniently be done; if there is little hope for repayment, it will suffice to give him an alms. Charity may also obligate a person to make a loan to a wealthy man if he is in momentary need. But charity never obligates anyone to make a loan, so that the borrower can make a profit out of the loan; need, not profit, is the reason for charity.

Since ownership is transferred in a loan, the *lender* has the obligation to notify the borrower of any important defects in the article loaned. If he is morally delinquent in his failure to give proper notification, he is responsible for any damage resulting therefrom. He may not demand the return of the object before the expiration of the time fixed by mutual agreement; if no time was fixed, he must at least give the borrower enough time to use the object. If the borrower desires to return the object before the expiration of the specified time period, he should accept the object when offered.

On his part, since he has received the ownership of the borrowed object, the *borrower* assumes all responsibility for the object once it has passed into his possession. He must return an object equivalent in kind and quality at the

time stipulated; if he fails to do this through his own fault, he is responsible for all losses suffered by the lender. If a general inflation sets in between the time the loan of money was made and the time the contract calls for repayment, the borrower, in all probability, has no strict obligation to pay more than the sum loaned, because the calamity of a general inflation affects all people alike.

Strictly speaking, a loan is a *gratuitous contract*, so that it would be *unjust to exact a fee* for the use of something which is consumed in first use. Such an object has no value except its use, just as the value of the substance of wine is identical with the value of its use as a beverage. Whoever, therefore, would demand a price for the use of a loaned object would be like a wine merchant who would charge a price for the wine and also a price for the use of the wine; the wine merchant would act unjustly, because he would charge two payments for one and the same thing. *Per se*, therefore, to charge interest for money loans is usury and morally wrong.

Per accidens, however, because of the methods of modern business, there are a number of *extrinsic titles*, based on *just compensation*, which make it morally permissible for a moneylender to exact interest on money loans. The objects of ordinary loans, for example, wine, grain, wood, coal, cloth, are destroyed or substantially altered in first use; but money as a medium of exchange is a commodity in a class by itself. The lender loses the gains he might have made if he invested his money instead of loaning it to another; according to some authors, this is the extrinsic title of *cessation of gain*. The lender runs the risk

of losing his money because the borrower may be unable to repay the loan; this constitutes the extrinsic title of danger of loss. The lender may suffer a positive detriment to his finances by the very fact of making the loan; this constitutes the extrinsic title of emerging damage. Then there is the necessity of forcing the borrower to return the loan at the specified time, since borrowers are notorious for desiring an extension of time; this gives rise to the title of a *conventional penalty*. The floating of large loans is a practical necessity in modern times in order to stimulate extensive industries for the benefit of the population in general; as a result of this trend toward large-scale business, governments have encouraged people of means to invest their capital in such enterprises, permitting a moderate interest return on their investment. Many authors, therefore, add the *title of civil law* to the others. Economic conditions thus justify the taking of interest, provided the interest rate is not exorbitant.

Just what rate of interest should be considered 'reasonable and just' depends to a great extent on the circumstances of time, place, and person. The general judgment and practice of conscientious business people ordinarily will be a good norm for estimating a 'reasonable and just' rate of interest. Usually civil laws, reflecting the attitude of the average citizens, regulate prevailing interest rates, so that usurious rates are proscribed and punishable in court.

While the question of charging a fee for a loan pertains mainly to money loans, other types of loans may often acquire the same status as that of money in business, so

that *just compensation* applies to them also; hence, the charging of a fee for them will also be justified.

As a rule, an interest rate of 5 or 6 per cent is reasonable and just. If considerable risk is involved, even an interest rate of 10 per cent or more is justifiable. To charge an exorbitant rate of interest, particularly when a person in need is practically forced to apply for a loan, is *usury*. Usury is really a form of theft and violates commutative justice; hence, the usurer is bound in conscience to make restitution, just as in the case of theft.

Buying and Selling

Buying and selling is a contract by which the two contracting parties mutually agree to deliver merchandise for a price. Three things are required for this contract: a mutual agreement between seller and buyer; a movable or immovable article whose possession is to be delivered by the seller to the buyer; a certain amount of money as the price of the article to be delivered.

There are a number of obligations incumbent on the *seller*. With regard to the *object* to be sold, he has the obligation to sell the kind of object the buyer wants to contract for. If it is not the identical kind of object, it must be at least morally the same, so that it serves equally as well for the purpose intended by the buyer. The seller must be the actual owner of the object he sells. If the object actually belongs to someone else, but the seller acts in good faith, he is naturally entitled to the purchase price until actual ownership is proved; if he acts in bad faith, he is

guilty of fraud and must make good all losses of the buyer resulting from the sale. With regard to *defects* which affect the value of the article, a distinction must be made. Defects which render the articles useless or harmful are 'substantial' defects and must be manifested to the buyer, because otherwise he would not be buying the object he requested; failure to reveal substantial defects makes the contract void. 'Accidental' defects, which merely render the object less suitable, do not make the contract void, so long as the price has been lowered in proportion. If the buyer asks about possible defects, the seller must make known even the accidental defects; in the latter instance, if the seller did not manifest the accidental defects, the contract is voidable. With regard to the *delivery* of the merchandise, the seller must live up strictly to the terms of the contract concerning the object, the time, the place, and the manner of delivery. The seller is the custodian of the merchandise until delivered. Damage done to it in the meantime must be repaired by the seller, if the damage occurred through his fault; if the damage occurred by an accident for which he was not responsible, both he and the buyer must abide by the decision of the civil court, provided the seller refuses to repair the damage of his own accord.

The *buyer* also has certain obligations. If the seller is unaware of the true value of the merchandise offered for sale, the buyer must either warn him or offer him the lowest just price. The buyer must pay at the time stipulated in the contract; if no definite time is set, he must pay when he takes possession of the merchandise. He must accept the merchandise contracted for and at the time set in the

contract; if no time limit was specified, the contract goes into effect immediately.

Buying and selling bring up the important question: What is a *just sales price*? The price of an article, theoretically at least, is supposed to be a measure of its value. The 'value' of a thing is the common estimation of its worth among people of a certain region, and this estimation depends mostly upon the usefulness of an object to satisfy some human need. This usefulness of a thing is its 'use value.' A just price, therefore, is a price which is equivalent to the value of a thing. Money is the universal medium of exchange. The use value of one thing in relation to the use value of another thing is measured in terms of money. The value of an article in terms of money, therefore, is the price which should be demanded and paid for that article. A 'just' price is thus seen to be the price judged to be equivalent to the value of the article which is offered for sale or which someone wants to buy.

Moralists distinguish between three kinds of prices: legal, natural or popular, and conventional. The *legal* price is the price fixed by the civil authorities. Price fixing is sometimes resorted to in times of national emergency, such as a war or a famine. Since the government fixes prices for the common good of all citizens, the legal price is a matter of conscience. The *natural* or *popular* price is determined by the common estimation of the people living at a certain time and in a certain region. The *conventional* price is the price of an article determined by the free agreement of the buyer and seller.

Under *ordinary* circumstances, in the absence of a price fixed by the government, the just price is the *natural* or *popular* price. Whatever exceeds the maximum natural price commonly paid or falls below the minimum natural price commonly paid is unjust. If an object has a special sentimental value for the owner, he may charge more than the maximum price.

And if the owner wants to get rid of his merchandise by all means, he may offer it for a price lower than the accepted minimum price. But if he intends to 'freeze out' his competitors from the market by drastic underselling, so as to control the market later on for his own profit, he acts unjustly. 'Bargains,' an institution common to most merchandising concerns, are intended to attract customers and are morally permissible, because their effect on the general price level is only temporary and does not force competitors out of business.

The *conventional* price prevails in the selling and buying of articles which lie outside the scope of ordinary business and have no legal or natural price. The conventional price is determined solely by the desire of the buyer to possess the article. Rare books, manuscripts, paintings, collectors' items, etc., belong under this heading. Here everything depends on what the buyer is willing to pay and what the seller is willing to accept.

Trusts and monopolies present a special problem. A *trust* is a permanent organization which controls the commercial policy of a number of independently operated companies; it is the purpose, or at least the tendency, of such a trust, if strong enough, to control the prices in its respective

commercial field by suppressing or disregarding competition. Trusts tend to effect a monopoly. A *monopoly* is the exclusive control of the supply of a particular commodity in a given market. Monopolies are either public or private. *Public legal* monopolies are authorized by the government for its own use. All governments have a monopoly of the postal service; some have a monopoly of the railroads, some of the telegraph or telephone services, and so forth. *Private legal* monopolies are operated by a private company with the permission of the government; for example, some companies are granted the exclusive right to furnish light, electricity, streetcar service, water, and so on. A *natural* monopoly is one which results from a natural limitation of resources, as when one company controls the entire output of a commodity, such as gold, aluminum, uranium, diamonds, and so on, due to the limited area in which these raw materials are located. *Organizational* monopolies result from the sole possession of certain facilities, making competition impossible or impractical, such as telegraph and telephone service, railways and steamship lines. Sometimes organizational monopolies arise through the use of a secret process in the manufacture of goods, the secret being held by a single person or company.

Public legal monopolies are instituted for the general welfare and for the purposes of revenue; almost any price may be charged for the services given, because only legal justice, not commutative justice, is involved. *Private legal* monopolies may charge only a reasonable price. *Natural* monopolies may not charge more than the maximum price which would prevail if no monopoly existed. The same

principle applies to *organizational* monopolies. Just what the maximum price would be is not always easy to determine. Since the common good is directly involved, the civil authorities have the right to control trusts and monopolies and fix a reasonable price.

Renting and Hiring

Renting and hiring are contracts by which one party obtains the right to the use and usufruct of a thing (except money) or of services or of labor for a definite price. The thing rented may be movable property, such as an animal or a machine, or immovable property, such as land or a house; it may be certain services, such as the use of water power; and it may also be the labor of a person. The direct dominion of the thing hired still belongs to the owner; what is rented or hired is the indirect dominion of the use or usufruct of the property.

This type of contract is a form of *sale*, because the right to the use and usufruct of certain things is bought by one party and sold by the other. The principles governing buying and selling also govern renting and hiring.

A *landlord* is entitled to a reasonable return on his investment; but he may not charge an exorbitant rental because of The *third* type of partnership is the *holding company*. Holding companies own and control the stocks or securities of a number of companies or corporations; the interest or dividends derived from these stocks or securities constitutes the income of the members of the holding company. Since the ownership of 51 per cent or more of the

stock gives control of a company or corporation, it will readily be seen how a holding company can control a number of subsidiary corporations through the medium of a capital investment much smaller than the combined capital investment of the subsidiary corporations as a whole. Furthermore, holding companies can be pyramided, so that one supreme holding company can control a number of other holding companies, while these in turn control a large number of subsidiary corporations; the control is usually exercised through the medium of 'interlocking directorates.' While holding companies, in and for themselves, are legitimate and licit associations, it is obvious that they tend toward *monopolistic control* with an octopus-like strangle hold on all the business in a given field. Holding companies are thus a distinct menace to the social welfare of a nation and may even threaten the very existence of organized government. When this happens, they must be regulated by *civil law* for the common good or, if regulation is ineffective, even be dissolved as detrimental to the state and public welfare.

Exchange

Exchange is a contract by which money of one kind is changed into money of another kind with a moderate fee for the service rendered.

The money-changer may do a hand-to-hand business, changing one kind of money into another kind on the spot, as is the custom at stations along the frontier dividing two countries. It is a convenience for the benefit of people

passing from one country into another. There is, however, also a type of long-distance exchange, usually conducted by banking houses with international connections, for the convenience of persons desiring to send money to persons or business concerns in other countries.

To be *just* and *equitable*, the money given must be of the same value as the money received, with due regard to possible fluctuation in the rate of exchange existing in the currency at the time. The fee exacted for exchange must not be exorbitant but proportionate to the service rendered. This fee is determined by the customary practice prevailing at the time among reputable money-changers. As in most types of contracts, the civil law may prescribe what constitutes a maximum fee.

The contracts just treated are the main types of bilateral contracts based on a definite event. Each type has many varieties, depending on the terms incorporated in the contract.

Besides these contracts there are bilateral contracts of a totally different character based on an event determined by the *element of chance* as the deciding factor in the terms of the contracts.

In the bilateral contracts just considered there is almost always an element of uncertainty involved; that is why it is necessary that contracts bind both contracting parties. But the uncertainty is the uncertainty which accompanies all human activities. These contracts are concerned with definite objects, definite persons, and definite services; in other words, an equality exists between what a party gives

and what the same party receives in return. There is always a service rendered and a price for it.

In contracts based on a chance event there is *no service rendered* for which one is entitled to receive payment. Such contracts have this in common that they offer a reward without any service, of benefit to the other contracting party, having been performed. And these contracts grant no absolute right to any particular object, but only to the *hope* of being lucky enough to win something which depends entirely on a fortuitous event over which no one, if the affair is conducted honestly, has any control. The outcome of the contract is the result of *chance*.

There are five main types of contracts based on chance: betting, gaming, lottery, insurance, and speculation. A few words on each.

Betting

A *bet* is a contract by which two or more persons, disputing about the truth of a thing or about an event, agree among themselves that the winner of the dispute shall receive a reward.

By the very terms of the contract, therefore, it is presupposed that a real (not a feigned) dissension exists among the disputants concerning some fact. The fact must be uncertain to both parties, so far as the *objective conditions* are concerned, although each person may be subjectively certain that he is correct in his judgment. It would be unjust for anyone to make a bet about a thing or an event, if he had previously verified the objective

conditions which are the point of the dispute. Such a person does not base his contract on a 'hope,' but on a 'certainty,' and so he really risks nothing; on the other hand, he actually deprives his opponent of all hope to win and forces him to pay without any chance of winning. To be just, therefore, there must be an *equality of risk* and also an *equality of reward*. If one of the parties spontaneously offers odds, the payment must be made according to the odds stipulated.

However, bets must not only be just; they must be *licit*. Bets are licit under the following conditions: if the matter of the bet is morally good or at least indifferent; if an honorable motive exists for the bet, such as recreation or the incentive to discover the truth about a fact; if the amount of the bet is not beyond reason and is within the means of the betters, so that no duties of charity or justice toward others are violated.

Gaming

Gaming or gambling is a contract by which two or more persons, engaged in a game of chance, agree among themselves that the winner of the game shall receive a certain reward. Almost innumerable varieties of gambling games exist, among them card games, dice games, roulette, bingo, slot machines.

To be *just*, gambling must be done without cheating, and there must be a moral equality for all persons with regard to the hope of winning and the risk of losing. The use of fraudulent means voids the contract and brings with it the

obligation of restitution. When the expertness of one player practically eliminates the element of chance in his favor, the equality of hope and risk is not in the game, and the loser is not obligated to pay, unless he was aware of the other's proficiency and still decided to play. Similarly, all parties must enter the game of their own free will. It would be an invalid contract, therefore, to force someone to play the game or to play with a person who is mentally incompetent, such as a half-drunken person or a half-wit. Finally, to be just, it is necessary that the player be entitled to risk the loss of the stakes with which he is playing. Thus, for example, if a player needs his money for the support of his family, he acts unjustly in risking it by gambling.

To be *licit*, the game must be honest in itself and in all its circumstances, and the stakes must not be too high. Ordinarily speaking, legitimate gambling debts, all things being equal and fair, bind in conscience. If the civil law forbids gambling, a distinction must be made: if it prohibits and voids all gambling contracts, the contract is simply invalid from the start; if it merely prohibits gambling by means of a penal law, the contract itself is valid, but the gamblers can have no recourse to the courts to enforce the contract.

Lottery

A *lottery* is a contract by which a person, upon payment of a certain sum of money, acquires the right of obtaining an article or money, if the chance he holds wins.

A lottery, to be *just*, must be conducted without fraud. If the lottery is manipulated so that one or the other person is made to win, injustice is committed against the other participants, and their money must be refunded. Furthermore, in order that a lottery be just, there should, theoretically at least, be an equality between the money taken in and the value of the prizes given out, so that the price paid is proportionate to the possibility of obtaining a prize. In practice, however, this proportion is seldom found. Private concerns run. a lottery for a reasonable profit; governments, for revenue; charitable organizations, for funds to carry on their activities. This being understood, all participants are aware that their chances of winning a prize are mathematically below theoretical equality; it is assumed, therefore, that they are willing to make a donation of the money which is in excess of the value of the prizes offered in the lottery. If deception has been practiced in this respect by those who operate the lottery the lottery is conducted under false pretenses, injustice is committed, and the participants are entitled to reimbursement.

Insurance

Insurance is a contract by which one of the contracting parties obligates himself, upon the payment of a premium, to compensate another for any damage or loss in his person or property resulting from some untoward event.

The matter of an insurance contract is the danger of damage or the risk of loss which is constantly present with respect to persons and things. Persons and things can,

therefore, be insured against almost any kind of damage, injury, or loss. The insurance company makes statistical surveys of the various kinds of risks and charges its premiums accordingly. Civil law demands compliance with certain very definite regulations, so that insurance companies will always be solvent under normal conditions of operations and be able to meet their obligations. Since future contingent events, unforeseen at the time the contract is made, are a vital factor in the contract, neither contracting party can be certain if or when compensation for damage or loss will have to be made; it may occur soon or late or never, depending on the type of insurance and the vicissitude of circumstance.

In order that an insurance contract be *just*, a number of conditions must be fulfilled. There must be proper proportion between the risk accepted by the company and the premium demanded for insurance. The insurance company is entitled to a moderate profit on its capital investment and to the necessary expenses for equipment, management, salaries, etc., all of which will naturally be included in the premium money received. It would, however, be unjust for a company to charge excessive premiums in order to be able to give enormous salaries for officials. Furthermore, fraud must be excluded from the transactions. If the applicant fails to reveal any important circumstance which notably increases the risk assumed by the insurance company, so that the company would not have issued the policy had it known of this circumstance, the contract is void because of a substantial defect. Failure to reveal a minor defect does not automatically void the

contract, provided the insurance company would in all probability have made the contract anyhow; but the insurance company, upon discovery of the added risk, may raise the premium rate or apply to the courts for annulment of the contract. Finally the insurance company must possess the necessary funds to cover any damage specified in the policy, because its right to the payment of premiums is dependent on its ability to pay the indemnities stipulated in the contract. This does not mean that the insurance company must have enough funds on hand to pay all indemnities at once, so that, for example, it were able to cover the losses of all houses in a city destroyed simultaneously by a complete destruction of the city through bombing during a war; its liabilities are calculated on the basis of *probable* losses in *normal* times, and that is all the risk it can be expected to assume at the time the contract is made.

Insurance of persons and things has a tremendous social value. For this reason the civil authorities have the right and the duty to make laws safeguarding the interests of both the public and the investors, and these laws are binding.

Market Speculations

The *exchange* is a forum in which the buyers and sellers of stocks, bonds, and other commodities congregate for negotiating contracts of purchase and sale relative to these items. We thus speak of the stock exchange, the grain exchange, the cotton exchange. Exchanges are a practical

necessity in our times, due to the existence of the number of investors in large corporations. It is convenient to have a central forum for the quick purchase and sale of such commodities and for the determination of a fair price in buying and selling them. There is, therefore, nothing inherently wrong in the operations of an exchange, such as the stock market or the grain market. Operators often desire to buy or sell large quantities of stocks or provisions, and the logical place for these transactions is the exchange, because it is there that operators with ample funds are to be found. The mere fact that the amount of shares transferred involve huge sums of money is of no particular moral significance in itself; the moral principles governing buying and selling on a small scale also govern buying and selling on a large scale.

When such commodities are bought and sold on the exchange, with a direct and immediate transferal of the ownership of the commodities themselves, the contract is a contract based on a certain event. However, oftentimes contracts are made with the sole end of amassing a fortune through reliance on a *contingently future* increase or decrease in the price; since no one can predict with certainty what the price of commodities will be, the element of chance enters into such contracts, and the operation becomes speculation, with the possibility of gaining or losing a fortune in short order. Speculation on the exchange is thus a form of *gambling*.

In itself, the endeavor to make a profit through buying and selling, even when chance enters into the transaction, is something indifferent and therefore not morally wrong.

However, unscrupulous speculators, in their greed for sudden riches, sometimes do not hesitate to employ fraudulent devices and methods to influence the rise and fall of prices and twist the market to their own advantage. Gain for one means loss for another. The unjust enrichment of the speculator means the unjust impoverishment of someone else. Through his nefarious manipulation of the market the speculator in all too many instances wipes out the savings of hundreds and thousands of small investors who 'played the market' in a desire to increase their savings. Injustice does not cease to be injustice, simply because a clever speculator is a respected citizen and does not have a personal acquaintance with the persons he has robbed of their possessions. The principle ruling the transactions of the speculators on the exchange may be the jungle law of 'dog-eat-dog,' but the moral law of justice is still the supreme law of humanity and binds the stockbroker as well as it does the butcher and baker.

These, then, are the various titles which confer ownership of a specific, determinate thing on a person. Entire books could be written, and have been written, on each of the modes of acquiring private property. Space does not permit more than the briefest outline of the main kinds of titles and the moral principles involved in their operation, but the outline given should be of some help in understanding these basic factors in the relationship of individuals and groups of individuals toward one another.

Summary of Chapter XVII

Without a title there can be no ownership. This chapter treats of the various titles to ownership. For details, consult the text. There are *three original* titles: occupation, accession, and labor. There are *two derived* titles: prescription and contract.

1. *Occupation*. This is the effective seizure and possession of an ownerless object with the intention of making it one's property. *Three conditions* are required: that the thing have no owner; that the thing be seized; and that there be the intention of making it one's own.

2. *Accession*. Accession is the mode of acquiring ownership by means of some addition to one's property. This addition will be either *natural or industrial or mixed*.

3. *Labor*. Labor is human industry which produces goods of some sort. Only with respect to its own proper fruits can labor be regarded as a natural and original title of dominion.

4. *Prescription*. It is the mode of acquiring ownership or extinguishing a debt by the continuous possession of a thing for the time and in the manner prescribed by positive law. Prescription is either *acquisitive or extinctive*.

The *conditions* required for the validity of 'acquisitive' prescription are: aptness of the object; good faith; a title; continued possession; proper time. The conditions required for the validity of 'extinctive' prescription are: prescriptibility of the right or debt; non-use of a right; good faith; proper time.

5. *The Nature of Contracts.* A contract is the agreement between two or more persons to transfer a right to do or not to do something. It refers either to a 'thing' or to an 'action.' *Four conditions* are essentially necessary for a valid contract: suitability of the matter; competence of the contracting persons; mutual consent; and cause of the consent.

6. *Kinds of Contracts.* From the standpoint of their effect, contracts are either 'unilateral' or 'bilateral.' From the standpoint of their *purpose*, either 'gratuitous' or 'onerous.' From the standpoint of their *mode* or manner, either 'consensual' or 'real.' From the standpoint of their *matter*, they are either based on a 'certain event' or on 'chance.' From the standpoint of their *conditions*, they are either 'pure' or 'qualified.'

All contracts can be grouped under *three headings*: unilateral contracts; bilateral contracts based on a certain event; bilateral contracts based on chance. The unilateral contracts are: promise, donation, and testaments.

7. *Promise.* It is an act by which one person obligates himself gratuitously to another to do or to omit something, and the promise is accepted by the one to whom the promise is made. Whether the promisor is obligated from fidelity or justice, depends on his intention.

8. *Donation.* It is the act by which one person transfers the perfect dominion of all or part of his property to another. To be valid, the donee must express his acceptance of the donation.

9. *Testaments.* A testament or last will is the act of a person by which he ordains what disposition shall be made

of his goods after his death. In virtue of the natural law the descendants of a person possess the right of hereditary succession. Hereditary succession is either 'testamentary' or 'legal.' The heir must 'accept' the inheritance in order to succeed to all rights and obligations of the inheritance.

10. *Deposits. Bilateral* contracts imply an obligation binding on both contracting parties. Bilateral contracts based on a *certain event* are: deposits, commodates, commissions, loans, buying and selling, hiring, partnerships, and exchange.

A *deposit* is a contract by which some thing is taken over by a person to be guarded and to be returned later to its proprietor in its natural condition.

11. *Commodates.* A commodate is a contract by which a thing is turned over to someone with the right to use it for a certain time and with the obligation to restore it to the owner after use.

12. *Commissions.* A commission is a contract by which one person accepts the agency to do business in the name of another.

13. *Loans.* A loan is a contract by which the ownership of an object consumable in first use is transferred to another with the obligation that an object of a similar nature and quality be returned at a specific date. *Charity* may demand that the loan of an object be granted to a person in need of it, and that *without compensation*.

Due to a number of *extrinsic titles*, based on just compensation, it is morally permissible for a moneylender to exact *interest* on money loans. If an exorbitant rate is exacted, it is 'usury.'

14. *Buying and Selling*. It is a contract by which the contracting parties mutually agree to deliver merchandise for a price.

A *just sales price* is mandatory. A price is either *legal*, fixed by law; or *natural (popular)*, fixed by popular estimation; or *conventional*, determined by the free agreement of buyer and seller. Ordinarily, the natural or popular price is the just price.

Trusts and *monopolies* have a tendency to control the price of commodities beyond reasonable limits, to the detriment of public welfare.

15. *Renting and Hiring*. These are contracts by which one party obtains the right to the use and usufruct of a thing (except money) or of services or of labor for a definite price. These contracts are a form of *sale* and are governed by the principles of buying and selling.

16. *Partnership*. This is a contract by which two or more competent persons place their money, effects, labor, and skill, or at least some of these items, in lawful commerce or business, with the agreement that the profits and losses shall be shared between them in definite proportions. There are three main types: the firm or company; the corporation; the holding company.

17. *Exchange*. Exchange is a contract by which money of one kind is changed into money of another kind with a moderate fee for the service rendered.

Besides these contracts there are bilateral contracts based on an event determined by the *element of chance*: betting, gaming, lottery, Insurance, and speculation.

18. *Betting*. Betting is a contract by which two or more persons, disputing about the truth of a thing or about an event, agree among themselves that the winner of the dispute shall receive a reward.

19. *Gaming or Gambling*. This is a contract by which two or more persons, engaged in a game of chance, agree among themselves that the winner of the game shall receive a certain reward.

20. *Lottery*. This is a contract by which a person, upon payment of a certain sum of money, acquires the right of obtaining an article or money, if he should happen to hold the right number.

21. *Insurance*. Insurance is a contract by which one of the contracting parties obligates himself, upon payment of a premium, to compensate another for any damage or loss in his person or property resulting from some untoward event. Liabilities are calculated on *probable* losses in *normal* times.

22. *Market Speculation*. Commodity exchanges are a necessary convenience in our day of 'big business.' But *speculation* on the exchange is a form of gambling. When fraudulent methods are used to influence the rise and fall of prices, speculation is unjust.

Chapter 18

WORK AND WAGES

LABOR IS A TITLE TO OWNERSHIP OF PRIVATE PROPERTY. LABOR adds value to an object upon which human energy is expended. If, then, the workman also owns the raw material or object to which he applies his productive energy, he naturally owns the entire object. The vast majority of workers, however, do not own the materials or machines of industry. They hire out their labor for a definite wage. In this way industry and labor cooperate in the production of material goods. Usually this cooperation is effected through a wage contract.

Since both industry and labor share in the production of the material goods sold to the consumer, the question naturally arises: What share of the returns belongs to industry and what to labor? The problem is one of the most prominent issues disturbing the human relations of present-day society. An impartial analysis of the economic and moral principles involved alone can hope to solve the vitally human problem underlying the relations of industry and labor.

Liberalism and Labor

Economic liberalism and economic individualism are the same thing. Individualism was a reaction against the system and theory of mercantilism in vogue in France during the eighteenth century. The mercantilists maintained that all industry is of such vital importance to the public welfare of a nation that the civil authority of the government has both the right and the duty to supervise and regulate it for the national good. The physiocrats, a group of French thinkers, opposed mercantilism with the doctrine that the authority of the government is a necessary evil and that individual liberty is the greatest good; hence, the authority of the government must be curbed and individual liberty must be given free rein. The physiocrats coined the phrase '*laissez faire*' which, literally, means as much as 'Let (people) do or make (what they choose),' and everything will be for the best. In other words, they advocated *governmental noninterference* in economics, labor, manufactures, industry, commerce, and every kind of business. The physiocrats were followers of F. Quesnay (1694–1774), who propounded a system of political and economic doctrines based on the supremacy of the powers of nature as the source of national wealth and prosperity. The government, therefore, should never interfere with the natural laws which affect the processes of society and industry.

The system of *laissez faire* is termed *economic individualism* in as much as it maintains the political and economic independence of the individual and emphasizes the necessity of the complete liberty of individual initiative,

action, and interests, especially in industry and business. It is termed *economic liberalism* in as far as it maintains that the sole regulative principle of economic life is the law of supply and demand and free competition in the market place. In applying the principle of *laissez faire*, economic liberalism demands freedom of trade, freedom of contract, freedom of competition in the open market, freedom for operation of the economic laws of supply and demand, freedom from interference and restraint on the part of organized social groups and the government. Under such conditions, liberalism claims, the prosperity of the individual will merge into the social and economic welfare of society as a whole. The great protagonists of liberalistic capitalism, who sought to give a scientific and philosophic foundation to the theory and policy, were Adam Smith, Malthus, David Ricardo, Jeremy Bentham, John S. Mill, Herbert Spencer. And so the doctrine of individualism and liberalism, from the latter part of the eighteenth century, became the economic dogma of 'big business,' controlling the greater part of industry up to our day. The jungle law of untrammelled competition forced the weaker business concerns to the wall, so that industry became concentrated in the hands of a few magnates and enormous wealth flowed into the coffers of a small number of families.

The effect of the individualistic and liberalistic policy of industry on *labor* was disastrous. Sweatshop conditions, with long hours of arduous labor and bare subsistence wages for the individual laborer, became the common lot of the workingman. Because he could not support his family on his wages, the mother of the family and even the small

children were compelled to work in the mines and factories at reduced wages, thereby depressing the wage scale to a still lower level and often forcing the father into the ranks of the unemployed. The profits of the industrialist mounted higher and higher, while the living conditions of the laborer became worse and worse. Hiring was done on an *individual* basis, and the laborer had the dire choice of being employed at whatever wage rate the employer offered or starving to death for want of a job.

Every attempt on the part of the wage earners to form a union for mutual protection was fought tooth and nail by most industrial concerns as being contrary to the liberalistic dogmas of free competition and free contract. In all too many instances the laborer had to accept the 'yellow dog' contract which made it a condition of employment not to join a labor union or organization whose purpose it was to bring about better wages or better working conditions. Labor had indeed fallen on evil ways; the average worker in industry was no more than a *labor slave*: his economic oppression was complete.

In sheer desperation and under extreme difficulties the laborers in some industries managed to band together into *labor unions*. Wherever these unions flourished, the condition of the worker, both as to wage rate and to personal safety, improved. Little by little the movement grew. Instead of the individual free wage contract, *collective bargaining* between industry and labor unions assisted the workingman in wresting recognition of his human and social rights from reluctant management. The

laborers ceased to be mere 'hands' and became 'persons' again.

The Champion of Labor

Above the din of the titanic struggle between industry and labor a voice rose championing the *human rights* of labor on *moral grounds*. It was a call to the conscience of mankind. Pope Leo XIII, in his famous encyclical *Rerum Novarum* in 1891, attacked the basic doctrine of economic individualism and liberalism and proved to the world that it was immoral and indefensible. In particular, he attacked three basic concepts of liberalism — freedom of competition, freedom of contract, and noninterference on the part of the state.

He pointed out that *free competition*, within proper bounds, is a source of progress; but when free competition becomes unrestrained and excessive in dealing with human beings, it is a menace to society. Unrestrained competition in the labor market leads to injustice and to the degradation of the human person.

Next, he attacked the liberalistic concept of the *free contract* between employer and employee. Starvation wages, even though agreed upon in a free contract, are unjust; and starvation wages have always been the result of free competition on the part of a heartless and inhuman industrial system which looks merely to profit and the accumulation of wealth in the hands of the owners and considers labor a mere commodity to be hired in the open market at the lowest available price. The laborer in this

concept is a human machine capable of doing work, and his dignity as a human person is completely ignored. Liberalism overlooks the fact that human labor has both an *individual* and *social* character, and the oppression of the individual is always disastrous to the general welfare of society. *Social justice*, therefore, must be an essential element in the attitude of industry toward labor; when social justice is omitted from the human relations of employer and employee, the common good must inevitably suffer and eventually collapse. The employer-employee problem is definitely a *moral problem* and must be solved on the basis of moral principles; to view it as a purely economic problem affecting the individual relations of employer and employee is a grave error, because the general welfare of society, of which industry and labor are integral parts, is overlooked.

Liberalism demanded that the state or government follow the policy of *noninterference* in matters of business and labor, except in the case of breach of contract. This liberalistic doctrine degraded the state or government to the position of a policeman protecting the wage contract, and the contract, needless to say, almost always was made for the benefit of industry and not of labor. Pope Leo inveighed against this perversion of the nature of the state and restored its true purpose of protecting all citizens, especially the poorer classes. "To the state," he said, "the interests of all are equal, whether high or low. The poor are members of the national community equally with the rich; they are real component parts, living parts, which make up, through the family, the living body; and it need hardly be said that they are by far the majority. It would be irrational

to neglect one portion of the citizens and to favor another; and therefore the public administration must duly and solicitously provide for the welfare and the comfort of the working people, or else the law of justice will be violated which ordains that each shall have his due.

When there is a question of protecting the rights of individuals, the poor and helpless have a claim to special consideration. The richer population have many ways of protecting themselves, and stand less in need of help from the state; those who are badly off have no resources of their own to fall back upon, and must chiefly rely upon the assistance of the state. And it is for this reason that wage earners, who are, undoubtedly, among the weak and necessitous, should be specially cared for and protected by the commonwealth."¹ In these words Pope Leo outlined the functions of government, especially in relation to labor. He recommended social and labor legislation to alleviate the harsh conditions of the laboring class, but he did not favor a paternalistic government which would carry all the burdens of the workingman. Rather, wherever possible, workingmen should try to secure their rights through the activity of voluntary associations or *unions*. However, the government should always be ready to step in and secure their rights, when necessary or advisable, by means of legislation and assistance.

Pope Leo's encyclical became the Magna Charta of labor. Since his pronouncements on the errors of liberalism and rugged individualism, governments have turned more and more toward labor and its rights, so that today liberalism in its extreme form is discredited and labor is well on its way

toward proper recognition and treatment. We are now in a better position to formulate the *moral principles* which should govern the problem of industry and labor.

The Factors of Industry

The problem of 'labor' is an integral part of the broader problems of 'production.' It is through taking an active part in the production of goods that labor is entitled to a share of the income derived through the production of goods. Obviously, all who contribute to the production of goods are entitled to a share in the income derived therefrom. Now, there are *four factors* involved in the productive process, and correspondingly there are four classes of *agents* responsible for the productive process. These four factors are land, capital, business management, and labor; and the four classes of agents are the landowner, the capitalist, the businessman, and the laborer.

The *landowner* contributes land as a factor in the productive process from which national wealth is derived. The land may contain mines or timber, or it may be used for agricultural purposes, or it may be used as a building site for a home, a shop, or a factory. His income from land is *rent*, i.e., the price paid for the use of the land. The capitalist contributes his wealth as a factor in the productive process of goods, for wealth employed directly for the production of new wealth is 'capital.' If a capitalist employs his own money in his own enterprise, he is an active capitalist; if he lends his money to others for use in their enterprise, he is a loan capitalist. In either case his

contribution is a factor in the productive process of goods. His income from capital is *interest*, i.e., the price paid for the use of his capital. The *businessman* or *entrepreneur* contributes his energy and ability as a factor in the productive process, because he manages the production and sees to the proper distribution and sale of the finished product. His income from management consists in *profits* or a *salary*. The *laborer* contributes his energy and skill as a factor in the productive process, because he is the one who is immediately engaged in the actual making of goods. It is the laborer who actually tills the soil, does the mining, processes the timber, and operates the tools and machines. His income from labor is his *wages*.

Since there are four factors in production and each contributes its share to the product, each factor has a corresponding *claim to remuneration*, even if more than one factor is contributed by one person or group of persons: the landowner is entitled to normal rent; the capitalist, to normal interest; the businessman, to a reasonable profit or salary; and the laborer, to an adequate wage.

A distinction, however, must be made between these factors and agents, when one judges their relative importance. It is true that all four factors contribute their respective share to the productive process as a whole. However, when each factor is contributed by a different person or group of persons, the factors of land and capital are *passive* factors, while the factors of management and labor are *active* factors. The landowner and the capitalist do not expend their personal energy in the actual

productive process; but the business managers and the laborers actively produce the commodity itself through their knowledge, skill, and energy. In such a case, the landowner and capitalist can use their time and energy for other gainful pursuits, while the businessman and the laborer must give practically all their time and energy to the production of the commodity upon which their livelihood depends. From a moral standpoint of justice, therefore, the businessman and the laborer, as actual co-producers, have the first and greatest claim to remuneration.

The managers of a business or industry have, absolutely speaking, priority for an adequate livelihood from the income of the product, even with respect to the laborers, because they operate the business or industry as such, have a greater responsibility, and assume the risks. Next to the managers, the laborers have priority for an adequate livelihood, because they do the work of production and it is their *sole means of earning a livelihood*.

A Just Wage

It has been the great economic and moral error of individualistic and liberalistic industry to view labor as a mere commodity. Labor is more than a certain amount of energy and skill considered in the abstract. Labor in the concrete is *human* labor expended by a rational human being for human purposes. As such it is immeasurably superior to the energy of an animal or the operation of a machine. The laborer does not work in a factory or on the

farm or in a mine because he enjoys it; he works because he has both the right and the duty to *obtain a livelihood* for himself and, if he is married, for his wife and family. Due to the economic structure of modern society, the only way he can earn a livelihood for himself and his family is to hire out his working capacity to business and industry by contributing his own factor to the productive process and thereby assisting in creating a portion of the national wealth from which all incomes and all prosperity flow for the commonwealth at large. Without his creative activity the nation would sink into utter stagnation and the common welfare would collapse.

Labor, therefore, has a double aspect. It has both an *individual* and *social* function. For the individual it means wages for a personal livelihood, and for society it means the creation of values and the production of goods which are indispensable for the common welfare. On both grounds, therefore, the laborer is entitled to a *just wage*. A laborer is not merely an individual who must be able to live so that he can work and be able to work so that he can live; he is an integral part of society who is supposed to contribute his share to the common good of all and in return share in the benefits of the common good of all. Anything less is an injustice.

The *primary title* or moral claim to a share in the material goods of the earth is the *satisfaction of human needs*. It is precisely the fact of the existence of human needs requiring satisfaction that furnishes the right to private ownership through 'occupation,' through 'production of values,' through 'purchase,' through

‘inheritance,’ and so forth. Human needs are the foundation and justification for all specific titles to the material goods of the earth.

Three principles must be considered in this regard. The *first* fundamental principle is that the earth and its natural wealth were created by God so that *all human beings might sustain life* from the bounty of nature. As a result, all human beings have an inherent right to live off the material goods of the earth. All men possess the same dignity as persons, and in this dignity as rational beings all are equal. Because of this dignity as a person, no human being may be looked upon as inherently inferior to another or as a mere instrument to further the convenience and advantage of another. To look at man in any other way is to lower him to the level of a brute or of a machine. The *second* fundamental principle is that the earth will not yield its riches to man except through the *expenditure of human energy*. The natural fertility of the earth may, in certain localities and climates, offer sufficient food for the bare necessities of life, but even then man must exert himself to reap the harvest. Food, clothing, shelter, and the fashioning of tools will always require labor, so that man, as a universal rule, will not be able to lead a life consonant with his requirements as a rational being without much effort and exertion. Labor, therefore, is necessary in order to turn the potentialities of nature into actualities. The *third* fundamental principle is that all human beings, since they possess the natural right to subsist from the bounty of nature, also have the *right of reasonable access* to the goods of the earth in so far as these goods are necessary for

a livelihood. This means that every person who has the capacity and willingness to work for a livelihood has the natural right to earn his livelihood through work, especially if his labor is the only means at his disposal to earn a livelihood, provided there is the opportunity to exercise this natural right. Whoever hinders him from exercising this right through fraud or force treats him as an inferior being not entitled to the common gifts of the Creator; and whoever employs him at a wage rate which will not enable him to earn a livelihood befitting a human being who is equal in dignity to every other human being, also treats him as an inferior being and uses him as a mere instrument of convenience and advantage. On the basis of these principles it is clear that a *starvation wage* or a mere *subsistence wage* is not in accord with morality, because the essential dignity of man as a human person is violated. More is required to make the laborer's wage a 'just wage.'

The Living Wage

A just wage implies a wage that will give the laborer a *decent livelihood*. The right to a decent livelihood is on a par with the right to life and the right to bodily integrity. Every person, by the very fact that he has the dignity of a human person, possesses the natural, inherent right that his life and the integrity of his bodily members be respected by others. 'Life' and 'bodily integrity' do not mean mere 'subsistence'; they mean a 'reasonable life' befitting his dignity as a human being, and a reasonable life means normal *health* and the opportunity of *self-improvement*

through the development of his *bodily, mental, spiritual, and moral faculties*. These faculties were bestowed on him by the Creator for the realization of his temporal and eternal happiness as the end of his existence, and he has the right to the means which will further this realization, at least in so far as the ordinary conditions of life reasonably permit. To deprive him of these means is a violation of his dignity as a person just as much as to deprive him of life or bodily integrity. Hence, the laborer has a natural, inherent right to a wage which will enable him to share in the material goods of the earth to an extent which will insure for him a decent livelihood, because only a decent livelihood is worthy of a human being.

This does not mean that all persons must have an equal amount of income. Opportunities are not the same for all; nor are the powers, talents, and abilities of all men equal. Wealth, therefore, will of necessity be unequally distributed among men. However, each worker is entitled to a certain *minimum of income* which will enable him to meet the *minimum requirements* of a decent life. These requirements may be summed up as follows: food, clothing, and shelter of a quality and quantity which will give the worker health and reasonable comfort and enable him to live in surroundings conducive to good morals and to the exercise of religion; enough income to provide, through savings, for a modicum of security for the future, according to the ordinary course of human events; and sufficient opportunity for reasonable recreation, self-education, and membership in his church, so that he can improve his higher rational emotions and faculties. Every thinking man will realize that the average

human being, taking time and place into consideration, needs these things to develop his personality.

The just wage necessary for a decent livelihood, as outlined in the preceding paragraph, is termed a *living wage*. Such a wage does not admit of anything approximating mathematical precision, because circumstances change and needs differ with different classes of people. Certainly the *adult male laborer* of average health and physical and mental endowment, if unmarried, is entitled to a living wage, so that he can lead an independent life of his own, without the necessity of having recourse to charity to supply the essential needs of a decent life. The *adult female worker* who is forced to seek employment to support herself also is entitled to a living wage, sufficient to live independent of relatives. Hence, whether industry or the state employs a laborer, he is entitled to a living wage. Ordinarily, of course, a person or company or corporation engaged in business or industry hires the laborer, and they have the moral obligation to supply a living wage out of the income derived from the business or industry; otherwise they unreasonably hinder the laborers access to a decent livelihood on reasonable terms, and his human rights are violated. The reason is clear. The only means to a decent livelihood for the ordinary workingman is his wages, because he gives practically all his time and energy to the productive process as it exists in business or industry. He therefore has the right to be supplied with a living wage by the business or industry to which he contributes his entire services. Without a living

wage he is incapable of meeting the requirements of a decent livelihood.

The employer, quite obviously, is entitled to a decent livelihood himself, according to the standards of the class to which he belongs. He need not cede his right to a decent livelihood to the right of his employees to a decent livelihood. He also has a right to a reasonable return on his investment and also to the interest which he must pay for loans. If, after deducting all necessary expenses, he cannot give his employees a living wage, because the income of the business is not sufficient for this, his moral obligation ceases, so far as paying a living wage is concerned. But he has the duty to improve his business methods, if possible, in order to be able to pay a living wage. If all methods fail, his business is 'uneconomical' and he had better abandon it, because it is a detriment to social welfare. If there is a general 'business depression' throughout the country or in his particular field which makes it impossible for him to pay a living wage, then no moral delinquency is involved and the laborer must suffer with everyone else. The times are simply abnormal. When the 'hard times' give way to better prices and normal wages, the obligation to give the laborer a living wage also returns.

It should be evident that an employer is not obligated to employ any particular person who applies for a job. Hence, he need not employ a person whose ability is below the average and who would not add sufficient value to the product through his labor to warrant his employment; and he may also discharge the below-average laborer who is already employed. If he were to employ such a person or

keep him in employment, the employer would suffer a loss himself, and he cannot reasonably be expected to do this. Under such conditions he may employ a below-average person for less than a living wage, and no injustice is done; the employer has the option of either not employing such a person or of not paying him the full wage given to competent employees.

Under normal conditions, then, an employer is bound in justice to give normal employees a living wage.

The Family Wage

Due to an awakened social conscience, it is now almost universally conceded that the individual worker is entitled to a living wage. We contend, on moral and social grounds, that a living wage, as a rule, implies a *family wage*.

The average male is constituted in such a way by nature and, as a consequence, by the Creator, that he cannot lead a normal life and reasonably develop his personality except in the married state. The average man cannot lead a normal life outside the family; family life is one of his essential requirements for a reasonable existence as a human being. He has the natural, inherent right to take a wife and raise a family. Granted this right and its use, the obligation to support his wife and family in reasonable, frugal comfort follows as a necessary corollary; this obligation is natural and is quite as stringent, on moral and social grounds, as his obligation to maintain his own existence. A man who cannot support a wife and children has no right to get married. However, as was just pointed out, the average man

has the natural, inherent right to get married and raise a family, because that is a demand of nature and a human need which he is entitled to satisfy. Such being the case, and since the support of the wife and family is a natural responsibility of the husband and father, a 'living wage' must be interpreted to mean a *family wage*. Now, the existence of human beings is dependent on the material goods obtained from the bounty of nature, as intended by the Creator of man and of the earth. Hence, the normal man is entitled to reasonable access to the bounty of nature for the reasonable support of himself and his family. In the structure of modern industrial society, however, the great majority of men cannot earn a livelihood except through their wages; only through their wages can the majority of men effectuate their right to a decent livelihood. Hence, the worker has a right to a wage that will not only support himself but also his wife and family. Unless he receive a 'family wage, he cannot maintain his human dignity. A 'living wage and a 'family wage,' therefore, amount to the same thing, because man's need for a family is a personal need and he must be able to satisfy every reasonable need of his personality. To deny him reasonable access to the material goods of the earth, so that he can satisfy the reasonable needs of his personality, would involve a violation of his dignity as a human person. Consequently, his dignity as a human person demands that he be given a wage from the income of industry, to which he contributes all his time and energy in the production of wealth, to support himself and his family.

The *objection* is made, that a worker is entitled to no more than the *value of his services* to industry. This may be good economics, but it is poor ethics. The problem of labor is not a mere matter of economics, because a human being is not a brute or a machine; he is a human person who has definite moral rights and duties, and these rights and duties cannot be ignored in any consideration of the problem of labor. Morality is an integral part of economics. The objection is also made that the *employer has no obligation* to support the family of the laborer because the family is not in his employ and contributes nothing to his products. This, of course, is true. But the laborer has a natural, inherent right to a family and also a natural, inherent obligation to support his family. Since family life is one of his own normal needs, and since he cannot satisfy this need except by means of his wages, he is entitled to a family wage as his legitimate share of the products of industry.

Even from the standpoint of *social welfare*, it must be obvious that a family wage is necessary. Of what practical use is a reasonable living wage for the man as an individual if the family as a social unit cannot have reasonable living conditions? The social welfare of the commonwealth is no better than the social welfare of its constituent basic units. Now, the basic unit of the commonwealth is the family. Hence, if the social welfare of the commonwealth is to be sound, the social welfare of the majority of families must be sound. The majority of the families in the commonwealth, however, are the families of the laborers. The families of the laborers, therefore, must be able to enjoy reasonable conditions, or the social welfare of these families will be in

jeopardy. These families, however, depend upon the wages of the husband and father for their subsistence in reasonable conditions. Consequently, the social welfare of the commonwealth demands that the 'living wage' be a 'family wage.'

In some countries the *Family Allowance System* has been inaugurated, to take care of the family wage. Either as the result of legislation or of voluntary agreement among employers and employees, each employer contributes to a general fund a sum of money determined either by the number of his employees or by the amount of his payroll. At the birth of a child in a family, the wage earner automatically receives an increase in wages, and this increase in wages continues in effect until the child reaches a certain age. In some instances the state contributes its share to this general fund, so that the burden of payment is more equitably distributed among all the citizens of the commonwealth. Voluntary agreements, as a rule, are better than state aid; but, if necessary, state aid should be forthcoming in the interests of social well-being.

Labor Organizations

The view is becoming quite prevalent that society owes every man a living. While this view is patently wrong, society does owe every willing and capable worker the opportunity to earn a livelihood. Industry is not the free and private enterprise of a profit-making economic system that liberalism claimed it to be. The common good of all is not a private affair; it is the responsibility of all citizens of the

commonwealth whether they be industrialists or laborers. All must work together for the common good of all.

So long as the worker has the right to a decent livelihood for himself and his family, he has the duty to work and the right to a job. He has the right to seek a job and working conditions which will assist him in developing his potentialities as a human being. He is not a robot, an animated machine. Industrial relations are not mere dollar-and-cents relations; they are *social* relations, *human* relations. Industry is not an end in itself; it is a means to an end, and the end is the progress and betterment of the human beings engaged in industry, whether on the side of management or on the side of labor.

Management has always been organized. Because of the competitive nature of liberalistic industry, it had to organize to preserve its existence. Industrialists had the right to form organizations, and they never hesitated to use it. The same fundamental right is vested in the workers.

The right to organize is a natural human right.

Man is by nature a social being. By nature man is endowed with the need, the capacity, and the tendency to band together with his fellows and work conjointly for their common interests. Legislation does not confer this right; it is conferred by the very nature of man upon every human being. Legislation merely acknowledges and defends this natural human right. Laborers have as much right to protect their labor interests by *forming labor unions* as they have the right to form a bowling club or a singing society. More so. Because in forming a labor organization they are defending their natural, inherent right to life and a decent

livelihood for themselves and their family as befits their fundamental and essential dignity as rational beings. To deny them this right is to treat them as inferior beings.

The laborer has the right to *decent human treatment* on the part of management with regard to wages, hours of labor, and working conditions. Even when he works, he is a human being and not a machine or slave. Hence, both in the nature of the work assigned to him and in the hours of work demanded of him he may not be used in a manner which would endanger life or limb unnecessarily or exhaust his energy unreasonably. Because industry has neglected its social responsibility in this respect in the past, the workers were forced to fight their own battle for better conditions by joining with their fellow workers in unions. In doing so, they merely exercised a natural right. Neither industry nor the state may hinder them from forming a union for the protection of their common interests and rights.

The natural right to form a union brings with it the further right to have the union defend and promote the interests of the union members. A natural consequence of this right is the election of union representatives upon whom the members confer the authority to act in their name. *Collective bargaining*, therefore, is a perfectly legitimate union activity. In unity there is strength, and in numbers there is power. The individual worker is a helpless creature before the gigantic force of industry. Only through collective bargaining can he hope to attain justice for himself and his fellow workers in all the matters that affect his livelihood for the present and the future, such as adequate wages, job security, decent working conditions,

and provisions against unemployment, accident, sickness, and old age.

It is a false notion to consider management and labor as natural antagonists. Both are required for the success of industry, and the success of industry is necessary for the welfare of everybody. Management and labor must come to the realization that *co-operation*, not conflict, is essential to social welfare. Management has a right to a fair share of the income derived from the products of industry; but so has labor. Nothing is gained when management and labor view each other as enemies who seek to deprive the other of a fair share in the fruits of their joint endeavor. Since both are partners in production, fullest production is of benefit to both, because profits and wages depend on production. Hence, management and labor should co-operate to procure fullest production. Unfortunately, the difference of interests often leads to conflict.

The Right to Strike

A *strike* is an act of quitting work on the part of organized laborers, for the purpose of forcing the employers to comply with their demands for higher wages or better conditions or both.

The *moral justification* of the strike rests upon the accepted principle that individuals, groups, and nations possess the natural right to defend themselves against an unjust aggressor. The strike is a method of defense against injustice.

Voluntary arbitration is the common sense and truly rational way of settling industrial differences between management and labor. Whenever possible, both parties should seek a settlement through arbitration. At best, a strike is open warfare. Obviously, warfare is not preferable to peace. Neither management nor labor desire a strike, because a strike harms both. Labor unions go on strike to correct injustices. Some strikes, of course, are not justifiable, but many, perhaps most, are. Since the laborer has a natural right to a decent livelihood for himself and his family, he also has the right to lay down his tools and refuse to work whenever conditions are such that his right to a decent livelihood is violated, especially when collective bargaining and arbitration fail to do justice to his reasonable demands.

Oftentimes the strike is the only weapon left to the workers to enforce social justice.

In order that a strike be morally justified, certain conditions must be fulfilled. The cause of the strike must be a matter of *strict justice* concerning the welfare of the workers. For labor leaders to call a strike simply to show their power in the industrial world is an injustice against society and the laborers. Since the laborers are the ones whose families suffer most through work stoppage, a strike should not, be called except after a free and secret vote of the laborers themselves. Only after every reasonable method has been used to acquire justice by means of peaceful arbitration, is it permissible to use the drastic weapon of a strike; it must be the *last and only resort* remaining. There must be a reasonable *hope of success*;

otherwise the condition of the worker will be worse afterward than before and his sacrifices will have been made in vain. The *advantages* to be expected from a strike must be noticeably greater than the harm that is prudently anticipated, for the same reason. Extremely grave reasons must be present to justify a strike in industries essential to the welfare of the nation and of the world, such as the coal mining industry, public utilities, and transportation, because such a strike automatically tends to paralyze all other industries and jeopardize the welfare of everybody. The strike must not violate an existing *valid contract*; to violate a contract previously made by collective bargaining is an injustice, and it is morally wrong to seek to remedy one injustice by committing another. *Violence* must be avoided, except in extreme necessity in self-defense against unjust aggressors. *Peaceful picketing* is permissible as a medium of calling the attention of the public to the rightful demands of the workers; it dramatizes the workers' right to just treatment, to freedom of speech and assembly. When picketing leads to violence against persons or property, to disturbance of the peace, or to resistance against lawful authority, it becomes a public menace and is unjust.

The *sit-down strike*, as usually carried out, is morally wrong. It is a bad means to gain a good end. To occupy another man's property against his will is forceful invasion of his rights and a form of violence. A sit-down strike could be morally justified if the workers were part owners of the industry and its machinery of production.

The *sympathetic strike* is one in which workers quit their own work out of sympathy with other workers who are out

on strike. Those engaged in a sympathetic strike have no grievances against their own employers; they go on strike in order to add their support to the demands of the other workers. If the cause of the primary strikers is just and the sympathy strikers do not violate their own contract through work stoppage under the circumstances, they act out of charity in supporting the just cause of the other strikers, and this action is justifiable. However, if the sympathy strikers violate a valid contract to continue working for management, and this contract has been freely agreed to by both management and laborers, they violate justice; to violate justice for the sake of practicing charity is morally wrong. The sympathetic strike, therefore, would be justified in an industry where the unions are organized horizontally according to crafts and the contracts for all crafts terminate simultaneously, so that both the original striking crafts and the crafts striking out of sympathy would no longer be bound by a just and valid contract at the time of the strike. However, to extend a sympathetic strike to several businesses or industries will usually be unjust, because it inflicts serious injury upon employers who have done no injustice to their own workers.

The *general strike*, in which practically all union members of a nation quit work, can hardly ever be right. It is a fight against society, and injustice could scarcely be so general that all workers would be forced to strike in order to obtain justice. However, if the unjust situation is really general and extreme, a general strike may be justifiable on moral grounds.

The lockout, whereby the employer shuts down his business or plant as a protest against what he considers to be unjust demands of those of his workers who are striking, is justifiable, provided he does not violate a valid contract with other workers not on strike. It would, however, be unjust to close down several or all factories, mines, etc., because of the unfair demands made by the workers of one factory, mine, etc.; in this way he would inflict serious harm upon innocent workers without just reason.

The *jurisdictional strike* is called because of a dispute between two or more unions as to which union shall have exclusive jurisdiction over the workers of a certain factory or industry and exercise their bargaining rights. Jurisdictional strikes are not morally justifiable, because there is no just reason in calling such a strike in view of the serious harm done to the employer, the worker, and the public. The matter of jurisdiction should be settled by the vote of the workers; a strike does not settle the issue.

A *boycott* is the concerted action of a group of persons, withholding patronage and purchase of goods from an individual or business concern, for the purpose of forcing the correction of unjust conditions; it is usually combined with deterring others from purchasing the goods of the boycotted individual business concern. A boycott may be morally justifiable. Sometimes the workers of a business or industry have a just cause of complaint, but all efforts on their part to induce the employer to correct the unjust conditions are of no avail. They have not only the right to strike and to refrain from purchasing the employer's products, they also have the right to persuade others not to

patronize the unjust employer; everybody has the right to purchase or not to purchase a certain product, and the worker merely persuades him, because of the prevailing unfair conditions, to exercise this right by not purchasing the product of the unjust employer and thereby forcing the employer to do justice. *Secondary boycotts*, by which economic pressure is brought to bear on other businesses or industries to boycott an unjust employer under threat of boycotting these businesses or industries themselves if they refuse, is usually wrong; these businesses and industries have done no injustice and should not therefore be penalized. It might happen, however, that conditions are so unjust that even other concerns would be bound in charity to support the primary boycott, so as to remedy the original injustice.

Strikes, lockouts, and boycotts are weapons of industrial warfare that are like two-edged swords; they harm both the guilty and the innocent. Because of the emotional atmosphere in which they are used, they can easily lead to disorder and injustice. Self-discipline and a strong sense of morality are required for their proper use and with due respect for the rights of all concerned. Like war, they have no place in a civilized world, unless as a last resort to obtain justice and to defend oneself against an invasion of basic human rights. Unscrupulous and radical labor leaders are all too ready to use these drastic weapons to further their own nefarious ends. While the aims and purposes of unionism in themselves are good and praiseworthy, the actions of radical leaders and labor racketeers have at times thrown discredit on the labor movement. If labor

unions are to gain and hold the respect of the citizenry at large and effectively promote the true welfare of their members, they must clean house by eliminating the radical element in their leadership and show the world that they want nothing more than social justice and genuine industrial democracy. Abuse of power is always obnoxious, whether it exists in industry or in labor.

Closed Shop and Closed Union

The 'closed shop' and the 'closed union' are two of the most disputed questions in industrial relations today. By a *closed shop* is meant a 'union shop.' The employer makes an agreement with the union that all workers in his shop shall be union members in good standing; if they refuse to join the union or sever their connection with the union or fail to remain in good standing they are to be discharged. According to some closed-shop contracts, the employer may hire no one but a union member; according to other contracts, he may hire whom he pleases, but the hired employee must join the union. A 'closed union' is something totally different. A *closed union* limits the number of persons allowed to join the union; when the stipulated number of members has been reached, no new members are admitted to the union until there is a vacancy.

What is the *morality* of the 'closed shop' and the 'closed union'? We are not concerned here with 'legal right,' but with 'moral right.'

In principle, there is *no moral objection* to the 'closed shop,' provided it is freely agreed upon by both

management and labor and is not established by force, fraud, intimidation, or other high-pressure methods of dishonesty. The closed shop is undoubtedly the best means for effective collective bargaining. If handled rightly, it has a definite tendency to stabilize harmonious industrial relations between the employer and his employees, because two such single agencies can co-operate much more efficiently for the mutual benefit of both industry and labor than either one alone. Unionists base their moral right to a closed shop on the social necessity of unions for the protection of the human rights of the workers and on the dictates of justice. It is not just, they claim, that non-unionists should share in the benefits procured through the efforts and sacrifices of the unionists; to deserve these benefits, they should also share in the burdens of union membership. Non-unionists, who oppose the closed shop, claim that the necessity to join the union is an infringement on their freedom and independence of action. There can be no doubt that a certain amount of moral coercion is exerted on the non-unionists in forcing them to join the union or be discharged. It must be remembered, however, that the right to work and to freedom and independence of action is not an absolute right, but a right which is subject to the conditions of social justice and of the common good. Social justice and the common good may demand that a minority group of workers cede personal privileges to the welfare of all concerned. Most of the benefits and privileges enjoyed by non-unionists were not obtained by them through their own individual efforts, but through the bargaining power of the union as an organization. If, then, the closed shop is a

practical necessity for the common good of all workers in the shop, private views and preferences of the individuals and minority groups should, it seems, give way to the priority of the common good of all workers as a body. While this might not perhaps be a matter of strict justice, it can easily be a matter of equity or fairness toward the union workers. The medieval guilds were in a very definite sense closed shops. No one was obliged to join a guild, but only a guild member was allowed to ply his trade or craft within the territorial limits or jurisdiction of the respective guild.

The *morality* of the *closed union* is more difficult to defend. It places a monopolistic control over skilled labor in the hands of a particular union, so that a skilled craftsman who is denied union membership or who applies for membership after the list has been closed cannot find work or ply his trade on a job done under a union contract. Similarly, since the number of apprentices is also limited in a closed union, many persons are hindered from learning the trade. Is this morally justifiable? Does not this discrimination entail an injustice toward other workers?

That the closed union opens the door to serious abuses and is an invitation to labor racketeers to use it for unjust discrimination and bribery, is obvious. And these abuses have occurred. However, abuse is never a valid argument against proper use. Granted, then, that abuses are absent, the *principle* of the closed union, all things being equal, can be defended as *morally justifiable*.

While every capable and willing man has a right to a job in order to earn a decent livelihood, he has no right to a specific job from a specific employer. In some industries the

number of specific jobs for a particular craft is definitely limited. To train more men for jobs than the number of jobs available would place a drag on the labor market, and some skilled craftsmen would thereby be thrown into the ranks of the unemployed. Under such circumstances it is in the interest of these craftsmen themselves that the number of craftsmen be limited to the number of jobs; and that is what a closed union accomplishes. After all, when over a period of years or decades the members of a particular union have fought strenuously to gain benefits and have built up large funds out of their wages for their own financial, educational, and social welfare, it can hardly be called unjust if they refuse to permit an applicant to join their union and share in their hard-earned advantages.

It is a totally different matter if a particular industry is expanding and needs more workers, but the closed union refuses to open its ranks in order to create an artificial scarcity of skilled labor, thus boosting the wage scale and slowing down work in favor of its own privileged members. Due to this artificial scarcity and monopolistic control, the privileged members of the closed union are in a position to loaf on the job or produce inferior work or demand exorbitant wages, without fear of being discharged. This condition is an injustice toward the employer, toward the fellow workers, and toward the consumer who ultimately pays the bills. At the same time the officials of the closed unions are in a position to connive with management (for a consideration, naturally) and suppress every attempt of the rank and file of the workers to better their conditions and exercise their fundamental rights as unionists for an honest

and independent voice in the government of their own affairs. If the leadership is radical, much harm can come to the members of a closed union.

The closed shop and the closed union are not immoral in themselves. Circumstances, however, can make them immoral in practice. Every case will have to be judged on its own merits and demerits. No ironclad rule will fit all instances. So long as management and labor is composed of imperfect human beings, with all the virtues and vices of human beings, the closed shop and the closed union may be either a boon or a bane.

Industry, Labor, and the Public

All too often in the past, industry has exercised a dictatorial policy toward labor and treated its workers as animated machines to be used and discarded at will. And its policy of profit-taking with regard to the welfare of society has been tersely summed up in the slogan of one of its tycoons: "The public be damned." That period of industry is almost over.

As a revolt against the inhuman treatment on the part of management, the labor unions were formed. Their fight against industry was a battle for bread. Unfortunately, unions frequently forget that this battle for bread is a battle for human rights rather than a struggle for industrial advantage.

Both management and labor in all too many cases come to look upon their mutual relations as a private matter affecting only themselves. Each seeks to get all it can from the other, and the *welfare of the general public* is usually

ignored. That day, too, must and will pass. The relations between industry and labor are human and social relations; the welfare of both is an integral part of the welfare of society. The public is a third party in every industrial dispute and settlement.

Some disputes are only remotely connected with public welfare; others, however, are intimately connected, and they affect the public welfare directly and vitally. Among the latter are disputes in the coal industry, the steel industry, the oil industry, the railroad industry, the food industry. Any prolonged interruption of work in such industries causes untold suffering and misery to the people at large. The human rights of the general public must receive prime consideration and may not be disregarded by either industry or labor.

It is the first duty of the *state* to safeguard the common good. The state may not discriminate between one person and another, between one group and another. Before the state all are equal. The state must protect the personal and property rights of all parties. The state, therefore, must favor the common welfare of the public in all disputes between industry and labor. Hence, the state has the duty to avert disaster, and this means that it should endeavor to stave off crippling strikes through *mediation* whenever possible. Industry and labor should be encouraged to settle their differences amicably among themselves, without undue interference on the part of the state. When, however, the public peace and welfare is imperiled, the state has the right and the duty to use *legal coercion* if necessity demands such action. As Pope Leo XIII² put it: "The laws

should fore-stall and prevent such troubles from arising; they should lend their influence and authority to the removal in good time of the causes which lead to conflicts between employers and employed."

When the private rights of industry and labor interfere with the common good, they must give way to the common good, because the latter has precedence by natural law over the former.

The human relations between industry and labor must be grounded on two essentially moral and social concepts: the inviolable dignity of the human person and the supremacy of the common good or public welfare. On this basis alone can their problems be solved to the benefit of all.

Industry and labor will continue to war against one another until each side learns that their interests are interrelated and must be fostered through mutual good will and understanding. Not division, but unity, must become the basis of procedure. Mediation, co-operation, labor-management councils, partnership, and co-ownership in industry will have to take the place of hostility in the human relation of these two supreme groups, or both industry and labor will lose their independence and find themselves engulfed in the chaos of social and economic revolution.

Summary of Chapter XVIII

Labor is a title to ownership of private property. For his work the laborer receives wages.

1. *Liberalism and Labor*. Individualism was a reaction against mercantilism and advocated the liberalistic doctrine of *laissez faire*, with the complete political and economic independence of the individual, demanding freedom of trade, of contract, of competition; freedom for the operation of the laws of supply and demand in the open market; and freedom from interference on the part of government in industry. The effect of this policy of industry on labor was disastrous. The wage earner became a *labor slave*. Finally, in defense of their human rights, the workers formed labor unions.

2. *The Champion of Labor*. Pope Leo XIII, in his encyclical *Rerum Novarum* in 1891, attacked the basic doctrine of economic individualism and liberalism, particularly the concepts of *free competition*, *free contract*, and *the noninterference of the state*, and showed that this doctrine was immoral and indefensible.

3. *The Factors of Industry*. Four factors are involved in the productive process: land, capital, business management, and labor. Among these factors, land and capital are *passive* factors, while management and labor are *active* factors. In *justice*, management and labor have the first and greater claim to remuneration, because their claim rests upon the *intrinsic title* of the creation of new values through the expenditure of personal energy and

skill. For the worker labor is the sole means of earning a livelihood.

4. *A Just Wage.* Labor has both an *individual* and *social* function. The primary title to a share in the material goods of the earth is the 'satisfaction of human needs.' *Three principles* must be considered in this regard: the earth with its wealth was created by God for the sustenance of all men; the earth will not yield its riches except through the expenditure of human energy; all human beings possess the natural right of reasonable access to the goods of the earth in so far as these goods are necessary for livelihood. Since the laborer has only his labor whereby to earn a livelihood, it follows that he is entitled to a *just wage* as his share of the income of industry, and this wage must be more than a 'starvation' wage or mere 'subsistence' wage; otherwise he is treated as an inferior being or mere instrument of convenience and advantage.

5. *The Living Wage.* A just wage will give the laborer a *decent livelihood* befitting his dignity as a human being. *The minimum requirements* of a 'reasonable life' are: food, clothing, and shelter sufficient for health and reasonable comfort in decent surroundings; provision, through savings, for a modicum of security for the future; sufficient opportunity for reasonable recreation, self-education, and membership in his church, so that he can improve his higher rational emotions and faculties.

6. *The Family Wage.* A just and living wage means a *family wage*. Every normal man has the natural, inherent right to take a wife and raise a family, because he cannot lead a normal life and reasonably develop his personality

except in the married state. The obligation to support his wife and family in reasonable, frugal comfort follows as a necessary corollary. Hence, a living wage means not only a wage sufficient for himself, but for his family.

7. *Labor Organizations.* The right of the laborers to organize and *form a labor union is a natural human right*, because by nature man is endowed with the need, the capacity, and the tendency to form a society with his fellows and work conjointly for their common interests. *Collective bargaining* is a legitimate union activity, because it is only by this means that the workers can obtain their just demands.

8. *The Right to Strike.* The *moral justification* of a strike rests upon the morally accepted principle that individuals, groups, and nations possess the natural right to defend themselves against an unjust aggressor. The strike is a method of defense against injustice. In order, however, that a strike be morally justified, certain *conditions* must be fulfilled: the cause must be just; it must be the last resort, after peaceful methods of adjustment have failed; *hope of success*; the *advantages* must outweigh the disadvantages; no existing valid contract may be violated; violence must be avoided; *picketing* must be peaceful.

The *sit-down* strike is, as a rule, wrong. The sympathetic strike may be justified under certain circumstances. The *jurisdictional* strike is morally wrong. The *general* strike can hardly ever be right. The *lockout* may be justified. The boycott may be morally justifiable; but the 'secondary boycott' is usually wrong.

9. *Closed Shop and Closed Union.* In principle, there is no moral objection against the closed shop, provided it is freely agreed upon by both management and labor. The principle of the *closed union*, all things being equal, can be defended as morally justifiable. In *practice*, however, in the case of serious abuses, the closed shop and the closed union can easily become wrong.

10. *Industry, Labor, and the Public.* The relations between industry and labor are human and social relations; the welfare of both is an integral part of the welfare of society. The *public* is a third party in every industrial dispute and settlement. The human rights of the general public, therefore, may not be disregarded by either industry or labor.

It is the first duty of the *state* to safeguard the *common good*. Hence, the state should endeavor to stave off crippling strikes through *mediation*. When the public peace and welfare is imperiled, the state has the right and the duty to use *legal coercion*, if necessity demands such action. When the private rights of industry and labor interfere with the common good, they must give way to the common good, because the latter has precedence by natural law over the former.

Chapter 19

DOMESTIC SOCIETY

SO FAR WE HAVE CONSIDERED MAN IN HIS DUTIES TOWARD GOD and also in his rights and duties as an individual in relation to other individuals. Man receives his existence as an individual person and continues at all times to live as an individual person. In his capacity as an individual, each one possesses definite personal rights and duties.

But man is by nature not only an individual person; he is also a social being, destined by nature to live with other persons in societies of various kinds. History is witness to the universal fact that men, everywhere and at all times, have lived together socially, whether it be in the more restricted society of the family or in the wider organizations of highly developed communities of individuals and families.

Man simply cannot live alone. He depends on others and needs their assistance to develop his full personality in all its potentialities. This mutual dependence and need of assistance is the reason and ground for the formation of social organizations. Chief among these are domestic and civil society. In this chapter we treat of *domestic* society.

The Nature of Society

A *society* in general is the stable union or association of a number of persons for the mutual realization of a common end.

It is a '*stable union or association of a number of persons.*' A single person is not a society. Nor is any sort of association a society, in the strict meaning of the term. A crowd of people gathering together to witness a spectacle or hear a concert is not a society; they meet for the occasion and then disperse. In order that an association of persons be termed a 'society,' their membership must be a relatively permanent association, a stable union.

It is a 'stable union or association of a number of persons *for the mutual realization of a common end.*' The common end to be realized may assume many forms, but it is always of such nature that it is the common bond which holds all the members of the society together, so that they unite in the mutual endeavor to *bring* about its realization as a good to be achieved and shared by all.

The nature of a society, therefore, involves the *active cooperation* of all members of the association toward the realization of the common end, in so far as each member, in his own individual manner and according to his position as a member of the society, strives to further the interests of all members as determined by the end or purpose which led them to unite.

A society is thus seen to constitute a *moral unity*. The members of a society retain their personal individuality in relation to each other; they do not merge their separate

personalities into one single physical person by becoming a society. However, by banding together for the realization of a common purpose or end, they become 'one' in this respect and in this concrete endeavor. In other words, though they do not form a physical unity, they do form a 'moral unity' as members of the same society striving for the same goal.

Authority

The concept of *authority* is essential to the nature of a society. 'Authority' may be viewed either in the abstract or in the concrete. Abstractly considered, 'authority' is the *right* to lead the members of the society toward the attainment of the common end to be realized, namely, the power to regulate the actions of the members in the direction of the end through laws or ordinances which the members must observe and carry out. Concretely considered, 'authority' means the *bearer* of this right and power, namely, the person or persons entitled to direct the members toward the realization of the common end.

Authority is *essential* to society.

That authority is essential to society follows from the very nature of a society. Every society consists of a number of persons, and each one is an autonomous individual; these individuals, taken together, form the 'moral unity' of the society of which they are the members. In order that autonomous individuals can form a moral unity existing in concrete reality, *a concrete principle* of unity must be present which correlates their individual efforts toward the

realization of the common end. This concrete principle of unity is demanded, because all persons are endowed with a free will which is intrinsically indifferent in its activity and can direct its activity toward various goals. In order, then, that the free will of men be directed toward the specific goal which is the basis of membership in a particular society, a concrete principle must determine this indifference and lead the activities of the various individuals toward the specific goal. Besides, the activities of the members are by no means identical. Even though all members strive toward the realization of the common end, these activities will vary according to the nature of the individuals and the position they occupy in the society as a whole. These varying activities must therefore be coordinated in such a manner that they will all conspire to bring about, through mutual understanding and free decision on the part of all members, the realization of the common end. As a consequence, the activities of the individual members must be regulated by laws and ordinances which will effectively realize the common end; otherwise each individual will act according to his own inclination and decision, and the common good of all which is the end and goal of the society will not be achieved. Hence, authority, as a principle of unity determining the activities of all members according to the laws and ordinances required for the effective realization of the common end, is necessary in every society for its proper functioning. And, since a society is a concrete reality, not an abstract entity, this authority must reside in a person (or persons) as the *bearer* of the authority, because only a

person (or persons) can direct other persons in their activities toward a common goal by means of laws and ordinances. Without such a concrete authority, no stable and permanent union of individuals striving for a common end, which is the essence of a society, can exist and function. It follows, then, that authority is essential to society.

Kinds of Society

Now, all human beings possess the same rational nature and are destined by the Creator for the same eternal ultimate end. Whatever particular ends men may have as the immediate purposes of their activities, they must be subordinated to this eternal ultimate end. In this respect all human beings living on earth form a *universal* society which is usually referred to as *human society or the society of the human race*. God Himself, as the Creator of the human race, is the bearer of authority, directing and regulating the activities of all men toward their ultimate end by means of the natural law implanted in their rational nature.

Within the framework of this universal society there exist many *particular* societies. Particular societies follow certain definite ends to the exclusion of others, and the authority regulating the activity of the members is vested in human beings as the immediate bearers of authority. Depending on the standpoint of division, we distinguish between various types of particular or special societies.

From the standpoint of its *material* composition, a society will be either 'simple' or 'composite.' A *simple*

society is composed directly of individual (physical) persons; such, for instance, is a choir, a bowling club, a debating society, a family. A *composite* society consists of a number of societies (moral persons) as its proximate component parts or members; such, for instance, are national or international labor unions composed of a number of separate unions, and the state which is made up of a large number of families and communities.

From the standpoint of *origin*, a society is either 'natural' or '*pactitious*.' A *natural* society is one which is formed as a result of man's very nature, as something which is necessary for the proper attainment of the perfection suitable to his rational nature and without which he would, under normal circumstances, find it very difficult to develop his personality in due measure; such, for instance, is the conjugal society and the state. A *pactitious or conventional* society is one which has its origin, formation, and continued existence in the mutual free consent of its members for the attainment of an end specifically agreed upon; such, for instance, are a political party, a labor union, a corporation, an athletic league.

From the standpoint of its controlling *authority*, a society is either 'equal' or 'unequal.' An *equal* society is one in which all members share the authority in an equal degree, because the society itself is the bearer of social authority, even though the members may delegate a certain person or assemblage of persons to exercise this authority in their name; such, for instance, is a democratic government. An *unequal* society is one in which the social authority is vested by special right in one or more persons to whom the

members are subject; such, for instance, is the society of the family, since the father is the natural social head of the family.

From the standpoint of the *realization of its end*, a society is either 'perfect' or 'imperfect.' It is *perfect*, if it possesses within itself all the means necessary for the realization of its end, so that it is not directly dependent on any society of a higher order for the attainment of its end; such, for instance, are the state and (presupposing the supernatural order) the Church. It is *imperfect*, if it does not possess within itself all the means required for the complete attainment of its end; such, for instance, is the family, because it needs the assistance of the state to supply some of the means required for the full realization of its end.

Man a Social Being

Man, it is often stated, is a 'social animal.' Though an individual, he must fulfill his destiny as an integral member of *society*.

There is in man the *natural aptitude, propensity and need* for a permanent union and companionship with his fellow men, so that he cannot escape membership in society without doing violence to his human nature and running the serious risk of frustrating the purpose of his existence. Man is not born perfect; but he is born with a perfectible nature. It is his right and duty to perfect his nature; he cannot perfect his nature, however, except in a stable union with others throughout the course of his life.

That man has the *natural aptitude* for society, can be seen from the fact that he is gifted with speech. Speech enables men to communicate with one another, to exchange ideas, and to make known their needs and achievements; they can, therefore, give mutual assistance and work for the common good of all concerned. That he has the *natural propensity* to combine his efforts with others for the realization of a common end, is also evident; he dislikes prolonged solitude and isolation, he seeks companionship, and he is inclined to consult others for the solution of important problems. That he has the *natural need* of association with his fellow men, is obvious; he simply cannot receive life and grow to the full status of his bodily, mental, spiritual, and moral maturity except in community with others within the framework of society. To be a member of society, therefore, is a requirement of his *nature* as a human being.

Membership in the community does not entail depersonalization of the individual. The individual possesses inalienable *rights*, flowing from his nature as a rational person, and these rights are never lost or forfeited by belonging to a society. Society must respect and safeguard the rights of the individual, because its fundamental purpose is to work for the welfare of all members through mutual co-operation and the pooling of resources for the benefit of all in the fullest measure attainable. The individual, however, also has *social duties* toward the other members of the community. If he is to receive the services of others for his own benefit, he must give his services for the benefit of the others. Society makes its contribution to

his personal development, and he in turn must make his personal contribution toward the furtherance of the interests of society. Community life is thus grounded on the principle of mutual benefit through mutual service, because of the natural limitations and needs of man as an individual who must work out his destiny by developing all his powers, so far as possible, to their full capacity. Now, a society based on the natural aptitude, propensity, and need of man as a human being is a *natural society* and is a *mandate of the natural law* inherent in man's rational essence.

The original and most fundamental natural society is the domestic society of the family, because it is the one in which all other societies have their roots and from which they are supplied with a constant growth of membership. Aristotle and St. Thomas speak of the family as the natural society which has as its end the attainment of all the things man needs for his daily life and existence. In its most elementary form domestic society appears in the *conjugal* relationship of husband and wife united in marriage. The result is 'conjugal society.' The natural extension of the conjugal relationship is *parental* relationship, when the husband and wife become the parents of a child. We then have the *family* in the proper meaning of the term.

A number of important problems arise from the relationships just enumerated, and these must now receive separate treatment.

Conjugal Society

The fountainhead of social life lies in the union of man and woman in marriage. Marriage or conjugal society is defined as the permanent union, lawfully formed, of man and woman for the procreation of children and their proper education.

Man is naturally sociable. In virtue of his nature, as constituted by the Creator, man naturally and primarily tends to form the conjugal society for the purpose of raising a family. Since human beings act in this manner because of a natural aptitude, propensity, and need, marriage is a *natural society*.

Men and women possess the natural aptitude to form the conjugal society of husband and wife in marriage. Physiologically and psychologically the two sexes are complementary to one another. The sex organs of man and women are physiological counterparts. Taken separately and individually, the sex organs of neither man nor woman have meaning. Viewed in relation to one another, it is evident that the Creator intended each to supplement the other. The anatomical structure and the physiological function of these organs reveal their manifest purpose, namely, the conception and development of a child. Only in conjunction are the sex organs of man and woman capable of fulfilling the intrinsic purpose of their existence as organs of reproduction. Psychologically, too, the sexes complement one another. Perfect equality between the sexes never has existed and never will, due to the natural difference of position in the divinely ordained scheme of life. The man is the breadwinner, the worker, the explorer, the inventor, the governor; he represents the rugged strength needed for

success and achievement in life. Woman is essentially the homemaker and mother of the race who gives, nurtures, forms, and rears the new life; she represents the affectionate love necessary to soften and temper the harshness of life. Masculinity and femininity are emotionally opposite and as such naturally attract one another. There can, then, be no question about the natural aptitude existing in man and woman to form the conjugal society of marriage.

Man and woman also have the natural *propensity* to unite in marriage. This propensity shows itself in the mutual attraction of the sexes. There is no necessity of belaboring the obvious. The Creator placed a strong and imperative instinct in both sexes, regulated by reason and understanding, drawing them irresistibly together, so that love and the sex urge prompt the man and woman to enter into the union of conjugal society for the purpose of supplying the function required for the perpetuation of the race according to the plan of God.

Man and woman, furthermore, have the natural *need* to unite in marriage. Both are sexually incomplete beings; only in their conjugal union do they become complete, each supplementing the physiological and psychological deficiency of the other. Together they form a harmonious unit. The deeper reason for this need, of course, lies in the plan of the Creator of the human race to perpetuate mankind through the coordinated activities of both sexes. Children are helpless almost up to the time they reach maturity. They require continuous care for the maintenance of life and for suitable physical, mental, spiritual, and moral

development; and this requires the constant attention of both father and mother firmly and permanently united in conjugal society.

The aptitude, propensity, and need of the sexes proves beyond the shadow of a doubt that conjugal society is a *dictate of the natural law*.

Men and women are rational beings and as such are superior to the brutes. Unlike the brutes, therefore, they must be guided in their conjugal relations by reason rather than by instinct. Their relations are 'human' relations and consequently possess a *moral* character, based on the dignity and requirements of the human person. Their dignity as persons demands that their union be *permanent* and *exclusive*. Promiscuity in sexual relations implies a gratification of the sexual instincts on a level with the brute. Only a permanent and exclusive union is in accord with the dignity of man as a rational being, because only in such a type of union can the sexual instincts be regulated in a manner conducive to the fundamental interests of mankind. If God selected the sexual relations of husband and wife to be the natural instrumentality for the procreation of children, He also must have intended that the parents continue in their care for the proper and complete development of their children through the years of their growth as persons. Hence, parents have the natural duty to procure the proper and complete development of the child, through the prolonged period of their growth as persons. This is borne out by the universal fact of parental love and filial affection existing between the parents and their offspring and also by the universal fact of the care which

parents customarily give to the upbringing and education of their children. As husband and wife are the natural progenitors of the child, they must also be the natural custodians of its welfare. Someone must certainly have the definite obligation of procuring the proper and complete development of the child, and who, according to the dictates of reason, should have this obligation but the two who are responsible for its life? It follows, then, that God intended the parents to protect and further the welfare of the child, at least so long as the child is in need of their active assistance. Hence, it is the intention of the Creator that the conjugal union of husband and wife be a permanent and exclusive society. Whether this union must extend throughout the lifetime of husband and wife will be treated later. So much is clear, however, that conjugal society must be exclusive and at least relatively permanent.

The sole purpose of the sex instinct and of the sex organs is the procreation of children and the preservation of the race; and if the sex function is performed naturally and normally, as intended by the Creator, it will inevitably tend to produce this result. Hence, the gratification of the sex instinct *outside the conjugal union* of husband and wife, whether it be through fornication or masturbation or in any other manner, is *contrary to nature* and morally wrong. If such acts were morally permissible, few persons would feel inclined to assume the onerous duties of parenthood, and the welfare of mankind would suffer irreparable harm. All *extra-marital* relations must be condemned as a serious abuse of the natural function of sex, because they are

directly contrary to one of the primary purposes of the sexual relation, namely, the proper education of the child.

While it is true that the primary end of conjugal society is the procreation and education of children and the preservation of the race, there are, according to the plan of nature, *secondary ends* to be realized in marriage which are directed toward the welfare of both husband and wife in the conjugal union. Just as husband and wife supplement one another physiologically and psychologically to become a unified principle of reproduction, so, too, they supplement one another personally through mutual love and assistance. An intimate comradeship should exist between them, based on mutual affection and esteem, so that each may lead the other to the spiritual and moral perfection of a full and complete life as a human being destined by God to an eternal beatitude. A further secondary end of marriage consists in the possibility of satisfying the sexual instincts in a normal and legitimate manner, without husband and wife sacrificing their human dignity or acting contrary to the dictates of reason. This consideration is important in all cases where sterility makes the procreation of children impossible. Sterility is not an obstacle to the normal use of the marriage function, even though the function under the circumstances is accidentally hindered from producing its natural effect. The normal, not the abnormal, is intended by nature.

From the above it should be clear how we are to judge the morality of *sex pleasure*. Sex pleasure has been added to sex function as an incentive for married people to perform the sex function. If the sex function is performed

normally and naturally, as dictated by instinct and reason, it will be in conformity with the design of the Creator of man and bring about the result He intended by instituting conjugal society and the sexual relations of husband and wife, namely, the procreation of children and the subsequent preservation of the human race. To indulge privately in sex pleasure, therefore, since it frustrates the primary purpose of the sex function, is in disconformity to right reason and the purpose of the Creator and is always immoral. Only those have the right to enjoy sex pleasure who have the right to perform the sex function; only those have the right to perform the sex function who have the right to procreate children; and only those have the right to procreate children who are lawfully united as husband and wife in the conjugal society of marriage.

Celibacy

In as much as marriage was ordained by God for the preservation of the human race, and sex, with its insistent urge for satisfaction, is present in every human being, the question arises whether all persons have the obligation to enter the marriage state. To put the question in another way: Is celibacy permissible, or must it be condemned?

By *celibacy* in a *wider* sense one understands the simple abstention from marriage, the condition of being unmarried. Anyone is a celibate in this sense who has the capability of being married but is still unmarried, whether this be due to lack of desire or opportunity or to any other reason. In a narrower and *proper* sense, 'celibacy' is

permanent abstention from marriage chosen as a state of life from motives of virtue. Celibacy in this latter meaning is practiced especially by the clergy and members of religious communities in the Catholic Church; they bind themselves by a vow to remain celibates all the days of their life. The two kinds of celibacy are obviously quite different in character. To pass a proper judgment on their morality, they must be considered separately.

Celibacy, taken in the wider sense, is morally permissible. Not every human being is obligated to enter the state of marriage. We must distinguish between right and duty. Every-one, absolutely speaking, has per se the 'right' to enter the married state; but not everyone has the 'duty' to do so.

That everyone has the *right* to enter the married state, all things being equal, follows from the simple fact that everyone is endowed by the Creator with the faculties and instincts of sex. A natural power implies the natural right to exercise this power, according to the conditions intended by God. Now, the exercise of a person's sexual power is conditioned by entry into the conjugal union of marriage. Everyone, therefore, has the right *per se* of entering the marriage state.

Granted the right, *not* everyone has the *duty* to exercise this right. The individual is not obligated to concern himself actively with everything pertaining to the human race. The duty to render a *particular* service to the race is incumbent on an individual only, when something is necessary for the race and cannot be achieved without his co-operation. The tilling of the soil, for instance, is necessary for humanity, so

that men can have food and live; however, not every individual must become a farmer. In a similar way, marriage is necessary, according to the design of God, for the propagation and preservation of the race; hence, some men and women must enter marriage, in order to fulfill this purpose of the Creator. An individual person would have the duty to enter marriage and raise a family only if the race could not otherwise be preserved. There is, of course, no danger that the human race will die out because certain individuals abstain from entering the marriage state; the sexual instinct is so strong that the majority of men and women, as experience proves, are always willing to marry.

The mere fact that God implanted the sexual instinct in human beings is no proof that he intended to obligate everyone to assist in the preservation of the race. It proves nothing more than the truth that every person, due to his or her sexual capability, possesses the biological power and therefore also the natural 'right' to marry and contribute toward the propagation of the species.

Hence, celibacy in the wider sense of the term, whether voluntary or involuntary, is morally permissible. Obviously, if celibacy is a proximate occasion of serious sexual offenses for men or women, they have the moral obligation to reduce the proximate occasion to a remote occasion or, if that is of no avail, they must remedy the situation by seeking a suitable mate to marry.

Religious celibacy is also morally permissible.

If celibacy in general is morally justifiable, celibacy practiced from motives of virtue must, with greater reason, be permissible. The value of a state of life must be judged

according to the value of the good it seeks to achieve. Marriage is morally good, because it strives for the temporal welfare of the human race. Religious celibacy is morally good, because it strives for the *spiritual welfare* of the individual soul and for the *higher interests* of mankind. Persons who bind themselves to celibacy by a vow can dedicate themselves completely to the exclusive service of God and humanity; and this is a good superior to assisting in the propagation of the race.

The Unity of Marriage

It is of the essence of conjugal society that husband and wife in their sexual union become the one and undivided principle for the procreation and education of children. Here we have the primary source from which all the properties of marriage issue forth. There are two essential *properties* of marriage which deserve careful consideration, the *unity* and *indissolubility* of the matrimonial bond.

The 'unity' of the matrimonial bond is that property which demands that only one man be married to only one woman simultaneously. The unity of matrimony is violated by *polygamy*, in which one person simultaneously possesses more than one mate. Polygamy is called *polyandry*, when one woman has more than one husband; and *polygyny*, when one husband has more than one wife.

The *unity* of the matrimonial bond is an essential property of marriage, if violation of this property involves the frustration of the natural end of marriage. Now, the natural end of marriage is twofold: the 'primary' end is the

procreation and proper education of the children; the 'secondary' end is the mutual compensations of a community life for husband and wife, namely, an equal and preferential love and comradeship capable of leading husband and wife to the spiritual and moral perfection of a full and complete life. Polygamy, whether in the form of polyandry or polygyny, frustrates either the primary or secondary end of marriage or both. Hence, unity, which is violated by polygamy, is an essential property of the matrimonial bond.

Polyandry frustrates both the primary and secondary end of marriage. If one woman has a number of husbands, it is practically impossible to determine who is the father of the child and has the natural duty to provide for it. Since paternity is doubtful, paternal duty is doubtful. As a consequence, the proper education of the child is nobody's particular duty, and the upbringing of the child as befits its dignity as a human person is bound to be neglected. To bring a child into the world in this manner is not in accordance with right reason and is, therefore, contrary to natural law. A plurality of husbands also frustrates the secondary end of marriage. A union of this sort involves rivalry, discord, and disorder, because of the uneven distribution of affection and attention. Polyandry is a rare occurrence among people, and it is universally viewed with abhorrence.

Polygyny is not as much in opposition to the natural law as polyandry. When one man has a number of wives, paternity and maternity are definitely established, and so parental duty is never in question. Both the father and the

respective mother have the duty of providing for the proper care and education of the children, and this is not impossible of attainment. Polygyny, however, violates *per se* the secondary end of marriage, because it frustrates the mutual compensations necessary for married community life. There is no real equality between the husband and his wives, as called for by the purpose and contract of married life. Each of the wives gives herself fully to the husband, but the husband gives himself only partly to each of his wives; the wives are thus deprived of their full marital rights and privileges. There is no possibility of a complete and equal *comradeship* between one husband and a plurality of wives. History shows that in polygynous marriages one wife is preferred and holds a dominant position in the household, the other wives being reduced to the position of mere servants or virtual slaves. Envy and discord are prevalent in the relations of the different wives and their children, because it is virtually impossible for the husband to extend to all his wives and their children the same measure of devotion, love, and considered attention. Although polygamy in the form of polygyny is practiced quite frequently in some oriental countries and uncivilized nations, monogamy is the rule; polygamy is tolerated, but not prescribed.

As was just pointed out, the primary end of marriage is sufficiently safeguarded in polygyny. The *secondary end*, however, suffers harm in polygynous marriages, because the mutual compensations of conjugal community life, which is a means in the furtherance of the common end of human life, is rendered practically impossible. A plurality of

wives has the *effect* of frustrating the mutual compensations of married life, even though the plurality of wives in *itself* is not the *formal cause* of this result. God, in special circumstances and with the special assistance of his graces, can so strengthen human wills that, with proper co-operation, it would be *per se* possible to safeguard the secondary end of marriage even with a plurality of wives, especially when rapid propagation is advisable. This is probably the reason why God permitted the patriarchs of the Chosen People to have more than one wife.

The Indissolubility of Marriage

Indissolubility is that *essential* property of marriage in virtue of which the conjugal bond between husband and wife cannot be dissolved or broken by any human power during the life-time of either of the two. In other words, neither the married couple nor the state has the power in its own right to dissolve the matrimonial bond, once a marriage is lawfully contracted. God, the Supreme Lawgiver, can dissolve the bond, because He is the Author of all rights and duties existing in the married state. Divorce is in opposition to the indissolubility of marriage.

Ethicians speak of *imperfect* and *perfect divorce*. 'Imperfect' divorce amounts to 'separation from bed and board,' so that husband and wife are freed from their marital community life, although the matrimonial bond remains intact; they live apart, but they are still husband and wife. 'Perfect' divorce entails the dissolution of the matrimonial bond itself, so that both parties are free to

marry again during the lifetime of the other. That circumstances may at times justify a *separation* from bed and board is conceded by all moralists. That perfect divorce is also at times permissible, is a hotly debated question. Most modern states grant divorces for what the secular law considers to be sufficiently grave reasons. Notwithstanding recent laxity toward divorce on the part of some Christian denominations, Christ proclaimed the indissolubility of the marriage bond and forbade perfect divorce in the words:

“What God hath joined together, let no man put asunder. Whosoever shall put away his wife and marry another, committeth adultery against her. And if the wife shall put away her husband and be married to another, she committeth adultery” (Mark 10:2—12). Here, however, we are concerned with the purely ethical question whether the marriage bond, from the standpoint of the *natural law*, is indissoluble, so that it cannot be dissolved by any human power.

From the standpoint of the natural law, *no human authority has the power to grant a perfect divorce*.

If perfect divorce, in principle, frustrates either totally or partially the adequate and intrinsic end of marriage, it is contrary to the essence of marriage; indissolubility is then an essential attribute of the marital bond. Such, however, is the nature of perfect divorce.

Marriage has a *double end* or purpose. One, the secondary end, is concerned with the mutual compensations intended for the good and welfare of the married couple. The other, the primary end, is concerned with the procreation and proper education of the children

intended for the common good and welfare of mankind. Natural law forbids everything which, in principle, tends to frustrate the natural end, because the law has the purpose of safeguarding the interests of the community of persons under the general and ordinary circumstances which prevail in human life. While, then, under exceptional circumstances, the indissolubility of marriage might be detrimental to a particular couple, this result would be only accidental and incidental; the *common good and welfare of mankind* would still demand that perfect divorce be prohibited. In individual cases separation from bed and board would suffice to remedy an adverse situation existing between a particular married couple. The common good and welfare of mankind, however, would prohibit complete dissolution of the marital bond, because perfect divorce frustrates the primary end of marriage, and the natural law must foster the attainment of the ends of natural institutions.

If marriage were not indissoluble, *proper education* of the children begotten by the parents would *per se* not be possible. The proper education of the children demands constant, harmonious co-operation of both father and mother; not merely the efforts of one of the parents. Experience proves this abundantly. The children of divorced parents are all too frequently problem children who become juvenile delinquents, because they have been robbed through divorce of the proper atmosphere of a morally stable home. The bad example of the parents deprives them of a sorely needed respect for the laws of

God and of the state. Thereby the common good and welfare of human society is definitely harmed.

Difficulties are bound to arise in a family during the course of the years. How can mutual love and respect grow and flourish between a married couple if the possibility of perfect divorce hangs continuously over their heads as a permanent threat to the stability of their married existence? The possibility of perfect divorce reduces the married state to the level of transitory cohabitation. It is a constant invitation to an emotionally unstable mate to seek fresh experiences with a new partner, once the fires of physical passion have burned low. Divorce also places a premium on marital disorders of all kinds. The very possibility of the dissolution of the matrimonial bond thus makes the attainment of the intrinsic ends of marriage very difficult, if not practically impossible.

The *great error* underlying the possibility of divorce is the false attitude toward human welfare. Reason dictates that the good of individuals must be subordinated to the good of society. Unfortunately for everyone concerned, we have reversed the principle; the good of society has become subordinated to the good of individuals. So long as this attitude prevails, there can be no hope for a healthy national life. It is far better that a few individuals suffer the effects of their folly than that the nations go to ruin. The common good demands the indissolubility of the marriage bond, because in no other way will the common good of mankind be safeguarded. Such is the natural law.

The Marriage Contract

Every person, absolutely speaking, possesses the right to enter the married state; but no one is compelled or obligated to marry. Similarly, no one is compelled to marry one person rather than another. Hence, if a man and woman decide to enter conjugal society as husband and wife and be conjoined into one individual principle for the generation and education of children, they can do so only by means of a free consent which is true, internal, mutual, and manifested to each. This free consent of the two is the 'efficient cause' of their permanent union or 'bond' as husband and wife. And since, by means of this free consent, each party confers equivalent rights upon the other and assumes equivalent duties in justice, the free consent of marriage is a *strict contract*, not a mere resolution or promise. This contract involves as its 'matter' the right of each to the use of the body of the other for the proper functions of marriage and the duty of each to concede this right to the other whenever legitimately and reasonably demanded. Both parties, in virtue of this contract, also assume the mutual obligation to impart a proper education to any and all children which may issue from their union and to render to one another those mutual compensations which constitute the secondary end of matrimony.

In order that the contract of marriage be *valid*, therefore, a number of *conditions* must be antecedently present and fulfilled. Because the marriage contract is based on free consent, error, force, and fear must be absent. There must be no error regarding some presently

existing quality of the person, provided the presence of the quality was made a positive condition of the consent. *Physical force* may not be used; the consent given under duress would not be a true and internal consent. Grave fear, the result of unjust intimidation, would also invalidate the marriage. Both physical force and grave fear are nothing but a form of extortion and coercion and as such deprive the consent of the element of freedom. The contracting parties must be *physically capable* of performing the acts required for the generation of children. Hence, both must have reached the age of puberty; and they must be physically constituted in such a manner that no antecedent, incurable impotency renders either party incapable of the marriage function as intended by nature. Finally, there may be no *close blood relationship*. A marriage between persons related in the first degrees of consanguinity in a direct line, for example, between father and daughter or mother and son, is certainly prohibited by the natural law; such a relationship would be incompatible with the physical intimacies which are natural to the conjugal union. How far the impediment of consanguinity should be extended, it is impossible, from the standpoint of natural law, to decide. Since marriage affects the public welfare of church and state, they can enact positive laws regulating the conditions of a valid marriage not otherwise determined by the natural law.

The Family

In marriage the purpose of the sex of man and woman reaches its natural fulfillment in the procreation of a new human being similar to themselves — the child. The child is the concrete embodiment of their marital love. The parents now submerge their individual interests and their interests as husband and wife into the higher and more unselfish love of both for their child. The child and its interests enjoy a primacy. The life of the parents is renewed in the life of the child; the personality of the parents is duplicated in the personality of the child. The presence of the child brings about an extension of the community life of husband and wife into that of father, mother, and child. There now exists the *family*.

The family is the *basic unit of human society*, because the family is the source of life for all members of the human race and the primary institution for the bodily, mental, moral, and social development of man from birth to maturity.

Men and women have the natural aptitude, propensity, and need to enter into the bond of marriage and establish a family; this is the physiological and psychological completion of their personality in their natural development as human beings. Nature prepares them for parenthood, and the vast majority of persons seek their life's vocation in the establishment of a family. In doing so, they merely follow the dictate of their nature. Hence, the family is a *natural society* dictated by *natural law*.

The child comes into this world as a most helpless creature and for many years is dependent on others for the preservation and development of its being. The rearing and

training of the child is a tedious and difficult task, one which few persons will undertake, unless it be the parents themselves. That nature intends the parents to rear and train their offspring, is evident from the fact that parents are prompted by an ineradicable *instinct* to give every reasonable care to their child. And parents the world over assume this responsibility without question, as something demanded by the very nature of things. Since they are the agents through whose action the child has received life, they are conscious of their obligation to rear and train the child as befits its status as a rational being. By nature, generation creates a bond between parents and child more intimate than even that between husband and wife as spouses, because this bond is founded on the relation of cause and effect, so that the child is flesh of their flesh, bone of their bone, and blood of their blood. Due to this relationship of generation, the child is a part of their very being, and the parents have a definite *dominion* over the child.

Because of the mutuality present in this unique relationship of generation, parents have certain rights and duties with respect to their child, and the child has certain rights and duties with respect to its parents. The right of the parents implies a corresponding duty on the part of the child, and the right of the child implies a corresponding duty on the part of the parents. A moral union thus exists between parents and child, and this union has as its purpose the realization of a *common good*, namely, the proper rearing and training of the child through a complete education and the perfect development of the personalities

of the parents and of their child through mutual love and co-operation. It follows, then, that the moral union between parents and child is a true *society*, the domestic society.

The natural dominion of parents over their child gives rise to *parental authority*. This authority is not a matter of proprietary rights.' A child is not a thing, but a person. The child, as a person, is a rational being and as such is endowed with all the inalienable rights common to all human beings, and parents must respect these rights. The extent of parental authority is regulated by the 'common good' which is the end and purpose of domestic society.

Parental authority is *necessary*, because every society must be directed toward its end by means of authority, and this presupposes a concrete bearer. Both parents are the common bearers of authority in the family, because both, by the very fact of generation, are responsible for the child's well-being in every respect. In virtue of their authority, the parents have the right and the duty to use the means necessary for the proper upbringing of the child. Authority is given in all societies, so that the members of the society will be efficaciously directed toward the attainment of the end which is the reason for the existence of the particular society; the more important the society and the end to be attained, the stronger must be the authority necessary to attain this end. Parents, therefore, have the authority to use whatever means, *moral and physical*, are conducive toward the attainment of the end of domestic society, namely, the common good of all, but mainly the common good of the child who needs their efficacious direction for its complete physical, intellectual, moral, and social development. Even

corporal punishment may be necessary at times, especially in those years when the child is governed by sense impressions rather than by reason. The right of correction, however, is limited by the requirements of the child's education. Parental authority does not entitle the parents to treat the child with cruelty; punishment must always be just and reasonable, and should always be tempered with love and mercy.

It is universally recognized that parental authority is *primarily* vested in the *father*. No society can function properly under divided authority: a body with two heads is a monstrosity. By nature the father is the head of the family. Physiologically and psychologically, the father, as a rule, is endowed with those characteristics which are required for the proper maintenance and protection of the family, while the mother possesses the qualities of sweetness and affection so necessary for the internal direction of the home and for the winning of the confidence of the child. In every case, however, the strength of the father and the tenderness of the mother should supplement one another, so as to form a unitary principle of authoritative education for the child. The child needs both parents, not only for its generation, but also for its education.

Since the family is the union of parents and child established by nature for their common good, it will be necessary to determine this 'common good' in more detail. The *primary end* is the *good of the child*. This is evidenced by the fact that parents always consider the good of their child as the principal objective of all their endeavors. No effort is too laborious and no sacrifice too great for the

parents, when it is a question of the well-being of their offspring. The *secondary end* is the happiness of all the members of the family, brought about by the combined love and co-operation in every phase of family life on the part of father, mother, and child. By the realization of this intrinsic proximate end of domestic society, the welfare of civil and human society, as the remote natural end, is also achieved.

A consideration of the common good, which is the natural end and purpose of the family, will determine the rights and duties of the parents in reference to the child and also the rights and duties of the child in reference to its parents. Rights and duties are reciprocal.

Rights and Duties of Parents

The rights and duties of parents can be summarized under a few main headings. A child is a human person, a composite of body and soul. In both phases of its being it has a claim upon those who gave it life; it has the right to a proper upbringing both as regards its body and its soul. Correspondingly, parents have duties toward the *body* and *soul* of the child.

First of all, then, parents must see to the proper care of the *bodily life* of their child. A sound body is an important factor in the well-being of every child. Parents, therefore, have the grave duty of maintaining the health of the growing child, even in the prenatal period of its existence. They must take reasonable precautions to preserve the child from sickness and injury; and if, through unfortunate circumstances, the child becomes subject to sickness or

injury, they must use reasonable means to restore the health of the child. They must also, so far as their financial condition permits, furnish adequate food and clothing. Proper exercise is necessary for the development of a strong body; hence, parents should neither pamper the child nor impose excessive work upon it, for the child's health will suffer by too little and too much physical exertion. In general, parents must keep a watchful eye on the living habits of the child, so as to insure normal bodily development.

While the bodily welfare of the child is without question very important, its mental and spiritual welfare is far more important. In virtue of its *soul* the child is a human, rational being, destined by God for an eternal happiness as its ultimate subjective end. The child has the natural right to be trained in such a manner that it can effectively strive to realize this supreme end of its existence. And the parents, by the very fact that they are the cause of the child's existence, have both the natural right and duty to educate the child and prepare it for achieving its supreme end.

To 'educate' means much more than the mere funneling of knowledge into the child's mind. Knowledge alone is barren. *True education* is the development of the *total personality* in accordance with the dictates of right reason. It implies the training of all the cognoscitive and appetitive powers, both on the sensuous and spiritual level. Since sense life is the foundation of intellectual life, parents have the obligation to give the child such a training that its external and internal senses are properly developed and placed in the service of intellect and will. Especially,

however, must the parents teach the child in the early years of its life to control, regulate, and discipline its *emotional life*; otherwise it will be ruled by emotions instead of reason and morality, to the detriment of its behavior as an adult. Criminal tendencies often have their roots in neglected emotional reactions. The emotional training of the child, to be truly effective, must be begun in the pre-school period of the child's home life and carried through during the years that follow.

Knowledge, of course, is a vital part of education, because it involves the development of the child's mental powers and prepares it for the time when it must take its station in society and make its own way through life. Without proper schooling the child will be seriously handicapped in its future struggle for a livelihood and a home. Mere theoretical knowledge is of minor value; the knowledge the child receives should be of such a nature that it will be enabled to find a solution for the many intellectual, religious, and moral problems which are bound to arise.

Most important of all, for the development of the child's total personality, is a solid training in *religion and morality*. The child is more than a superior type of animal; it is a rational person. Its soul is an immortal soul with an immortal existence in the life after death. The primary educational duty of parents, therefore, is to train their child in both theory and practice so that it will understand its true position in the world and permanently endeavor to lead the kind of life which will bring it to eternal happiness. Religion and morality alone are capable of giving the life of

the child the direction necessary for the realization of its immortal destiny in union with God, the Supreme Good of the rational soul. Any other kind of education is misdirection and misguidance and a serious dereliction of duty on the part of parents. If parents fail in the religious and moral training of their child, they fail completely in their sublime calling of being the primary educators of their own child in the things that have real and everlasting value. Religion and morality, more than anything else, will make the child fit to lead a life in keeping with its high dignity as a rational person and as a child of God and prepare it, by means of the virtues acquired and the good deeds accomplished, for the enjoyment of that never ending beatitude which God has prepared for those who love Him. To assist their child in achieving its ultimate end is indeed the crowning glory of parents.

This, then, is 'education' in the true sense of the term: to *teach* and *train* the child toward the complete development of its *total personality*, so that it will be enabled to realize the proximate and ultimate ends of its existence and being. And this is what is meant when it is said that the primary end of marriage is 'the procreation and education' of the child and that the primary end of domestic society is the 'common good' of the child.

Since parents are by nature the cause of their child's very existence, and since the family is the first and most fundamental form of society, prior to every other form of society (the sovereign state included), it is evident that natural law imposes upon the parents before all others the *absolute duty of education* with respect to their child. This

duty is absolute, not conditional. Since the child has the natural, absolute, inalienable right to an education befitting its inherent dignity as a rational person, the parents have the corresponding natural, absolute, inalienable duty to furnish this education to their child. And for the same reason, the parents have the natural, absolute, and inalienable *right*, prior to the right of any other person or society (the sovereign state included) to educate their child. They may, of course, delegate their authority to others, if circumstance make this measure advisable; but they may not be deprived of this authority, except in the case of gross neglect or incompetence, without a grave offense against commutative justice. If, for good and sufficient reasons, parents delegate their authority to teach and train the child to others, they retain the fundamental right to send their child to the school of their choice, because they are bound in conscience by natural law to give their child that type of education which, by the proper means of teaching and training, tends to equip the child for the achievement of its temporal and eternal destiny. Whoever possesses the right to a particular end also possesses the right to all the means suitable and necessary for the realization of that end; and whoever has the duty to realize a particular end also has the duty to use all the means suitable and necessary for the realization of that end. The child has the right to an education from its parents which is suitable and necessary for the realization of its temporal and eternal destiny; hence, the parents have a corresponding duty. The parents, therefore, and not the state, have the primary right to educate the child. Consequently, parents also have the

primary natural right to build their own educational institutions, select the teachers, decide on the methods and principles of education, and in general determine the type of education they desire that their child receive, without interference on the part of the state.

Rights and Duties of the Child

By having received existence from its parents, the child has the right to a complete education of its total personality. On the other hand, since the child owes its existence and its bodily, intellectual, moral, and social education to its parents, it is *subject* to the parents and has definite *duties of piety* toward them. These duties, in particular, are respect, love, and obedience.

The child owes its parents *respect*. Respect consists in the dutiful acknowledgment of dependence on the parents. This respect must be both internal and external: internal in so far as it is a genuine sentiment existing in the heart and mind of the child; external in so far as it expresses itself in exterior behavior. In sentiment, word, and deed the child must exhibit filial reverence and good manners toward its parents, no matter what their condition or character may be.

The child owes its parents *love*. No one is closer to the child than its parents. No one, next to God, has given the child so much. The child has received life, food, clothing, shelter, education, and the great privilege of knowing and loving God, together with the practical training enabling it to possess God for all eternity in everlasting beatitude. The

parents spend themselves, their time, their energy, and their financial resources in endless sacrifices for the welfare of their child. The love of the child should show itself especially in good behavior, in the practice of virtue, and in rendering joyful assistance to their parents in all things and at all times.

The child owes its parents *obedience*. Since the child has its existence and very being from its parents, it is by natural law subject to them in all matters pertaining to its education and the order of the home. It has the duty to follow the admonitions and corrections of the parents with humility, to accept the domestic chores imposed upon it with a spirit of co-operation, to observe the order of the household with internal submission. Even when the child has reached the age of personal maturity and independence, it must accommodate itself to the rules and regulations laid down by the parents, so long as it lives under the parental roof; the home belongs to the parents, and they have the authority to decide what order shall prevail for the benefit of all members. Parents, of course, have no authority to command or ask that their child do something sinful; if they should, the child must refuse obedience, because the authority of God, in that case, supersedes the authority of the parents. In all matters, however, that are legitimate and reasonable, the child has the duty of obedience.

God intended the home to be the training school of life. So long as the family is ruled by the spirit of religion and the practice of morality, the well-being of society is secure. But as soon as the home is permeated by religious

indifference and lax morals, society becomes decadent and is headed for disaster.

Contraception

There can hardly be any doubt that the greatest evil threatening the foundations of the family in present-day society is the practice of *contraception*. Theodore Roosevelt, former president of the United States, aptly called it 'race suicide.' The defenders of the practice use the more euphonious names of 'birth control' and 'planned parenthood.' The scientific name is 'contraception,' and it is defined as the voluntary prevention of conception by the positive use of artificial means which hinder the generative cells from uniting during the sexual act. It is immaterial whether the method employed be chemical, physical, or mechanical; the effect is the same.

What is the *morality of contraception*?

There are three elements or determinants which contribute to the morality of a human act, making it morally good or morally evil: the object, the circumstances, and the end of the agent.¹

A human act, to be intrinsically and by nature good, must preserve the *hierarchical order* of the powers and functions of man's nature as intended by the Creator. And it must also be in accordance with the *natural tendency and function which is proper to the power* or faculty of man which is used in the act. The nature of man as a whole will indicate the proper function and tendency of a particular natural power and the place which it is to occupy in the hierarchical

order of powers and functions.² A human act, therefore, which violates the proper hierarchical order of the powers and functions of man's nature or which contravenes the proper natural tendency and function of a particular natural power or faculty, is intrinsically and by nature morally evil; neither the circumstances nor the good intention of the agent can make it morally good, because such an act is *intrinsically* and *antecedently* evil in itself and contrary to *natural law*.

These preliminary principles having been given, it should not be difficult to judge the morality of voluntary, artificial contraception.

According to these principles, *contraception is intrinsically evil*.

A consideration of the anatomical arrangement of the sex organs and of the function of the sexual act makes their 'intrinsic purpose' manifest. If the sexual act between man and woman is performed normally and naturally, the semen will inevitably be placed in a position which makes it possible and probable that the male cells (*spermatozoa*) can meet the female cells (*ova*), can unite with them, and can *effect the conception* of a human being. Any other natural and intrinsic purpose is excluded from the sexual act as intended by the Creator. Hence, if the sexual act is performed normally and naturally, it is in accord with the intention of nature and of God and as such is morally good, provided, of course, that the man and woman are husband and wife, so that they have the right to perform the act at all. Whether conception actually occurs or not is immaterial to the sexual act as much; but the sexual act must be

performed, if performed at all, in such a manner that conception can occur, if nature does her part. Whoever performs the sexual act in a manner that renders conception impossible, *frustrates its normal and natural purpose* and therefore acts contrary to the intention of nature and of God. Such a person uses a natural power or faculty contrary to its intrinsic purpose, and the sexual act thereby becomes intrinsically evil. Now, contraception renders conception impossible through the positive application of chemical, physical, or mechanical means. Hence, contraception is the frustration of the intrinsic purpose of a natural power and its function, and as such, therefore, it is *intrinsically evil*.

No circumstances and no good intention can make an intrinsically evil act good, because evil may not be done to accomplish good. Consequently, contraception is always and under all circumstances a grievous offense against nature and the natural law and therefore morally wrong. Contraception can never be justified.

Very different from contraception is the practice of *periodic continence* or, as it is popularly called, *rhythm*. It is based on the independent discoveries of two scientists, Hermann Knaus of Prague, Czechoslovakia (1929), and Kyusaku Ogino of Niigata, Japan (1930). According to the Ogino-Knaus findings, a 'rhythm' exists in the menstrual period of every woman in the course of each lunar month (28 days), in virtue of which she is normally fertile during certain days and sterile during the others. These definite periods of fertility and sterility can be determined with relative certainty. Hence, if married persons practice

‘periodic continence’ during the period of fertility and perform the conjugal act only during the period of sterility, they can perform the conjugal act normally and naturally and yet avoid conception with certainty. Here, then, is a method of ‘spacing births’ in a rational manner according to the laws of nature implanted by God Himself in the very sexual system of man.

But what about the *morality* of ‘periodic continence’? It must be borne in mind that the primary end of marriage is the procreation and education of children. Persons who enter the state of matrimony must include in their intention this primary end of marriage, or it is no marriage in the real sense of the term. That, however, does not mean that married people must procreate as many children as it is physically possible for them to have. While married couples should cooperate with the creative power of God in giving the boon of life to a number of children proportionate to their own health, economic means, and conjugal happiness, circumstances may exist at times which make it advisable to regulate or restrict the number of children. It is not regulation or restriction itself which is morally evil, but the frustration of a natural act, as the unnatural means of regulation or restriction, which is wrong. Contraception is the abuse of nature’s laws, while periodic continence is a *rational use* of nature’s laws.

Besides the primary end of marriage, the *secondary ends* also have their definite and legitimate place in married life, so long as the primary end is safeguarded and maintained. To circumvent the primary end out of sheer pleasure-loving selfishness would be contrary to right

reason and therefore morally indefensible. But to 'space births' through periodic continence, according to biological laws inherent in the human constitution itself, so long as the conjugal act is performed normally and naturally, is not *intrinsically evil*, provided the spouses have *good and sufficient reasons* for the regulation or restriction of births. Under such conditions the use of the Ogino-Knaus method would be in accord with right reason and therefore morally justified, for the secondary ends of marriage would be achieved.

There are quite a number of 'good and sufficient reasons' which would make the use of periodic continence morally permissible. The reasons may, for example, be *eugenic*; as when it is practically certain, from previous experience, that the children would be afflicted with grave physical or mental defects. The reason may be *personal*; as when the wife is in very poor health, or when the mother has proved incapable of fulfilling her ordinary duties in the physical or moral training of the children. The reasons may be *economic*; as when sickness, misfortune, unemployment, or poverty makes it practically impossible to raise a larger number of children on the insufficient income of the father. Such and similar reasons would be 'good and sufficient' to justify periodic continence.

Parenthood in marriage is a high and noble calling. Parents participate with God in the creation of immortal souls and are instrumental in placing eternal beatitude within the grasp of human beings who, except for their love and devotion, would never receive existence. The 'I' of individuality becomes the 'We' of conjugal society in the

marriage of man and woman, until it is expanded into the trinity of domestic society in the family, where father and mother and child are united in mutual love and affection to carry to completion the sublime purpose of God in the wonderful designs of His Providence.

Summary of Chapter XIX

Chief among the natural societies are domestic society and civil society. We treat here of the *domestic society*.

1. *The Nature of Society*. A *society* in general is the stable union or association of a number of persons for the mutual realization of a common end.

2. *Authority*. Authority, in the 'abstract,' is the *right* to lead the members of the society in the direction of the common end to be realized. In the 'concrete,' it is the *bearer* of this right and power. Authority is essential to society.

3. *Kinds of Society*. There is the 'universal' society of the entire human race. All others are 'particular' societies. From the standpoint of their material composition, societies are either 'simple' or 'composite.' From the standpoint of origin, they are either 'natural' or 'pactitious (conventional).' From the standpoint of controlling authority, they are either 'equal' or 'unequal.' From the standpoint of the realization of their end, they are either 'perfect' or 'imperfect.'

4. *Man a Social Being*. Man has the natural aptitude, propensity, and need for a permanent union and companionship with his fellow men.

The original and most fundamental natural society is the domestic society of the *family*. In its most elementary form domestic society appears in the 'conjugal' relationship of husband and wife united in marriage; its result is *conjugal society*. The natural extension of the conjugal relationship is

‘parental’ relationship, when spouses become the parents of a child; the result is the family proper.

5. *Conjugal Society. Marriage* or conjugal society is defined as the permanent union, lawfully formed, of husband and wife for the procreation of children and their proper education.

Their dignity as persons demands that the union of husband and wife be *permanent* and *exclusive*; otherwise there is no possibility for the proper and complete development of their children through the years of their growth as persons.

Since the sole purpose of the sex instinct and of the sex organs is the procreation of children and the preservation of the race, any gratification of the sex instinct outside the conjugal union of husband and wife is *contrary to nature* and morally wrong.

The *primary end* of marriage is the procreation and education of children. The *secondary end* is the welfare of husband and wife in mutual companionship and assistance.

6. *Celibacy*. Celibacy is abstention from marriage. It is morally permissible.

7. *The Unity of Marriage*. The unity of marriage is that essential property which demands that only one man be married to one woman simultaneously. Unity is violated by *polygamy*, in which one person is united simultaneously to more than one mate. A plurality of husbands is *polyandry*; a plurality of wives, *polygyny*.

Polyandry frustrates both the primary and secondary ends of marriage. *Polygyny* violates *per se* the secondary

end of marriage, because it frustrates the mutual compensations necessary for married community life.

8. *The Indissolubility of Marriage.* indissolubility is that essential property of marriage in virtue of which the conjugal bond between husband and wife cannot be dissolved or broken by any human power during the lifetime of either of the two. *Divorce* is in opposition to the indissolubility of marriage. 'Imperfect' divorce is separation from bed and board, but the matrimonial bond remains intact. 'Perfect' divorce is the dissolution of the matrimonial bond itself, so that both parties are free to marry again during the lifetime of the other.

From the standpoint of natural law, *no human authority has the power to grant perfect divorce*. Divorce frustrates the adequate and intrinsic end of marriage. If marriage were not indissoluble, proper education of the children would *per se* not be possible. The *common good* of society will not be safeguarded, if the bond were dissolved.

9. *The Marriage Contract.* Because there is no compulsion to marry any particular person, marriage must be entered by two persons through a *free consent* which is true, internal, mutual, and manifested to each. Error, force, and fear must be absent.

10. *The Family.* With the arrival of offspring, conjugal society expands into parental society and the *family*. The family is the basic unit of human society; it is a 'natural' society dictated by natural law.

The *primary end* of domestic society is the good of the child. The secondary end is the happiness of all the members of the family.

11. *Rights and Duties of Parents.* First of all, parents must see to the proper care of the *bodily life* of the child. They must also see to the proper education of the soul of the child. True *education* is the development of *total personality*. The parents alone have the absolute duty and the absolute right of education with respect to their child.

12. *Rights and Duties of the Child.* The child has the *right* to complete education of its total personality. But it also has the *duties of piety* toward the parents; these duties, in particular, are respect, love, and obedience.

13. *Contraception.* This is the voluntary prevention of conception by the positive use of artificial means which hinder the generative cells from uniting during the sexual act. *Contraception is intrinsically evil.* It frustrates the normal and natural purpose of the sexual act and is contrary to the intention of nature and of God. *Periodic continence* is permissible for good and sufficient reasons.

Chapter 20

CIVIL SOCIETY

MEN HAVE A TENDENCY TO UNITE INTO GROUPS, CLUBS, associations, and societies of various kinds, for the purpose of realizing some special end. Many societies are conventional in character, depending in their formation and existence upon the voluntary agreement of their members. A society which has its origin in a dictate of human nature is a 'natural' society. The family is such a 'natural' society.

Just as it is natural for man to form domestic society, it is also natural for him to form *civil society*. In general, civil society is the permanent union of a multitude of families and individuals, under a common authority, for the purpose of promoting their public welfare. Civil society is found in many forms, such as village communities, tribal governments, and similar organizations. Civil society assumes its highest form in the complex organization of the sovereign state. For the purposes of ethics, therefore, no distinction will be made between 'civil society' and the sovereign 'state.'

The Concept of the State

The *state* is a form of *society*, and a society is the stable union or association of a number of persons for the mutual realization of a common end. This definition of a society in general must also be verified in the state. Depending on the nature of a particular society, this definition will have to be modified in a manner which befits the nature of the society in question. The full nature of the state will be understood best at the end of our discussion. However, a definition must be given now, even though many of its elements will only be established in the subsequent sections of our analysis.

We *define the state* as a natural and perfect society, consisting of many families and individuals, established for their common good under the direction of the supreme authority of a common ruler. Each item of the definition calls for explanatory remarks.

The state is 'a *natural* society.' It is not a mere 'conventional' society like a bowling club or a labor union, but a 'natural' society in the same sense that the family is 'natural,' namely, because man is ordered by the natural law to form civil society.

The state is a natural and *perfect* society.' It is self-sufficient and contains within its organization all the means required to realize its proper end, namely, the common good of the community in general.

It is 'a natural and *perfect* society, consisting of many families and individuals,' because its constituents are primarily the families and secondarily the individual persons.

It is 'a natural and perfect society, *consisting of many families and individuals*, established for their common good.' The proper and specific end and purpose of civil society is the 'common good' of all or 'public welfare'; not the particular good or welfare of any special groups or classes.

In our definition of the state we claim that the state consists essentially of a ruler and those ruled, and the *common ruler has the supreme authority* to direct all members of the state toward the realization of the proper end of civil society by exacting from all full co-operation in the use of the means necessary to the attainment of this end of the state.

The inclusion of these various items in the definition of the state is obviously not self-evident. Their necessity will have to be proved.

The State a Natural Society

Since the state consists of human beings and is intended for the welfare of human beings, it will have to be either a 'conventional' or 'natural' society. If it is a 'conventional' society, it is the result of a voluntary convention or agreement of men, and this agreement is prompted by *expediency*; men unite in such a society, for instance, an orchestra or labor union or business association, because it is to their advantage to gain a particular end by pooling their efforts. If it is a 'natural' society, it is the result of a dictate of human nature, and its formation is based on *moral necessity*.

The state, we claim, is a natural society.

Man has the natural aptitude, propensity, and need to associate himself in a permanent union and companionship with his fellow men for the purpose of attaining temporal happiness or felicity. But such a permanent union and companionship is found in the state; and any society which is formed under the impulse of such a natural aptitude, propensity, and need is the result of a *dictate of man's nature* and as such is a *natural* society. Hence, the state is a natural society.

No two persons are alike in every respect. The two sexes differ greatly, whether viewed from a biological, physiological, emotional, or mental viewpoint. All persons differ in ability, talent, tastes, temperament, character, and personal requirements. The one thing which all persons, no matter what their condition, have in common is their *human nature*; they are rational animals, with a composite nature consisting of a material body and a spiritual soul. Now, the existence of the state is a constant and universal fact. Such a constant and universal phenomenon demands a constant and universal explanation, and this explanation can be found only in the one changeless and constant thing present in man — his human nature.

Man's uniform nature manifests itself in a natural aptitude, propensity, and need to live in the state. That man is by nature a 'social being' has been proved in the preceding chapter. Conjugal society is a 'natural' society, because man has the natural aptitude, propensity, and need to live in conjugal society, in order to develop the

potentialities of his nature and thus realize the natural end of his life. For the same reason the state is a natural society.

That man possesses the *natural aptitude* to live in the state is evident from the very fact that everywhere and always, as history and experience show, he actually lives in the society of the state. Notwithstanding all selfish interests present among human beings, they practice mutual love and benevolence, assist one another in mutual helpfulness, unite into various groups and associations for mutual advancement and welfare.

The societies people form in consequence of this natural aptitude are manifold. The members place themselves under definite rules and regulations and let themselves be directed in their activities by a president or board with authority to govern the members in all matters pertaining to the special ends for which these societies were formed. This same aptitude comes into play in the wider scope and larger organization of the state. If men had no natural aptitude to live in the state, the state simply would not function, and there would be no state. But the state exists everywhere and always. Therefore men have the natural aptitude to form the state.

That man possesses the *natural propensity* to live in the state is equally clear. Anarchy is a most uncommon phenomenon. People have often rebelled against their rulers and governments. However, when rulers and governments were overthrown, people never remained for any length of time without rulers and governments, but immediately set about establishing a state more to their liking. Men thus instinctively seek their common temporal

welfare by uniting in mutual co-operation under the directive guidance of some governing authority. If men possessed no natural propensity to live in the state, rebellion would be the rule, and they would seek to live without rulers and governments as their natural mode of life. Since the opposite is true, it is manifest that man, by his very nature, is impelled to live in the state as a normal mode of existence. That man possesses the *natural need* to live in the state is

evident from the fact that it is impossible for him to bring about the *physical, intellectual, and moral development* of the potentialities befitting his human nature except in the organized existence characteristic of the state. Neither the individual person nor the family is capable of supplying all the means necessary for the complete development of the human personality, although this development lies within the natural scope of the common end of human life as intended by the Creator of man. Individual persons and families cannot adequately cope with the dangers to property, bodily integrity, and life, which threaten them from the forces of nature and the evil intentions of criminally minded malefactors, without the organized protection of a properly constituted state. Nor are they, as isolated individuals and families, capable of procuring or manufacturing the things required for the proper development of their physical life and economic existence; only through the extensive co-operation of everyone for mutual assistance, as is found in the organization of all groups directed toward the common welfare, in the state, can this development be accomplished. The arts and

sciences are the outgrowth of the concentrated efforts of many generations working in dependence and unison; they are the result of coordinated observation, experimentation, exchange of ideas, and reasoning processes. Single persons and families, and even smaller groups, are incapable of inaugurating and maintaining the facilities necessary for bringing education to that high level of perfection which the innate potentialities of man can attain; to accomplish this, the personal and economic resources of a highly organized society, such as is found in the state as a stable and permanent union of a large number of families and individuals, are a practical necessity. To reach the plenitude of his moral capacities, man must be able to practice the social he is by nature a social being. The family, however, is too restricted in numbers to give full scope for the exercise of the virtues which are connatural to his human nature, because many social virtues. The moral growth of people, therefore, would be correspondingly restricted and stunted, if individuals and families lived more or less in isolation. By living the group life of civil society in the state in all its ramifications and diversified activities, man can exercise all virtues, personal and social, and thus attain to the full growth of his moral personality as intended by God. Even for the complete moral development of man, therefore, life in the state is a natural need.

Now, any society which man is prompted to form and in which he is required to live, in consequence of a natural aptitude, propensity, and need, is a dictate of his nature and of the natural law and as such is a 'natural society.' The perfection of man's physical, intellectual, and moral life is

always found in civil society and nowhere else, as is evident from the testimony of history and experience. Hence, *civil society or the state is a natural society*, a requisite of human nature.

The State a Perfect Society

There are two natural societies directing man toward the attainment of his natural end here on earth — the family and the state. The family is an ‘imperfect’ society, whereas the state is a ‘perfect’ society. A society is said to be ‘perfect’ if it possesses within itself all the means necessary for the attainment of its proper end, so that it is not dependent on any society of a higher order for the attainment of its end; it is ‘imperfect’ if it does not possess within itself all the means required for the attainment of its end.

The family of itself is incapable of providing for peace and prosperity in any full measure. The family cannot ward off a concerted attack on the part of a band of individuals or families, as is evident; it needs the active assistance of others. Nor is the family, by itself, sufficient to furnish all the means necessary for the complete physical, intellectual, and moral development of its members, as was pointed out in the foregoing section. These means must be supplied by the organization of civil society or the state. Since the family is thus dependent on the society of the state for its complete protection and the full attainment of its end, it is an ‘imperfect’ society.

On the other hand, the *state is a perfect society*.

The state possesses within itself all the means necessary for the attainment of its proper end, which end is the common good of peace and prosperity. In other words, the state is *self-sufficient* in its own sphere of activity; it is a 'perfect' society.

In the process of the development of man's social nature, the community of the family is the first and most natural. As the number of families increases in a locality, the physical, intellectual, and moral requirements lead gradually to a division of labor and social functions in different directions among the various families. A community, with community interests, is formed. And as various communities of families develop in a given territory, this division of labor and social functions becomes still more diversified. The interests of the various groups, though common in a general sense, will often conflict with one another, especially in the economic field. While co-operation is necessary, jealousy, discontent, and moral delinquency will often disturb the social order and threaten to disrupt the peace. The family as a society is evidently not sufficient to meet the rising demands of social charity and justice. A new community order is necessary in order to coordinate the social and economic activities of all families and communities and to safeguard the rights of everybody concerned. A greater authority than that of the father of the family is needed if peace and order are to be preserved and fostered; laws must be imposed on all for the common good, and justice must be maintained and administered. And thus the social process passes from the family to the political state.

The state does not abolish the family and the free associations of particular groups; but they are assimilated into the broader organization of the state which has a goal of its own and its own authority. The state is a unity of order, and in it man's social nature is able to develop in a more perfect manner. The self-sufficiency of the state is primarily *social* and *political*, a self-sufficiency of unity, order, and peace; it is a *legal* and *moral* self-sufficiency, for the regulation of internal matters and for independence in matters pertaining to other states. These are goals which the families and individuals could not attain through their efforts with the limited means at their disposal.

To effect this order and to achieve this unity, the state enacts laws and regulations through its legislative power; makes decisions and ends disputes through its judiciary power; and enforces the laws of the land and the decisions of the courts through its executive power. To protect the commonwealth from external attack and internal sedition, the state uses the might of its armed forces. The comprehensive order of the state and its constituents is thus a complete and self-sufficient order, capable of leading its members to the common good of peace and unity for the benefit of all as a self-contained community.

To say that the state is self-sufficient and perfect does not necessarily imply that it can provide for all the wants of its citizens, especially in the economic field. What is meant is that the state possesses the organization which normally is capable of providing or procuring the means necessary to satisfy the wants of the community in a reasonable measure, even if it must negotiate with other states to

import certain raw materials or finished products not available in its own territory.

Self-sufficiency also implies that the state is a complete organization in itself, with all the rights, powers, and competences necessary to carry out its activities, so that it is *independent* of any other society of a similar nature. That is why we see that people never set up a social order higher than that of the state for the attainment of temporal happiness. Some countries, for example, the United States, have a union of separate states. These states, however, are only semi-autonomous and are limited in their activities. The federal government, of which they are integral parts, is the real state, and it alone is self-sufficient and a perfect society.

The Origin of the State

When the problem of the origin of the state is raised, the problem does not refer to the origin of any particular state in the setting of its special historical circumstances. It is a question *here of the origin of the state in general as a social institution* with its supreme juridical moral power, with its right over life and death and over peace and war. Whence comes the institution of the state? Why do people found a state at all? What is the origin of the state?

The state is an institution composed of human beings. It is a *human* institution. It must, we claim, find its explanation in *human nature*. It must, therefore, have a natural origin derived from the peculiarity of human nature. The nature of man, considered in its full philosophical meaning, is both

bodily and spiritual, and the state must have its origin in the bodily and spiritual nature of man. Now, the nature of man is not something static; it is the dynamic principle of all the activities of man tending toward the realization of the inherent and native potentialities of man as the natural end of man's being and existence. Consequently, to live in the political status of civil society, in the state, is the necessary result of man's sociality as a part of his nature, for the attainment of man's natural end of being and existence. Because man seeks happiness in the completion and perfection of his personality, and because this completion and perfection can be achieved only through social living with his fellow men in the permanent union of political life, the formation of the state and life in the state is a moral necessity imposed on man by his nature. Civil society is thus an intentional disposition of man's nature which he cannot escape, if he intends to find temporal happiness in the completion and perfection of his personality while living here on earth.

It follows, then, that *human nature* is the *reason* for the existence of the state and the *cause* of its origin. The state is the necessary outgrowth of man's nature seeking its completion and perfection in the status of civil life. Since the development of man's nature is natural, the origin of the state, which is the result of this development, is also natural. God, therefore, is not the direct and immediate cause of the origin of the state, as if He established it through some superhuman, supernatural act. God, of course, wills the state as an integral part of the human and cosmic order, because He is the Author of human nature

and therefore indirectly and mediately also the Author of the state as an institution to the formation of which human nature naturally tends.

Man is a rational being, and rationality implies intellectual insight and freedom of the will. The normal life of man is based on his rationality, free will included, even if certain lines of activity are prompted by his nature. Conjugal life, and therefore conjugal society, are prompted by human nature; but in concrete instances the marriage of two individuals will only be effected by mutual free consent. So, too, civil life and therefore civil society, are also prompted by human nature; but, as in the case of marriage, the state cannot be formed and originated except through the co-operation of the free will of men. The origin of the state, therefore, cannot be the result of some blind, irrational, biological urge of man's nature, but must find its cause in the *free consent* of the men who form the state.

The *actual origin* of the state must be envisioned somewhat as follows. Man is by nature a social being who must seek the completion and perfection of his nature in dependence on other human beings. Since man in isolation and solitariness cannot achieve the full end of his being, because he would lack many aids necessary for his complete welfare, God ordered man's life in such a manner that he is born and reared in society. Primarily, man is born and reared in the family. Then, since the family is not self-sufficient, the families, upon increasing in number and as a result of diversification and specialization of interests and activities, combine to form the political community, because only the state possesses the self-sufficiency necessary for

the full development of human life as required by the family and the individual.

The state, therefore, originated through a natural growth out of the natural combination of *families*. Families of the same kin would gravitate into more or less concentrated communities. A single *clan* or *tribe*, as its population grew, would consist of a number of such communities, under the leadership of a chief or patriarch. The expansion of the clan and tribe, and possibly also the juxtaposition of other clans and tribes in the same general territory, would gradually develop a concord of interests in some matters and a clash of interests in others. The need for protection and security would become more urgent, so that the family organizations of itself, would be insufficient to meet the rising needs of all. Through imperceptible stages, then, the family passed over into a new form of society, possessing an autonomous sovereignty and sufficiency. This is the view expounded by Aristotle,¹ and it is the view almost universally accepted by the sociologists who have made a comprehensive study of primitive peoples and ancient states.

In later periods of history some states, no doubt, had their origin in virtue of a direct effort to form a state, and not as the natural outgrowth of families united through the ties of blood. Such, for example, was the formation of the Orange Free State in 1854. Here, however, we are speaking, not of the origin of a particular state, but of the rise of the state in general as a new form of social life superior to that of the social life of the family in general.

The Theory of Hobbes

Thomas Hobbes (1588—1679) also deduces the origin of the state from the nature of man. But his view of man's nature is pessimistic in the extreme. In itself, according to Hobbes, man's nature is essentially *anti-social*.

In the '*state of nature*,' prior to the existence of civil society, Hobbes contends, men had equal faculties of body and mind and used them for their exclusive personal advantage, to the injury of everyone else. "Hereby it is manifest," Hobbes argues,² "that during the time men live without a common power [the state] to keep them all in awe, they are in that condition which is called war; and such a war, as is of every man, against every man. . . . In such condition there is no place for industry, because the fruit thereof is uncertain, and consequently no culture of the earth; no navigation, nor use of the commodities that may be imported by sea; no commodious building; no instruments of moving and removing such things as require much force; no knowledge of the face of the earth; no account of time; no arts; no letters; no society; and, what is worst of all, continual fear and danger of violent death; and the life of man, solitary, poor, nasty, brutish and short."

Hobbes also pictures the life of man in this 'state of nature' from the *moral* angle. "To this war of every man, against every man, this also is of consequent; that nothing can be unjust. The notions of right and wrong, justice and injustice, have there no place. Where there is no common power, there is no law; where no law, no injustice. Force and fraud are in war the two cardinal virtues. . . . It is

consequent also to the same condition, that there be no property, no dominion, no 'mine' and 'thine' distinct; but only that to be every man's, that he can get; and for so long, as he can keep it."³

Due to the imperative impulse for self-preservation found in men, they seek peace; otherwise all would be destroyed. In order to end this continuous and self-destructive condition of warfare, they *found the state* with its sovereign power of control by means of a mutual *covenant*. Such is the origin of the state, the 'Leviathan.'

Evaluation. Needless to say, the harrowing picture which Hobbes draws of man living in the pre-state condition is altogether *imaginary* and *arbitrary*. Aside from this, it takes but little thought to realize that the picture is radically contrary to the nature of man as it must have been even in the pre-state condition.

According to Hobbes, man originally is *individualistic* and *anti-social*. He overlooks the vitally important fact that there could not be a 'state of nature' without the *family*. Family life, however, means *social life*. And the social life of the family means the *social virtues* which are natural to the members of the family. Family ties, even among primitive peoples who live without the benefit of the civil life under government authority, are the strongest in the world and are universally characterized by mutual love, mutual assistance, and mutual protection. Wherever families exist, there is industry and property, affection between husband and wife, respect and obedience of the children toward their parents, love and devotion between related families, and friendly feeling toward neighbors. Right and wrong,

justice and injustice are based, not on the positive law of the state, but on *natural law*, and natural law is the basis of the family. The substantial error of Hobbes consists in deriving the origin and nature of the state from a merely human covenant or contract, thus denying the natural *origin* of civil, political society and its authority.

The Theory of Rousseau

Jean Jacques Rousseau (1712—1778) viewed man in the 'natural state,' in opposition to Hobbes, as naturally and completely free, fully self-sufficient, and altogether virtuous. Each man was a peer among peers, endowed with equal rights, and no one was subordinate to anyone else. There was no work or toil of any kind, but all lived an idyllic, arcadian life of ease and comfort and tranquillity. If Hobbes's concept of man in the 'natural state' was pessimistic, Rousseau's was optimistic in the extreme.

Unfortunately, according to Rousseau, this paradisiac condition did not last. It was not 'sin' which disturbed the scene, bringing evil and misery in its train; at least not 'sin' in the Christian sense. Nature endowed man with the fatal gift of *perfectibility*. Slowly and gradually man began to learn the arts, acquire objects as his own, fashion tools of various sorts, and communicate and associate with others; and so he left the condition of the innocent savage for the more turbulent condition of social contacts and activities with his fellows. The result was fraud and deceit, dissension and conflict everywhere, and the loss of primitive peace and tranquility of spirit. Conditions became so bad that men

found it useful to establish the state in order to restore and preserve peace. The state came into being through the free consent and *social contract* of all concerned, whereby everyone grants all his individual rights and ruling power to the 'general will' embodied in the authority of the community. In this way, Rousseau thought,⁴ it was possible "to find a form of association which shall defend and protect with all the strength of the community the person and the goods of each associate, and whereby each one, uniting himself to all, may nevertheless obey none but himself and remain as free as before." To the question as to how men in the state can remain as free as before, Rousseau answers: "Each of us puts into a common stock his person and all his power under the supreme direction of the general will; and we receive in our turn the offering of the rest, each member as an inseparable part of the whole."⁵

Evaluation. There are many flaws in Rousseau's theory. As in the case of Hobbes, Rousseau's view of man's nature in the 'natural state' is purely imaginary and arbitrary.

Rousseau *confuses physical and moral freedom*. We admit that man possesses 'physical' freedom as an essential attribute of his rational nature, so that he has freedom of choice in the activities of his will. But this does not mean that he is free from all moral obligation. The *natural law* is in force at all times, and the natural law confers certain inalienable rights on persons, with corresponding moral obligations or duties on the others.

Like Hobbes, Rousseau conceived the pre-state condition of man as essentially *individualistic*; but, whereas, Hobbes considered primitive man to be 'anti-social,' Rousseau

considered him to be *non-social* by nature. Rousseau was guilty of a serious oversight. The family certainly existed at all times, and the family has not changed essentially. As was pointed out against the theory of Hobbes, family life is by its very nature *social* in character, not individualistic. Furthermore, the very nature of membership in the family precludes the possibility of perfect equality; the relation between husband and wife and between parent and child brings with it a natural individual *inequality*, with differences in rights and duties in domestic society which are ineradicable and unescapable. And family life naturally demands *private property*, so that private property did not have its origin in fraud and force, as Rousseau contended, but in the needs and requirements of the rational nature of man. These same needs and requirements prompted man to till the soil, to learn the arts, to associate with others, and finally to *form the state*, because the perfection of his nature demanded these things.

Since the formation of civil society, of the organization of the political state, is an outgrowth of man's natural needs, the origin of the state is a dictate of the natural law, not of an exclusively human agreement and social contract.

The Evolutionary Theory

The *basic principles* of evolution, in so far as they apply to the origin of the state, can be summed up briefly. Man evolved from the brute according to strictly deterministic biological laws. Biological laws, in the case of man's development, become sociological laws. The blind forces of

evolving nature developed the family out of sexual promiscuity; the same blind forces developed the state out of the family: the environment, and not reason and will, brought on the development, so that the state is merely an adaptation to the biological environment of man. Originally, men were governed by egoism and fear.

For self-protection they banded together. Egoism gives way to altruism, and altruism produces a sense of the common good governing all human relations. When the feeling of unity and mutual sympathy pervades a relatively large group of individuals associated together, the state, with civil authority as the capacity of expressing the general will, is present as an established fact. The prototypes of the human state are the anthill and the beehive.

Evaluation. Even if we granted the fundamental assumption of human evolution, the evolutionists are guilty of a *serious omission* in their calculation of the factors that assisted in the original formation of the state.

Quite obviously, the social life of the *family* preceded the formation of the state; the origin of government, on evolutionary principles, is a relatively recent development in the sociological evolution of man. The family was a universal and firmly established institution long before the first state ever appeared. While men and women are strongly influenced by the sex instinct in entering conjugal society and raising a family, it would be a grave error to think that blind instinct is the sole factor which determines their action. *Rational insight* and the decision of the *free will* play a far greater role than mere instinct in the choice of a mate and in conduct of family life, as experience amply

proves. Only a confirmed materialist will deny this fact, and he does so in violation of all evidence. Since the state evolved out of the family, it is clear that reason and will must also have played a dominant role in the original formation of the state. After all, man is more than an ant or a bee, and his reason and will give *initiative* and *direction* to all sociological changes that affect his welfare. Adaptation to environment was certainly a factor in the formation of the state, but only because the changing sociological environment made man intellectually conscious of new needs for his physical, intellectual, and moral perfection. It was to meet these needs, since they could not be taken care of sufficiently by the activities common to the family circle, that man formed the higher organization of the state. The state, therefore, was indeed an outgrowth of the family, but as a *natural demand of man's rational nature*, not as the blind result of blind biological forces.

A variant of the biological theory is the *racial theory* advocated by Adolf Hitler's national socialism. According to the basic concepts of this theory, the state originated through the blind struggle of the races as biological groups. Superior blood is the deciding factor in this struggle, so that the superior race wins out and eventually becomes a state. L. Gumplowicz was a typical exponent of this view.

Here, too, reason and will are excluded as factors in the formation of the state; nothing operates but the blind, irrational, non-moral forces of a biological process. The arguments against the general evolutionary theory are also valid here. Man is more than a sum of biological characteristics and tendencies. As a rational being, *his*

intellect, will, and moral inclination must always be figured into any social process of human development and improvement as initiating and directing factors.

Government by Consent

The contract theory of Hobbes, Rousseau, and others, and the biological theory of evolutionism and racism, are extreme in their basic concepts. The former overemphasizes reason and will, while it fails to take into account the tendencies and demands of human nature. The latter overemphasizes the biological tendencies, while it ignores the rational nature of man.

The *scholastic theory* of the origin of civil society avoids both extremes. The state originates in the native tendencies of human nature. With *moral necessity*, not biological inevitability, it grows out of the social life of the family, because human nature, in seeking to satisfy its increasing needs for self-perfection, cannot find the adequate means to satisfy these needs in the restricted activities of the family. It lacks self-sufficiency in the family, and so *human nature* tends to unite the families into the higher and self-sufficient organization of the state. Basically, therefore, the state finds its origin in human nature. However, since human nature is essentially rational, endowed with intellect and free will, the state could not actually and concretely come into existence except through the active participation of *reason and free will*. The interaction of the biological forces and of the rational powers of man's nature as a 'rational animal' are responsible for the origin, formation,

and organization of the state as the supreme realization of man's social life on earth.

Two *things* must be accounted for in the origin and formation of the state as a new form of human social life. The *first* is the *essence* of the state. The state is a new form of society, with an authority superior to that of the family and with an end different from that of the family. Hence the question: Why do human beings form the state at *all*? The answer is: Because human nature is so constituted that it must strive for ultimate self-perfection, which cannot be attained except in the new social form of the political state. The state, therefore, is a dictate of human nature and a mandate of the *natural law*; in so far it is independent of the human will in its origin. The *second* is the origin and formation of the *individual historical states* as they actually and concretely come into existence as historical events in definite localities on the globe (for example, in France, Italy, Greece, Mexico). Hence the question: How does a multitude of families and individuals actually and concretely bring about the origin and formation as it exists *here and now*? The answer is: Through the *mutual consent* of the families and individuals who freely decide to live in the society of the political state for the purpose of actively co-operating for the common good of all. While, therefore, the state in its metaphysical *essence* is a mandate of human nature and as such independent of the human will, the state in its historical *existence* occurring at a particular time and in a particular territory is dependent on the free consent, the mutual *pact*, of those desiring to form the state. Historically and concretely, then, the state is *government by consent*.

The parallel between conjugal society and civil society is obvious. The 'essence' of conjugal society and the family is determined by the natural law and as such is independent of the consent of the contracting couple when they unite in marriage. The 'existence' of a particular marriage between two persons, however, is dependent on their mutual consent, and there would be no existing marriage without their freely given consent. So, too, with the state; it is the combined result of a natural urge and a free decision.

This consent or pact may be *express or tacit*. 'Express' consent is given verbally or expressed in writing, as was done, for example, in the formation of the Orange Free State and of the United States, where the contracting members deliberately set about to establish their government. 'Tacit' consent is implied by the people accepting the given government or omitting to oppose it, as happens, for example, when someone assumes the ruling power or when a conqueror subjugates a people, and the people acquiesce in the new government.

The doctrine here proposed is that of *Robert F. Bellarmine* (1542—1621) and *Francis Suarez* (1548—1617), two eminent philosophers of late scholasticism. Most modern scholastics subscribe to this view. Their teaching, as it is now generally conceded, was adopted by the founders of the republic of the United States. It is expressed in the famous words of the Declaration of Independence: "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable rights, that among these are life, liberty, and the pursuit of happiness. That to secure these rights,

governments are instituted among men, deriving their just powers from the consent of the governed.”

We subscribe to the doctrine of Bellarmine and Suarez and contend that the concrete historical *state comes into existence through the consent, express or tacit, of the members contracting to form the state.*

The *formal* element characteristic of the state is the constant moral union of a multitude of families and individuals actively co-operating for the *common, public good* of all through the *bond of legal justice*. To establish this bond, the consent of the governed is necessary and sufficient.

Unless we wish to ascribe the origin and formation of the state to some blind, irrational biological or racial urge, we must assert that the bond of the moral union, which knits a multitude into the new social order of the state, must be *rational* in its origin. It can be rational only if those who unite to form the state have ‘knowledge’ of the common end involved and ‘will’ to co-operate to achieve this common end. These conditions mean definite *consent* of the members. The common end is public welfare, the peace and security and prosperity of all as a body. To belong to a state imposes the obligation on all to strive mutually and effectively for this common end. Obligation, however, presupposes the consent of the one obligated, because there can be no obligation to strive for the *common* welfare under *legal justice*, which is the mark of the state, unless one is aware of the obligation and accepts it; otherwise such an obligation would be irrational. Hence, consent is *necessary*.

This consent is also *sufficient* for the establishment of the state. Given the multitude of families and individuals desirous of seeking the common good of all through mutual and effective co-operation, the very fact of their consent puts them in the status of a civil society and obligates them to strive efficaciously for the common welfare through mutual endeavor and the use of common means. They then cease to be a mere multitude and become a 'society'; and since the end of this society is the public welfare of all as a body, a definite moral union is established with a distinct common end. Civil rights and duties now bind them in virtue of the natural law. This society is the state.

Pope Leo XIII, one of the greatest modern exponents of the state, expresses the doctrine of government by consent succinctly, as follows: "Diverse families, without abandoning the rights and duties of the domestic society, unite under the inspiration of nature in order to constitute themselves as members of another greater family, the civic society."⁶

From the above it is clear that a *double authorship* exists with regard to civil society or the state. The immutable essence of the state, of which every individual state is an expression and embodiment, has its foundation in the natural law. The Author of human nature and of the natural law is God as the Creator and Supreme Lawgiver. Hence, *God* is the primary and ultimate cause of civil society. The contingent existence of a particular state is due to the effective consent of those who associate together to form the state and obtain thereby the benefits to be derived from civil society. The *contracting members*, therefore, are the

secondary and proximate cause of the state as it actually and concretely comes into existence.

The Constituents of the State

Every society must consist of constituent members. They are the *material* cause of the composition of the state. While the state as a 'society' is a moral unity, it consists basically of a plurality bound into unity. Conjugal society is a simple society, because it consists of individual physical persons. The state, on the other hand, is a composite society, because it consists of subordinate societies or associations as moral persons.

The *matter in general* of the state is all those persons, moral or physical, who belong to the state and are its constituents. This matter is either 'proximate' or 'remote.' It is *proximate* if the persons are subject to the jurisdiction of the state directly, and not through the social bond of some subordinate society of which they are members. It is *remote* if the persons are primarily members of a subordinate society, and this subordinate society is proximately subject to the jurisdiction of the state.

Primarily, we contend, the *proximate matter* of the state as a natural society is the *families*.

Since civil society is a natural society, natural law determines both its proximate and remote matter. Hence, those persons who are ordered directly and primarily to assume the social bond of civil life in the state are the proximate matter of the state.

Now, the natural law orders the families directly and primarily to assume the social bond of civil life in the state. There are three natural units among men: the individual, the family, and the state. The individual is ordered by natural law to the family: the individuals are not only born and reared in domestic society according to the dictates of natural law; they also have the natural destiny to be the fathers and mothers of the race. Only in the family does the average person find the means to perfect his personality. And the families are ordered by the natural law to the social life of civil society in the state, because it is only in the political state that the families, and in the family the individuals, can find the perfection desired and sought as a result of the needs and demands of human nature. Families gather into communities, and communities gather into colonies and provinces; then they naturally take the final step and establish the state. Man, therefore, in seeking his connatural development, is directly ordered by the natural law with regard to the family; and the family, without any further sort of mediation, is directly ordered by the natural law to the civil society of the state. Primarily, therefore, the families are the proximate matter of the state.

It happens, of course, that *adult individuals*, who are unmarried, have left the domestic society of the parental roof and lead a life of their own. Since there exists no social bond mediating between them and the state, they, too, belong to the proximate matter of the state, but only *secondarily* and *per accidens*.

Children belong to the state through the mediation of the family of which they are members. Immediately and

directly they are under the jurisdiction of the father as the juridical head of the domestic society of the family; only 'mediately' and 'indirectly' as remote matter, do they belong under the jurisdiction of the state. This applies also to the wife, in so far as she is subordinated to the husband.

The state, therefore, is the natural expansion of the families, rather than of the individuals. The families are by nature and existence prior to the state and do not lose their identity by being incorporated in the state.

The Proper End of the State

It is not a question here of the 'ultimate' end of the state, because the ultimate end of the state coincides with the ultimate end of the family and of all individuals, namely, the glorification of God and the eternal happiness of man in the possession of God. What we seek to determine is the *proper and immediate end of the state*; it is that end which distinguishes the state from every other type of society and determines its specific nature. The concrete states may be monarchies, aristocracies, democracies, or blendings of these fundamental forms. Since, however, all forms agree in this that they are 'states,' there must be a 'proper end' of the state as such in all of them. And since the state is a mandate of human nature and of the natural law, the proper end of the state must be *determined by nature itself*.

Three main theories regarding the proper end of the state have been advanced. The theories differ according to the scope which the proponents ascribe to the state's activities.

The *first* general theory *restricts* the purpose of the state to the protection and furtherance of the *individual rights and liberties* of the subjects. The proper end of the state, therefore, consists solely in forbidding and hindering all those external acts which interfere with the exercise of the personal rights and liberties of other members of the community.

This is essentially the theory of *Kant*. According to Kant, the juridical order is divorced from the moral order. The moral order pertains merely to the 'internal' liberty of man as an autonomous being, while the juridical order pertains to the 'external' liberty of man as a social being. Hence, the proper end of the state is exclusively 'peace,' i.e., the preservation of the liberty of all subjects so that they can live in harmony. The individualistic, liberalistic *Manchester School* maintained that material prosperity is the highest good of man on earth. Private property is the keystone of a healthy social order, and each individual has the right to accumulate as much wealth as possible in free competition with others. Hence, it is the duty of the state to give free rein to personal initiative, and it is the end of the state to protect each one in the acquisition, possession, and enjoyment of private property.

Evolutionary utilitarians also advocate the restriction of the proper end of the state. In their view, mankind is in a continuous process of evolution toward the chiliastic state of the future. This process is a sociological 'struggle for existence,' in which the less useful members are gradually eliminated, until none remain but those ideally suited for the future ideal state. The 'survival of the fittest' is a

biological law governing the evolutionary process, and the state must not interfere with its operation. Hence, the state has as its end nothing more than the protection of individual rights. The welfare of all subjects cannot be the proper end of the state, or it would be forced to protect the weak and unfit and thus nullify the evolutionary process.

The *second* general theory *expands* the purpose of the state to such an extent that it considers the *state as an end in and for itself*, submerging all individual rights and liberties in the omnipotent will of the state.

This view was dominant in the political philosophy of classical paganism. Thus, *Plato* maintained that man existed solely for the state, and the state is the great pedagogue of the citizens; it is the purpose of the state to educate its subjects to virtue, and all subjects must subordinate themselves completely to the state. The state, therefore, has unlimited power over property, marriage, children, and family life. Even *Aristotle* conceded far too much power over the individual to the state.

Toward the end of the Middle Ages, *Niccoló Machiavelli* (1469—1527) revived the pagan concept of the absolutism of the state. Politics has nothing to do with morality. The individual virtues must give way to the interests of the state. The state is everything; and all things are good, if they are good for the state. Results count, not the means employed, because the moral law which binds the individuals does not bind the nations. Hence, treaties need not be kept and rights need not be respected, if they run counter to the objectives of the state. *Hobbes*, too, gave absolute power to the ruler, once the state is established.

The pantheists, such as G. Hegel (1770—1831) and *F. Schelling* (1775—1854), saw in the state the supreme embodiment of the Absolute in its internal deterministic evolution. The state is an end-in-itself, and the individuals are mere means.

In our day, the omnipotence of the state has been proclaimed by the totalitarianism of *national socialism* in Germany, fascism in Italy, and communism in Russia. The state is supreme, and everything and everyone is subservient to the interests of the state.

The *third* general theory is the one defended by most Christian thinkers and *scholastics*. It represents a middle course between the extremes of the foregoing general theories. They contend, in opposition to the first general theory, that the proper end of the state includes more than the mere preservation and protection of individual rights and liberties; they also contend, in opposition to the second general theory, that the state is not an end-in-itself and that the individuals and families must not lose their identity in the state. The proximate and proper end of the state is *public welfare*, namely, the common good of peace and prosperity, through the realization of a social status which offers the citizens security in their rights and the opportunity to achieve true temporal felicity by means of self-activity. True temporal felicity is achieved, when the citizens live *in peace*, which is tranquility of order internally and externally, and in prosperity, which is the abundance of all the means necessary for the complete self-perfection of the individuals and families in their physical, intellectual, social, and moral life. It is not the end of the state to furnish

temporal felicity ready-made to its citizens, because temporal felicity is not a commodity which can be manufactured and then handed over to a person. But it is the proper end of the state to furnish the opportunity and the means, so far as is possible with the material and human agencies at its disposal, to its citizens, so that they may find it possible of achieving temporal felicity *through free self-activity*. This possibility the state must strive to place within the reach of all its members, not only of a privileged class or group, because the proper end of the state is the 'common good' or 'public welfare' of all.

We subscribe to the scholastic theory and contend that the *proper end of the state is public welfare*.

If we desire to know what the proper end of the state is, we must go back again to the reason why people form the state. They do so because they come to the realization that neither the individuals nor the families nor the conventional voluntary societies are self-sufficient, since they are not able to supply the bodily and spiritual goods necessary for the developed life which man seeks and needs. To supply these necessary goods they combine to form the state; and the state is a new form of social living, a qualitatively different society, different from that of the family and all other conventional societies. The individual good merges in many ways with the common good sought in the state, for the simple reason that the state consists of and in the individuals and families and exists for their benefit. But there is a difference. The individual good is a 'private' good, and the individuals and families are best able to look after their own private interests in their own way. There is,

however, also a 'common' good which contrasts with the 'private' good, and it is the good of the *social body* as an organized community of individuals and families; it is the welfare of the 'society as such,' *public welfare*, and this cannot be achieved by the individuals and families but only through the state. It is, therefore, the proper end of the state to work for the 'public welfare' of the social body as a unit, and that is the reason why people combine to form the state.

M. Cronin⁷ explains what is contained in the 'common good' as the characteristic end of the state. "It is the business of the State to protect the community from enemies without, and to furnish the machinery and prepare the organization required for this end. Again, it is the business of the State to make laws for the community, to set up tribunals for administering justice, to establish a proper educational system, to regulate commerce so that the whole community may not suffer by the inordinate action of a few individuals. All these things are matters appertaining to the good of the community as such. Again, it is the business of the State to provide and maintain such an environment, physical and moral, as is required for the welfare of individuals, physical and moral, for though individuals may benefit by such an environment, it really is, properly speaking, a 'good' of the whole community, and the providing of it is wholly outside the capacity of individuals. Men could not be healthy in unsanitary surroundings. Virtue can prosper only with difficulty where the level of public morality is low and the atmosphere morally offensive."

It is obvious that the individuals and families are incapable of defending themselves, alone and by themselves, against the aggression of a powerful foreign enemy. An army is required for this defense, and an army requires the *conscription* of citizens as soldiers who can be ordered into *battle and death*, if necessary, for the preservation of the community. But this raising of an army and this ordering of fellow men into battle and death far exceeds the right and power of individuals and families. This one point alone is sufficient to disprove the contention of the first theory, mentioned above, that the state is nothing more than an institution to protect individual rights and liberties. The fact that citizens can be conscripted, and the fact that the soldiers must be ready to sacrifice their life in battle, is justifiable only on the supposition that the state has a proper end of its own and that this end consists in the *public welfare*, the common good of the community as such, distinct from the private good and the private rights of the individual. Radical *pacifists* are of the opinion that the state has no right to send citizens as soldiers into war, no matter how just the cause. However, the generality of men, and this includes the wisest and best, have always conceded this right to the state, and they cannot be wrong in a matter which affects the most vital rights of man.

We contend that the second theory, which defends the absolutism of the state as an end-in-itself, contradicts the *natural law*, because it reduces human beings to a mere means for the progress of the state; this is a violation of the *essential dignity of man*. The state exists for the benefit of man; not man for the benefit of the state. When men form

the state, they form it as an organization of *service* for themselves. The state is not a substance, an entity existing for itself apart from the individuals and families who compose it: they are the state. The destiny of the state is temporal and mortal, while the ultimate destiny of man is eternal and immortal; and the temporal and mortal must be in the service of the eternal and immortal; otherwise there would be a subversion and perversion of the right order. Totalitarianism is slavery of the people.

The proper end of the state has been well defined in the opening paragraph of the Constitution of the United States. "We the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America."

Authority and Power

The *authority* of the state and its power are, strictly speaking, distinct realities. The 'authority' of the state is the *right of jurisdiction*, or the moral competence to issue commands and impose obligations on the wills of its subjects in matters pertaining to the public welfare. The 'power' of the state is the *right of coercion*, or the legal competence to enforce obedience to these commands and fulfillment of these obligations. Since mere authority without power is an empty shell and mere power without authority is nothing but tyranny, the two are so closely

interwoven in actual fact that it is customary to consider them as synonymous, so far as all practical purposes are concerned.

Whence is this supreme civil authority and power of the state *derived*?

The question presents a distinct problem. In posing the problem, we are not concerned with the particular bearer or bearers of this supreme authority and power. Nor are we concerned with the particular type of government in which it is found. What concerns us in this connection is the *cause* of the supreme civil authority and power *as such* of the state in general.

The *contractualists*, such as Hobbes, Locke, Rousseau, and their followers, maintain that the supreme authority and power of the state arises from the individuals who originally set up civil society or the state; and they do this by yielding their individual rights to their ruler or by pooling their individual rights and efforts for mutual protection and advantage. *Evolutionists* maintain that the immediate cause of the state's supreme authority is collective human nature developing through biological necessity.

We subscribe to the *scholastic teaching* that the supreme civil authority and power *as such* proceeds *immediately and proximately from* God, without the intervention of any other cause, on the basis of natural law as a requirement of the *natural order*.

It is a valid principle of science and philosophy that no effect can be greater than its cause. No cause can produce an effect superior to itself, for the self-evident reason that

‘no one can give what one has not got. Now, it is obvious that supreme authority and power is an *essential element* of the equipment necessary for the state in the realization of public welfare. Without this authority and power it would be impossible for the state to direct *efficaciously* its members toward the *specific end* for which the state is formed, namely, the public welfare of the community as such. This specific end is a requirement of natural law, and as a consequence the supreme authority and power of the state is also a requirement of the natural law, because any society which by nature has a specific end must also be entitled by nature to the means necessary for the attainment of that end. But since the specific end of the state, in as much as it is prescribed by natural law, is independent of the will and consent of the persons forming the state, the supreme authority and power of the state, as an essential means to that end, is also independent of the will and consent of these persons. That the state is really a requirement of the natural law, was proved when it was shown that the state, like the family, is a ‘natural’ society.

The natural law, as was shown before, is a participation in the eternal law. The order of the natural law, therefore, is a *divinely established order*, with God, the Eternal Lawgiver, as its immediate, proximate Cause. In consequence of this fact, man is in no way the author or cause of the natural law, but is subject to it in all things, even without his consent. He may violate the natural law, but he still cannot on that account escape its binding force. Just as the essence of conjugal and family society is a mandate of the natural law and has God as its immediate

author, so the essence of the state is a mandate of the natural law and has God as its immediate Author; and since the supreme authority and power of the state is an essential element of the state, this authority and power must also have God as its *immediate Author*.

As soon, therefore, as men form the state by mutual consent, God, without their consent and intervention, gives to the new political body (the state) the supreme authority and power required by natural law for the attainment of its specific end. This does not demand a special supernatural act on the part of God; authority and power are given to the new political body (the state) by God in *virtue of the natural law*. The process, therefore, is natural, not supernatural, and belongs wholly to the *natural order* as instituted by God. The process is neatly characterized by I. W. Cox⁸ "Because in human generation," he says, "the parents initiate a procreative process which demands a human soul, and in consequence of which God creates a human soul, the parents can rightly be called the efficient causes of the concrete individual generated. So too, citizens constituting civil society start a process which demands supreme civil authority, and in consequence of which God grants *immediately* and as sole *proximate* cause this authority, although the citizens still remain the efficient cause of the concrete civil society. The members, who organize the state by their consent, place the foundation of the civilly social bond. This bond, by the Natural Law, descends *immediately* on those giving consent, and immediately there arises by the Natural Law supreme civil authority as an essential property of civil society."

The whole argument, of course, revolves around the question whether the state's supreme authority and power is *qualitatively and quantitatively superior* to the authority and power vested in the individuals and families who form the state. It is. The state's proper end being the public welfare, it can and actually does, in order to efficaciously realize this end, levy taxes upon its citizens, condemn private property when necessary, preserve peace and order through law enforcement agencies, enact general laws affecting all individuals and families, inflict capital punishment on those guilty of serious offenses against public order and the welfare of the community at large, establish military forces for the preservation of the state against internal and external enemies, declare war, and conclude international treaties. Since individuals and families possess no such authority and power, it is evident that they *cannot be the cause* of this authority and power in the state. Only God, through the natural law, can give such supreme authority and power to the state formed by the citizens.

We can now understand better why St. Paul⁹ wrote to the early Christians of Rome that they must obey their (pagan) civil rulers: "Let everyone be subject to the higher authorities, for there exists no authority except from God, and those who exist have been appointed by God. Therefore he who resists the authority resists the ordinance of God." And that is also why Christ¹⁰ said to Pilate: "Thou wouldst have no power at all over me were it not given thee from above."

When, therefore, a state has been legitimately established by its constituting members, its authority and power is present in virtue of the natural law, and the *duty of obedience and loyalty* is also incumbent on the members of the state in virtue of the natural law. This obedience is then not a servile submission to mere physical might, but a 'reasonable' obedience, because it is really an obedience to God, the Author of the natural law and of the authority and power of the state.

Such is the ethical concept of civil society or the state. It represents the culmination of man's natural tendencies in the sphere of social life. The state, since it consists of persons who are weak and often immoral, often falls short of the ideal. In itself, however, and as intended by the Creator, it is the perfect, self-sufficient society, endowed with the high purpose of working out the common welfare of all.

Summary of Chapter XX

Just as it is natural for man to form domestic society, it is natural for him to form *civil society* or the state.

1. *The Concept of the State.* The state is *defined* as a natural and perfect society, consisting of many families and individuals, established for their common good under the direction of the supreme authority of a common ruler.

2. *The State a Natural Society.* Man has the natural aptitude, propensity, and need to associate himself in a permanent union and companionship with his fellow men for the purpose of attaining temporal happiness or felicity. Such a society is a *dictate of man's nature* and as such is a *natural* society. This society is civil society or the state.

3. *The State a Perfect Society.* A society is *perfect* if it possesses within itself all the means necessary for the attainment of its proper end, so that it is not dependent on any other society for the attainment of its end. Such is the state; it is *self-sufficient*.

4. *The Origin of the State.* We are concerned here with the origin of the *state in general as a social institution*. The formation of the state and life in the state is a moral necessity imposed on man by his nature seeking its completion and perfection in the status of civil life. Since the development of man's nature is natural, the origin of the state, which is the result of this development, is also *natural*. And since the rationality of man implies intellectual insight and freedom of the will, the origin of the state must be the result of the free consent of the men who form the

state. It originated through a natural growth out of the natural combination of *families*.

5. *The Theory of Hobbes*. In the 'state of nature,' Hobbes contends, there existed a war of every man against every man; there were no rights, no property, no moral values. For the sake of self-preservation men founded the state through a mutual covenant.

Evaluation. Hobbes's picture of man in his pre-state condition is imaginary and arbitrary. Man is supposed to be *individualistic and anti-social*. But the family existed, and family life means *social life* with social virtues, rights and duties, and the order of natural law.

6. *The Theory of Rousseau*. Rousseau viewed man in the 'natural state' as leading an idyllic life, free, self-sufficient, and virtuous. Man was simply *non-social* at first, but had the gift of *perfectibility*. Through association with others, gradually fraud and deceit, dissension and conflict prevailed. In order to restore peace, the state was formed by a *social contract*.

Evaluation. Rousseau's view of man in his pre-state life is imaginary and arbitrary. He confuses physical and moral freedom. According to him, man's life before the founding of civil society was *individualistic and non-social*. The family existed then, and family life is essentially social in character. The formation of the state is based on *natural law*.

7. *The Evolutionary Theory*. Not reason and will, but the blind biological laws of evolution developed the state out of the family.

Evaluation. The *family* was a universal institution long before the state could come into existence. Since the state

developed out of the family, *rational insight* and *free choice*, not merely biological urge, must also have played a dominant part in the formation of the state.

8. *Government by Consent.* According to the *scholastic* theory, the concrete state finds its origin basically in human nature and comes into existence through the *consent*, express or tacit, of the *members contracting* to form the state.

Consent is *necessary*. The bond of legal justice must be 'rational,' involving knowledge and will. To live in the state imposes the obligation on all to strive mutually and effectively for the common end. Obligation presupposes the consent of the one obligated, because there can be no obligation to strive for the 'common' welfare under 'legal justice' unless one is aware of the obligation and accepts it. This consent is *sufficient*. Given the multitude of families and individuals desirous of seeking the common good of all through mutual and effective co-operation, their consent creates the moral union with a distinct common end which is civil society or the state.

9. *The Constituents of the State.* Primarily, the *proximate* matter of the state is the *families*. Adult, unmarried individuals belong to the proximate matter of the state only *secondarily* and *per accidens*. Children and wives belong to the state 'mediately' and 'indirectly,' through the mediation of the family, as *remote* matter.

10. *The Proper End of the State.* We contend that the proper end of the state is *public welfare*. People form the state because they realize that neither the individuals nor the families nor conventional societies are sufficient to

supply the bodily and spiritual goods necessary for a developed life. Hence, they unite and form the state as a new form of society, in order to attain their 'private' welfare together with the *public* welfare of the entire *social body* as a unit. The state has the ability and the means to procure many types of goods which lie outside the capacity of the individuals and the families.

11. *Authority and Power.* Authority is the right of jurisdiction; power, the right of coercion. The supreme civil authority and power as such proceeds *immediately and proximately from God* on the basis of the natural law as a requirement of the natural order.

Without this supreme authority and power the state could not direct efficaciously its members toward the *specific end* for which the state is formed, namely, the public welfare of the community as such. This specific end is a requirement of the natural law, and therefore the supreme authority and power of the state is also a requirement of the *natural law*, because any society which by nature has a specific end must also be entitled to the *means* necessary for the attainment of that end. The order of the natural law is a divinely established order, with God as its immediate, proximate Cause. And since the state is a mandate of the natural law, and since supreme authority and power is an essential element of the state, the authority and power of the state must also have *God as its immediate Author*.

Chapter 21

GOVERNMENT

THE STATE IS NOT AN ABSTRACT ENTITY, BUT A CONCRETE REALITY. It consists of human persons, of those who govern and who are governed. *Government* may be taken in two meanings. In the *passive* sense government means the actual organization through which the activities of the state are carried out. In an active sense government means the ruling and administration of the political body. Thus the state always appears as a 'government' in the concrete affairs of the world.

There are many things about government that interest the ethicist — the organization, the administration, the relationship between the ruling power and the people, their respective rights and duties, and similar matters. The moral philosopher obviously cannot take up the moral implications of government in great detail. He must be satisfied to uncover the *fundamental moral principles* upon which just government rests, because that is all moral philosophy is supposed to do.

Types of Government

History informs us that many types of government have existed in the course of human development toward political perfection. Sociologists recognize three main types.

One is the *monarchy*. As the name indicates, a monarchy is a form of government in which one person possesses the supreme rule over the political community. A monarchy is either 'absolute' or 'limited.' It is absolute if the monarch's rule is complete in every respect, so that his word is the sole law of the realm. The Roman emperors ruled in this fashion.

A dictator who assumes complete and exclusive rule is the same as an absolute monarch; in general, however, a dictator's power is not so extensive. A monarchy is *limited* if the monarch's power is curtailed in some respects. Monarchical power may be curtailed by a constitution, in which case the government is a 'constitutional' monarchy; or a parliament or similar governing body may possess partial governmental power, which arrangement would constitute a 'parliamentary' monarchy.

The *oligarchy* is another main type of government. It is ruled by a few persons or by a privileged group. Membership in the group may be determined by election or by birth. Oligarchy is often styled 'aristocracy,' because the nobility usually rules.

The third type is *democracy*. Literally, democracy means 'rule by the people,' and this is indeed the basic concept underlying the democratic form of government. In a democratic government the ruling power resides in the people themselves. This power is exercised either 'directly'

or 'indirectly' by the people. In a *direct* democracy every issue facing the political body is decided by all the members of the democracy. Such a government can manifestly exist only where the political community is relatively small and lives in a confined territory. Most democratic governments are *indirect* democracies, in as much as the people exercise only indirect control over government by means of the constitutional election of representatives to whom they delegate the direct rule. These representatives are deputies of the people, act in their name and authority, and are responsible for their acts to the people. In genuine democracies these representatives are elected to short-term offices, in order that the people can periodically express their governing will and exercise their basic governing power.

In a genuine democracy the techniques of government are not as important as the *spirit* which permeates the entire organism of the state. True democracy is based on the moral dignity of the human person; on the inviolable sanctity of the family and of family life; on the fundamental equality of all persons before the law, irrespective of class, creed, color, or national origin; the protection of personal rights and personal freedom for everybody; the right of minority groups to exist and work for their particular ends, so long as they are not in opposition to public welfare or public morals; equality of opportunity in the educational, economic, and political fields, all achievements to be the result of personal ability and initiative, and not of privilege; just and impartial administration of every department of government for the common good of all members of the

commonwealth, whether they be rich or poor, educated or uneducated, influential or un-influential.

From the standpoint of ethics, it is indifferent what particular type of government a people decides to live under as best suited for its conditions. Any type of government will be good if it constantly and earnestly strives to promote public welfare; and it will be bad if it fails in its endeavor to achieve its proper end which is the common good of all. *St. Thomas*¹ advocated a *mixed government*, with the dominant note on democracy, as the best in general. He says: "Two points are to be observed concerning the right ordering of rulers in a state or nation. One is that all should take some share in the government: for this form of constitution ensures peace among the people, commends itself to all, and is most enduring. . . . The other point is to be observed in respect of the kinds of government, or the different ways in which the constitutions are established.

The best form of government is in a state or kingdom, wherein one is given the power to preside over all; while under him are others having governing powers: and yet a government of this kind is shared by all, both because all are eligible to govern, and because the rulers are chosen by all. For this is the best form of polity, being partly kingdom, since there is one at the head of all; partly aristocracy, in so far as a number of persons are set in authority; partly democracy, i.e., government by the people, in so far as the rulers can be chosen from the people, and the people have the right to choose their rulers." This analysis of the ideal government, it will readily be seen, coincides closely with

the *representative democracy* of the United States. But from this it does not follow that such a type of government would be suitable for all nations. Here, too, circumstances alter cases.

The Reception of Authority

Many types of government have existed in the past and still exist in the present. Since the general authority to rule a state has God as its Author, the question arises: *How* do the rulers of this or that concrete form of government actually *receive* the supreme authority to rule? How does the supreme ruling authority *descend from God* to be a particular ruler? Does God communicate ruling power to governments *directly or indirectly*? The answer naturally has a vital bearing on the relationship between the ruler and those ruled, because it offers a rational basis for the distinction between legitimate government and tyranny.

Three main theories have been advanced in the course of the centuries as an explanation of how the actual rulers receive their supreme authority to rule the political community or state.

One is the theory of the *divine right of kings*. The theory goes back as far as the Byzantine emperors and was based upon a misinterpretation of the teaching of St. Paul regarding the origin of the authority and power of the state as coming from God. St. Chrysostom² pointed out the error of this interpretation, when he stated: "The Apostle does not say, there is no ruler who does not come from God; but,

speaking of the thing itself, he says, there is no power that is not from God.”

The divine right of kings was again defended in the Middle Ages by some court jurists and theologians who were partisans of Philip the Fair and Louis the Bavarian in the historic struggle between the emperors and the popes. The theory became widespread in the era of the Reformation, in consequence of the Protestant principle of *cujus regio ejus religia*. James I of England defended the doctrine most strenuously. It also became prominent again in the Restoration period and was at the bottom of Gallicanism in France, Josephinism in Austria, and Febronianism in Germany.

According to the theory of the divine right of kings, the supreme political power is conferred on the ruler by a special act of God, so that he rules by *divine law*. The ruling power cannot be abolished, nor can it be transferred from him to another, except again by a special act of God; he is, therefore, totally independent of the people he governs.

The second important theory is the theory of *translation or transference*. According to this view, all political authority, at the time the state is formed by the self-organizing members, rests in the *people* as a political body or community. Since all members are free and legally equal, there is no reason by virtue of the natural law, why any particular individual or group of persons should have the supreme power to rule in preference to any other. In order that the power to rule pass from the original self-organizing community to a certain person or group after the formation of the body politic, this power to rule must be *transferred*

by the politically organized community to that person or group. Originally, therefore, the politically organized community is a *non-representative democracy*; it is made into a kingdom or other form of government only through the free act of the people who transfer their supreme political power to the person or group of their choice by an express or tacit decision. Solely in virtue of the natural law, government is essentially immediate democracy as self-government of the people and by the people without representation; all other types of government are the result of human positive law, not natural or divine law. The transference of political power from the people to a particular person or group always implies the consent, the *pact of submission* (*pactum subjectionis*), on the part of the people to the ruler so chosen. In the case of the conquest of a people by a neighboring ruler, the conquered people become members of the state of the conqueror either by willing submission or by acquiescence to his imposed rule; they thereby give their consent.

While St. Thomas Aquinas did not expressly treat this topic, his disciple Aegidius Romanus (c. 1247—1316) elaborated on the doctrine. From this point on most scholastics adopted the transference theory with its 'pact of submission.'

The greatest exponents of the theory are undoubtedly Suarez and Bellarmine. Suarez³ argues as follows: man is by nature free in his acts, and this freedom inheres also in man when he forms a political community; hence, the political community, when first formed, is the master of its own acts, because supreme authority is a necessary

property of the community as a political body. Supreme authority, therefore, is born simultaneously with the birth of the political body and resides in it; the result is an immediate democracy. Since all men are by nature essentially and equally free, no one has the right to be the holder of supreme authority over his equals. If immediate democracy is changed into another form of government, for example a monarchy, it can only be because the people consider the change to be for their benefit, decide in favor of it, and then choose a ruler, either by acclamation or election or in some other manner, whom they are willing to obey in all matters pertaining to the common good. By selecting or accepting a ruler, supreme authority is automatically transferred to him from the people as a political community.

The transference theory held undisputed sway among scholastics until the time of the French Revolution, when many political philosophers, ascribing the horrors of the revolution to the doctrine of 'popular sovereignty,' moved away from the transference theory and adopted the theory of *designation*. These philosophers contended that the bearer of public authority is determined neither by the natural law nor by the consent of the people forming the state, but by the nature of the *historically given circumstances*. The person who, under the given circumstances, is destined to become the ruler may be a person eminently distinguished by talents, wisdom, wealth, esteem, and leadership, so that, at the time the state was formed, as a matter of fact he actually exercised such control over his fellow men as is essentially the same as that

exercised by a sovereign ruler. The acceptance of his political authority by the people, through election or otherwise, would not involve the transfer of ruling power from the people to the ruler their consent would be merely a necessary 'condition,' a *designation* of the ruler who is to hold political office, because the supreme power was never vested in the people as such. Following this 'designation,' God confers upon the person so designated, without any special act on His part, the supreme authority and power to rule the state. To show that free consent of the people is not required, the proponents of this theory refer to the patriarchal regime in primitive times. Originally families of the same tribe or clan lived together as a colony in the same general territory under the direction of their patriarch. Political authority was a demand of the natural law. Under such circumstances, one single person, the patriarch, had the necessary authority; and the colony had the duty, under those circumstances, to recognize him as their political ruler. He was the only one capable of ruling and therefore also the only one who had the right to rule; everyone living in his territory was in conscience bound to obey his rule. No consent or pact on their part was required to make him the ruler, and so no power was transferred by them to him.

Karl L. von Haller (1768—1854), mainly in opposition to the tenets of the French revolutionists, propounded an extreme version of the patriarchal idea. Another extreme version, in which history designates the ruler, was advocated by Joseph M. de Maistre (1754—1821). Among the prominent scholastic philosophers who defended the

‘designation’ theory against the ‘translation’ or ‘transference’ theory were Tongiorgi, Theo. Meyer, V. Gathrein, and M. Gronin. While probably most scholastics of the present time prefer the transference theory, based on the idea of immediate and inherent ‘popular sovereignty’ in the sense of Suarez, the respective merits of the two theories are still a controversial issue.

EVALUATION. THE THEORY OF THE *DIVINE RIGHT OF KINGS* HAS practically no defenders of importance today. If God appoints the ruler and confers the ruling power upon him directly, how are the citizens to know this? Only *divine revelation* could give the people assurance of this fact, as was done in the case of Saul of the Chosen People of Israel. This revelation, however, was an exception. Natural knowledge depends on natural events, and civil society is a natural institution. Divine revelation, as we know from experience and history, is absent in these matters. The theory of the ‘divine right of kings’ is simply a confusion of the natural and the supernatural orders.

The theory of *translation or transference* holds that authority passes from the people to the ruler, through express or tacit consent of the governed in changing from an immediate and non-representative government into a particular form of government. This theory seems more logical and more in accord with the fundamental concept that civil society belongs to the moral order. It stresses the freedom of the will, even in the choice of the form of government and its ruler, and thus makes the citizens

responsible for both, rather than having history and tradition make the decision for man. It is better able to account for the right of the citizens to throw off the yoke of tyranny and establish a new order of government — a right which is universally conceded by all when the cause is just and the change necessary for the public welfare of the citizens.

The *designation* theory emphasizes the fact that civil society is and should be a stable order in its own right; and that it should not be the plaything of the discontented and ambitious members of the citizenry who can whip up the frenzy of the multitude for the overthrow of an existing government, in order to satisfy their lust for power. If the supreme authority of the state resides basically in the people, the door is open to the grossest forms of demagoguery, as can be seen in the Jacobin machinations and excesses of the French Revolution.

While both theories are represented by prominent philosophers and have good arguments in their favor, we believe the *transference theory* is based on firmer philosophical ground. Civil society has as its specific end the attainment of public welfare; and supreme political authority is a necessary means for the attainment of this end. *Per se* and primarily, the political *community* has the right and the duty to seek the attainment of public welfare through the use of the proper and necessary means, and that in virtue of the natural law. Consequently, since supreme political authority is an essential means, which by its very nature is necessary for the attainment of public welfare, the political community must possess supreme

political authority as a right given to it by natural law. This authority, therefore, is a *natural right* of the political community as such. And since a natural right cannot pass from the primary subject to someone else, for example, a king or representative body, without being transferred, the political community must transfer its supreme authority to a secondary subject if it changes into a form of government with a ruler as its authoritative head. Thus, it is the political community which has the primary and natural right to determine the form of government, the constitutional limitation and distribution of governmental power, and the method by which this power shall pass on from one ruler to another. Once the machinery of government has been established and set into motion, the *formal exercise* of governmental power belongs to the representatives of the people, while the community as such retains the *radical* power of government. It will thus be seen that the source of just governmental power lies in the consent of the governed and that the rulers exercise their powers in virtue of a grant derived from the people as a politically organized civil society.

Some authors claim that there is a dangerous similarity between Suarez's theory of the origin of the state's governmental power and the social-contract theory of Hobbes and Rousseau. The resemblance is altogether superficial. The *differences* are essential.

So far as the *pre-state life* is concerned, Hobbes maintained that man was individualistic and anti-social; Rousseau, that man was individualistic and non-social (extra-social). According to Suarez, man is by nature social

and always had the natural destiny to form the state and live in civil society.

So far as *morality* is concerned, Hobbes and Rousseau maintained that a moral system of laws first came into being with the social contract. Suarez, like all scholastics, taught that natural law was in full force at all times among men, even before the state came into existence.

So far as *political authority* is concerned, Hobbes maintained that, once the social contract was made, the ruler had absolute power; Rousseau, that the people retained full authority, and the ruler became merely the magistrate of the people. Suarez taught that political authority in general comes from God, is vested primarily in the political community, and then is transferred from the community to the ruler, so that the ruler is neither vested with absolute power nor is he a mere magistrate; he is a true ruler with governing power, but this power is limited by natural law and by the will of the people.

So far as the *nature of the state* is concerned, both Hobbes and Rousseau maintained that it is an artificial institution, arbitrarily established by man as a matter of expediency. Suarez, together with all scholastics, taught that the establishment of the state was a moral necessity based upon the natural aptitude, propensity, and need of man's rational being; the state, therefore, is a natural institution, a demand of the natural law and as such intended by God.

The one point in which the theories of Suarez, Hobbes, and Rousseau agree is the *contract* or *pact*. In as much as Suarez lived before Hobbes and Rousseau, it is probable

that Hobbes and Rousseau copied the idea from Suarez and promptly proceeded to adulterate it almost beyond recognition.

Extent and Limitation of Power

It should be almost self-evident that governmental power is neither arbitrary nor unlimited. The intrinsic purpose of this power is the attainment of public welfare as the proper end of the state and of the people comprising the state as a civil society. 'Public welfare' determines both the extent and limitation of governmental power.

The state consists of persons, some governing and others governed. All persons without exception are subject in all things to the *divine* and *natural* law. The state, therefore, as an organized community of persons, is also subject in all things to the divine and natural law, and this constitutes a limitation of its power.

The state can issue a *command* to its subjects only in matters which are morally good or indifferent. It can *forbid* whatever is morally evil or indifferent; and also at times what is morally good in itself, but only when the subjects are not bound in conscience to perform this good, as happens, for example, when the state orders all schools and churches temporarily closed in the time of a serious epidemic. It can *permit* or *tolerate* a morally evil situation if this negative attitude is necessary in order to avoid more serious evils; thus, for instance, it may be in the public interest to concentrate houses of ill fame in a definite

district rather than have them operate clandestinely throughout a city.

The state possesses all rights and duties, and only those, which are pertinent to the attainment of its proper end, namely, *public welfare*. Hence, the state has no authority over the *purely internal acts* of the citizens. Such acts have a 'private,' not a 'public,' character. Since the proper end of the state is the 'common' good or 'public welfare' internal acts are outside the competence of civil authority. However, the state may have indirect jurisdiction over certain internal acts which are necessary for the proper performance of those external acts belonging to the jurisdiction of civil authority and over which it has the power of command. Thus, for instance, although loyalty is an internal act, the government may order so-called 'loyalty tests' for all persons engaged in important government work, especially in times of national emergency. It is well to note, too, that an act is not 'purely internal' when it manifests itself in some external manner. For example, law enforcement agencies need not wait until a crime is actually committed, but may act in behalf of public welfare whenever the preparations plainly indicate that the persons involved have the definite intention of committing the crime. Ordinarily, though, only *external acts* fall under the jurisdiction of public authority.

Furthermore, as a general rule the civil authorities have no right to demand of the citizens *morally impossible* acts — acts beyond the average capability of the subjects. This follows from the principle that it is the purpose and aim of the state's laws and authority to work for the welfare of its

citizens, and this welfare must be gauged according to the capability of the average citizen; otherwise the demands of the state would harm, not further, public welfare. On the other hand, public welfare may at times demand extraordinary efforts and sacrifices on the part of the citizens. During war, for instance, when the very existence of the state is in danger, the state has the right, because of the primary law of self-preservation, to demand greater sacrifices, even the risk of life itself, in the interests of the civil community as a whole.

The *protection of civilian rights* is one of the first and foremost duties of the state. The state, therefore, also has the right to use all reasonable measures to ward off unjust attacks upon the life, the bodily integrity, the health, the liberty, the honor, the morals, the security, and the property of its citizens, so as to insure peace and prosperity. Such rights pertain to the individuals, to the families, and to all other morally good or indifferent associations, secular and religious, found among the citizens. Not only has the state no authority to suppress these rights; it has the duty to protect them against all undue interference on the part of others.

Since it is the proper end of the state to seek the welfare of the citizens, it is one of the main tasks of the state to support and foster the *temporal welfare* of the citizens. It is precisely because of their lack of self-sufficiency that families and individuals combine to form the state. The state should *not be paternalistic*, as if the state had the duty to supply everything for everybody; that is not the purpose of the state. Individuals and families retain their identity in the

state and have the natural duty to satisfy their needs through 'self-activity.' Hence, the state merely has the duty, and the right, to assist them in their private endeavors to fulfill the purpose of their existence. Only in the case where entire classes or sections of the people are incapable of obtaining the necessary means to satisfy their fundamental needs should the state step in and assist them through special measures to work out their own welfare. *Social legislation* for the sick, the disabled, the aged, the unemployed, the mentally defective, and the victims of disaster, lies within the province of governmental activity, whenever these persons cannot otherwise be cared for in an adequate manner. Generally speaking, however, it is better that the citizens provide for such persons through voluntary charitable associations, if possible and feasible; but if such measures are inadequate, the state should provide for these unfortunate members of society through public assistance. The general principle which should guide the government in such matters is this: the citizens, both individuals and families, have the first duty and right to provide for their needs; only if they neglect their duty or are incapable of carrying it out, should the government, in the interests of public welfare, assist the needy in leading a life consonant with the essential dignity of man. 'Public welfare' embraces a rather wide field. Even when it seems that a certain activity involves only the welfare of an individual in his 'private' interests, the implications may have a decided bearing on the welfare of the community as a whole, and the state may act. Thus, it lies within the competence of the state to regulate trade, enact pure food

laws, control the pollution of water, forbid the sale of injurious articles, ban immoral shows, prohibit quackery in medicine, clear slums, install proper methods of sanitation on streets and in public places, insist on adequate protection against fire hazards, and a thousand similar things which pertain to the general welfare of the public.

In many instances it may appear that such actions of the state constitute an infringement of *personal liberty*. They do. But it must be borne in mind that personal liberty is not absolute. Whoever lives in civil society must co-operate for the 'common good,' of which his personal liberty is an integral part, and so he may be obligated to curtail the *exercise* of his personal liberty in order to bring it into harmony with public welfare.

Legislative Power

Governmental power is one and indivisible. Nevertheless, depending on the different objects that lie within its competence, the power of the government is exercised in three distinct spheres of activities or *functions*. After the lead of Montesquieu (1689—1755), three separate functions in the internal affairs of the state are customarily distinguished: the legislative, the executive, and the judicial.

The *legislative* power of government is the right to enact laws which are norms of action for the citizens. These norms regulate the conduct of the various citizens and groups in their relation to each other and to the community as a whole. These laws, considered in and for themselves in

general, *obligate in conscience*. To obligate in conscience, however, these positive laws must have their foundation in the natural law, either as deductions from the natural law or as specifications and determinations of the natural law.

Many writers on jurisprudence contend that the laws of the state have no moral character and are based solely on the ability of the state to enforce observance by physical power. Moral obedience and obligation in conscience lie entirely outside the purview of the law. Such, for example, is the theory of the *legal positivists*, prominent among whom in the United States was the former Associate Justice Oliver Wendell Holmes.

In opposition to legal positivism, we maintain that the government has the power to enact laws which *bind in conscience*.

The proper end of the state and of governmental power is public welfare. Consequently, the government must possess the means necessary to attain this end. The government, however, cannot attain this end *permanently and efficaciously* in dealing with free human beings except through the medium of laws which contain fixed norms of conduct binding in conscience.

If the laws were not binding in conscience, they would be mere *counsels or directives*. No one, however, is constrained to follow a counsel or directive. If a law would cause inconvenience (and what law does not?), a person could evade the law, whenever possible, through whatever means he could find, even by bribery, subterfuge, and deceit. That such a general attitude is not conducive to public welfare is obvious; it would put a premium on the

evasion and violation of the law. Mere police power will never suffice to compel obedience to the law, if the citizens are not bound in conscience to observe the law and do it willingly.

The state, as we have shown, rests on the *natural law*, and the natural law binds in conscience. Now, legislative action is one of the necessary functions of government, for without it the government cannot attain public welfare. Hence, the government, in virtue of the natural law, has the right to enact laws for public welfare, and the citizens are in conscience bound to observe these laws, provided the laws are in accord with the natural law. Obedience through mere physical force is a slave's obedience and unworthy of man as a rational, free being. As a moral institution, the state has the right to impose moral obligations.

Executive Power

The *executive* power of the government is the competence of the government to establish and maintain the agencies necessary to carry out the laws. The government, therefore, has the power to promulgate its laws, to supervise and compel their observance, to establish law-enforcement agencies, to organize and maintain an army, to levy taxes with which to pay the expenses of government and carry out social legislation, and in general to do everything necessary to insure the peace and prosperity of its citizens.

Since civil society is intended to be a stable and permanent union of citizens co-operating for the common good, many of the governmental functions will be

standardized and *permanent* in character. The fundamental framework of laws and governmental functions, therefore, will remain relatively the same throughout the existence of the state. Still, civil society is a dynamic, not a static, reality. Consequently, the executive power must be flexible enough to take care of all the situations as they arise.

On certain occasions *emergency measures* are required. Many conditions are exceptional but urgent. The citizens may suddenly be confronted by misery and disaster, due to floods, fires, earthquakes, wars, and similar calamities. The ordinary executive powers of the government are insufficient to cope with such conditions, yet the public welfare demands remedial measures for the benefit of this portion of the citizenry. Since the people themselves are incapable of providing for their needs, the government has the duty to protect life and public security to whatever extent is necessary and expedient. Hence, the government is endowed with *emergency powers* to meet such situations, and the citizens have the duty to submit to the regulations and measures imposed on them. In times of national danger or war, for instance, the government has the right to mobilize industry and to induct all able-bodied men into the military service for the defense of the country and to prosecute the war to a successful conclusion.

Judicial Power

The *judicial* power of the government is its competence to restore the legal order when disturbed. This order is disturbed when citizens enter into litigation among

themselves concerning some right, or when one citizen violates the right of another. For the sake of public peace and security, it is the duty of the state to restore the legal order in both kinds of disturbances. The judicial power thus has a double function. It exercises the function of *civil justice* when it gives definitive decisions in litigations, and the function of *criminal justice* when it inflicts punishment on the violators of rights.

The *juridical settlement of disputes* regarding the existence or non-existence of civilian rights is a moral necessity in every community. Such disputes are bound to occur, due to the clash of interests which are unavoidably present in the social and economic activities of a multitude of people. These disputes require definitive legal decisions in a court of law to preserve peace and security among the contenders and the citizens at large. Hence, the government has not only the right, but also the duty, to set up an effective judiciary for the settlement of disputes. The citizens have the right to appear before the judge and present their case, and they have the duty to abide by the ultimate decision of the court.

Similarly, the judiciary has the right and duty to *impose penalties* upon the transgressors of the law and the violators of other people's rights. All laws must have sanctions, or the laws will be inefficacious. Too many persons are selfish and inclined to violate other people's rights if they can do so with impunity. Mere threats of punishment are inadequate to make evildoers observe the law. The government must be able to apply appropriate sanctions, or it cannot uphold the legal order and fulfill its

proper end, the public welfare of the community. The threat of punishment has the purpose of deterring criminally minded persons from disturbing the legal order; and if the legal order has been violated through the commission of a crime, the criminal must suffer the penalty and the legal order must be restored.

Practically all governments have laws which demand the infliction of *capital punishment* on persons guilty of very serious crimes, particularly premeditated murder and treason. Such crimes are so heinous in themselves and represent so grievous a violation of the common good, that the state is justified in imposing the death penalty on the criminals. Again it must be borne in mind that it is the duty of the government to uphold the legal order with every means at its disposal and to restore this order whenever violated, and capital punishment effectively restores the balance of justice. A person who commits treason murders his country, so far as lies in his power, and he also forfeits his life thereby. It is no valid objection to say that no one has the right to take another's life except in self-defense against unjust aggression. This moral principle does not apply to the state, because the state participates in the *supreme authority of God*, and God certainly has the right to take a person's life when necessary for the preservation of the moral order. After all, the infliction of capital punishment is only a physical evil, less grave by far than the moral evil committed voluntarily by the culprits in question; and those condemned to death can use the opportunity to accept death in expiation for their crime and thereby attain their

eternal salvation. Only those who deny immortality can see in capital punishment an evil beyond comparison.

Murder and treason, of course, are not the only crimes which may merit death. Much depends on circumstances. Any serious crime which is a grave threat against public welfare may, if necessary, be declared punishable by death. Thus, looting and rape in time of war or in a period of great disaster, when the law-enforcement machinery of the state is practically ineffectual, are usually punished by summary execution. Almost any kind of grave criminal act may be punishable by death if the circumstances are such that it threatens to dissolve the very social fabric of civic life. The principle which must guide the government in these matters is: *Salus populi suprema lex*, "The welfare of the people is the supreme law."

THERE HAS BEEN A CONSIDERABLE CHANGE OF *ATTITUDE TOWARD crime* in the course of history.

Retribution or vengeance was the dominant note in the old Talic law. The principle which governed the treatment of criminals was that of 'an eye for an eye and a tooth for a tooth.' Christianity with its precept of charity modified this extreme attitude.

Repression of crime through most severe punishments was a common attitude in the latter period of the Middle Ages. Judges passed arbitrary sentences, and extreme punishment was often meted out for comparatively minor criminal acts.

The *classical theory* of penology, inaugurated by the Marquis of Beccaria (1735—1794), advocated that the punishment should fit the crime according to the criminal's personal responsibility, that the penalty should be fixed by statute and not be left to the discretion of the judge, and that a speedy trial and sentence would do more to deter criminals than harsh measures.

The *neoclassical theory*, while following Beccaria in his general tenets, advocated fixed punishment as a common policy, but maintained that courts and judges be allowed greater latitude in interpreting the individual's responsibility. It is clear, for example, that sometimes criminal acts are performed by persons who are not morally responsible, as in the case of the insane; no punishment should be meted out to them, but they should be institutionalized in hospitals for the criminally insane. Again, sometimes crimes are committed with limited responsibility because of a partial hindrance of the full exercise of free will, as in the case of a child, of a person under the influence of alcohol or drugs, of a person swayed by strong emotion; in such instances, the punishment should be reduced or the sentence suspended.

The *positivist school of Cesare Lombroso* (1836—1909) is materialistic in concept. The actions of man are determined in every respect by heredity and environment, and the criminal is simply a psychopathic individual who is not responsible for the crime he commits. Lombroso maintained that there exists a definite 'criminal class' and a definite 'criminal type' with distinctive physical features. Crime should be punished as a matter of necessary self-

protection on the part of society; but punishment should fit the criminal, not the crime. Lombroso's theory of the criminal class and the criminal type has been conclusively disproved, particularly by Charles Goring (1870—1919), an English physician. It is now generally conceded by scientists that certain dispositions can be inherited, but not crime or a criminal tendency strictly as such.

The *reform theory*, as advocated by J. Bentham and many modern penologists, defends the view that the sole purpose of the government's power of punishment is the correction, reform, and rehabilitation of the criminal.

Without question, criminal justice must be *human* justice. Criminal justice is necessarily based on the freedom of the will. To punish a person for a deed which he could not avoid performing is the height of folly. On the basis of positivism there should be no judicial or punitive power in the state. Granted the freedom of the will with its consequent responsibility, the judicial power of the state, to be just and human, must take the condition of the criminal and the circumstances of the crime into consideration, so that the punishment will fit both the *criminal* and the *crime*.

In all matters pertaining to the judicial function, its *primary* purpose is identical with the proper end of the state as such, namely, the 'public welfare' through the maintenance of the legal order, so as to insure peace and security for the common good of the community. Its *secondary* purpose is the 'private welfare' of the individuals and families, in as much as they comprise the community and are integral members of the body politic. Hence, the correction, reform, and rehabilitation of criminals is neither

the sole nor the primary purpose of the judicial function of government. However, once the primary purpose of the state, namely, the preservation and restoration of the legal order in the interests of the public welfare, is fulfilled, the state should give due attention to the correction, reform, and rehabilitation of criminals as the secondary purpose of its judicial function. By tempering justice with mercy in this way, criminal justice becomes truly 'human' justice.

The state should have *four objectives* in punishing criminal conduct. First, punishment should always be in the nature of *retribution*. It is the duty of the state to maintain law and order for the sake of public welfare; it must, therefore, demand expiation on the part of the criminal, in order to restore the disturbed legal order and prevent further injury to the citizens. Second, punishment should act as a powerful *deterrent*. The good and the bad citizens should be made to realize that 'crime does not pay.' The offenders should be deterred from violating the laws again, and potential criminals should be deterred from committing a first offense. Third, punishment should assist in the *prevention* of crime. It does this in the case of hardened criminals by isolating them from the law-abiding citizens and preventing them from infecting the minds and morals of the weaker members of society. Fourth, punishment should be an indirect means, together with direct means, of *reform* for the criminal. A criminal always remains a human person. Punishment is never an end in itself. The restoration of the violated legal order having been accomplished, every effort should be made to turn the criminal away from the path of evil and help him become a

law-abiding, useful citizen again, particularly in those instances where the criminal, after serving his time, must be released and return to society. The state would render poor service both to society and to the offender, if it did not do everything in its power to strengthen the legal order by reforming the criminal and thereby preventing further depredations on society and repeated incarcerations of the criminal. What special measures should be applied to accomplish this purpose will depend on the financial, educational, cultural, and religious facilities at the disposal of the government.

The State and Morality

A distinction must be made between 'private' and 'public' morality. *Private* morality pertains to the life of the citizens in so far as they are private individuals. *Public* morality pertains to the community life of the citizens in so far as they are members of civil society. Morality in both forms will be either 'natural' or 'supernatural,' depending on whether it is restricted to the observance of the natural moral law or includes also the precepts of positive divine revelation.

The *principle* which must govern the relations between the state and morality is the principle which gives existence to the state and its supreme authority, namely, the preservation and promotion of public welfare. Whatever affects public welfare favorably or unfavorably falls in some manner under the jurisdiction of the state.

According to this principle, *private morality* lies *outside* the jurisdiction of governmental power. The government

has no control over supernatural morality, because the state belongs exclusively to the temporal and natural order, while supernatural morality is achieved through supernatural means. Moreover the government has no control over private natural morality, so long as it is strictly private and does not affect public welfare. Private morality is an affair of the individual and the family, not of the state. Indirectly, the state is concerned with private morality, in so far, namely, as private morality is the foundation for public morality. The state, therefore, should promote private morality by using every legitimate means to safeguard public morality.

Public welfare is definitely a moral issue and is based to a very large extent upon sound moral life in the community. The foundations of government rest on the natural law, and public welfare as the proper end of government is a dictate of the natural law. Morality, too, both private and public, is the outcome of the precepts embodied in the natural law. Public morality is nothing else, if we leave supernatural religion aside for the time being, but community life lived in conformity with the norms of the natural law. Hence, public morality is an integral part of public welfare. As such it falls *within* the jurisdiction of the state, and the government has the solemn duty to preserve and promote public morality as the cornerstone of temporal felicity. Negatively, the government fulfills its duty if it curbs and suppresses vice wherever it appears in public. Community morality naturally embraces a rather wide field, including the press, the radio, amusement centers, public addresses and gatherings, and every form of life in the open. Positively, the

government should assist every movement that tends to improve virtuous living among the people, implement the demands of morality with appropriate legislation, and appoint only men of solid character to administer the internal and external affairs of the nations. A moral nation is a happy nation.

The State and Religion

The state, as a civil society consisting of human beings, cannot avoid taking a definite stand with respect to religion. Due to the prevalence of secularism, the view is frequently expressed that religion is a 'private matter' of the citizen and no affair of the state. The state, modern liberalists assert, should hold itself aloof in the entire question of religion, both natural and supernatural.

The problem revolves around the *fact* of the existence of a natural or supernatural religion. If God exists, natural religion exists; and if God revealed Himself, supernatural religion exists. God exists; so much at least is proved by theodicy, and in ethics the existence of God is assumed as a postulate. As a consequence, the necessity of at least natural religion, based on the existence of God, must be taken for granted, so far as the individual human beings are concerned. Then what must be the attitude of the state with respect to *natural religion*? Can it remain indifferent?

Beyond reasonable doubt, the state, as a state, has the duty to *practice* and *promote* religion, and that publicly. This duty is incumbent on the state from the standpoint of God, of its own welfare, and of the welfare of its citizens.

First, from the standpoint of *God*. The individuals and the families owe their very existence ultimately to God, and for that reason they owe Him reverence, adoration, and obedience. Natural religion is thus a mandate of the natural law. The state is not an entity over and above the individuals and families who constitute it, as if it were a thing apart and independent of them. The individuals and families are the state. They form the state because of an inescapable aptitude, propensity, and need of their rational nature, and this nature they have received from God. Hence, the state receives its existence as a mandate of the natural law and therefore ultimately from God. In as much as the state obtains its supreme authority and power from God through the people, the state, like the individuals and families from whom it springs, must acknowledge God as its Supreme Author and, as a consequence, also show Him reverence, adoration, and obedience. But therein consists the essence of natural religion. Hence, the state has the duty, as a state, to practice and promote natural religion. And since the state is essentially a public body, it has the duty, as a state, to acknowledge God as its Supreme Author by public acts of reverence, adoration, and obedience.

Second, from the standpoint of *its own welfare*. Religion is the indispensable basis of the state. The state could not exist without justice, truthfulness, fidelity, loyalty, honest administration, and willing obedience to its authority on the part of the citizens. If the state does not base these essentials on the conscience and the religious motives of the people, it must base it on expediency and physical force; but no state can long exist on such a shifting foundation.

Without the sanctity and inviolability of the oath, there can be no honesty in the administration of public officials, in the dispensation of justice in the courts, and in the loyalty of the armed forces in times of crisis. Religion, therefore, is a necessity for those who govern and for those who are governed.

Third, from the standpoint of the *welfare of the citizens*. It is the purpose of the state to protect and promote the welfare of the people by supplying the means necessary for their temporal felicity. Temporal felicity, however, is impossible unless ordered toward the ultimate end of man, and that is his eternal beatitude in the possession of God as the Supreme Good. Religion, of which the observance of the moral order is an integral part, is necessary for the attainment of man's ultimate end. Religion, therefore, is necessary for the true temporal felicity of the people. Consequently, the state has the duty to protect and promote religion among the people. A good life is worth more than a full pocket. If it is the duty of the state to provide for the economic prosperity of the people, so far as it can, it is all the more the duty of the state to provide for the religious life of the people, so far as it can. Not only must it ward off all attacks against religion; it must do all in its power to facilitate the practice of religion as one of the most potent means of attaining the true welfare of its citizens.

Indifferentism is thus seen to be contrary to the proper end of the state and must be condemned.

The State and the Church

What should be the attitude of the state toward *revealed* religion? The only revealed religion which can come into consideration here is the Christian religion, or the *Christian Church*, based on the personality and teachings of Jesus Christ. Just as there is but one Redeemer and one God, there can be but one true Christian Church, no matter how much people may differ in their personal convictions as to which of the many denominations is the true Church founded by Christ. Which of these is the true Church is an historical question, not a question of ethics. In order to simplify matters, we will suppose that the people of a state belong to the true Church, so that they are members of the same state and the true Church at the same time. In that case, what should be the *relation between state and Church*?

The Church is an organization or society which possesses within itself all the means necessary for the spiritual salvation of its members, just as the state possesses all the means necessary for the public welfare of its citizens. Both Church and state are thus 'perfect' and 'self-sufficient' societies, each in its own particular sphere. Due to the differences of their respective proper ends, each is 'independent' of the other, in the sense that the proper end of the one is not per se a means to the end of the other. However, since the same individuals and families are members of the Church and the state, it is evident that there are many points of contact between them. What relationship, then, should exist between these two perfect and self-sufficient societies? Modern *liberalism* contends

that there should be complete separation of Church and state.

We contend that *separation* of Church and state, *in principle*, must be *rejected*.

Under the supposition mentioned above, the same individuals and families belong as members to the same state and the same Church. Both societies, though perfect, self-sufficient, and independent, are concerned with the welfare of the same people, the state with their temporal welfare and the Church with their eternal welfare. Both, therefore are willed and intended by God for the welfare of the people. Since the temporal and eternal welfare are so closely interwoven, and since state and Church are visible societies composed of the same subjects, it is evident that God, who is a God of order and the Author of both, must intend that they live and work together in *union and harmony* for the benefit of their *common subjects*. Hence, separation of Church and state, in principle, cannot be the intention of God.

The *ideal* situation, therefore, would undoubtedly exist when the nation as a whole has the same true faith, so that state and Church work hand in hand in perfect union for the material and spiritual welfare of the nation.

Unfortunately, this ideal situation does not obtain in many nations. Individuals and families profess different faiths and belong to different denominations. Each denomination considers itself to be the true Christian Church. On practical grounds, therefore, separation of Church and state will often be the lesser of two evils. The division of Christianity into denominations is deep and

abiding. A unification, humanly speaking, is a moral impossibility. Under such conditions *civil tolerance* of all denominations, with no preferential status for any, will be the best solution of the problem for a particular nation. All have equal rights before the law, and it is the duty of the state to protect these rights against infringement from any side. *Liberty of conscience* is a basic right of each individual, because conscience is the final subjective norm of action for every human being, and the state must respect the right of each individual to live according to the dictates of his conscience. When unity of faith is impossible, the state may, and under circumstances should, decree separation of Church and state for the sake of peace and harmony among the citizens as members of the commonwealth. Such, for example, was the situation which prevailed at the time of the formation of the United States. Not irreligion or indifference, but respect for the sincere convictions of the many dissenting citizens within the nation induced the framers of the constitution to prohibit the establishment of a 'state religion.'

In *principle*, therefore, the harmonious union of state and Church is the ideal situation for a nation; *in practice*, however, the separation of state and Church may, in particular instances, be advisable and even morally necessary.

The State and Education

In the chapter on the family (Chap. 19) it was established that *parents* have the primary and immediate right and

duty to educate their children, in virtue of the natural-law relation which exists between parents and children. Individuals and families, with their respective rights and duties, existed prior to the state, and they formed the state in order to obtain the necessary assistance from civil society to fulfill their proper end. The basic rights of individuals and families are conferred on them by natural law and, through the natural law, by God; the state did not confer these rights on them at any time. The state has the duty to protect these rights and to assist them in fulfilling the duties implied in these natural-law rights. Upon entering the political organization of the state, the right and duty of parental education of the children is neither forfeited nor absorbed by the state. The family is a society *sui juris* and remains such at all times, even when it becomes an organic unit of the state.

Government, therefore, has *no immediate jurisdiction over education*. Its function is to render assistance to the parents, so they are able to carry out properly their mission as the educators of their children.

Indirectly, however, the government has certain *rights* with respect to education. Since the proper end of the state is the public welfare of all citizens and since the education of the children is a matter of public welfare, the government has the right and duty to see to it that parents fulfill their obligation in this regard. The children have the natural right to a proper education. Hence, if parents seriously neglect the duty of educating their children, so that it is justly feared that the children of such parents will later on become a danger to the public welfare, the state

must intervene and force the parents to carry out their parental obligations; and if the parents still neglect to provide an adequate education, the government has the right, as a last resort, to commit such children to a proper educational institution. The children do not lose their natural right to a proper education because of the serious neglect of their parents.

In countries with a relatively high cultural standard the average family is incompetent to supply an education adequate to meet this standard. A part of the educational duty of the parents is turned over to the *school* as an auxiliary of the family. Since the state should support the family in all projects which affect the common good, it should *assist* in erecting, maintaining, and staffing such schools, whenever the efforts of the families or the community prove inadequate. The state, however, is no more a substitute for the family than the teachers' authority is a substitute for parental authority; education still is, and must remain, the primary concern and duty of the parents. Hence, even when the community or the government erects and maintains schools with public monies, the parents have the primary right of deciding what kind of educational program and what type of teachers their children shall have. In this respect, *parent-teachers associations* are a forward step in the solution of this problem.

The state has certain definite *rights* which stem from its obligation to procure and secure the common good of the citizens. Knowledge of the *elementary* subjects is a practical requirement for intelligent citizenship. For this reason the state may demand that parents see to it that all children

receive instruction in reading, writing, and kindred subjects. Parents may impart this knowledge to their children by means of private tutoring, if they so desire; or they may commit this instruction to the teachers in the schools. If the parents neglect to discharge their duty in this regard, the state may force them *by law*, in the interests of the common good, so send the children to a school where they can obtain the requisite knowledge. Similarly, the state has the natural right to exclude teachers and subjects from the schools if they are *subversive* of good morals or loyal citizenship.

State monopoly of schools is fundamentally *wrong*. It is a violation of the basic rights of parents to deprive them of schools of their choice, so that their children do not receive the type of education which they, in the considered judgment of their conscience, deem to be suitable or necessary for the intellectual and moral well-being of their offspring. Such a monopoly is contrary to *natural law* and therefore to the law of *God*. The state is bound by the natural law just as the parents are, because both domestic and civil society have their origin and authority from the natural law.

The persons occupying positions in governmental agencies are imperfect human beings. State monopoly of education, for this reason, is bound to have a *detrimental effect* on public welfare. The bureaucratic control of the schools stifles educational freedom and private initiative in the progress of education; introduces the corrosive influence of politics into the schools by placing them in the hands of partisan officeholders and job seekers; gives

centralized direction to the educational system of the whole country, enabling the heads of the department to dictate policies and apply pet theories in every phase of school life; fosters state absolutism; and leads to oppression of conscience and tyranny of intellect. *State socialism* is the almost inevitable outcome of a state monopoly of education.

The State and Intervention

In order to realize the common good effectively, the citizens owe *legal* justice to the state, and the state owes *distributive* justice to the citizens.

Every individual, family, and association or group existing in the commonwealth must contribute its share to the common good of all. This is a duty imposed by natural law. On the other hand, every individual, family, and association or group has the right to share in the benefits of the common good. This right is also derived from the natural law. The state has the right to expect and demand a proportionate contribution to the common good by all these physical and moral persons, because they are members of the commonwealth. But it also has the duty to see to it that they *can* make such a proportionate contribution, in order that they may share in the benefits of the common good; for the state, in virtue of the natural law, must provide for the welfare of all its members. Hence, if the social and economic order is so disturbed and disrupted that certain groups and classes of the people cannot make an adequate contribution to the common good and in consequence do not receive an adequate share of the benefits of the

common good, then the state has the right, and also the corresponding duty, to *intervene* and restore the order of social justice by means of appropriate *social legislation*.

The conflicting interests of capital and labor, of agriculture and industry, of vast corporations and small business, often bring on conditions of acute social distress which constitute a grave violation of the common good. Then the state must intervene through legislation, so as to re-establish the proper social order and restore social justice, in favor of the oppressed.

In order to avoid undue interference with the freedom and self-activity of the citizens, certain *conditions* must be present before the state can rightly intervene. *First*, the injury to the common good must affect the essential rights and interests of the whole community or at least of one of its important groups. *Second*, the injury to the common good must be present or be imminent. *Third*, the situation must be such that it cannot be adequately met through self-help or the cooperative effort of other groups. *Fourth*, the intervention of the state may reach only so far as is necessary to meet the emergency, to restore the disrupted social order, and to remove the existing or imminent injury to the common good.

These conditions are required in order that the intervention of the state may not deteriorate into the benevolent tyranny of a busy-bodying bureaucratic *paternalism*. Paternalism, which seeks to give everything to everybody so as to keep everybody satisfied and happy, is a kind of *despotism* with a tendency to reduce all citizens to the status of helpless children. Man wants to retain his

freedom of initiative, not be a ward of the state; if he must be helped by the state, he prefers to be helped only to the extent necessary to enable him to help himself.

State intervention presupposes that it be a remedy for an adverse situation caused by a maladjustment of social factors among the citizenry. If the government itself is to blame for injustices which disrupt the social order permanently, the people frequently turn against the government, and the result is revolution.

The Right to Resist Tyranny

A *tyrant* is a person who usurps governmental power unlawfully and unjustly or who uses lawful governmental power oppressively and unjustly. A person, therefore, who overthrows the legitimate government through internal sedition and unlawfully and unjustly wrests unto himself the supreme ruling authority and power of the state is a 'tyrant.' Similarly, a person who invades and conquers a country unlawfully and unjustly, and then proceeds to assume the supreme rule over the subjugated people, is a 'tyrant.' Finally, a legitimate and legal ruler who exercises his lawful governmental power oppressively and unjustly, contrary to the common good of his people, is also a 'tyrant.'

When *sedition or conquest* is unjust and unlawful, the people have the natural right to oppose the new government as tyranny and, if possible, overthrow it. What is unjust and wrong in its very cause does not become just and right through the success of the undertaking. An unjust

revolution may be nullified by a counter revolution, and an unjust conquest by reconquest. The people need not acquiesce in the unjustly imposed rule; they have the right to use the force of arms to regain their freedom. Unjust sedition or conquest are cases of *unjust aggression* against a nation, and the unjust aggressor may be repulsed by force, so long as the people do not voluntarily, either expressly or tacitly, make the 'pact of subjection' to the new ruler. That the aggression was perpetrated against a 'moral' person rather than a 'physical' person is a minor point and does not change the essence of the situation. There is no real problem here.

A real moral problem is involved in the question whether the people have the *right to resist their own government* when the latter abuses legitimate power by tyrannous oppression, either by disregarding the existing just laws or the provisions of the constitution, or by enacting unjust and oppressive laws which are harmful to the people.

Obviously, a *distinction* must be made. A few isolated unjust and oppressive *acts* do not make the ruler or administration guilty of 'tyranny' in the full sense of the term. The oppression must be prolonged and more or less general before one can speak of 'tyranny' and 'despotism'; hence, the ruler or administration will be guilty of tyranny if their *governmental policy* is oppressive and unjust. When the problem of 'tyranny' is posed, relative to the people's lawful right of resistance to their legitimate government, the distinction between a 'tyrannous act' and a 'tyrannous policy' must be carefully noted and borne in mind.

The problem, then, boils down to this: When are *laws*, as a policy of government, *just or unjust*? St. Thomas⁴ answers the question very lucidly. “Laws framed by man,” he says, “are either just or unjust. If they be just, they have the power of binding in conscience, from the eternal law whence they are derived. . . . Now laws are said to be just, both from their end, when, to wit, they are ordained to the common good, — and from the *author*, that is to say, when the law that is made does not exceed the power of the lawgiver, — and from their *form*, when, to wit, burdens are laid on the subjects, according to an equality of proportion and with a view to the common good. For, since one man is a part of the community, each man, in all that he is and has, belongs to the community; just as a part, in all that it is, belongs to the whole; wherefore nature inflicts a loss on the part, in order to save the whole: so that, on this account, such laws as these, which impose proportionate burdens, are just and binding in conscience, and are legal laws.

“On the other hand, laws may be unjust in two ways: first, by being contrary to *human good*, through being opposed to the things mentioned above: — either in respect of the end, as when an authority imposes on his subjects burdensome laws, conducive, not to the common good, but rather to his own cupidity or vainglory; — or in respect of the author, as when a man makes a law that goes beyond the power committed to him; — or in respect of the form, as when burdens are imposed unequally on the community, although with a view to the common good. *The like are acts of violence rather than laws...* Wherefore such laws do not bind in conscience, except perhaps in order to avoid

scandal or disturbance, for which cause a man should even yield his right.

“Secondly, laws may be unjust through being opposed to the *divine goods*; such are the laws of tyrants inducing to idolatry, or to anything else contrary to the divine law: and laws of this kind must nowise be observed, because, as stated in Acts V. 29, ‘we ought to obey God rather than man.’⁵

In these words St. Thomas sets the *criteria* according to which laws are to be adjudged just or unjust. Furthermore, he lays down the *general principle*: Just laws bind in conscience and must be obeyed; unjust laws, since they are ‘acts of violence’ and tyrannous, do not bind in conscience and need not be obeyed. But if they need not be obeyed, the people have the *moral right to resist*. And that is logical. When laws are unjust, they are not according to reason and the natural law; they are a perversion of the legal and moral order. The sole reason why a government exists at all is the *will of the people* who have established it for the attainment of the common good; and unjust laws are always, in some form or other, contrary to the common good and as such tyrannous. *Resistance* to tyranny and unjust laws is but the civil community’s defense against unjust aggression on the part of the government against the people.

Acts and laws of the governing authority, if directed against the *divine* good, are also against the common good and must never be obeyed, because they constitute a violation of conscience. Every God-fearing citizen must resist such tyrannous acts and laws with at least a passive

resistance, namely, by simple nonconformity to the demands of the government.

Is *active resistance* morally permissible? 'Active resistance' is opposition to the government by *force* or by some other *positive means*, with a view to changing the unjust and oppressive situation. Everything in this problem depends on the common good.' The 'common good' is not only the measure of the government's justice and injustice; it is also the measure of the people's resistance. If the government's injustice and tyranny is deep-seated, general, and persistent, the citizens have the right and the duty, on the basis of self-protection, to offer active resistance in some form. In most modern states, the constitution provides the means for seeking redress. As a rule, it is possible for the citizens to remove the ruling administration through election or impeachment or other legal measures. It is seldom necessary to remove the existing government through revolution. However, if the existing government refuses to let the provisions of the constitution operate, so that it remains in power through force and illegal means, the citizens have the right, as a last resort, to overthrow the government through *revolution*, if necessary. Revolution under such extreme circumstances would not be sedition; the tyrannical government is itself in a state of rebellion against the body politic and deserves to be ousted. Still, the citizens should never resort to rebellion until all legal and constitutional means have been exhausted and the situation is truly intolerable; otherwise the remedy would be worse than the disease.

According to Hobbes, the ruler is the source of all laws and civil rights; he is therefore above the law and not subject to the political order. According to Rousseau, the people retain full authority at all times, and the ruler is merely the magistrate of the people executing their will; he can therefore be deposed at any time by the people through revolution. We contend that both the rulers and the citizens, as integral parts of the state, are subject to legitimate law and must be guided by the natural-law precept of working together for the common good. We also contend that the rulers, once government is established, possess the supreme authority to rule from God through the natural law and cannot be deposed except for very grave cause, namely, that their rule is truly tyrannical and all legal means to remedy the intolerable situation have failed. Therefore, neither the right of the government to rule nor the right of the people to resist legitimate authority is absolute; both rights are *relative* to the supreme purpose of civil society which is the 'common good' of the body politic.

As a consequence of this principle, the citizens' moral right to resist the government is contingent on the *common good*. Prudence will have to dictate the right course of conduct. When tyranny of government is of a minor nature and pertains merely to the economic and civil rights of the people, the citizens may have to *yield* their rights for the sake of internal peace. When tyranny consists in grave but isolated acts of injustice, the citizens may offer *passive* resistance and seek redress in the courts or in public opinion. When tyranny is the result of wide-spread and

general corruption among the government as a whole, they have the right to offer *active* resistance; first, by using the legal measures provided by the constitution to remedy such evils, and then, if the situation is truly intolerable and legal measures unavailable, by using force in revolutionary action to form a new government as a last resort.

The following *conditions* must, therefore, be present before an organized attempt to overthrow a legitimate government by force is justified: (1) the violation of the citizens' rights on the part of the government must be grave and prolonged, not merely sporadic acts of injustice; (2) constitutional procedures of reform and redress must have been tried and failed, so that no other method but revolution is available as a last resort; (3) there must be a reasonable prospect that the revolt will succeed and that the subsequent government will be just and equitable, otherwise the common good would not be served and justice and charity would demand the avoidance of the great evils of civil war for the sake of the welfare of the citizens.

Neither the dictatorship of an irresponsible government nor the dictatorship of an irresponsible people is conducive to the public welfare of the political community. Government and people must be motivated by the sincere endeavor to cooperate for the common good of the body politic. Only in this way will political society be a blessing and not a curse.

Summary of Chapter XXI

The state always appears as a *government* in the affairs of the world.

1. *Types of Government.* There are three main types of government: *monarchy, oligarchy, and democracy.*

2. *The Reception of Authority.* How do the rulers of this or that concrete form of government actually *receive* the supreme authority to rule? Three main theories have been advanced.

One is the theory of the *divine right of kings*. The supreme authority is supposed to be conferred on the rulers by a special act of God, so that they rule by divine law.

The second is the theory of *translation or transference*. According to this view, all political authority, at the time the state is formed, rests in the people as an immediate democracy. This democracy is then transformed into a kingdom or other form of government through the free act of the people who transfer their supreme political power to the person or group of their choice by an express or tacit decision, by means of a pact of submission.

The third theory is the theory of *designation*. No consent is necessary on the part of the people. The ruler receives his position by nature of the *historically given circumstances*, because he is the logical person to rule; the people merely designate the ruler, and he receives his power, after this designation, directly from God. The supreme power is at no time vested in the people as such.

Evaluation. The 'divine right of kings' is a myth. Scholastic philosophers defend either the transference or the designation theory; most are in favor of the former.

3. *Extent and Limitation of Power.* Public welfare, as the proper end of the state, determines the extent and limitation of governmental power. Whatever is conducive to 'public welfare' falls within the jurisdiction of the government; whatever pertains to private welfare' is outside the competence of the government, except indirectly, namely, in so far as private welfare is an integral part of public welfare.

4. *Legislative Power.* There are three main functions of government: the legislative, the executive, and the judicial function.

The *legislative* power is the right to enact laws which are norms of action for the citizens. In general, laws obligate in conscience, because the government has its power from the *natural law*.

5. *Executive Power.* This is the competence of the government to establish and maintain the agencies necessary to carry out the laws.

6. *Judicial Power.* This is the competence of the government to restore the disturbed legal order. It has a double function: to administer *civil and criminal justice*.

There has been a considerable change of *attitude toward crime* in the course of history: retribution, repression, the classical theory, the neoclassical theory, the positivist theory, the reform theory.

The *primary* purpose of the judicial function is the 'public welfare' of the community; its *secondary* purpose is the

‘private welfare’ of the individuals and families.

The state should have four objectives in punishing crime: retribution, deterrence, prevention, and reform.

7. *The State and Morality.* Whatever affects *public welfare*, the proper end of the state, favorably or unfavorably, falls in some way under the jurisdiction of the government.

8. *The State and Religion.* As regards natural religion, the state has the duty to *promote* and *practice* religion. This duty is incumbent on the state from the standpoint of God, of its own welfare, and of the welfare of its citizens.

9. *The State and the Church.* In principle, the separation of Church and state must be rejected. Both are perfect societies, and God, who is a God of order and the Author of both, must intend that they work together in union and harmony for the benefit of their common subjects.

In *practice*, due to the division into many denominations, the separation of Church and state may, in particular instances, be advisable and even morally necessary.

10. *The State and Education.* Since parents have the immediate duty to educate their children, the state has *no immediate jurisdiction* over education. However, since education pertains to public welfare, the state has certain *indirect* rights and duties. It should assist parents in educating the children; it may even force them to the minimum requirements of education. But a state *monopoly* of education is wrong.

11. *The State and Intervention.* Ordinarily, the individuals and families should help themselves. In conditions of acute social distress, threatening the common

good, the state may *intervene*. *Four conditions* must be present, affecting the common good, in order to justify state intervention.

12. *The Right to Resist Tyranny*. The people and the government have the right, as a matter of self-defense and self-protection, to resist *unjust rebellion* (sedition) and *unjust conquest*.

The people also have the right to resist tyranny on the part of their own government. The sole reason why a government exists is the *will of the people* who have established it for the attainment of the *common good*. Resistance to tyranny is but the civil community's defense against unjust aggression on the part of the government against the people. This resistance, depending on circumstances, will be either *passive or active* resistance. If all legal means fail and the situation becomes truly intolerable, even *revolution* is justifiable.

Chapter 22

INTERNATIONAL SOCIETY

THE STATE IS SELF-SUFFICIENT, BECAUSE IT CONTAINS WITHIN itself all the means necessary for the attainment of the public well-being of its members. This self-sufficiency of the state, however, is only relative, not absolute. Due to geographical, cultural, and ethnical conditions, there exists a *plurality* of independent states, many of which are contiguous and related. No state contains within its borders all the natural resources commonly required by its citizens, so that they could live in absolute self-sufficiency. And even if a state did, other nations are not so fortunate; sooner or later these states will enter into trade relations with it. Where a community of interests prevails, treaties will be made between one state and another; where a difference of interests becomes acute, rights will be violated, and one state will war against another.

The states, therefore, constitute a *family of nations*, and their association forms international society. Many moral problems arise pertaining to the conduct of nations in their relation to each other. These must now be considered.

Sovereignty

The state is called the 'perfect' or 'self-sufficient' society. Closely related to the concept of 'self-sufficiency' is the concept of 'sovereignty.' It is a relatively new term, so far as the history of the philosophy of the state is concerned; it became popular through the writings of Jean Bodin (1577).

Sovereignty is the *legal supremacy of the state*. Viewed positively, sovereignty means that the ruler has the right of supreme rule over the people of the state with reference to the attainment of the public welfare of the political community. Viewed negatively, it means supreme political independence of the state, so that it is an equal among equals and not subordinated to the jurisdiction of another state in the community of nations. More concretely, a state is said to be 'sovereign,' when it has a properly constituted and organized government capable of performing the administrative functions of a state; when it has the power and ability of maintaining and preserving public tranquility within the confines of its borders; when it possesses the financial and economic resources required for normal needs; when its legislature and judiciary are able to dispense justice and regulate the conduct and dealings of its subjects in competent fashion, so as to promote general peace and harmony; when it is relatively competent to maintain the integrity of its territory against encroachment; and when it can, in treating with other states, determine independently its own foreign policies, in as much as it acts in virtue of its own rights and not in virtue of the authority of some other state to which it is subordinated.

The chief mark of sovereignty, therefore, is that the state possesses supreme power in its own political order and full independence among states in its own authority and right. Sovereign states are free and equal among themselves. Such a sovereign state would retain its identity, even if the rest of the race, for some reason or other, ceased to exist.

International Society

Although the individual states are sovereign, they are interdependent in many ways. Man's nature perfects itself socially in his political existence as a citizen of a particular state, but there exists a *universal brotherhood of all men* in virtue of their common essential nature as human beings. Men are not primarily Frenchmen, Russians, Germans, Chinese, or Americans; primarily they are human beings, and as such they transcend the narrow boundaries of nationality and race.

While there exists a pluralism of states, the essential nature of all men makes them akin and constitutes the international community, the more comprehensive 'society of mankind.' The stoics recognized this fact and stressed the citizenship of all men in the *civitas maxima*. Out of this concept the Roman jurists developed the *jus gentium*, the *Law of Nations*, the first approach to an international legal order. Beside the civil or national law there existed in all nations a law common to all free men, established by natural reason, which applied to men in so far as they were human beings and not merely nationals of a particular state. This Law of Nations is common to all men and states;

it is observed by all men and states; and it is deduced from natural law by natural reason, so that it is recognized by all nations as a true moral and legal norm of social conduct.

The *jus gentium* thus represented that part of the positive law which contained necessary implications and deductions from the natural law. It must not be confused with 'international law' in the modern sense. International law contains the norms which govern the conduct of the various independent states among themselves as political equals; the *jus gentium* was more in the nature of an international private law guaranteeing the sanctity of universal human rights given with the very nature of man independent of, and prior to, the organization of the political state. Man is simply man, no matter where or in what political community he may chance to live, and his right to life, liberty, and property is inviolable in all places and at all times. These were the universal natural rights, together with their detailed applications, which formed the body of the Law of Nations and were eventually incorporated in the civil codes of the various political states.

International Law

Modern international law evolved out of the *jus gentium*. Christianity, through its teaching that all men are children of God and possess an essentially equal nature, abolished the pagan distinction between freemen and slaves, between civilized and barbarian races. It thus deepened and broadened the natural-law basis underlying the provisions of the *jus gentium*. This Christian concept of man gradually

ruled all human, social, and political relations throughout Europe, regardless of the citizenship of the individual persons. When the Holy Roman Empire finally dissolved into independent national states and the great transoceanic discoveries revealed the existence of hitherto unknown states, the concept of self-sufficient 'sovereign' states demanded an expansion of the *jus gentium* into international law. The Law of Nations (*jus gentium*) was an international private law dealing with rights and duties of the individuals belonging to various national groups. It now became necessary to establish *International Law* as the *public* legal order regulating the rights and duties of the sovereign states in their conduct and relation to each other.

And so the evolution of the European nations into separate sovereign states brought on the development and formulation of 'international law' as we know it today. The fathers of international law were the eminent scholastic philosophers F. Vittoria¹ and F. Suarez.² Hugo Grotius, in his monumental work on international law, frankly acknowledged his indebtedness to these two great men.

International law may be defined as the code of laws which determine the rights and duties of sovereign states and their citizens in their mutual relations and conduct. International law, of course, is a fact and is recognized by all civilized countries. But what is the basis of these rights and duties? Have they a 'moral' or only a 'conventional' character?

The *positivistic* interpretation of the sovereign states places the source of all political rights and duties in the *enforcing will* of the states. But then, who is to force the

states to live up to their treaties? There is no world government over and above the single states which has the authority and power to force them to honor and keep a treaty. Or have the states no obligation to honor and keep a treaty? If not, the jungle law of superior might, practiced so nefariously by the totalitarian and Communist states, will be the supreme law of international relations, and under such conditions there is no possibility of amity and peace among nations. If, however, sovereign states have an 'obligation' to live up to their treaties, whence has this obligation its source? Certainly not in the enforcing will of the state itself, because no state will force itself to observe the provisions of a treaty and, if the state violating the treaty is powerful enough, no other state can force it to honor the treaty.

Many modern writers on international politics advance the theory that the binding force of international law has its source solely in the *treaties or agreements* made by the sovereign states. Governments may draw up and sign 'express' treaties through their representatives, or there may be a 'tacit' agreement and understanding between them regarding certain rights and duties. There are, they claim, no rights and duties between sovereign states prior to, and independent of, such an express or tacit covenant. This view is *false*. Suppose a treaty is made between two sovereign states. The *obligation* to keep the treaty is obviously something different from the *provisions* of the treaty itself. Unless the obligation has its basis in a moral law, the obligation to observe the provisions of the treaty must be the subject matter of another treaty. But then, the obligation to keep this second treaty will not be binding

except in virtue of a third treaty; the third treaty will demand a fourth; and the fourth a fifth, and so on in an infinite series of treaties, because all international duties must rest upon a treaty or covenant. Since an infinite number of treaties or covenants is an impossibility, valid and binding treaties between sovereign states are also an impossibility. International law then is nothing but an empty formula.

Unless, therefore, the binding power of international law has its source, not in the enforcing will of the state or in treaties and covenants existing between states, but in a *moral law* independent of the states, all laws, rules, treaties, and agreements regulating the conduct of states among themselves are just so many 'scraps of paper,' to be torn up and cast aside whenever they prove inconvenient. International relations would then be at the mercy of the nation possessing the greatest military power with which to impose its will upon the others. Absolute might then becomes absolute right.

International and Natural Law

International law must have more than a 'conventional' character. Without a 'moral' basis, international law is a useless fiction. But wherein does the *moral basis* of international law consist?

International law is the body of laws which determine the rights and duties of the sovereign states in their relation to each other, the public legal order of the community of nations. Each state is a moral person, equal in

sovereignty to every other state, with all the rights and duties of a moral person. But though the states are sovereign in the sense that they are supreme in their own order, they are not sovereign in the sense that they are beyond 'good' and 'evil,' beyond 'right' and 'duty.' All civilized states recognize the fact that they have the duty to respect and protect the *personal rights* of individuals concerning life, liberty, and property, regardless of their national affiliations.

As soon as it is acknowledged that the sovereign states have the 'obligation' to respect the general human rights of aliens and also have the 'obligation' to live up to their treaties and covenants, it is admitted that the states in their international relations are *bound by the moral law*. But again, whence this moral law with its binding power of obligation? It can be only the universal *natural law* which imposes its obligation on the sovereign states in their mutual relations, just as it does on the individuals and families. All are subject to the same natural law, whether they be physical or moral persons, because all are human in their essence. The ultimate components of the international society are the same individuals and families which constitute the membership of the various sovereign states; and so the natural law, which underlies the societies of the families and states, is also the foundation of the international society of the sovereign states.

There is, however, this difference. The 'common good' which international society seeks to realize through the medium of international law is the public welfare of the *states* and of *humanity* in general, rather than of the

families and individuals as such. Since the single sovereign states are 'moral persons' based on the social nature of man, it is necessary to establish an *international order of law*, so as to direct the activities of the community of nations toward the common good of humanity. This common good is justice, peace, security, and the temporal welfare of all the states and their citizens as members of the universal brotherhood of man under the universal Fatherhood of God.

Natural law alone is able to give an adequate account of the existence of national and international law. Both have their common source in the social nature of man seeking the realization of its latent potentialities in the co-operative union of men in the national order of the sovereign states and in the international order of the community of states. And both pursue the same end, namely, the temporal felicity of man in his social and political life. It is on the basis of natural law that governments recognize the inviolable rights of individual persons and families, and it is on the same basis that international law recognizes the inviolable rights of sovereign states. Now, where there are rights, there are duties. International law, therefore, is a body of laws which determine the rights and duties of the sovereign states 'in their relation to each other. And the moral basis of international law in its rights and duties is the natural law which governs all human relations in every phase of existence.

The provisions of international law refer either to justice or to charity.

International Justice

All individuals, considered from the standpoint of their nature as 'persons,' have the same essential capacities and the same final end; hence, all individuals possess a natural juridical equality among themselves. This equality is the basis of 'personal justice.' As equals, one person may not treat another as a means to himself or for his own convenience or advantage. The same fundamental principle of justice applies to states. They are all sovereign, each having the same essential capacities and the same proper end. As such they are moral persons possessing natural juridical equality among themselves, so that no state may treat the other as a means to itself or for its own convenience or advantage; to treat another state in this fashion would mean to treat it as a subordinate and not as an equal. Consequently, all states in the community of nations have *equal rights and duties*, based on the natural law of justice.

All states have an equal right in justice to their *existence*. This right is essential to every state.

It follows that every state has the natural right of *independence*. Since all states are equal, the mere size of its population and the extent of its resources and power make no difference. No state has the right to invade and subjugate another nation simply because the latter cannot offer effective resistance. Every state has also the natural right of *national integrity*, so that it may not be deprived of its citizens or its lands through fraud or force on the part of another state. This does not curtail the personal right of an

individual to emigrate into another country and assume citizenship there. Furthermore, every state has the natural right to peace and tranquility within the limits of its own jurisdiction. It is contrary to international justice, for example, for one state to develop a 'fifth-column' organization in another nation, with whom it is at peace, and foment dissension and trouble or sedition. Finally, every state has the natural right to *self-development*. Like an individual person, each state, being a moral person, must seek its own well-being by developing the potentialities of its people in agriculture, industry, business, commerce, science, art, and in whatever way its citizens may benefit, so that the state itself may thereby become more perfect and powerful as a political body in its own right.

All states have an equal right in justice to their *property*. A state cannot exist without property.

The citizens of a state live in a definite *territory* marked off by fixed boundaries. Parts of this territory are owned directly by the state itself, such as, for example, highways, roads, bridges, public buildings, military and naval establishments. Most of the territory will, in all probability, be owned by individuals, families, societies, and business corporations. Even in the case of private property, however, the state has the right of 'eminent domain,' namely, the superior dominion of the state over all property within its territory, so that it may appropriate any part of it for necessary public use after proper compensation has been made to the owners. The citizens are members of the state, and their property is an integral part of the general territory acknowledged by international law as belonging to

the state as a political body. No outside nation, therefore, can purchase property within the territorial limits of another state without the latter's permission; nor can it seize any property belonging to another state or its citizens without violating justice.

Parts of the globe which are not the property of another state belong to nobody, and any state may make it its own property through the title of first *occupancy* by annexation and settlement. In order that this title be valid in natural law, however, the occupying state must actually control this land effectively. Mere discovery or mere intention is not sufficient for ownership. The same principle applies to land occupied by an uncivilized people which lacks the political organization proper to a genuine state; in such a case the people living in the area retain all rights to their private property, while the occupying state acquires the right of public jurisdiction over the territory in general.

The *high seas* do not properly belong to any nation or group of nations. The ocean cannot be the living abode of a people, and the state consists essentially of a people living under its jurisdiction in a definite area. The waters immediately touching the coast of a country are usually considered as part of the country itself. Hence, positive international law has defined the three-mile limit of coastal waters as the outer boundary of all countries facing the open sea. Fishing rights in waters adjacent to a country are customarily settled by treaty.

All states have an equal right in justice to *freedom of action* in their internal and external affairs.

Like an individual person in his own home, the state as a moral person has the right to control and regulate the *internal affairs* of its own political household without interference on the part of outside nations. So long as its actions are conducive to the proper end of the state, the public welfare of its citizens, and violate no rights of justice with respect to other states, it acts within its own sacred rights. If sedition (and not a just rebellion against government tyranny) arises within the territory, so that a traitorous group or party seeks to overthrow the legitimate government, the state has the right to suppress the insurrection by force of arms, and no outside power may in justice assist the insurrectionists or hinder the government from carrying out its attempt to quell the sedition. Each state also has the right to regulate the trade of its citizens for the benefit of the whole community, by establishing, for instance, free trade in favor of one country and high tariffs against another.

Because it has the natural right to freedom of action as an independent moral person, each state has the right to communicate with other nations in a free and unrestricted manner. In particular, it has the right to make offensive and defensive *alliances* with other powers for the sake of mutual protection and advantage, so long as such alliances are not intended as an actual or virtual unjust attack upon another nation. Preferential friendships have their legitimate place among states as they have among individuals, and others have no right to complain, much less to hinder, such special acts of preference. The *external* affairs of a state are as much its own concern as are the internal affairs within its

territory, because each state is sovereign in its own sphere and not subordinated to the jurisdiction of any other state in matters pertaining to the welfare of itself and of its citizens.

To maintain and sustain these rights of justice, a state is entitled to prepare itself in time of peace against a possible *unjust attack* from within and from without. Hence, it may establish a military force of sufficient strength to repel and conquer any group or nation or combination of nations which unjustly threatens its existence. And if the threat becomes an actuality, it may go to war in defense of its just rights.

International Charity

There are *rights and duties of charity* among states, as there are rights and duties of justice. They, too, are based on the prescriptions of natural law. Individual persons are bound by the law of charity toward their neighbors, because all are human in their possession of the same essential nature and in their destiny to the same common end. The fact that each individual is an independent, autonomous person does not change the situation. For the same reason, the various states are bound by the nature of their being to charity toward other states, because they are also human in the possession of the same essential *nature* and in their destiny to the same *common* end. States are independent and sovereign, but they always remain 'moral persons' with an essentially human nature and purpose.

The primary duty of a state is always the welfare of its own subjects. A state, however, should not make the welfare of its citizens its sole concern, to the exclusion of the welfare of other states and their subjects. The brotherhood of man is all-embracing, and charity demands a *benevolent good will* toward all human beings, irrespective of their nationality. Charity, to be genuine, must frequently enter the sphere of practical assistance, especially in times of great need and distress. When a country is stricken by disaster, whether in consequence of a natural catastrophe or of a devastating war, it may become a duty of charity for other states and their citizens to come to its aid. But since charity, unlike justice, does not obligate under circumstances of grave inconvenience, a poor state would be exempt from this duty except in a case of extreme necessity.

The duty of charitable assistance in time of need brings up the problem of *neutrality* and *nonintervention* in international affairs. Since states are sovereign political entities, supreme in their own order, must they be allowed absolute freedom in conducting their own affairs, even if their conduct involves tyranny toward their own subjects or unjust aggression toward another state?

If it is conceded that international law is grounded on the *moral law*, it must also be conceded that sovereignty is not absolute, but relative, and that tyranny and unjust aggression may *justify intervention* on the part of other states.

Governments have the strict duty to strive at all times and with all legitimate means for the welfare of their

people; they are bound to promote the proper end of the state, because that is the essential purpose of the state's existence. If they act contrary to the proper end of the state, they violate the sacred trust imposed on them and accepted by them. Hence, when a government *habitually* and *gravely tyrannizes* all or a large portion of its citizens, it is guilty of a serious injustice. Another state, in a spirit of charity, may and should offer its friendly services to remedy the situation; and if the offending government refuses mediation and the intolerable situation persists, the other state may intervene in the name of humanity, with force if necessary. Of course, if such a procedure would precipitate a war with other states who favor the tyrant government, the obligation of charity may cease, because charity does not bind to an act of assistance which entails serious inconvenience. In general, no state is allowed to interfere in the internal affairs of another state; but this principle applies to the legitimate internal affairs of the state. *Tyranny* is never legitimate, because it involves serious and habitual injustice against the citizens as human beings. Hence, intervention for the purpose of abolishing tyranny is grounded on the fundamental rights of human nature guaranteed by the natural law, not on enactments of positive international law.

Unjust aggression against a state is a parallel case. When one nation unjustly attacks or uses another nation, neutrality and nonintervention are no longer an obligation, especially if the nation suffering the unjust attack appeals for assistance. Anyone may come to the aid of a person who is unjustly attacked by an assailant. He need not even wait

until an appeal is made for help. The mere fact that an unjust aggression is attempted is sufficient reason to enter the fray and beat off the attack of the assailant. So, too, when an unjust aggression is attempted internationally. Whether the person attacked is a 'physical' or 'moral' person, is immaterial; justice is violated, and all states have *per se* the duty of charity to intervene and preserve the international order on the basis of natural law. *Per accidens*, namely, if a nation is too weak to overcome itself, it may observe neutrality; charity would not bind under such circumstances.

According to the same principles of natural law, one state is justified in giving effective aid to another state, when the latter appeals for help to quell *anarchy* or an *unjust rebellion* on the part of its citizens. Here the citizens are the unjust aggressors against their legitimate government. Under the circumstances, intervention would be no breach of neutrality, but an act of charity seeking to restore the proper public order.

Natural law thus imposes serious obligations of justice and charity upon the community of states in their relations to each other, regardless of the provisions of positive international law. Consequently, the principle of 'nonintervention' in its extreme form, as advocated by *liberalism*, is contrary to natural and sound morality.

International Treaties

Treaties are compacts made by one state with one or more states. They may be *secret* or *public*, depending upon whether they are known only to the contracting parties or brought to the attention of other states not parties to the treaty.

Since treaties are solemn compacts made between sovereign states, only the supreme authorities have the power to make or ratify them. Treaties are of the nature of *contracts* and have the binding power of contracts. Where governmental officials are chosen by popular elections, the incoming government automatically assumes all obligations of the outgoing government, and that includes treaties; the obligations rest upon the sovereign states as such and not merely upon the officials who happen to be in power.

In general, the *conditions* for a *valid treaty* are the same as those for any contract. There must be no 'substantial error' on the part of the contracting parties regarding the provisions of the treaty. The 'consent' of the contracting parties must be genuine and mutual; unless the signatories (or one of them) are forced to sign the treaty under threat of personal injury, the signing of the instruments must be considered an act of free (though perhaps reluctant) consent. The 'matter' of the treaty must be ethically good or indifferent, and the execution of the provisions of the treaty physically and morally possible.

Ordinarily, the provisions of a treaty *cease to bind*, if observance of them would entail the dissolution of the state or threaten the loss of its independence. Treaties are made, not for the present moment, but for the future; and they are made by sovereign, independent states. Hence, the very

fact that a treaty is made between two or more states presupposes the existence of these, states in the future, together with their sovereignty and independence. Ordinarily, therefore, it cannot have been the intention of the contracting parties to obligate themselves to carry out the provisions of the treaty under circumstances which would entail dissolution or threaten the loss of independence. If the treaty does not cease outright, it is at least *voidable*.

The matter is totally different, however, when the dissolution of a state or the loss of its independence is made the very *substance* of the treaty or is a *contingency* taken into consideration at the time the treaty was concluded.

To fulfill the provisions of a treaty is a matter of *strict justice*. It is also a matter of national and international *honor*. The violation of a treaty is a serious insult to the honor of the state which is the other party to the treaty. And such an insult often leads to war.

The Morality of War

War in any event is a terrible calamity, both for those who win and for those who lose. Modern warfare, in particular, unleashes such a fury of destruction and suffering that many people are of the opinion that war can never be justified. Is that true?

War is a condition of armed conflict between two or more sovereign states. Wars are either 'offensive' or 'defensive.' Popular parlance usually speaks of that nation as waging an 'offensive' war which first declares war on another nation

or which first proceeds to wage war against another nation, irrespective of the justice of the action; the nation against which war is declared or waged is said to wage a 'defensive' war. These expressions are altogether erroneous and morally inept. *Morally* speaking, that nation wages an offensive war which goes to war, not in defense of a violated right, but simply in order to damage or destroy another nation or in order to further its own aggrandizement, so that its act of war has the character of 'unjust aggression'; it is immaterial whether it declares war first or not, or whether it is attacked first or not. Reversely, that nation wages a *defensive* war which goes to war in defense of a right that has been unjustly violated by another state; here, too, it is immaterial whether it declares war first or not, or whether it is attacked first or not. Hence, if war can be justified at all, it must always be a 'defensive' war waged for the vindication of violated rights.

Heinrich von Treitschke (1834—1896) defended the justification of war as something naturally necessary for the perfection of the state and its people, because only in war is the complete solidarity of a people achieved. Such an attitude is utterly immoral or at least amoral, because it views war as an intrinsic good, as an integral part of the common good of the state; it advocates war for war's sake, regardless of the justice or injustice of the cause. War is not beyond the pale of morality. War must conform to the norms of morality, or it is as unjust and immoral as murder.

War, under certain conditions, is *justified by natural law*.

War is neither intrinsically good nor intrinsically evil. It may be morally right, and it may be morally wrong. Like

every other act of man, war must be morally good from the standpoint of the 'end of the action' as such, of the 'circumstances' accompanying the action, and of the 'end of the agent.' If it lacks moral goodness in any of these features, it is morally wrong; contrariwise, if it possesses moral goodness in all these features, it is justified.

There can be no serious question that a nation, in going to war, can meet all these *conditions*. As regards the *end of the action* as such, in order that a war be just, it must be in defense of violated rights. An important right may have been actually violated, as when a nation, for instance, has suffered an unjust attack by a hostile force; or the violation of an important right may be adjudged with moral certainty to be imminent, as when a neighboring nation mobilizes its armed forces at the border. As regards the *end of the agent*, the nation going to war must be actuated by the good intention of defending its sovereign rights against an unjust attack, and not merely act, for example, out of revenge, envy, greed, or spite. As regards the *circumstances* accompanying the initiation of warfare, a number of things must be considered. Since war is such a tremendous physical and social evil, it can only be used as a last resort. First, all peaceful means, such as diplomatic negotiation and mediation by other powers, must be exhausted. Second, the evils of war must in a measure be proportionate to the injury inflicted on the innocent nation and to the harm done to international order, and the latter point is important, because condonement of an international act of violence will inevitably lead to more and greater disorders in the course of time. Last, there must be

reasonable hope that the outcome of the war will result in more equitable conditions for international peace and amity.

It must be remembered that in a just defensive war armed action is undertaken for the sake of a *moral good*. War may be the only effective means of restoring the violated moral order as it exists among sovereign states and of protecting a nation's sacred rights. Moral evil is incomparably worse than physical evil. Physical evils, the result of warfare, may therefore sometimes be allowed for the sake of attaining a moral good which cannot in any other way be attained. The principles governing individual action in defense of one's person or property against an unjust aggressor apply to a state defending itself against unjust aggression. Even more so. An individual, except in the case of an attack actually or imminently present, can appeal to the courts and to the law-enforcement agencies of the government for protection and redress. At present, however, there exists no world government to which a nation can appeal for effective protection and redress. The organization of the United Nations possesses no military power capable of adequate measures to prevent a powerful nation bent on unjust aggression from carrying out its evil design. Hence, it can easily happen that a nation may have to use its own armed forces and go to war in the *just defense of its co-active rights*.

But here, too, the principle of *proper moderation* applies. The nation whose rights have been violated may not go beyond the measure of *proper defense*. If the guilty nation offers complete amends for its unjust act to the offended

nation, either prior to the inception of hostilities or during the course of the war, this reparation must be accepted. If the enemy surrenders, the offended nation must cease actual warfare; to continue the war would exceed 'proper moderation' and become an act of revengeful aggression. If enemy soldiers surrender or are wounded, they may not be mistreated or killed; proper defense means putting the enemy forces out of action and incapacitating them for further resistance, not complete annihilation. Poisoned bullets, explosive bullets, or dumdum bullets and similar weapons are not permitted in combat, because the sole purpose of their use is to kill or torture the enemy, and this purpose exceeds the proper moderation of defensive warfare. For this reason these weapons have been outlawed by international agreement. On the basis of natural law, the use of 'poison gas' would not exceed the principle of proper moderation, provided it would only disable enemy combatants and thus force them out of action. However, due to its harmful effects over a long period of time, even after the war is over, positive international law has proscribed the use of poison gas as a legitimate weapon; unless, therefore, the aggressor nation violates the law and uses it, the innocent nation must refrain from the use of poison gas in warfare.

Granted, then, that all the requisite conditions are fulfilled, a war in defense of violated rights is just and permissible.

The Rights of Civilians in War

The *rights of civilians* in time of war has always been a thorny problem for the moralist and the jurist. Just who are exempt from military attack and violence? The unjust aggressor, of course, has no moral right to attack anyone; he is the criminal in the case, and the criminal is bound in justice to desist from attacking. The question, therefore, applies only to the state defending its rights against unjust attack.

The statement is often made that 'civilians are *innocent* people, and it is morally wrong to fight innocent people.' The term 'innocent,' as used here, contains an ambiguity; it may mean as much as 'morally innocent' in the sense of 'not being guilty of crime,' or it may mean 'militarily innocent' in the sense of 'not taking an active part in the war.' If the word 'innocent' is taken in the first meaning, so that it would be morally wrong to fight them, the meaning is false; because in that case it would be wrong to fight the vast bulk of the armed forces of the enemy, since very few of the armed personnel have anything to do with the crime of the war. The word 'innocent,' therefore, must be taken in the *second* sense of 'militarily innocent.' In that case the military force may justly attack anyone in uniform; but many civilians will also be open to attack, because they 'take an active part in the (unjust) war.'

It is immaterial whether an unjust aggressor is formally innocent of injustice or not; so long as the person suffering the unjust attack is defending his right, he is entitled to ward off the attack, even to the extent, if necessary, of wounding or killing his assailant. And that is also true of a sovereign state. Hence, as Gronin³ observes, whoever is

actively engaged in the unjust aggression of war, whether personally innocent or guilty in a moral sense, is subject to attack, according to the principles of the natural moral law. All who are actively engaged in the unjust aggression of war are, from the standpoint of natural law, true *combatants*, whether they wear the uniform of the armed forces or not. It is not necessary to shoot off a gun, in order to be counted among the 'combatants.' All civilians who take an active part in promoting the unjust war, even if they bear no arms, are unjust aggressors and as such can lay no claim to immunity from attack, because they must be reckoned among the 'combatants' just as truly as soldiers and sailors in uniform. The term 'combatants,' therefore, embraces all persons belonging to the *military forces* of the aggressor nation and all *civilians taking an active part* in the war effort. All these persons are subject to attack. The only persons not subject to attack are those civilians who are not actively engaged in any way in the war; they are the only non-combatants in the true sense of the word.

To be more specific. Among the 'combatants' belong all members of the armed forces, whether or not they belong to combat units; all persons in military training and those called to the colors; all government officials; and all civilians employed in the war effort. Among the latter, it is obvious, belong all war workers in factories making ammunition, planes, guns, tanks, trucks, cars, clothes, or anything else that serves as equipment for the armed forces; all who actively assist in the making and operating of transportation services on land or sea or in the air, in so far as they are used to transport personnel or materials for the

prosecution of the war; all employed in radio, telephone, telegraph, or any means of communication connected with the war; all who grow, process, and supply foodstuffs are active participants in the unjust aggression and as such subject to military attack. Immune from attack, then, are those civilians who are truly non-combatants, that is to say, all men, women, and children not actively connected in any way with the unjust war. In view of the nature of modern warfare, it will readily be seen that a large portion of the civilian population belongs to the category of 'combatants' subject to military attack.

WHAT ABOUT *ENEMY PROPERTY*?

Since justice is on the side of the nation unjustly attacked or used, it is clear that the innocent nation has the right to employ all legitimate means necessary to win the war and bring the guilty nation to terms, for to be entitled to an end is to be entitled to the means necessary for the attainment of the end. Now, the destruction of enemy property is such a means, a 'military necessity' to win the war. Hence, the destruction of enemy property, when dictated by *true military necessity*, is justified according to natural law.

In the event of true military necessity, it is clear that it is permissible to destroy or render useless any property which may benefit the guilty nation in the prosecution of the war, because such destruction or damage *lowers the enemy's war potential* and will eventually bring about his defeat. Hence, all installations of public or military

character, useful to the enemy, are legitimate targets. Such targets are fortifications, arsenals, factories for the production of munitions and war equipment of all kinds, communication establishments, railroads, bridges, public buildings presumably used for war purposes, supply trains, and in general everything which assists in maintaining the enemy in his unjust cause. Ships carrying food or military supplies may be attacked and, if necessary, sunk, all provisions being made, wherever possible, for the lives of the crew and passengers.

Here, too, a distinction must be made between public and military property and private property. *Private property*, if used for military purposes, is equivalent to military property, because it falls within the sphere of 'combatant activity.' But the private property of true non-combatant civilians is *per se* not subject to attack; *per accidens*, however, even such property may be destroyed or damaged if it stands in the way of an attack upon a legitimate military objective. Non-combatant civilians are members of the body politic and will often have to suffer losses together with the losses inflicted upon the body politic in general. Attacking forces, however, have the duty to respect the private property of non-combatants whenever and wherever feasible.

Air raids on cities pose one of the most difficult moral problems involved in lawful warfare. Many cities contain large numbers of government institutions, military personnel, military establishments, war factories, warehouses, docks, railroads, and other facilities necessary or advantageous to the conduct of war. To reduce them to

impotency would evidently lower or destroy the enemy's capacity to continue fighting. Hence, they must be considered legitimate targets for air raids in this respect. Unfortunately, however, the larger cities also contain the greatest number of non-combatants. These cities do not cease to be legitimate targets, so far as military objectives are concerned, notwithstanding the fact that many non-combatants live within their limits. The legitimacy of air raids on particular cities and towns resolves itself into the answer to this question: If no civilian non-combatants were present in the city or town, would the city or town contain installations necessary or advantageous for the conduct of war on the part of the enemy? If so, these installations are a legitimate target for bombs and shells. If not, air raids serve no useful purpose, because they are not a 'military necessity,' and they are not permitted. If a city or town is a legitimate target of sufficient importance, so that its reduction is a military necessity, civilian non-combatants should leave the place or be removed by the authorities entirely, at least in areas adjoining military targets; if they remain, they must accept the chances of war. Pilots and artillerymen must strive to direct their missiles at military objectives, and *indiscriminate* bombing and shelling, especially if aimed at predominantly residential sections, is illicit. Stray shots, inflicting damage or death in such sections, must be discounted as unintentional. If non-combatants are killed or wounded in the bombing or shelling of definitely military objectives, when the attack is reasonably adjudged to be a military necessity, the principle of the *double effect* receives application: the destruction of

the military objective alone is intended, while the death or wounding of non-combatants is not intended but merely permitted as a chance effect unavoidable under the circumstances. It should be fairly evident that the complete mobilization of a nation's industry for military purposes in present-day warfare makes all important cities more or less legitimate military targets, because practically all factories do war work in some form or other, and they are concentrated in the cities. Formerly, wars were fought by relatively small armies, and the ordinary civilians had little or nothing to do with the war; modern wars, however, involve almost the whole population, civilians included.

Robot bombs, as used by the Germans against England toward the end of World War II, cannot be justified. Launched from a great distance, they could be aimed only at a general area and not at definite military targets. If *guided missiles* can be made to select a military target, their use will be morally permissible. The *atomic bomb* has naturally caused a great deal of discussion among moralists. Due to the widespread havoc caused by its tremendous explosive power, many condemn its use as being utterly inhumane and therefore morally unjustifiable. Others are not so sure; they feel that it would be premature to give an authoritative decision on its morality at the present time. Atomic bombs are not like robot bombs. They are under the control of the bombardier, are released at the time desired, and are aimed at the target with all the precision of ordinary bombs in a regular air raid. It is true, of course, that their demolition effect is spread over a wide area. However, it must also be conceded that certain

military targets occupy an extensive territory, relatively far removed from the non-combatants. Such are, for example, concentrations of naval vessels in large harbors and on the open sea; troop convoys; naval and army bases; training camps; oil wells and refineries; hydroelectric power dams; air fields in isolated places; atomic energy plants; important war factories; and many types of installations that are operated solely by military personnel or civilians actively engaged in the war effort. The atomic bomb, when restricted in its use to such limited targets of great military importance, should, it would seem, be considered a legitimate weapon of defensive warfare. However, since the atomic bomb with its enormous power of destruction of life and property can be abused all too readily by an unscrupulous enemy, it would certainly be better if the nations of the world would place it on the list of outlawed weapons. *Per se*, though, viewed strictly from the standpoint of natural law, it would appear that its restricted use, as indicated above, can hardly be termed 'intrinsically evil.' The same principles apply to the hydrogen bomb.

The Rights of the Victor

When we speak of the *rights of the victor*, it must be understood that the rights referred to are those of the *unjustly attacked nation*; the unjust aggressor has no rights, even when victorious. It must also be understood that victory, as such, simply means that the victor has vanquished the aggressor through physical power. Physical power, however, is not a source of right. Hence, the fact of

victory, as such, confers no new right upon the victor. Whatever rights the victor possesses were already his before he went to war. After these preliminary observations, just what rights does the victor possess with respect to the vanquished aggressor? There are *three main rights* which the victor may exercise over the vanquished foe because of victory.

First, since the victor went to war with the aggressor nation because the latter violated certain sovereign rights, the victor has the right to the *restoration of the violated rights*. If the aggressor unjustly annexed a certain amount of territory, the victor has the right to reclaim this territory and incorporate it again into the sovereign state from which it was wrested. If the aggressor insulted the honor of the victor's people or state, the victor is entitled to demand suitable amends.

Second, the victor has the right to *indemnities for all losses* which the war brought upon his people and his state in consequence of fighting for the restoration of violated rights. These losses in personnel, material, and money were unjustly forced upon the nation by the aggressor. That being the case, the unjust aggressor can be compelled to make good these losses by means of an adequate reparation in kind or in equivalent value. The lives of the dead cannot, of course, be restored, nor is it possible to make any sort of adequate compensation for these lives in the form of reparations in money; however, the victor can impose monetary reparations upon the aggressor, the money to be given to the surviving parents, wives, or

children, in view of the fact that they have been unjustly deprived of their legitimate support.

Third, since war is not waged for the sake of war, but for the sake of restoring the violated peaceful order, the victor has the right to *insure the peace for the future* by preventing future unjust attacks on the part of the aggressor nation. If the unjust aggression has occurred a number of times, so that it appears to be a definite policy of the government, a complete subjugation of the guilty state may be justified.

In accordance with the first principle, the victor may occupy whatever enemy territory falls under his dominion while war is being waged. Such occupation is justified, because it is a legitimate means of weakening the enemy's power, until victory is assured. In accordance with the second principle, the victor has the right to occupy the territory of the vanquished aggressor from the time of victory until the time the peace terms are signed and accepted, because the peace terms will stipulate the amount and nature of the compensation to be made for the losses sustained in the war. In accordance with the third principle, after the restoration of peace, the victor has the right to occupy the enemy territory as long as is reasonably necessary to make sure that order will be observed and that the terms of the peace treaty will be carried out. Without this right it might not be possible to insure peace for the future.

The occupying army is the guardian of the public order and is in fact the governing authority during the period of occupation. It has both the right and the duty to preserve

public order. The military government may not be arbitrary in its rule, but should always be just and humane in its treatment of the inhabitants. When disorders arise, it may use only such repressive measures as are justified according to natural and positive international law. The whole population or a community may never be punished for crimes committed against the occupying forces, except when the whole population or the community is collectively responsible. *Reprisals* represent a difficult moral problem for nations at war, particularly for occupation authorities. Positive international law permits retaliatory acts against the enemy for violation of the customary procedures of war. With regard to the *morality of reprisals*, a distinction must be made. If the retaliatory act constitutes a breach of the natural law, it is not allowed, no matter what crime the aggressor nation may have committed; two evils never make a good, and two crimes do not cancel out each other. But if the enemy violates a positive law agreed upon by international treaty, the injured nation may respond by a retaliatory act of the same kind. For example, if the enemy kills hostages, one would not be permitted to kill innocent non-combatants held as hostages, because they have committed no crime and should not suffer death for the crime of others; but if the enemy uses poison gas, the unjustly attacked nation would be permitted to do the same, because the use of poison gas is prohibited by international agreement and not by natural law as such. It may thus happen that a military leader will not be permitted in conscience to use a certain method of reprisals. Oftentimes a nation has no other course open but to wait until the

conclusion of the war and then place the criminals on trial before an impartial court, as it was done in the Nuremberg trials after World War II.

Duties of Citizens in Time of War

What *duties* have the citizens regarding participation in the war?

If a war is *evidently unjust* in the view of the better and best citizens capable of forming an adequate judgment about the morality of the war, it is clear that the citizens may not conscientiously support the injustice perpetrated by the government.

If a war is *evidently just*, so that the facts are plain as to the guilt of the offending nation, the citizens have both the right and the duty to support their government in its attempt to vindicate the violated rights of the state and its people. The state is not free to accept or refuse the defense of important rights; it has the solemn duty to resist unjust aggression, both from the standpoint of the common good of its citizens and from the standpoint of international welfare. And when the state goes to war against an unjust aggressor nation, the citizens, as integral members of the state, have the duty to give every assistance to the state to bring the war to a successful conclusion. While no able-bodied man is obligated to volunteer his services in time of war, he may not refuse his services if he is drafted (conscripted) in a just war.

If a war is *doubtfully just* in the view of competent judges, the citizen must give his government the benefit of

the doubt. The citizen has the right to presuppose that his government would not plunge the nation into a devastating war without being convinced that it had a just cause. Furthermore, the ordinary citizen, and even the citizen of exceptional intelligence, is not sufficiently versed in international matters, both as to laws and facts, to be capable of passing a competent judgment on the absolute justice or injustice of the government's action. Matters are usually so complicated, that the ordinary citizen cannot be expected to dispute the judgment of the highest officials of the state. And so, as a general rule, the citizen may abide by the decision of the government, so long as the government is not manifestly wrong.

All men already in the military service, and all draftees, may assume that their country's cause is just. The volunteer must be sure in his own mind of the justice of the war, because he freely decides his course of action, and no one may act with a doubtful conscience in matters of life and death. A *conscientious objector*, truly convinced that all wars are forbidden by his religion, must abide by the decision of his conscience.

International Peace

Peace among nations is a great blessing. But only to those of good will. When justice and charity are moral pillars supporting the structure of international policies, nations will be able to live in peace and harmony with one another.

Nations truly desirous of maintaining international peace will not seek to take undue advantage of their fellow

nations, but will do everything within reason to settle their differences amicably, without having recourse to the doubtful decision of arms. Might is not right. And victory is not necessarily on the side of justice.

International charity will therefore strive to find a more equitable manner of defending just claims. More and more the nations of the world recognize the futility of war and realize that peace must rest upon the good will and solidarity of all peoples as members of a family of nations. Hence, the continued efforts to reduce armaments to the minimum compatible with national security, and to settle all controversies between states through *conciliation, mediation, and arbitration*.

After World War I the League of Nations was formed to carry this ideal into execution. It failed. Now, after World War II, the war-weary governments have established the organization of the United Nations, hoping to have better success in averting future wars and insuring a just and lasting peace. The United Nations may also fail. But sooner or later the governments of the earth, if they are not to disappear in a holocaust of fire and in a sea of blood, must outlaw war and seek the solution of all international problems in a *world democracy of nations* which will act in unison to remove the cause of war and nip in the bud every attempt of recalcitrant states to disturb the peace. Only then will justice and charity, not expedience and greed, rule the world and bring about that tranquility of order which is the essence of harmonious living among the races of mankind.

This is the supreme problem facing the sovereign nations: Destroy war, or be destroyed by war.

Summary of Chapter XXII

The sovereign states constitute a family of nations, and their association forms *international society*.

1. *Sovereignty*. Sovereignty is the *legal supremacy* of the state, both with regard to the rule over its own subjects and with regard to political independence among the states.

2. *International Society*. There exists a universal brotherhood of all men in virtue of their common essential nature as human beings, so that they form an international community. This fact found expression in the *jus gentium* or Law of Nations, which was in the nature of an international private law guaranteeing universal human rights to all men.

3. *International Law*. This is the code of laws which determine the *rights and duties of sovereign states* and their citizens in their mutual relation and conduct. It is neither the enforcing will of the states nor treaties and covenants between states which constitutes the basis of their rights and duties. Rights and duties imply 'obligation,' and obligation presupposes a moral law.

4. *International and Natural Law*. The moral basis of the international order of law is the *natural law*. The natural law, which underlies the societies of families and states, is also the foundation of the international society of sovereign states. The common good to be realized is the public welfare of the states and of humanity in general. National and international laws have their common source in the *social nature of man*. The provisions of international law refer either to justice or to charity.

5. *International Justice*. All sovereign states possess equal rights and duties, based on justice.

All states have an equal right to their *existence*; to their *property*; to the control and regulation of their *internal* and *external* affairs, due regard being given to the rights of the other sovereign states.

6. *International Charity*. As moral persons with an essentially human character and the same common end, states have the duties of international charity. Charity demands a *benevolent good will* and also *practical assistance* when needed. Hence, situations of tyranny and unjust aggression may justify *intervention*.

7. *International Treaties*. They are *compacts* made by one state with one or more states. They are of the nature of 'contracts,' and the conditions of validity apply to both.

8. *The Morality of War*. War, to be just, can only be undertaken in *defense of violated important rights*. It must meet three essential conditions, in order to be justified according to natural law. The *end of the action* must be good, that is, in defense of violated important rights. The *end of the agent* must be good, that is, the intention of the state must really be to defend its sovereign rights against an unjust attack. The circumstances must be good; it is especially important that all peaceful means of an amicable settlement be exhausted. 'Proper moderation' must be used in the conduct of the war.

9. *The Rights of Civilians in War*. All who are actively engaged in the unjust aggression of war must, according to natural law, be reckoned as true combatants and as such are subject to attack; these are all members of the *military*

forces and all *civilians taking an active part* in the war effort. All others are non-combatants, and these alone are immune from military attack.

As regards the destruction of enemy property, the innocent nation has the natural right to destroy or damage all installations of a public or military character useful to the enemy. *Per se*, the private property of true non-combatants is not subject to attack. *Air raids* are permissible, when directed against military objectives; indiscriminate bombing is not allowed.

10. *The Rights of the Victor*. The unjustly attacked state, when victorious, is entitled to the *restoration of its violated rights*, to *indemnities* for all losses sustained, and to the *prevention of future aggression*.

11. *Duties of Citizens in Time of War*. If a war is manifestly unjust, the citizens may not co-operate. If it is evidently just, the citizens have the right and duty of full co-operation. If a war is doubtfully just, the citizens must give their government the benefit of the doubt. As a general rule, the citizens may abide by the decision of the government.

12. *International Peace*. International charity requires that the nations do their utmost to outlaw war and settle all controversies through *conciliation, mediation, and arbitration*.

Chapter 23

INTERNATIONAL COMMUNISM

WHEN REVOLUTION BROKE OUT IN RUSSIA IN THE LAST DAYS OF February, 1917, after the Russian military debacle in World War I, it was the signal for various revolutionary groups to vie for control of the government. Many professional revolutionaries had been waiting for this moment, among them Vladimir I. (Ulianov) Lenin (1870—1924) and Leon (Bronstein) Trotsky (1877—1940). Both men had been living in exile; now they hurried back to Russia. After months of agitation the bolshevik party, headed by Lenin and Trotsky, was victorious. They established the 'dictatorship of the proletariat,' and Lenin became the acknowledged leader of the bolshevik party and of Russia. Upon his death on January 21, 1924, Joseph (Dzugashvili) Stalin (1879—1953) seized power through ruthless brutality and wholesale murder. By means of iron party discipline and the use of a vicious secret police, he crushed all opposition and assumed complete dictatorship. Trotsky had to flee and was subsequently assassinated in Mexico.

During World War II, Russia and Stalin happened to fight on the right side, and as a consequence the Union of Soviet Socialist Republics gained tremendously in power. Since

then the U.S.S.R. has been endeavoring to master the international situation.

What is this *international communism* which threatens to engulf the world?

One cannot understand communism unless one understands the philosophy of *Karl Marx* (1818—1883) and his collaborator *Friedrich Engels* (1820—1895). Marxism is a comprehensive and integral philosophy and should be evaluated as such. A book on ethics, however, must be limited to a brief treatment of the cardinal points of the theory.

The Foundations of Marxism

Karl Marx was born of Jewish parents in Treves (Trier), Germany, on May 5, 1818. When he was six years old, his parents renounced Judaism and embraced Protestantism, most probably for prudential reasons. Neither Judaism nor Christianity exerted strong influence on the development of Marx's education.

While attending the University of Berlin, Karl Marx studied Hegel's philosophy. He disliked Hegel's idealism, because Marx inclined more toward materialism; but he was deeply interested in *Hegel's dialectic method*, and this method became a basic element in Marx's philosophy of history.

According to Hegel, dialectics is the self-development of the Absolute Idea. The dialectic method has three phases: *thesis, antithesis, and synthesis*. In developing an idea, the first stage is always the enunciation of the positive truth of

the original idea (thesis, position). This original idea always contains its contradictory, and this leads to its negation (antithesis, opposition). Both the original idea and its opposite, however, contain only partial truths. Their conflict leads to the final stage of reconciliation, to the more fully developed idea (synthesis, composition). The idea obtained in the synthesis will start a new dialectic process, and this threefold process can be carried out indefinitely. Applied to the Absolute Idea, Hegel maintained that it is in a continuous dialectic process of self-development by means of thesis, antithesis, and synthesis. According to Hegel, the rational alone is real; all being is thought realized, and all becoming is a development of thought. Here we see his idealism. The Absolute thus becomes nature and spirit in succession. Nature or the universe is merely an externalization of the Absolute Idea in the process of self-development; in nature the Absolute Idea is unconscious of itself and manifests itself in the necessity of nature's laws. Passing through this stage of nature, the Absolute Idea finally emerges into man and gains self-consciousness. In Hegel's idealistic theory, therefore, the entire universe and all reality is the result of the self-development of the Absolute Idea by means of an intrinsic principle of progress through the dialectics of thesis, antithesis, and synthesis. He thus explained the entire natural, historical, and spiritual world as a *dynamic process* of continuous perfection, always emerging into higher levels of being.

Marx was intrigued by this theory of the dialectic process of constant higher perfection through the medium

of an intrinsic principle of progress through conflict. But he did not like the idealistic setting of Hegel.

Marx became a *materialist* and an ardent disciple of Ludwig Feuerbach (1804—1872). But Feuerbach's materialism was too mechanical for Marx; it was based too much, like former materialistic theories, on mere mechanical motion and lacked an intrinsic energizing principle. Without such an energizing principle, intrinsic to matter, it would be impossible to explain the upward trend in the evolution of nature without eventually having recourse to a Creator. Marx, the materialist, had no use for God. It was necessary to account for the origin and development of everything on an atheistic basis. Hegel's dialectic came to his rescue. What the dialectic method was for Hegel's idealism, Marx would make it to be for his materialism: the energizing principle of all change, progress, transformation, and intrinsic self-development in nature and history. Marx thus reversed the Hegelian process. "My own dialectic method," he said,¹ "is not only fundamentally different from the Hegelian dialectical method, but is its direct opposite. For Hegel, the thought process is the creator of the real; and for him the real is only the outward manifestation of the idea. In my view, on the other hand, the idea is nothing other than the material when it has been transposed and translated inside the human head."

Expressed in simple language, Marx's theory amounts to this: Matter exists from all eternity; matter is not inert, but active; matter contains opposing properties and tendencies in constant conflict, so that matter possesses an intrinsic

principle of development and progress within itself; this internal conflict in matter gives rise to more perfect beings, finally culminating in man.

In 1842, Marx became the editor of the *Rheinische Zeitung*, published in Cologne by the left-wing Hegelians. In his capacity as editor, Marx, for the first time, became acutely conscious of the miserable living conditions of the German working class and his own lack of a social philosophy. He thereupon resigned his editorship in 1843 and spent three years in Paris, mostly in the company of socialists and revolutionaries, for the purpose of deepening his knowledge of history, economics, and politics. Here he made the acquaintance of Pierre Joseph Proudhon (1809—1865) and Friedrich Engels (1820—1895); these two men gave final and decisive direction to Marx's philosophy of the world.

Proudhon pointed out to Marx that the Hegelian dialectics would be sterile unless applied to social conditions. Real dialectics could be found and observed in the bitter and cruel struggle for supremacy between the higher and lower classes of society, in the class conflict existing in economic society. Marx now recognized the purpose of his life: he would revolutionize society in favor of the exploited working class, the proletariat, on the basis of an *atheistic, dialectic materialism*.

Friedrich Engels, in 1844, became Marx's closest friend, and both together henceforth collaborated on the development of the Marxian theory of social revolution.

Communism and History

Marx developed his philosophy of nature merely as a prelude to his *philosophy of history*. History to Marx, as the activities of man in pursuit of his ends, was only a special, but the most important, phase of human activity within the general frame-work of material processes. Like nature itself, the history of man is governed by definite and inexorable laws which are totally independent of God and any sort of divine providence. This Marxian philosophy of history, therefore, is often referred to as *historical materialism or economic determinism*.

Freedom of the will, as freedom of choice, is denied by Marx; this denial is in keeping with his general doctrine of materialistic determinism. The only sense in which he admits 'free will' is in the sense that man can know the natural necessity which determines his actions. While, therefore, there exists a diversified interaction of human wills seeking definite and different ends, and while many individual historical events happen through the activity of such wills, history manifests such a constant orderly sequence of development that this progress must be ascribed to some *unified basic factor*.

Marxism does not deny that certain 'ideological' factors, such as religion, patriotism, morality, and social conventions, move people to action and influence history. Such ideal forces, however, are only superficial and secondary in their influence on social phenomena. There must be a more fundamental motive which is the driving force underlying all such secondary motives. It is a dogma

of Marx, that the consciousness of men does not determine their existence; their social existence determines their consciousness. According to his view, consciousness is social before it is individual; and man himself is primarily a social being, determined by the society in which he is born and lives, rather than an individual. Hence, Marx set out to discover the great fundamental and dynamic motive responsible for the social structure of mankind. He is convinced that man became differentiated from the animal as soon as he began to produce his own means of livelihood. Hence, the fundamental, ultimate shaping force of history is the *production of life's necessities and the exchange of products*. When Marx speaks of 'mode of production' or 'productive forces,' he always means the productive activity of man, the material to which man's labor is applied, and also the tools and techniques of production. Religion, morality, philosophy, law, governments, politics, art, and similar ideological factors exist, of course; but they represent the 'superstructure' built upon the foundation or 'basic structure' of economic production. So long as the economic factor remains unchanged, they remain unchanged; but when the economic factor changes, they change accordingly. Hence, *history is determined by the productive forces*.

Resting on this determinism of history, Marx developed his theory of *class struggle*. The prevailing mode of production is the main source of economic classes. The small group which owns the means of production in a nation dominates society, because it controls the production and distribution of all wealth for their own private interest; this

group is the *exploiting class*. The large group, in the employ of the exploiting class, produces the surplus value of wealth for this class, while it receives only the bare necessities of life in return. This large group of workers is the exploited class.

Here Marx uses the Hegelian dialectic method again, applying the principles of thesis, antithesis, and synthesis to social history, just as he applied them to the development of the universe in his philosophy of nature. The exploiters and the exploited constitute the contradictory elements in the social organism, forever in conflict, which determine history by producing new types of society in the course of the centuries. These class conflicts are the *revolutions* which periodically occur in the history of human society, whenever the productive forces can no longer function properly within the framework of the existing social order. When the prevailing mode of production reaches a point where the toiling masses are oppressed beyond endurance, they necessarily seek economic emancipation and better existence conditions; the result is revolution, because the exploiting class naturally resists any attempt on the part of the exploited class to alter the social system presently in operation. Such class struggles existed between freeman and slave, patrician and plebeian, lord and serf, guild master and journeyman, and in our day it exists between capitalist and laborer.

The exploiting class is firmly entrenched behind the bulwark of the social system and its many institutions. When a social revolution occurs, the entire social system is changed, and with it is also changed the superstructure

(religion, politics, government, etc.) built upon it. Obviously, a change in the economic foundation of society necessarily involves a corresponding change in the social structure based upon the foundation.

It is thus seen, declare Marx and his communistic disciples, that history is not shaped by the free choice of man's acts. *History is determined* by the productive forces of every age.

Evaluation. Economic determinism, or the materialistic interpretation of history, is a cardinal point in Marx's entire theory of communism. As a philosophy of history, it is extremely weak and actually *false*.

Marx denies the freedom of choice in man, but his entire treatment of the class struggle is a surreptitious admission that man possesses such a freedom. 'Motives,' whether ideological or economic, have no meaning except in the supposition that man has freedom of choice in his actions. To identify, as Marx and Engels do, 'freedom of will' with 'knowledge of natural necessity' means that man is free to *know* that he is *determined* (not free) in his actions, so that he must act according to inexorable laws over which he has no control. These are weasel words which deceive no one. If man's actions are determined in all matters by economic factors, what sense is there in the endeavor of Marx and the communists to arouse the workers of the world to change the social system? Why divide humanity into the two classes of the 'exploiters' and the 'exploited' and why rant and rave against 'capitalist oppression,' if both classes are merely the result of the deterministic laws governing the entire social system? No one would dream of appealing to a stone to

throw off the fetters of gravitation; then why appeal to the toilers to throw off the fetters of economic servitude,' if they have no more freedom of choice than a stone? Appeals, exhortations, admonitions, and threats of punishment have no meaning, if man is devoid of freedom of action and responsibility. Soviet Russia's infamous trials and propaganda methods are in direct contradiction to the materialistic doctrine of the denial of the freedom of choice in human actions.

According to Marx, religion, morality, government, law, and similar *ideological elements* are the result of the economic condition of the age; they are the superstructure erected upon the foundation of the productive forces. As the foundation, so the superstructure. If the foundation remains unchanged, the superstructure remains unchanged; if the foundation changes, the superstructure necessarily changes with it.

This is an interesting theory, but it is contradicted by the facts of history. *Government* is such an ideological element of society. Hence, if the state were essentially dependent upon economic production as its necessary cause, different modes of production should produce, by their very nature, different forms of government; and the same modes of production should produce, by their very nature, the same forms of government. However, we find the same form of government under entirely different systems of production. In the United States, for example, we find at first an agricultural type of production, which gradually turned into a highly industrialized type of production, and we also find a type of production based on slavery develop into

production based on capitalism and free labor; yet these radical changes in the mode of production caused no appreciable alteration in government. The reverse is also true. History reveals various forms of government arising in a nation without any change in the mode of production. This happened to the Greeks, the Romans, the Egyptians, and many other nations. The Magna Charta of England produced a radical change in the form of government, but it was neither the effect nor the cause of any radical change in the forces of production. The same argument applies to *religion* which, according to Marx, is also nothing more than a direct resultant of the economic forces of a particular era, so that the mode of production determines the character of religion. History refutes this theory. The mode of production was the same for the Jewish people and the pagan nations surrounding Palestine, but their religions were altogether different. Christianity had its origin in the Jewish nation, but no economic upheaval preceded the advent of Christianity. Nor did the acceptance of Christianity by the pagan civilized world follow from any kind of radical change in the mode of production. Furthermore, the Catholic religion remained the same, notwithstanding the enormous economic changes from slavery to capitalism which have occurred in the two thousand years of its existence. The spread of Islamism and of the hundreds of divergent Protestant denominations do not coincide with anything like a corresponding fundamental change in economic production. Nor does Marx's principle account for the rise and fall of the many types of *philosophic systems*. These systems range all the

way from skepticism and materialism to realism, idealism, and pantheism; they were present among the ancients as well as the moderns, no matter what the economic conditions of the times happened to be. Marx's theory does not fit the facts; instead, he made the facts fit his theory.

Marx's theory of the *class struggle* and of the *two classes* fares no better in the light of an intelligent criticism. The division of human society into the 'exploiters' and the 'exploited' is an *over-simplification* which is fatal to the whole theory of economic determinism. It leaves out of consideration the vast middle class of independent farmers, small-business operators, craftsmen, and shopkeepers. When applied to humanity in general and to the entire history of mankind, such a division is a glaring myth. At most, the division found justification in the highly industrialized sections of the urban populations of Western Europe following the introduction of capitalism in industry. It is one of Marx's great errors to generalize this condition and extend it to all history. To designate all owners of the means of production as 'exploiters' and 'oppressors,' is another contention of Marx which is obviously false. Most farmers and operators of small crafts own their business and as such own means of production, but it is not true that they belong to the 'exploiting class' like big industrialists. Since the division of society into these two exclusive classes is unjustified and false, the claim that all great social changes in history and all wars were the result of an economic *class struggle* between the exploiters and the exploited is equally unjustified and false. It was certainly not this type of a class struggle which caused World War I

and the downfall of the czarist regime in Russia, thereby giving the communists the fortunate opportunity to gain control of governmental power. Not economic determinism, but the vision of Marx and the energy of Lenin, produced sovietism in Russia.

Perhaps the most serious defect in Marx's materialistic interpretation of history lies in his contention that all radical changes in the social system are the result of changes in the mode of economic production and his failure to give an adequate explanation of the *causes which produce these changes in the mode of production* on the basis of economic determinism. Marx maintained that intellectual achievements follow economic achievement. He overlooked the undeniable fact that all changes in the methods of production are the result of the invention of new tools and machinery, invention, however, is an intellectual achievement, conceived and executed by the mind of man in his mastery over the material conditions of nature. Far from matter and material conditions being responsible for economic trends, and through these economic trends over the 'ideology' of man's mind, man's mind with its 'ideology' is responsible for all changes in economic trends and in the mode of production. But if inventions determine methods of production, the intellect and will of man, not economic determinism, are the causes of all basic changes in the social system. Even Marx's philosophy of history and communism itself are 'ideological,' not material, forces. The very theory of 'economic determinism' is an ideological product, not a material fact.

Communism and the State

The communistic philosophy of the origin, nature, and purpose of the state as a social institution stems from the communistic theory of the *origin of private property*.

Engels, who always expounds the ideas of Marx himself, maintains that in the beginning all property was held in common, so that the early period of humanity was communistic. Gradually it became customary to produce things for the purpose of barter rather than for use alone. The proceeds of such an exchange became *private property*. This new mode of production created wealth for the owners of the means of production. Soon the people were divided into owners and non-owners of the means of production; the former were the wealthy, powerful leisure class, while the latter were the poor, helpless, working class. Hence, ownership of private property led to the formation of the two classes of the exploiters and the exploited, and this situation naturally led to class antagonisms and class struggles.

In order to preserve their power in the face of revolt on the part of the exploited class, the wealthy and ruling class found it advantageous and necessary to institute an organization of power to protect their private interests. This organization of power is the *state*.

It is, therefore, the *nature* of the state to be an *organ of class domination*, a unified power of coercion. Its purpose is to protect the possessing class against the non-possessing class, so as to maintain the system of private ownership; and its *function* is the oppression of the proletariat, so as to

keep the toilers in economic servitude. The more the masses are oppressed in the capitalistic state, the more intense becomes the class struggle and the more repressive does the attitude of the state toward the working class grow.

As capitalism advances, state control of the means of production increases, until the state becomes the *national capitalist*. That is the final stage of the capitalistic concentration of wealth.

In order better to understand why the ownership of private property and its protection by the state constitute an exploitation of the working masses, we must consult Marx's book *Das Kapital*. In it Marx explains the modern methods of production. Whatever value a manufactured article possesses for use or exchange accrues to it through the labor of the worker manufacturing it. The industrialist, after deducting the cost of production, sells it at more than its inherent value and thus makes a profit for himself. This *profit* is a *surplus value* derived from the labor of the worker, appropriated by the employer out of the legitimate earnings of the laborer, and the unearned profit becomes the private property of the employer. The industrialist thus robs the worker and enriches himself at the expense of the worker. The only way to overcome this unfair distribution of wealth, together with the iniquitous division of society into exploiting and exploited classes, is to return to the original communistic condition of society by *abolishing the state and private ownership of the means of production*.

EVALUATION. THE COMMUNISTIC CONCEPT OF THE STATE AND OF private ownership is diametrically opposed to our view. Both the state and private ownership of property, the latter including also the means of production, are a *natural necessity* based on the very nature of man and are not the result of an exploiting minority's desire to enrich itself by taking unfair advantage of the helpless majority. We admit, of course, that labor constitutes a proper title to the ownership of the value created through labor; but there are other legitimate titles besides labor. The organization of the state, with its supreme authority, laws, and distinction between governing and governed classes, has its origin in the need of social cooperation between families and other groups, and as such it rests upon a dictate of the social nature of man. Not all nations, especially in the past, were industrial nations, yet they formed the state. All this was established in previous chapters, and there is no necessity to reiterate the arguments here.

In advancing their arguments against the private ownership of the means of production and against the state as protecting the interests of capitalists, communists invariably base them on the fact of the *exploitation of the masses*. First, this supposed fact of exploitation is greatly over-generalized. Not every owner of the means of production exploits the working classes. Millions of independent farmers and small shopkeepers run their business as a family affair, without employing outside help. Even among those who hire help, especially in small business and manufacturing concerns, the owners barely make more than a decent living, so that one cannot speak of

‘exploitation.’ Second, we are fully in accord with the communists that many industrialists are guilty of exploitation and that state authorities have connived with them in their nefarious get-rich methods. This exploitation of the working class was particularly flagrant since the advent of the machine age, in consequence of the application of the doctrine of liberalistic individualism to the methods of industry. These methods frequently amounted to downright oppression and exploitation. These evils, however, were brought on by the abuse of private ownership and state authority. The error of communists consists in confusing ‘abuse’ and ‘proper use. *Abuse* is no valid argument against proper use. One should correct abuse, but not abolish *proper use*. Everything is abused by some people, even food and drink and the functions of life; but it would be wrong to attempt to abolish them simply because they are abused. No physician would think of cutting out the heart of his patient because it does not function properly.

Besides, Marx’s doctrine on wages and surplus value indicates plainly that he considers the workingman entitled to the full value, of the manufactured article, not merely to the part represented by his wages. In other words, Marx thereby admits *in principle* the right of the laborer to *ownership of property*; it is only a question of the amount to which he is entitled in virtue of his productive labor. What communism fails to take into account is the fact that the laborer who is engaged immediately in the production of commodities is not the only one who contributes to its value as an article of exchange; other persons also have a part,

either directly or indirectly, materially or intellectually, in the creation of value in the finished product, and they also have a right to compensation.

Revolution and Dictatorship

The *Communist Manifesto*, drawn up by Marx and Engels in January, 1848, is an illuminating document. It shows how the history of human society is the history of class struggles; how the ‘bourgeoisie,’ the class of modern capitalists who own the social means of production and employ wage labor, gradually evolved, giving rise at the same time to the ‘proletariat,’ the class of modern wage laborers who possess no means of production and must sell their labor power in order to live; how capitalism deepens the gulf between the bourgeoisie and the proletariat, until the concentration of wealth and power in the hands of the few is counterbalanced by the unified association of the laborers, both classes fighting for supremacy; how the bourgeoisie, through the development of modern industry, increases the associated power of the proletariat and thereby produces “its own grave diggers.” The inevitable end of the struggle is the fall of the bourgeoisie and the victory of the proletariat.

Modern capitalistic society must give way to communistic society. The increasing socialization of the means of production has outgrown the bourgeois form of using them; that represents a contradiction, and this contradiction between social production and capitalistic appropriation can lead to — but one result — the *revolution*

of the masses of toilers against existing society. Though revolution is thus inevitable, every worker is a conscious member of the laboring class and must assist in *hastening* the revolution and bringing it to a successful conclusion. Since the bourgeoisie will not concede victory and agree to hand over its power to the proletariat peacefully, the proletarians are forced to overthrow its power by violence and destroy the *political state* upon which the ruling class relies.

Once the capitalistic state is abolished, the proletariat will establish a state of its own, and this state is the *dictatorship of the proletariat* with a power founded solely on the armed force of the masses. Without such a dictatorship of the masses the resistance of the bourgeoisie could not be permanently crushed, nor could the exploited toilers of the world be effectively directed toward the realization of the final communistic society. The dictatorship of the proletariat is, therefore, a political state; but it differs from the capitalistic state in this that it is the dictatorship of an exploited majority over an exploiting (capitalist) minority, while all previously existing class states were the dictatorship of an exploiting minority over an exploited (proletarian) majority. This dictatorship is essentially a *transition organization*, leading from capitalism to communism proper, and communists refer to it as *state socialism*. Such an era of socialism, for example, exists in Russia, which is officially designated the Union of Soviet Socialist Republics. Lenin, Stalin, and others are emphatic in their statements that the transition from capitalism to communism, represented by the dictatorship of the

proletariat as a political state, may occupy an entire epoch of history, because it may take a long time to build the masses into a force capable of governing themselves and to educate the minds of the vanquished capitalistic class to the ideals of true communism.

In the meantime, communists must instigate revolutions everywhere. As Marx says at the close of the *Communist Manifesto*: "The communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions. Let the ruling classes tremble at a communistic revolution. The proletarians have nothing to lose but their chains. They have the world to win.

"Workingmen of all countries, Unite!"

In the light of these principles it is clear that real communists disagree with the policy of the milder *socialists*. The latter would take over the apparatus of existing governments by parliamentary action of some kind and then proceed to socialize or nationalize the means of production by placing their ownership in the hands of the state. Communism would destroy all existing governments and erect in their stead revolutionary dictatorships of the proletariat.

Marx and Engels were convinced that the German workers would be the first to overthrow their government and establish a proletarian 'democracy.' They had little faith in Russia, because they considered that country too backward. Historically, as we know, Russia became the first modern nation to fall completely under the sway of the communist party. Moscow is now the center of all

communist activity seeking to dominate the world by its *international policy of revolution*.

EVALUATION. COMMUNISTS ARE, OF COURSE, PERFECTLY CORRECT in decrying the injustices perpetrated by liberalistic capitalism in the past on the masses of workers in the field, of industry. Christianity agrees with them in condemning these injustices. Christianity, however, disagrees with communism in the *remedy* proposed to cure the ills of modern society.

Communism considers the private ownership of the means of production to be the cause of all exploitation of the masses. Hence, by abolishing it they believe they will remove all inequalities and injustices among men. Such an attitude is naive. The source of the trouble in the world is *not things*, but *men*. Things are good; men are often bad. Through envy, greed, and lust of power men abuse the means of production to amass wealth for themselves without regard for the welfare of the working class and the common good of society. Blaming the means of production for the ills of mankind is like blaming the trigger for the shot that murders someone instead of blaming the man who pulled the trigger. Men, not the insensible forces of production, are responsible for the unjust distribution of the wealth of the earth. To supplant capitalists with commissars is not the solution to the problem. Men being what they are, the problem will remain so long as greed and avarice control men's hearts and actions; and the mere transfer of the titles of property from the capitalists to the

Soviet will not change men's morals. Men must be reformed, not governments overthrown. What is needed is the violence of virtue to discipline the passions of individuals and nations. And only Christianity can bring about this *revolution of the soul*.

International Communism

The international communist revolution, say Marx and his followers, will eventually triumph. Then capitalistic governments and bourgeois society will be swept away. For a time an international dictatorship of the proletariat will govern the world. This transitional era of dictatorship will last until the iron discipline of the communist party has succeeded in molding the minds of all men in conformity with the communistic teachings and habituating their actions in conformity with the communistic ideals. The length of this era no one can foretell.

Once all capitalistic tendencies are eradicated from the hearts and minds of people, there will be no need for the existence of a state, for there will no longer be anyone to be suppressed. *The state will disappear*; it will simply "wither away." The cessation of the state is made possible by the fact that everybody realizes that work is the first necessity of life and that no distinction exists between physical and mental labor. In consequence of this universal attitude toward the nature of work, all inequality between persons, so conspicuous in bourgeois society, will vanish. There will be a complete absence of all private ownership of the means of production and therefore also of all exploitation.

Wealth will exist in great abundance, for each will give according to his capacity and receive according to his needs. Communist society will be a *classless society*, a united and harmonious commonwealth of labor.

With the advent of pure communism as a stateless, classless society of free and equal men, there will be no class antagonisms, no wars, no exploitation, no poverty, no dissension. The evolution of human society will have attained perfection in its dialectical process. In the Marxian sense, therefore, communism is that final stage of social perfection, characterized by a state-less and classless society in which there will be perfect freedom and equality of all men, in which there will be an abundance of material goods in common, and in which everything will be regulated by the principle "from each according to ability and to each according to need."

In communism man will have produced an earthly paradise.

Evaluation. All this sounds fine in speeches and in books. But it is, notwithstanding communistic statements to the contrary, *utopian* and *unrealistic*.

The chiliastic picture of the communist paradise manifests a woeful *ignorance of human nature*. The only way in which the ultimate condition of communistic society can achieve what the propagandists ascribe to it would be through a complete renovation of man's nature. Man is not angelic by nature; rather, he is very prone to greed and selfishness. How would communism expect to eradicate such passions? By the simple method of abolishing private ownership of the means of production. But the members of

religious orders in the Catholic Church have already done that for centuries; yet these members know only too well that these passions are still very much alive in their own hearts. There is no reason to believe that the hopes of an earthly paradise will succeed better in eradicating these passions than the hope of an eternal reward. And if these passions are not completely destroyed in the human hearts, communism is but a tragic dream.

The famous communistic *standard of living* in the classless age reads: each will work according to his capacity; each will receive according to his needs. What is meant by *capacity*? The full limit of one's working powers? This norm would be labor slavery beyond anything found in capitalistic society. Communists do not intend this meaning, because they maintain that the means of production will be more than ample and labor time will be greatly reduced. Because of the different types of work necessary, the time and amount of labor will vary according to the types of work; some workers will have longer hours, some shorter. Who will determine the type of work and the time of each worker, since there exists no authority and no enforcement power? Who is to assign the different types of work to the millions of workers? Who will be a professional man and who a common laborer? It is easy to make visionary prophecies regarding social conditions in the unforeseen future, when their truth or untruth cannot be assayed until the time is actually present. The only safe grounds for social predictions for the future are the social experiences of the past and present. These social experiences, however, demonstrate that men do not love work, especially hard and

dirty work, but love ease and comfort and 'soft jobs.' Why should it be any different in the communist laborer's paradise? What is to prevent dissatisfaction and refusal to work? What is to prevent strikes over working conditions? Communists, of course, assure us that such things are unthinkable in the classless society of the communistic millennium; but what guarantee have they for this sublime faith? Will human nature have reached the status of angelic perfection? Why should human nature change? And by what unknown alchemy will communism bring about this essential change? Their theory is quixotic.

Each, they say, will receive according to his needs. What needs? Physical, mental, intellectual, cultural? All, or only some? Who is to determine which and in how far? We must not forget that all men are supposed to be social equals, and there is no presiding authority of any kind to enforce demands and commands. Happiness consists to a great extent in contentment, and man can be content with little. But many persons are not even content with very much. The needs of men depend largely upon their personalities, and personalities differ greatly. Chameleon-like, these needs may change from day to day, shifting constantly according to age, climate, and geographical location. And what of the desire for luxuries, for example, special food and drink, clothes, and jewelry? Or will such articles cease to exist or not be made? Or will the desire for them have vanished with the coming of the communistic millennium? Will everyone be satisfied with the same food, the same clothes, the same housing, the same recreation? If so, communism will have to perform a miracle in reducing all

persons to the same level of desires and needs. If not, how can all these desires and needs be satisfied? Men are not perfect altruists. Yet they must be made perfectly such, or communism will fail because of the weakness, selfishness, and depravity found in human nature. To say the least, communism is unrealistic.

Many critics have pointed out that Marx's dream of a chiliastic future of human happiness in the stateless, classless society of communism is but a reflex of his Jewish and Christian heritage. He dreamed of a *Messianic redemption and restoration of the human race*. He lost his faith and became an atheist and a materialist; but he could not deny the Jewish and Christian influence of his education. Like a prophet of old he thundered against the injustice of man toward man and looked upon himself as a Hegelian Messiah who was destined to lead erring mankind into the Promised Land of a materialist paradise without God or a Saviour. Salvation from sin became for him salvation from economic oppression, and the eternal happiness of man as a spirit degenerated into the painless paradise of man as an animal.

If man is nothing but a sublimated animal, morality is senseless. Man may as well live and die as an animal and be done with it. But if man is a *rational* animal, with a spiritual soul fashioned in the image of God, morality is not only a logical necessity for human living but the crowning glory of man as a child of God. Not communism with its pseudo-reformation of economic man, but Christianity with its supernatural redemption of sinful man, is the salvation of

the world. Man does not live by bread alone. Grace, too, is necessary for man and morals.

Summary of Chapter XXIII

To understand *international communism*, one must understand its philosophy as expounded by Karl Marx and Friedrich Engels.

1. *The Foundations of Marxism*. From Hegel's idealism Marx accepted the dialectic method with its thesis, antithesis, and synthesis, because it represented a dynamic process with an intrinsic principle of progress. From Feuerbach he took materialism as his basic philosophy and applied to it the dialectic method. At Proudhon's suggestion he applied his dialectic materialism to the class conflict existing in *economic society*.

2. *Communism and History*. Marx's philosophy of history is called 'historical materialism' or 'economic determinism.' Man possesses no freedom of choice. While 'ideological' factors have influenced history, the constant orderly sequence of progress shows that history has a basic unified factor of development, and this is economic production; hence, history is *determined by the forces of production*. Economic conditions determine history, because they result in the *class struggle* between the owners of the means of production (the 'exploiting' class) and the workers (the 'exploited' class).

Evaluation. Man possesses *free will*; otherwise there is no sense in denouncing the 'exploiters' and appealing to the 'exploited' to throw off the yoke of servitude. According to Marx, the ideological elements of society, such as government and religion, are totally the effect of economic

conditions. If this were true, a change in these conditions should bring about a change in these elements, but history refutes this claim. Marx's theory of the class struggle and the two classes is an *over-simplification*. He fails to explain the *causes producing the changes* in mode of production. Such changes are the result of new inventions, and inventions are 'ideological' because intellectual.

3. *Communism and the State*. The origin, nature, and function of the state, Marx contends, is based on private ownership; it is an organ of class domination, controlled by the capitalists and directed toward the oppression of the laboring class. The state and private ownership of the means of production must be abolished, and mankind must return to the original system of communism.

Evaluation. Marx's theory of the exploitation of the masses is an *over-generalization*; the middle classes are not exploiters. He confuses 'abuse' and 'proper use.' In principle, he admits the right of private ownership, so far as the workers are concerned.

4. *Revolution and Dictatorship*. Communism advocates the overthrow of the present economic system and the capitalistic state through *international revolution*. Once this overthrow is accomplished, communism will establish the *dictatorship of the proletariat* as a transitional state organization preparing the way for communism proper. The means of production will be socialized.

Evaluation. Communists blame private ownership for all exploitation and injustice perpetrated by capitalism against the masses. They fail to see that *things* are good, while *men*

are bad. The need is not abolition of private property, but reformation of man.

5. *International Communism*. After capitalistic society is completely replaced by the communistic dictatorship of the proletariat, and after the latter has completely re-educated mankind to the communistic ideal, the state and all classes will wither away and the *stateless, classless society* of true communism will prevail. This will be the worker's paradise.

Evaluation. The theory of this stateless, classless society is *utopian* and *unrealistic*, being based upon ignorance of human nature. The communistic *standard of living* in the classless age will be: each will work according to his capacity; each will receive according to his needs. The standard is too vague and impractical, because there will be no one to determine the 'capacity' and the 'needs' of all.

Communism is a materialistic version of the Messianic redemption and restoration of the human race, with Marx as the Hegelian Messiah.

GLOSSARY

ABORTION. The expulsion of a living fetus from the mother's womb before the fetus is viable. If abortion is induced intentionally, when the mother is in serious danger because of the existing pregnancy, it is called 'therapeutic abortion.'

ABORTION, INDIRECT. An abortion which is the secondary effect of an otherwise licit action which is the primary object of the intention.

ABORTION, THERAPEUTIC. See Abortion.

ABSOLUTE. As an adjective, without condition or restriction. As a noun, the unconditioned, the ultimate ground of reality.

ABSTINENCE. As a species of the cardinal virtue of temperance, moderation in the use and enjoyment of food and non-intoxicating drink.

ACCESSION. The acquisition of ownership by means of some addition to one's property.

ACT, ACTUALLY VOLUNTARY. An act in which the intention is present here and now, effectively influences the act, and is consciously before the mind during the performance of the act.

ACT, COMMANDED. See Act, Imperate.

ACT, DIRECTLY VOLUNTARY. An act which is the immediate object of the will's striving and as such is immediately caused by the will. An act voluntary in itself.

ACT, ELICITED. An act begun and completed in the will as its sole agent.

ACT, EXPRESSLY VOLUNTARY. An act in which the consent is manifested externally by some word or sign.

ACT, FORMALLY GOOD OR EVIL. An act is said to be formally good or evil in so far as it is viewed to be such by the individual's conscience, even if his conscience is erroneous in its judgment. Thus, if a good act is erroneously judged by an individual's conscience to be evil, the act is materially good but formally evil; if an evil act is erroneously judged by an individual's conscience to be good, it is materially evil but formally good. See Act, Materially Good or Evil.

ACT, HABITUALLY VOLUNTARY. An act in which the intention was made at some former time and never retracted, but its power of causality does not exist here and now, so that the present act can no longer be considered as being influenced by it.

ACT, HUMAN. An act proceeding from the deliberate free will of man.

ACT, IMPERATE. An act begun in the will but completed through the medium of other powers or faculties under the command and control of the will.

ACT, IMPERFECTLY VOLUNTARY. An act in which voluntariness is imperfect, either because the advertence of

the mind to the act is incomplete and only partially present or because the will does not give full consent.

ACT, INDIRECTLY VOLUNTARY. An act which has as its object the effect of an object immediately willed, provided it is foreseen that this effect will follow out of this cause. An act voluntary in cause.

ACT, INTERPRETATIVELY VOLUNTARY. An act in which the intention to perform the act was never present and cannot have an influence upon the act; but the character of the person is such that one prudently judges an actual intention would be present, if the person had a proper understanding of the situation.

ACT, MATERIALLY GOOD OR EVIL. An act is said to be materially good or evil in so far as it agrees or disagrees with the norm of morality objectively in itself, independent of the judgment of the individual's conscience. If a good act is erroneously judged by an individual's conscience to be evil, it is materially good but formally evil; if an evil act is erroneously judged by an individual's conscience to be good, it is materially evil but formally good. See Act, Formally Good or Evil.

ACT, MIXED VOLUNTARY. An act in which an object is willed which pleases in some qualities but displeases in other qualities, so that there is a mixture of desire and repugnance, of voluntariness and involuntariness.

ACT, MORALLY INDIFFERENT. An act which, from the standpoint of its object, is neither morally good nor morally bad.

ACT, NEGATIVELY VOLUNTARY. An act of the will in virtue of which a person deliberately decides not to perform

a particular act but to omit it.

ACT OF MAN. An act not proceeding from the deliberate free will of man.

ACT, PERFECTLY VOLUNTARY. An act in which the preceding knowledge of the object and its circumstances is complete, so that the act is performed with full knowledge and full consent.

ACT, POSITIVELY VOLUNTARY. An act actually willed and performed.

ACT, PURE VOLUNTARY. An act in which the object willed is pleasing in all its qualities and is therefore willed with full consent and without any repugnance.

ACT, TACITLY VOLUNTARY. An act in which the consent is not manifested externally, but is indicated by some fact or the omission of some fact which entitles one to conclude that the consent is present.

ACT, VIRTUALLY VOLUNTARY. An act in which the intention was elicited at some former time, is present here and now, and influences the act to be performed, although the intention is not adverted to consciously during the performance itself.

ACT, VOLUNTARY IN CAUSE. See Act, Indirectly Voluntary.

ACT, VOLUNTARY IN ITSELF. See Act, Directly Voluntary.

ACTION. The exercise or operation of an operative power; the production of an effect. See Act.

ADORATION. An act whereby man expresses his acknowledgment of God's infinite greatness and majesty and of his utter dependence on God as his Creator and Master.

AFFABILITY. As a potential part of the cardinal virtue of justice, the virtue which regulates man's external conduct with others, so that he behaves toward them in a becoming manner.

AGNOSTICISM. The doctrine which denies the constitutional ability of the mind to know reality and concludes with the recognition of an Intrinsically Unknowable.

ANGER. As a capital vice, the excessive desire of revenge or an unreasonable opposition to a person or thing.

ANNIHILATION. The reduction of an existing being to nonexistence.

APPETENCY. The tendency of one thing toward another.

APPETENCY, CONCUPISCIBLE. The propensity to enjoy a good.

APPETENCY, IRASCIBLE. The propensity to fight an evil.

APPETENCY, RATIONAL. The will.

APPETENCY, SENSUOUS. The power in virtue of which a sentient being tends toward a consciously apprehended sensuous good and away from a consciously apprehended sensuous evil.

ASSOCIATIONISM. The doctrine that simple ideas are derived from the senses and that mental development proceeds entirely and exclusively through the combination of sensory elements according to the Laws of Association.

AUTHORITY. Viewed abstractly, the right to lead the members of a society toward the attainment of the common end to be realized by their association. Viewed concretely, the bearer of the right or power to lead the members of a society toward the attainment of the common end to be

realized by their association. In reference to the state, authority is the moral competence to issue commands and impose obligations in matters pertaining to the public welfare. Right of jurisdiction.

BEATITUDE. Supreme happiness. See Happiness.

BETTING. A bet is a contract by which two or more persons, disputing about the truth of a thing or about an event, agree among themselves that the winner of the dispute shall receive a reward.

BIRTH CONTROL. See Contraception.

BLASPHEMY. Contempt for God expressed in insulting thoughts or words.

BOURGEOISIE, In the theory of communism, the class of modern capitalists who own the social means of production and employ wage labor.

BOYCOTT. The concerted action of a group of persons, withholding patronage and purchase of goods from an individual or business concern, for the purpose of forcing the correction of unjust conditions; it is usually combined with deterring others from purchasing the goods of the boycotted individual or business concern.

BOYCOTT, SECONDARY. A boycott by which economic pressure is brought to bear on other businesses or industries to boycott an unjust employer under threat of boycotting these businesses or industries themselves if they refuse.

BUYING AND SELLING. A contract by which the two contracting parties mutually agree to deliver merchandise for a price.

CAPITALISM. The economic system in which the ownership of natural wealth, the production and distribution of commodities, the employment and remuneration of labor, and the organization and operation of the economic system itself, are affected and controlled by private enterprise under competitive conditions.

CAUSE. That which in any way whatever exerts a positive influence on the production of a thing.

CAUSE, EFFICIENT. That by which something is produced.

CAUSE, FINAL. That for the sake of which an efficient cause acts.

CAUSE, FORMAL. That through which a thing is made to be what it is.

CAUSE, MATERIAL. That out of which something becomes or is made. 329

CAUTION. As an integral part of prudence, the auxiliary virtue which avoids difficulties and obstacles in the performance of a moral action.

CELIBACY. Abstention from marriage; the status of being unmarried.

CERTITUDE. That mental state in which the mind gives a firm assent to a judgment without fear of the possibility of error, due to recognized valid reasons.

CHASTITY. As a species of the cardinal virtue of temperance, moderation in the use and enjoyment of the legitimate functions of sex.

CHOICE. The selection of definite means to achieve a specific end.

CIRCUMSPECTION. As an integral part of prudence, the auxiliary virtue which considers the circumstances attending an action.

CIRCUMSTANCE. As a determinant of morality, a circumstance is a condition superadded to the essence or nature of the moral act and affects its morality. Such circumstances are: who? what? where? by what means? why? how? when?

“CIVITAS MAXIMA.” World community, the family of nations.

CLEMENCY. As a potential part of the cardinal virtue of temperance, the virtue which inclines the will to forgive the faults committed against one’s self by others and to exact a lesser punishment (within the demands of reason) than the strict letter of the law requires.

CLOSED UNION. See Union, Closed.

COACTION. That property or quality of a right in virtue of which a person may use physical force, if necessary, to exact his just dues from anyone who seeks to prevent him from exercising his right.

COLLISION OF RIGHTS. An apparent conflict of rights which cannot be satisfied simultaneously.

COMMISSION. A contract by which one person accepts the agency to do business in the name of another.

COMMODATE. A contract by which a thing is turned over to someone with the right to use it for a certain time and with the obligation to restore it to the owner after use.

COMMUNISM. In general, the theory or system of social organization which advocates the common ownership of the means of production and the equal distribution of the

products of industry, In the Marxian (and Soviet) sense, it is the final stage of social perfection, following capitalism and state socialism, characterized by a stateless and classless society of free and equal men in which there will be no class antagonisms, no wars, no exploitation, no poverty, and no dissension, in which there will be an abundance of material goods owned in common, and in which everything will be regulated by the principle "from each according to ability and to each according to need."

COMMUNISM, ABSOLUTE. The doctrine which bans ownership of property in every form and which advocates the simple use of all goods.

COMPANY. A relatively simple form of partnership, in which the members assume the responsibility for the conduct of the business and share in the profits and losses.

CONCUPISCENCE. The natural tendency or inclination of sensuous appetency toward a consciously perceived sensuous good and away from a consciously perceived sensuous evil. It is a transitory impediment to voluntariness. See Passion.

CONCUPISCENCE, ANTECEDENT. The concupiscence which occurs prior to any act of the free will in its regard.

CONCUPISCENCE, CONSEQUENT. The concupiscence which occurs after an act of the free will in its regard.

CONFIDENCE. As a potential part of the cardinal virtue of fortitude, the virtue which inclines a person to be calm and collected in approaching dangers and difficulties.

CONSCIENCE. The immediate judgment of practical reason with respect to the character of individual acts as being permitted, commanded, or forbidden. Conscience is

the immediate subjective or manifestative norm of moral conduct.

CONSCIENCE, DOUBTFUL. Conscience in so far as the practical reason cannot reach a definite decision whether the contemplated action is good or evil.

CONSCIENCE, ERRONEOUS. Conscience in so far as its judgment disagrees with the objective norm of morality.

CONSCIENCE, RIGHT. Conscience in so far as its judgment agrees with the objective norm of morality.

CONSENT. The decision of the will to use the means necessary for bringing the intention into execution.

CONTINENCE. Abstention from the sexual act.

CONTINENCE, PERIODIC. See Rhythm.

CONTRACEPTION. The voluntary prevention of conception by the positive use of artificial means which hinder the generative cells from uniting during the sexual act.

CONTRACT. An agreement between two or more persons to transfer a right to do or not to do something.

CONTRACT, BILATERAL. A contract which imposes an obligation on both contracting parties.

CONTRACT, CONSENSUAL. One which is made essentially by the mere consent of the contracting parties.

CONTRACT, GRATUITOUS. A contract in which one party intends generosity, while the other party receives a favor.

CONTRACT, ONEROUS. A contract in which both contracting parties intend to obtain something to their advantage.

CONTRACT, REAL. One in which the contract is not essentially completed until some object has passed from the

hands of the one contracting party to the hands of the other.

CONTRACT, SOCIAL. The theory of J. J. Rousseau in which he maintains that the state came into existence through the free consent and 'social contract' of all concerned, whereby everyone grants all his individual rights and ruling power to the 'general will' embodied in the authority of the community.

CONTRACT, UNILATERAL. A contract which imposes an obligation upon only one of the contracting parties.

CONTROL, VOLUNTARY. The control which the will exercises over the powers and actions of the human organism.

CORPORATION. A group of persons treated by the law as a single juridical person, having rights or liabilities, or both, distinct from those of the persons composing the partnership and endowed by the law with the capacity of succession.

COVETOUSNESS. The excessive desire of worldly goods.

CRITERION. A rule or standard by which principles, facts, statements, and conduct are tested, so as to form a correct judgment concerning them.

CRITERION, MORAL. A rule or test by means of which we are able to discriminate between what is morally good and morally evil and to judge correctly that a particular act is morally good or morally evil.

CUSTOM. Usages, practices, standards, and codes which are common to certain groups or classes of people and which regulate their actions in social and religious affairs.

DELIGHT, ENJOYMENT (FRUITION). As an elicited act, the satisfaction of the will in the achievement of an end.

DEMOCRACY. A form of government in which the ruling power resides in the people themselves.

DEMOCRACY, DIRECT. A form of democracy in which every issue facing the political body is decided by all the members of the democracy.

DEMOCRACY, INDIRECT. A form of democracy in which the people exercise only an indirect control over government by means of the constitutional election of representatives to whom they delegate the direct rule.

DEPOSIT. A contract by which something is taken over by a person to be guarded and to be returned later to its proprietor in its natural condition.

DESIGNATION. The doctrine that the bearer of public authority in the politically organized community is determined neither by the natural law nor by the consent of the people forming the state, but by the nature of the historically given circumstances.

DETERMINANTS, ETHICAL (MORAL). The factors which determine the morality of a concrete individual human act. They are: the object, the circumstances, and the end of the agent.

DICTATORSHIP OF THE PROLETARIAT. In the theory of communism, a political state with a power founded solely on the armed force of the masses. It is a transition organization, leading from capitalism to communism proper, and communists refer to it as 'state socialism.'

DISEASES, MENTAL. Disorders and abnormalities of the brain and nervous system, resulting in disturbances in the

sensory powers of knowledge and appetency and involving indirectly a consequent disturbance in the proper functions of the intellect and will. A mental disease is a permanent impediment to voluntariness.

DIVINATION. The attempt to foretell or to acquire knowledge of future events by evidently insufficient means.

DIVINE RIGHT OF KINGS. The theory that the supreme political power is conferred on the ruler by a special act of God, so that he rules by divine law.

DIVORCE, IMPERFECT. Separation from bed and board, so that husband and wife are freed from their marital community life, although the matrimonial bond remains intact.

DIVORCE, PERFECT. The dissolution of the matrimonial bond, so that husband and wife are free to marry again during the lifetime of the other.

DOCILITY. As an integral part of prudence, the auxiliary virtue of responsiveness to outside instruction concerning right means in a moral action.

DOMAIN, EMINENT. The superior dominion of the state over all property whereby it has the authority to appropriate and dispose of the property of its subjects, adequate compensation being made to the private owners whenever possible, for the necessary purposes of public welfare.

DOMAIN, PRIVATE. The proprietary dominion or the right of private ownership. See Ownership.

DONATION. An act by which one person gratuitously transfers the perfect dominion of all or part of his property to another.

DOUBLE EFFECT. See Effect, Double.

DOUBT. That state of mind in which a suspended judgment ensues, due to the mind's inability to decide whether the judgment is true or false.

DUEL. A conflict between two individuals, undertaken by mutual agreement and fought with weapons capable of inflicting serious wounds or death.

DUTIFULNESS. As a potential part of the cardinal virtue of justice, the virtue which urges man to render proper respect and obedience unto his parents (including relatives) and his country, because he owes them his existence and sustenance. Also called 'piety.'

DUTY. In the passive sense, duty is an action or omission of an action to which one is obligated by justice. In the active sense, duty is the moral obligation to do something or to omit something in favor of another according to the demands of strict justice. See Right.

EDUCATION. The development of the total personality in accordance with right reason.

EFFECT, DOUBLE. Mixed effects, one good and the other bad, issuing from the same act.

EMOTION. An affective mental state of the animal organism, following the cognition of an object or situation, characterized by strong feeling, by an impulse to action, and by physiological changes in bodily function.

EMPIRICISM. The doctrine that all human knowledge is derived from the data of particular states of consciousness, so that experience is the exclusive source and criterion of all knowledge.

END. In ethics, an end is that for the sake of which an advertent intellect and a free will act; purpose; that which an advertent intellect and a free will intend in their action; that which man intends when he acts intelligently and freely.

END, ABSOLUTELY ULTIMATE. The last end of all proximate and intermediate ends in every series, so that no further ulterior end or purpose can be conceived for which to tend.

END, ACCESSORY. See End, Secondary.

END FOR WHICH (WHOM). The thing or person that is to benefit by the acquisition or realization of the 'end which' is acquired or realized.

END, INTERMEDIATE. A remote end to which some other end is referred, while it is itself referred to some ulterior end.

END, NATURAL. An end which is such that it lies within the tendencies and powers of the nature of the agent to strive for this end and to realize it.

END, OBJECTIVE. The object or thing itself which is striven for and realized as the result of purposive action.

END OF THE ACT. That particular end which is present in the act itself and which the act as such tends to realize because it is this particular kind of act. *Finis operis*.

END OF THE AGENT. The end or purpose which induces the agent as a motive to perform this particular kind of act. *Finis operantis*.

END, PRIMARY (PRINCIPAL). The main one among two or more ends which actuate an agent (efficient cause) and is sufficient of itself to make the agent act.

END, PRINCIPAL. See End, Primary.

END, PROXIMATE. An end that is referred to some ulterior end, but has no other end referred to it.

END, RELATIVELY ULTIMATE. An end that is the last end in a particular series of ends.

END, REMOTE. An end to which one or more ends are referred.

END, SECONDARY (ACCESSORY). An end intended together with a primary end, without however exerting the same potent influence on the action of the agent.

END, SUBJECTIVE. The possession of the objective end and the personal satisfaction or happiness which accompanies this possession.

END, SUPERNATURAL. An end which is such that it lies beyond the tendencies and powers of the nature of an agent to strive for this end and to realize it.

END, ULTIMATE. A remote end to which one or more ends are referred, while it is not itself referred to any other end.

END WHICH. The good itself which is striven for as the end to be realized by the efficient cause (the 'agent') through the action.

ENDURANCE. As a potential part of the cardinal virtue of fortitude, the virtue which inclines the will to steel itself in the struggle for the moral good by faithfully overcoming all the difficulties which arise from the very nature of the struggle.

ENERGISM. One of the forms of 'the New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously

directed toward the perfection of the individual and the attainment of maximum happiness for mankind.

ENJOYMENT. See Delight, Fruition.

ENVY. Displeasure over another's good qualities or good fortune because it lessens one's own glory and importance.

ERROR. Discomformity (disagreement) between intellect and thing.

ETERNITY. Endless duration.

ETHICS. The philosophical science of human conduct in so far as conduct is viewed as good or bad, right or wrong. Moral philosophy, philosophical morals.

ETHICS, GENERAL. That part of ethics which treats of the moral concepts, judgments, and principles which are basic to the entire moral order.

ETHICS, SPECIAL. That part of ethics which applies the general moral concepts and principles to the various situations of life in which man finds himself, so as to define and determine his rights and duties more in detail.

EUBULIA. As a potential part of prudence, the proficiency in discovering the proper means to the end in a moral action.

EUDARMONISM. The ethical system which considers earthly happiness to be the ultimate end of man and the standard according to which man must judge what is morally good or evil.

EUDAEMONISM, SOCIAL. See Utilitarianism.

EUDAEMONOLOGY. That part of ethics which treats of the supreme happiness, or beatitude, of man.

EUTHANASIA. The art or practice of painlessly putting to death a person suffering from a marked deformity or

from an incurable and distressing disease.

EVIL. Whatever is unsuitable for a natural tendency or appetency; the privation of a required good.

EVIL, APPARENT. The privation of an apparent good.

EVIL, INTRINSIC. That which is evil by nature; it is always and under all conditions evil.

EVIL, MORAL. Something unsuitable for a rational being according to the demands of the moral law; the privation of the proper relation between an action or its omission and the moral law.

EVIL, PHYSICAL. The privation of a physical good.

EVIL, REAL. The privation of a real good.

EVOLUTION, EMERGENT. The theory that nature is the product of evolution in such a manner that entirely new and unpredictable properties originate through synthesis and thereby form new and higher levels of reality.

EVOLUTION, ORGANIC. The theory according to which the various species and types of animals and plants derive their origin, not through distinct and separate creative acts of God, but through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws.

EVOLUTION, PURPOSIVE. The doctrine that the Supreme Intelligence (God) endowed nature with a purpose and with the necessary principles of action to realize this purpose through evolution.

EXCHANGE. A contract by which money of one kind is changed into money of another kind with a moderate fee for the service rendered.

FAIRNESS. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to overlook the mere letter of the law in man's dealings with others, whenever higher considerations of justice so demand.

FAMILY. The natural society of father, mother, and child.

FEAR. An affective state of the mind in virtue of which a person shrinks from an impending evil considered to be difficult or impossible to avoid. It is a transitory impediment to voluntariness.

FEAR, ANTECEDENT. A fear which is the real cause of an action, so that the person is said to act 'out of fear.'

FEAR, CONCOMITANT. A fear which accompanies an action, but the action itself is produced by a different cause, so that the person is said to act 'with fear.'

FEAR FROM WITHIN. The fear which exists in a person who, because of the imminence of the evil, decides on a certain action himself; otherwise he would not so decide.

FEAR FROM WITHOUT. The fear which is caused by another person threatening an evil unless the action is performed.

FEELING. An elementary mental state characterized by pleasantness or unpleasantness.

"FINIS OPERANTIS." See End of the Agent.

"FINIS OPERIS." See End of the Act.

FORESIGHT. As an integral part of prudence, the auxiliary virtue which arranges everything necessary for the attainment of the end in a moral action.

FORMAL. Applied to goodness, as understood by many ethicists, formal goodness is the goodness inherent in the act itself, irrespective of its consequences.

FORMALISM, ETHICAL. A system of ethics which maintains that goodness inheres in the act as such, irrespective of the consequences of the act. Since intuitionism looks toward the formal goodness of acts, it is often referred to as 'ethical formalism'; in a similar manner, Kant's ethical theory is styled 'formalism.'

FORMALISM OF KANT. As a system of ethics, Kant's formalism is based on the intrinsic objective norm of human nature. The will is autonomous, a law unto itself. Actions are morally good only if performed because of duty; duty is the obligation to act from pure reverence for law. The norm of morality is the categorical imperative: "Act in conformity with that maxim, and that maxim only, which you can at the same time will to be a universal law." The consequences of an act are outside the scope of the moral law.

FORMAL OBJECT. See Object, Formal.

FORTITUDE. The moral virtue which inclines the will to overcome grave danger and sustain severe hardship in the pursuit and maintenance of the moral good.

FREE WILL. The ability of the will, all conditions for action being present, to decide whether to act or not act and whether to act in this manner or in that manner.

FREEDOM. In the widest sense, the absence of external coercion or restraint; in the strict sense, the absence of intrinsic necessity or determination in the performance of an act on the part of the will.

FRUITION. As an elicited act, the satisfaction of the will in the achievement of an end.

GAMBLING. A contract by which two or more persons, engaged in a game of chance, agree among themselves that the winner of the game shall receive a certain reward.

GLUTTONY. Excessive love of the pleasures of the palate.

GNOME. As a potential part of prudence, proficiency in finding the proper solution in extraordinary and difficult cases according to principles of a higher order which demand exceptional insight or perspicacity of judgment.

GOOD. Whatever is suitable for a being. That which a being desires.

GOOD, ABSOLUTE. Good without qualification or condition. Usually taken in the sense of 'ontological good,' 'objective good,' 'good in itself.

GOOD, ABSOLUTELY ULTIMATE OBJECTIVE. That supreme good through the acquisition and possession of which man obtains his supreme happiness.

GOOD, ABSOLUTELY ULTIMATE SUBJECTIVE. The supreme happiness which man obtains through the acquisition and possession of the supreme objective good.

GOOD, APPARENT. Something that is judged to be good for a being, but is actually not good for it.

GOOD, INTRINSIC. That which is good by nature; it is always and under all conditions good.

GOOD, MORAL. A good which has everything demanded of it by the moral law.

GOOD, ONTOLOGICAL. A thing as good in its very entity or reality.

GOOD, PHYSICAL. That which is good for physical well-being; a good which satisfies the demand of the nature of a being.

GOOD, REAL. Something that is judged to be good for a being and actually is good for it.

GOOD, RELATIVE. Good with reference to another being, in the sense that something is suitable for another being.

GOODNESS, FORMAL. As understood by many ethicicians, the goodness of the act as such; goodness, considered as inherent in the act, irrespective of its consequences.

GOODNESS, MATERIAL. As understood by many ethicicians, material goodness is the goodness of the act in its results; if the consequences of the act are good, then the act itself is considered good. Among the ethical theories based on the extrinsic norm of the consequences of action are hedonism, utilitarianism, and evolutionary naturalism.

GOVERNMENT. In an active sense, it is the ruling and administration of the political body. In a passive sense, it is the actual organization through which the activities of the state are carried out.

GRATITUDE. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to be mindful of favors received and to seek to render favors in return.

HABIT. A facility and readiness of acting in a definite manner, acquired by the frequent repetition of a certain kind of act. It is a permanent impediment to voluntariness.

HAPPINESS. As defined by Boethius, a state made perfect by the aggregation of all good things. The possession of all good consonant with man's nature.

HEDONISM, EGOISTIC. The ethical system which is based on the extrinsic norm of the usefulness of an act in

promoting individual human happiness. Happiness consists in pleasure.

HEDONISM, UNIVERSALISTIC. See Utilitarianism.

HIRING. See Renting and Hiring.

HOLDING COMPANY. A company which owns and controls the stocks or securities of a number of companies or corporations.

HOPE IN GOD. As a potential part of the cardinal virtue of justice, the virtue which enables man to expect confidently that he will always obtain the means necessary to achieve ultimate happiness.

HUMANISM. An attitude of thought or action, whether arranged into a system or not, centering upon distinctively human ideals, usually in contrast to religious or naturalistic interests. In ethics, one of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind.

HUMILITY. As a potential part of the cardinal virtue of temperance, the virtue which inclines the will away from seeking greater honor and estimation than one deserves.

IDEALISM. In general, the doctrine which holds that the being of things is conditioned by their being known; consciousness is constitutive of its objects; the being of sensible things is simply their being sensed, and their true characters are their sensed characters; the world we know is the world of our perceptual content; the mind of man cannot transcend its own internal, conscious states.

IDEALISM, DIALECTICAL. The doctrine which holds that reality is constituted of logical ideas (logical entities), so that we have direct knowledge of reality in the ideas of logical thought.

IDIOCY. Extreme deficiency of intelligence, commonly due to an undeveloped or abnormally developed brain. It is a permanent impediment to voluntariness.

IDOLATRY. The giving of divine honor to a creature.

IGNORANCE. The lack of required knowledge. It is a transitory impediment to voluntariness.

IGNORANCE, AFFECTED. An ignorance which is willed directly in itself by a person who does not desire to have his ignorance removed.

IGNORANCE, ANTECEDENT, OF THE ACTION. An ignorance which precedes the will's decision and is the (negative) cause of the action, so that the action is performed through ignorance and on account of ignorance.

IGNORANCE, ANTECEDENT, OF THE WILL. An ignorance which precedes the decision of the will and is independent of the decision of the will.

IGNORANCE, CONCOMITANT, OF THE ACTION. An ignorance in which the action is performed in and with ignorance, but not through ignorance and on account of ignorance.

IGNORANCE, CONSEQUENT, OF THE WILL. An ignorance which follows from the decision of the will and is dependent on the decision of the will.

IGNORANCE, CRASS (SUPINE). The ignorance of a person who uses hardly any reasonable diligence to remove the ignorance.

IGNORANCE, INVINCIBLE. An ignorance that cannot be removed.

IGNORANCE, MORALLY INVINCIBLE. An ignorance which cannot be removed by any reasonable effort normally made under the circumstances by prudent and conscientious persons.

IGNORANCE, PHYSICALLY INVINCIBLE. An ignorance which cannot be removed at all, because the person is totally unaware of the presence of ignorance in his mind.

IGNORANCE OF FACT. Lack of the knowledge of the necessary conditions required for the application of the law to a particular situation.

IGNORANCE OF LAW. Lack of the knowledge of the existence of the law or the content of the law.

IGNORANCE, SIMPLY VINCIBLE. The ignorance of a person who uses some diligence, but not a sufficient amount to remove the existing ignorance.

IGNORANCE, SUPINE. See Ignorance, Crass.

IGNORANCE, VINCIBLE. An ignorance which can be dispelled with the diligence and effort customarily applied by prudent and conscientious persons under the given circumstances.

IMMORTALITY. Endless duration of life.

IMPEDIMENTS. With reference to human acts, those factors which impair perfect knowledge and perfect consent in moral matters. Such impediments may be either transitory or permanent.

IMPEDIMENTS, ACTUAL. See Impediments, Transitory.

IMPEDIMENTS, PERMANENT. Impediments to the human act which lessen or prevent the advertence of the

intellect and the exercise of the freedom of the will in such a manner that a more or less stable condition of involuntariness results in a person. Such permanent impediments are: infancy, idiocy, moronism; propensities and habits; mental diseases.

IMPEDIMENTS, TRANSITORY. Impediments which affect individual human acts, lessening or preventing the exercise of freedom in their regard. Actual impediments. They are ignorance, concupiscence or passion, fear, and violence.

IMPUTABILITY. That property of moral acts in virtue of which these acts are attributed to a person as his own, because he is their author and cause.

INDIFFERENTISM. Practical indifferentism is the actual neglect of one's religious duties. Theoretical indifferentism is the mental attitude and conviction that a person can fulfill his religious obligation in any type of religion.

INDISSOLUBILITY OF MARRIAGE. See Marriage, Indissolubility of.

INDIVIDUALISM. In general, the doctrine or system which stresses the reality and importance of the individual. The laissez-faire system of competition in political economy.

INDIVIDUALISM, ECONOMIC. The doctrine or system which maintains the political and economic independence of the individual and emphasizes the necessity of the complete liberty of individual initiative, action, and interests, especially in industry and business.

INFANCY. That period in the life of the individual human person which extends from conception to the time when the

age of reason and discretion is reached. It is a permanent impediment to voluntariness.

INSURANCE. A contract by which one of the contracting parties obligates himself, upon the payment of a premium, to compensate another for any damage or loss in his person or property resulting from some untoward event.

INTELLECT. The spiritual power to form concepts, judgments, and inferences.

INTELLIGENCE. As an integral part of prudence, the auxiliary virtue that pertains to present items which contribute to the judgments of a moral action.

INTENTION. The active striving of the will for the attainment of a particular good.

INTUITION. A mental process of direct and immediate apprehension. Applied to ethics, it means the direct and immediate perception of human conduct as good or evil, so that the knowledge of the distinction between good and evil conduct is not the result of an intellectual process or reasoned judgment, but of a special perceptual faculty or sense. The system of ethics based on intuition as the norm of morality is called 'intuitionism.'

INTUITIONALISM. See Intuitionism.

INTUITIONISM. The system of ethics based on intuition as the norm of morality. See Intuition. It claims that man possesses a distinct faculty or power or sense which, through its own immediate perception, is the criterion of what is right and wrong, good and bad, in human conduct. Intuition is thus the intrinsic subjective norm of morality.

IRRELIGION. An attitude or act whereby a person refuses to render unto God the reverence which is His due

or whereby a person dishonors Him.

“JUS GENTIUM.” See Law of Nations.

JUSTICE. The moral virtue which inclines man’s will to render unto each his due. As a cardinal virtue, it inclines man’s will to render unto other rational beings that which they have the right to demand as their due.

JUSTICE, COMMUTATIVE. The cardinal virtue of particular justice which orders the dealings of one individual with the other individual and sees to it that each one receives strictly what is his own.

JUSTICE, DISTRIBUTIVE. The cardinal virtue of particular justice which orders the dealings of society toward its members and inclines those in government to distribute equitably the common goods and burdens among the members of the commonwealth and inclines the latter to be contented with their share of the social goods and burdens assigned to them.

JUSTICE, GENERAL. See Justice, Legal.

JUSTICE, LEGAL. The virtue which regulates the actions of the individual in his relations to the commonwealth or community to which he belongs as a member.

JUSTICE, PARTICULAR. The cardinal virtue of justice which regulates the actions of an individual in his relations to private persons and inclines his will to render unto everyone his due in the equivalent of value.

LABOR. Human industry which produces goods of some sort.

LAST WILL. See Testament.

LAW. A rule or norm according to which something is drawn toward an action or restrained from an action.

LAW, AFFIRMATIVE. A law of command obligating a person to perform a definite positive act.

LAW, DIVINE. A law which emanates from God as the legislator.

LAW, ETERNAL. The plan of God's wisdom directing all created things toward the realization of their natural end. The rational will of God commanding the preservation of the natural order and prohibiting its violation.

LAW, HUMAN. A law enacted by legitimate human authority.

LAW, INTERNATIONAL. The code of laws which determine the rights and duties of sovereign states and their citizens in their mutual relations and conduct.

LAW, MORAL. A rule or norm governing the free actions of man relative to moral obligation. An ordinance of reason directed toward the common good and promulgated by the one who has the care of the community.

LAW, NATURAL. A law manifested by the natural light of human reason reflecting on the fundamental principles of morality. The moral law, manifested by the natural light of reason, demanding the preservation of the natural order and forbidding its violation; the binding norms of moral actions, in so far as these norms are manifested by mere reason.

LAW, NEGATIVE. A law of prohibition obligating a person to refrain from performing a definite act.

LAW OF NATIONS. International private law dealing with the rights and duties of the individuals belonging to

various national groups. Jus gentium.

LAW, PENAL. A law which imposes a penalty upon violation.

LAW, PERMISSIVE. A law which allows a person to perform a certain act without hindrance from others.

LAW, POSITIVE. A law enacted by legitimate authority, such as the state, supplementing the provisions of natural law and made in view of the special needs of the community.

LAW, PUNITIVE. See Law, Penal.

LAW, TEMPORAL. A law enacted in time by human authority through legislative channels.

LIBERALISM, ECONOMIC. The doctrine or system which maintains that the sole regulative principle of economic life is the law of supply and demand and free competition in the market place. In applying the principle of laissez faire, it demands freedom of trade, freedom of contract, freedom of competition in the open market, freedom for operation of the economic laws of supply and demand, freedom from interference and restraint on the part of organized social groups and the government.

LIBERALITY. As a potential part of the cardinal Virtue of justice, the virtue which inclines one's will to give gladly of one's earthly goods to others.

LIE. The telling of an untruth, so that there is a contradiction between what a person thinks and says. Contradiction between a person's thought and speech.

LIE, FORMAL. Contradiction between a person's conviction and speech, when he is conscious of the contradiction; a conscious and deliberate statement

contrary to one's subjective judgment, whether this subjective judgment be objectively true or false.

LIE, JOCOSE. One made in jest, in order to amuse someone.

LIE, MATERIAL. Contradiction between a fact and a person's statement of the fact, but the person is unconscious of the contradiction.

LIE, OFFICIOUS. One in which a person seeks to gain some advantage or avoid some difficulty, be it for one's own self or for another, without thereby inflicting any harm upon another.

LIE, PERNICIOUS. One in which a person not only deliberately attempts to deceive another, but also seeks to inflict harm upon him by means of the lie.

LIKING. See Wish.

LIMITATION OF RIGHTS. That property whereby the exercise of one right is curtailed by some other right.

LOAN. A contract by which the ownership of an object consumable in first use is transferred to another with the obligation that an object of a similar nature and quality be returned at some specified time.

LOCKOUT. An act whereby the employer shuts down his business or plant as a protest against what he considers to be the unjust demands of those of his workers who are striking.

LOTTERY. A contract by which a person, upon payment of a certain sum of money, acquires the right of obtaining an article or money, if the chance he holds wins.

LOVE OF GOD. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to love God for

His own sake and to prefer Him as the supreme good to all temporal goods.

LOVE OF MORAL TRUTH. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to act toward others in word and deed with truthfulness and faithfulness.

LUST. The excessive desire of sexual enjoyment.

LYNCH LAW. The practice or act of meting out punishment by private persons to guilty or suspected persons without due process of law.

MAGIC. The endeavor to produce effects transcending human powers by inadequate means or by some means other than the power of God.

MAGNANIMITY. As a potential part of the cardinal virtue of fortitude, the virtue which inclines a person to be generous-hearted in undertaking difficult assignments.

MAGNIFICENCE. As a potential part of the cardinal virtue of fortitude, the virtue which inclines the person of wealth to carry out large projects for the alleviation of distress and the promotion of human welfare.

MARRIAGE. The permanent union, lawfully formed, of man and woman for the procreation of children and their proper education. Conjugal society.

MARRIAGE, INDISSOLUBILITY op. That essential property of marriage in virtue of which the conjugal bond between husband and wife cannot be dissolved or broken by any human power during the lifetime of either of the two.

MARRIAGE, UNITY OF. That property which demands that only one man be married to only one woman simultaneously.

MATERIAL OBJECT. See Object, Material.

MATERIALISM. A naturalistic form of philosophy which finds the ultimate explanation of all phenomena, physical and psychical, in the nature and activity of universal matter or force.

MEEKNESS. As a potential part of the cardinal virtue of temperance, the virtue which moderates anger and the desire for revenge, so that we may avoid vindictiveness.

MELIORISM. The belief or teaching that the world tends to become better in the course of time and that man can assist in its betterment. As an ethical doctrine, it is one of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind.

MERCY KILLING. See Euthanasia.

METAPHYSICS. The science of the ultimate principles and properties of real beings.

MODESTY. As a potential part of the cardinal virtue of temperance, the virtue which regulates external deportment and makes us strive for becoming behavior in movement, speech, posture, dress, and amusements.

MONARCHY. A form of government in which one person possesses the supreme rule over the political community.

MONARCHY, ABSOLUTE. A monarchy in which the monarch's rule is complete in every respect, so that his

word is the sole law of the realm.

MONARCHY, CONSTITUTIONAL. A monarchy in which the monarch's power is curtailed by a constitution.

MONARCHY, LIMITED. A monarchy in which the monarch's power is curtailed in some respects.

MONARCHY, PARLIAMENTARY. A monarchy in which the monarch's power is curtailed by a parliament, in as much as the parliament possesses partial governmental power.

MONISM. The doctrine which seeks to deduce all the varied phenomena of both the physical and psychical worlds from a single principle which is in a continuous state of evolution; specifically, the metaphysical doctrine which holds that there is but one substance, either mind (idealism) or matter (materialism) or a neutral substance that is neither mind nor matter but is the substantial ground of both.

MONOPOLY. The exclusive control of the supply of a particular commodity in a given market.

MORALITY. That property of human acts in virtue of which they are said to be 'good' or 'evil,' 'right' or 'wrong.' The 'rightness' and 'wrongness' of human acts.

MORALITY, INDEPENDENT. The doctrine that man can lead a truly moral life without natural or supernatural religion.

MORALITY, OBJECTIVE. The conformity or disconformity of a particular human act and its object with the objective proximate and ultimate norm, irrespective of our judgment.

MORALITY, PERSONAL. See Morality, Subjective.

MORALITY, SUBJECTIVE. The conformity or disconformity of a particular act and its object with the

objective norm of morality, according to our judgment.

MORALITY , THE NEW. A trend in recent ethics which is decidedly teleological in character, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind. Typical of this new morality are the names 'self-realization,' 'energism,' 'total self-development,' 'idealistic perfectionism,' 'cultural progress,' 'humanism,' 'meliorism,' and 'value ethics.'

MORAL PHILOSOPHY. See Ethics.

MORONISM. A state of moderate feeble-mindedness. It is a permanent impediment to voluntariness.

MURDER. The intentional and unlawful killing of a person.

NATIONAL SOCIALISM. See Socialism, National.

NATURALISM. The doctrine that scientific knowledge of physical objects is the final and only legitimate form of knowledge.

NATURALISM, EVOLUTIONARY. A system of ethics which combines the principles of utilitarianism and evolution, seeking to explain the rise and development of morality through organic evolution. Basically, it is a form of utilitarianism. The welfare of human society is the norm and criterion for determining what is morally good or bad. See Utilitarianism.

NEIGHBORLY LOVE. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to be benevolent toward one's fellow men because they have the same human nature and ultimate end.

NORM. An authoritative standard which serves as a pattern or model to which things of a similar nature must conform.

NORM, MORAL. An objective standard or rule or principle which determines the morality of an act in itself.

NORM OF MORALITY. See Norm, Moral.

NORM OF MORALITY, PROXIMATE. The immediate norm, available to all persons, used as a standard with which to compare human acts for the purpose of judging their morality. In the case of human acts it is the nature of the whole man.

NORM OF MORALITY, ULTIMATE. The final, most basic norm which is the ground and reason why human acts are morally good or evil. The ultimate norm or standard for judging the morality of any human act is God's nature and perfections.

OATH. The calling upon God as a witness to the truth of a statement or of the intention to fulfill a promise.

OBJECT, FORMAL. That specific aspect of the general subject matter (material object) which is the proper object of a particular science and which distinguishes this science from all others. In ethics, it is the 'rightness' and 'wrongness,' the 'goodness' and 'badness,' of human conduct.

OBJECT, INCIDENTALLY EVIL. An object which is evil because of a precept.

OBJECT, INCIDENTALLY GOOD. An object which is good by reason of a precept.

OBJECT, INTRINSICALLY EVIL. An object by nature evil; it is always and under all conditions evil.

OBJECT, INTRINSICALLY GOOD. An object by nature good; it is always and under all conditions good.

OBJECT, MATERIAL. The general subject matter which a science treats in its investigation. In ethics, it is the conduct of man, the acts controlled by the will, 'human acts' as distinguished from 'acts of man.'

OBJECT OF THE MORAL ACT. That which the will intends directly and primarily.

OBLIGATION. The necessity, based on intelligent motivation, of obeying the prescription of a law. The moral necessity to do the good and avoid the evil, based on the knowledge that God, our Supreme Good, demands the observance of the law and forbids its deliberate violation.

OBSERVANCE. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to render honor and submission unto those who occupy positions of authority in the commonwealth.

OCCUPANCY. See Occupation.

OCCUPATION. The effective seizure and possession of an ownerless object with the intention of making it one's property.

OLIGARCHY. A form of government in which the ruling authority is vested in a few persons or in a privileged group.

OWNERSHIP. The exclusive right to control and dispose of some thing as one's own according to one's will.

PACT OF SUBMISSION. The pact or consent in virtue of which a politically organized people transfers the political power from the people to a particular person or group as their chosen ruler.

PARTNERSHIP. A contract by which two or more competent persons place their money, effects, labor, and skill, or at least some of these items, in lawful commerce or business, with the agreement that the profits and losses shall be shared between them in definite proportions.

PASSION. The emotional excitement which normally accompanies the sensuous appetency in its activity of striving for a sensuous good and of avoiding a sensuous evil. It is a transitory impediment to voluntariness. See Concupiscence.

PASSION, ANTECEDENT. The passion which occurs prior to any act of the free will in its regard.

PASSION, CONSEQUENT. The passion which occurs after an act of the free will in its regard.

PATIENCE. As a potential part of the cardinal virtue of fortitude, the virtue which inclines the will to accept with resignation the existing trials and sufferings.

PERFECTIONISM (SELF-REALIZATION). As a system of ethics, perfectionism, or self-realization, maintains that the total perfection of man is the end of all ethical striving.

PERFECTIONISM, IDEALISTIC. One of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the maximum happiness of mankind.

PERSEVERANCE. As a potential part of the cardinal virtue of fortitude, the virtue which inclines the will to go steadily forward in an undertaking, notwithstanding all the difficulties which endanger it from without.

PERSON. An intellectual hypostasis, that is, an individual, complete, subsistent, intellectual substance.

PERSON, MORAL. A society or organized group of persons capable of rights and duties.

PERSON, PHYSICAL. Any living person, considered as an individual.

PHILOSOPHY. The science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason alone.

PHILOSOPHY, MORAL. See Ethics.

PIETY. As a potential part of the cardinal virtue of justice, the virtue which urges us to render proper respect and obedience unto one's parents (including relatives) and one's country, because we owe them our existence and sustenance. Dutifulness.

POLYANDRY. A form of polygamy in which one woman has more than one husband.

POLYGAMY. A marriage in which one person simultaneously possesses more than one mate.

POLYCYN. A form of polygamy in which one husband has more than one wife.

POSITIVISM. A form of naturalism which denies the legitimacy of philosophical problems and methods and claims that science is the only knowledge which is exact and ultimate. In the philosophy of law, the system which maintains that the only valid law is positive law, excluding any higher law such as natural law.

POSITIVISM, LEGAL. The system, as a philosophy of law, which repudiates the concept of natural law as being 'metaphysical' and maintains that the philosophy of law

must restrict itself to an analysis of positive law as it actually exists in the statutes.

POSITIVISM, MORAL. The system which denies the natural (intrinsic) distinction between the morally good and the morally evil and claims that this distinction is derived solely from the free and positive enactment of authority. When the distinction is based on the enactments of human authority, moral positivism is anthroponomic; when based on divine authority, theonomic.

POSTULATE. A proposition which is either self-evident or which is taken over without proof by one science from another science because it has been proved by this other science.

POSTULATE, EPISTEMOLOGICAL. For ethics, the proposition that human reason is a reliable and trustworthy source and instrument of true and certain knowledge.

POSTULATE, PSYCHOLOGICAL. For ethics, the proposition that man is a rational organism composed of matter and a spiritual soul united into a unitary nature, endowed with intellect and free will.

POSTULATE, THEODICIAN. For ethics, the proposition that God exists and is infinitely intelligent, good, and just.

POWER. The right of coercion. In reference to the state, power is the legal competence to enforce obedience to commands and fulfillment of obligations.

POWER, EXECUTIVE. The competence of the government to establish and maintain the agencies necessary to carry out the laws.

POWER, JUDICIAL. The competence of the government to restore the legal order when disturbed.

POWER, LEGISLATIVE. The right of the government to enact laws which are norms of action for the citizens.

PRAYER. Conversation with God for the purpose of honoring Him.

PRESCRIPTION. The acquisition of ownership or the discharge of a debt by the continuous possession of a thing for the time and in the manner prescribed by positive law.

PRIDE. Excessive esteem of one's own self and the failure to attribute all excellencies to God rather than to one's own person.

PRINCIPLE. That from which something else follows.

PROGRESS, CULTURAL, One of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind.

PROLETARIAT. In the theory of communism, the class of modern wage laborers who possess no means of production and must sell their labor power in order to live.

PROMISE. An act by which one person obligates himself gratuitously to another to do or omit something and the promise is accepted by the one to whom the promise is made.

PROPENSITIES. Natural dispositions, inclinations, drives, which are rooted in the particular kind of nervous system which the individual has inherited. They are permanent impediments to voluntariness.

PROPRIETY. As an integral part of the cardinal virtue of temperance, the love of the beauty which is found in the temperate use of pleasurable things.

PRUDENCE. The cardinal virtue of the intellect which enables man to judge correctly in each individual case what the moral order demands of him.

RATIONALISM. In general, the theory or method of philosophy which maintains that the criterion of truth is not sensory but intellectual and deductive. In ethics, the system which seeks to deduce the moral law in a detailed form from the supposed 'pure state of nature' in which man existed prior to the establishment of communal or political life with its positive laws.

REASON. The power of the mind which perceives the truth and validity of derived ideas, judgments, and principles on the basis of indirect and mediate evidence.

REASON. As an integral part of prudence, the auxiliary virtue which assists a person in the comparison and valuation of different things in a moral action.

REASON, RIGHT. Taken as the proximate subjective norm of morality, whatever is in accord with reason is in accord with the nature of man, as man.

RELATIVISM. The doctrine that every known object is relative (in relation) to the knowing subject and as such is dependent in its being upon the knowing subject and incapable of existing apart from consciousness; the doctrine of the immanence of relations as constitutive of their being; the doctrine which holds that truth has no objective standard but is relative and may vary from individual to individual and from time to time.

RELATIVISM, MORAL. The doctrine that ethical truths are not based on objective grounds but are relative, so that

the rightness and wrongness of actions or objects depend solely on the attitude taken toward them by some individual or group.

RELIGION. In its primary meaning religion is the worship extended by men to an extramundane and supramundane personal being, on whom they believe to be dependent in their lives and fortune and whom they seek to make propitious by special observances. In its secondary meaning it is the virtue which inclines men to render honor and homage to God as the Supreme Being, the first cause and last end of man. Also used to signify all the truths which express the relation of man to God and all the duties which pertain to man in consequence of these truths.

RELIGION. As a potential part of the cardinal virtue of justice, the virtue which inclines the will to render honor unto God and to submit ourselves to the yoke of His commandments.

RELIGION, NATURAL. Religion based on the truths and duties which man knows through the aid of human reason alone.

RELIGION, OBJECTIVE. The objective truths which underlie the relation of man to God and the objective duties which pertain to man because of this relation; these truths and duties are independent of man's knowledge or ignorance and of his likes or dislikes.

RELIGION, SUBJECTIVE. The personal sentiment, inclination, and practice of worship, by means of which an individual renders honor and homage to God.

RELIGION, SUPERNATURAL. Religion based on the voluntary revelation of God.

REMEMBRANCE. As an integral part of prudence, the auxiliary virtue that recalls past items which contribute to the judgment of a moral action.

RENTING AND HIRING. A contract by which one party obtains the right to the use and usufruct of a thing (except money) or of services or of labor for a definite price.

RESERVATION, BROAD MENTAL. A statement which limits the full meaning of the spoken words, so that, although there exists some external indication of the limitation either in the spoken words or in the circumstances of the speaker, the listener will most likely deceive himself as to the actual meaning of the statement.

RESERVATION, MENTAL. A statement which 'reserves' the communication of knowledge from one mind to another by not efficaciously revealing the judgment present in the mind of the speaker.

RESERVATION, PURELY MENTAL. A mental reservation in which the statement does not reveal the judgment of the speaker's mind in any manner, neither by speech nor by the circumstances.

REVOLUTION. The overthrow or renunciation of one government or ruler, and the substitution of another government or ruler, by the governed.

RHYTHM. The practice of periodic continence during the time of the wife's period of fertility and the performance of the conjugal act during the time of the wife's period of sterility.

RIGHT. In the passive sense, a right is something which is due to someone according to strict equality because of a strict obligation. In the active sense, a right is the moral

and inviolable power vested in a person to do, hold, or exact something as his own.

RIGHT, ALIENABLE. One which can be renounced or transferred for sufficiently grave reasons, because it is not an essential requirement of human nature.

RIGHT, CONGENITAL. See Right, Connatural.

RIGHT, CONNATURAL. One which belongs to man because of his very nature as a person, without any action on his part or on the part of any other person in his behalf. Also called 'congenital right.'

RIGHT, DIVINE, OF KINGS. The theory that the supreme political power is conferred on the ruler by a special act of God, so that he rules by divine law.

RIGHT, IMPERFECT. One based on some virtue other than commutative justice and is not so determined as to object (matter) and subject that one may resort to physical force to exact it.

RIGHT, INALIENABLE. One which cannot be renounced or transferred because it is necessary for the fulfillment of man's purpose of being and essential duties.

RIGHT, LEGAL. One determined and enforced by an enactment of the civil authorities.

RIGHT, MORAL. One based on the moral law and which appeals through knowledge to another's will.

RIGHT, NATURAL. One founded on the natural law.

RIGHT, PERFECT. One based on strictly commutative justice and is so determined as to object (matter) and subject that one may resort to physical force to exact it.

RIGHT, PERSONAL. One which gives to a person power to exact something from another person, so that this

something may become his own (*jus ad rem*).

RIGHT, POSITIVE. One founded on the positive law.

RIGHT, PRIVATE. One which inheres in private persons as against private persons.

RIGHT, PUBLIC. One which inheres in the state or in private persons against the state.

RIGHT, REAL. One which gives to a person power in or over his own objects (*jus in re*).

RIGHT REASON. See Reason, Right.

ROMANTICISM. The movement based on the doctrine that the Spirit, or the Absolute, is fundamentally creative and self-expressing, so that the universe must be interpreted in terms of process, life, consciousness, and self-realization.

SACRIFICE. The offering of a sensible, relatively valuable object to God and its actual or symbolic destruction, in order to acknowledge that God is the Creator and Lord of all things.

SACRILEGE. The unworthy and offensive treatment of persons, places, and things dedicated to God and His service.

SAGACITY. As an integral part of prudence, the auxiliary virtue which helps a person in making a quick decision of the proper means in a moral action.

SANCTION. The rewards or punishments ordained by a legislator for the observance or transgression of the law.

SCHOLASTICISM. The system of philosophy which advocates a natural dualism of God and creature, mind and matter, thought and thing, as against monism and

pantheism; it defends a moderate realism, as against ultra-realism, nominalism, and conceptualism; it is spiritualistic and not materialistic, experimental and not aprioristic, objectivistic and not subjectivistic; in sense-perception it is presentational and not agnostic or representational or idealistic; concerning intellectual knowledge it defends a moderate rationalism, as against sensism, positivism, and innatism; it is common sense knowledge critically examined and philosophically vindicated.

SCIENCE. Certain knowledge derived from reasoned demonstrations of causes and reduced to a system of definite truths.

SCIENCE, NORMATIVE. Practical science. Ethics is a normative science, treating of the rules and norms which should govern human conduct.

SCIENCE, PRACTICAL. A science whose fundamental purpose is the knowledge of the principles of regulation which govern the correctness of certain acts in accordance with definite rules and norms.

SCIENCE, SPECULATIVE. A science whose fundamental purpose is the acquisition of knowledge as such.

SECRET. Subjectively, the obligation not to reveal some hidden thing or knowledge. Objectively, the hidden thing or knowledge which may not be revealed.

SELF-DEVELOPMENT, TOTAL. One of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind.

SELF-REALIZATION. One of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the attainment of maximum happiness for mankind. See Perfectionism.

SELF-RESTRAINT. As a potential part of the cardinal virtue of temperance, the virtue which enables the will to resist the most powerful emotions of sensible desires for pleasure which run counter to the norm of morality.

SELLING. See Buying and Selling.

SENSATIONALISM. The doctrine which holds that sensation is the sole origin of knowledge. Sensism.

SENSE OF HONOR AND SHAME. As an integral part of the cardinal virtue of temperance, the anxiety to avoid the personal shame and disgrace which follow the unbecoming and excessive enjoyment of pleasures.

SHOP, CLOSED. A 'union shop,' so that the employer makes an agreement with the union that all workers in his shop shall be union members in good standing.

SIMONY. The voluntary attempt to buy or sell spiritual things for money or the equivalent of money.

SLOTH. Laziness of body and mind, causing one to neglect the obligations involved in the pursuit of moral goodness.

SOBRIETY. One of the species of the cardinal virtue of temperance, moderation in the use and enjoyment of intoxicating drink.

SOCIALISM. The political doctrine that the workers should take over the apparatus of existing governments by

parliamentary action of some kind and then proceed to socialize or nationalize the means of production by placing their ownership in the hands of the state. Socialism advocates production for use, not for profit; hence, all means of production for profit must be owned by the state, not by individuals or private groups.

SOCIALISM, NATIONAL. A form of totalitarian government based on the theory, propounded by Adolf Hitler, that the state originated through the blind struggle of the races as biological groups and that the superior (Aryan) race wins out because it possesses superior blood.

SOCIETY. The stable union or association of a number of persons for the mutual realization of a common end.

SOCIETY, CIVIL. The permanent union of a multitude of families and individuals, under a common authority, for the purpose of promoting their public welfare.

SOCIETY, COMPOSITE. One consisting of a number of societies (moral persons) as its proximate component parts or members.

SOCIETY, CONJUGAL. The permanent union, lawfully formed, of man and woman for the procreation of children and their proper education. Marriage.

SOCIETY, CONVENTIONAL. One which has its origin, formation, and continued existence in the mutual free consent of its members for the attainment of an end specifically agreed upon.

SOCIETY, EQUAL. One in which all members share the authority in an equal degree, because the society itself is the bearer of social authority, even though the members

may delegate a certain person or assemblage of persons to exercise this authority in their name.

SOCIETY, IMPERFECT. One which does not possess within itself all the means required for the complete attainment of its end, but needs the assistance of some society of a higher order.

SOCIETY, INTERNATIONAL. The association of states or governments for the public welfare of mankind.

SOCIETY, NATURAL. One which is formed as a result of man's very nature, as something which is necessary for the proper attainment of the perfection suitable to his rational nature.

SOCIETY, FACTITIOUS. See Society, Conventional.

SOCIETY, PERFECT. One which possesses within itself all the means necessary for the realization of its end, so that it is not directly dependent on any society of a higher order for the attainment of its end.

SOCIETY, SIMPLE. One composed directly of individual (physical) persons.

SOCIETY, UNEQUAL. One in which the social authority is vested by special right in one or more persons to whom the members are subject.

SOVEREIGNTY. The legal supremacy of the state. Viewed positively, it means that the ruler has the right of supreme rule over the people of the state with reference to the attainment of the public welfare of the political community. Viewed negatively, it means supreme independence of the state, so that it is an equal among equals and not subordinated to the jurisdiction of another state in the community of nations.

SPIRITUALITY. The property in virtue of which a being is neither composed of matter nor intrinsically dependent on matter. Immateriality.

STATE. A natural and perfect society, consisting of many families and individuals, established for their common good under the direction of the supreme authority of a common ruler.

STERILIZATION. The mutilation of the sexual power in man or woman so as to render conception impossible. If performed for the purpose of hindering the conception of undesirable or mentally unfit children, it is called 'eugenic sterilization.'

STERILIZATION, EUGENIC. See Sterilization.

STOICISM. As a system of ethics, stoicism is based on the intrinsic objective norm of human nature as the standard of morality. Virtue is the only good, and happiness consists in virtue; virtue and happiness consist in living a life consonant with reason. Complete apathy is a characteristic mark of stoic virtue and duty.

STRIKE. An act of quitting work on the part of organized laborers, for the purpose of forcing the employers to comply with their demands for higher wages or better working conditions or both.

STRIKE, GENERAL. A strike in which practically all union members of a nation quit work simultaneously.

STRIKE, JURISDICTIONAL. A strike called because of a dispute between rival unions as to which union shall have exclusive jurisdiction over the workers of a certain factory or industry and exercise their bargaining rights.

STRIKE, SIT-DOWN. A strike in which the workingmen quit work but continue to occupy the premises.

STRIKE, SYMPATHETIC. A strike in which the workers quit their own work out of sympathy with other workers who are out on strike.

SUBJECTIVISM. The doctrine which holds that man can immediately know only what is present in consciousness.

SUICIDE. The direct, intentional destruction of one's own life.

SUPERSTITION. The attribution to a creature of some power which belongs to God alone.

SYNDERESIS. The habitual knowledge of primary moral axioms or practical principles of moral action which are present in the human intellect.

SYNESIS. As a potential part of prudence, the proficiency in clear, decisive judgments, following the inventive reflection of eubulia, in those common cases where ordinary principles are sufficient for prudence to arrive at a practical decision.

SYNTERESIS. See Synderesis.

TELEOLOGY. The tendency of efficient causes to realize definite results through their action. The doctrine that final causes are operative in nature.

TEMPERANCE. The moral virtue which orders the desire for sensible pleasure within the limits of right reason.

TESTAMENT. An act of a person by which he ordains what disposition shall be made of his goods after his death.

TOTALITARIANISM. The doctrine that the will of the state is the exclusive and sufficient source and foundation of all laws and rights of man. Politically, a highly centralized government controlled by an individual or group excluding voice and existence to opposing minority groups. State omnipotence.

TRANSFERENCE. The doctrine that all political authority, at the time the State is formed by the self-organizing members, rests in the people as a political body or community and is then transferred by the politically organized community to a certain person or group. Also called 'translation.'

TRANSLATION. See Transference.

TREATY. A compact made by one state with one or more states.

TRUST. A permanent organization which controls the commercial policy of a number of independently operated companies.

TRUTH. Conformity between mind and thing.

TYRANT. A person who usurps governmental power unlawfully and unjustly or who uses lawful governmental power oppressively and unjustly.

UNION, CLOSED. A union which limits the number of persons allowed to join the union; when the stipulated number of members has been reached, no new members are admitted to the union until there is a vacancy.

UNION, LABOR. A league or association of workingmen, organized for the purpose of promoting and defending their common interests and rights.

UNION SHOP. See Shop, Union.

UNITY OF MARRIAGE. See Marriage, Unity of.

USE. As a form of indirect private ownership, it is the right to employ someone else's property for one's own purposes, but without the right to dispose of its substance.

USE. As an elicited act, the practical execution of the choice of the means selected to achieve an end.

USUFRUCT. The right to employ someone else's property and also take its fruit, but without the right to dispose of its substance.

UTILITARIANISM. The ethical system which is based on the extrinsic norm of the usefulness of an act in promoting the happiness of the individual and of the human race. Happiness consists in pleasure. The norm is expressed in the formula of "the greatest happiness for the greatest number." Also called 'universalistic hedonism' and 'social eudaemonism.'

UTILITARIANISM, EVOLUTIONARY. See Naturalism, Evolutionary.

UTILITARIANISM, RATIONAL. See Naturalism, Evolutionary.

VALUE. That which is perfect or perfective.

VALUE ETHICS. As the outcome of the modern theory of value, 'value ethics' is frequently viewed as one of the forms of the 'New Morality,' a teleological system of ethics developed in recent times, based primarily on the 'results of conduct,' consciously directed toward the perfection of the individual and the maximum happiness of mankind.

VICE. An operative habit inclining the will to acts at variance with right reason.

VICES, CAPITAL. The principal vices from which practically all evil deeds derive their origin. They are: pride, covetousness, lust, anger, gluttony, envy, and sloth.

VIOLENCE. Physical force applied to a resisting person by an external agent. It is a transitory impediment to voluntariness.

VIRTUE. The permanent inclination and facility to perform morally good acts; the operative habit to perform morally good acts.

VIRTUES, CARDINAL. Among moral virtues, the principal ones among several groups of virtues. They are prudence, justice, temperance, and fortitude.

VIVISECTION. The operation on living animals, especially for biological and physiological study.

VOLITION. Rational appetite.

VOLITION, DELIBERATE. Volition which results in consequence of a deliberation over the respective merits of particular values.

VOLITION, NATURAL. Volition which must follow the perception of a perfect good.

VOLUNTARINESS. The state of an act in so far as it proceeds from the will as its cause.

VOLUNTARY. See Act under various headings.

VOW. A voluntary promise made to God whereby a person binds himself to do the better good.

WAGE, FAMILY. A wage enabling the workingman to support his wife and family in reasonable, frugal comfort.

WAGE, LIVING. A wage that will give the workingman a decent livelihood.

WAR. A condition of armed conflict between two or more sovereign states.

WILL. The rational appetency, or the power to strive for an intellectually perceived good and to shun an intellectually perceived evil.

WILL, FREEDOM OF. The absence of intrinsic necessity or determination in the will with regard to the performance of an act.

WISH, LIKING. Simple inclination toward a recognized good.

WORSHIP, DIVINE. The honor and homage rendered to God in proportion to His excellence, dignity, and power.

PREFACE

OF THE VARIOUS DEPARTMENTS constituting the general science of philosophy, *theodicy* (natural theology) is the most noble and *most important*.

It is the most noble. Its nobility stems from the pre-eminence of its subject-matter which is God Himself, the Supreme Being. God is the *summum bonum*, the supreme good, both in Himself and in His relation to creatures. He is the supreme truth and as such alone satisfies the undying craving of the human mind for a complete explanation of the world and of every being.

It is the most important. Nothing can be more important to man in time and eternity than to know God and to love Him. Life here on earth would have no meaning if God were removed from the key position of influencing man in his thought and action. Man must, therefore, be sure of God's existence and seek to inform himself thoroughly with regard to His nature and operations.

A survey of the American people has brought out the information that ninety-nine per cent believe in God; of these over ninety per cent are absolutely convinced of God's existence. Inasmuch as it has been currently assumed

that Americans are rather 'materialistic' in their general attitude, this fact is both startling and heartening. Such a survey, however, could not be expected to bring out what the individuals thought about the real nature of the Supreme Being. If such a survey were made, it would probably show much confused thinking. That is practically unavoidable in convictions which are the result more of spontaneous thinking than of reflective reasoning. The matter of God's existence and nature is too important to be left to spontaneous thinking, especially so far as the educated classes are concerned.

The present book seeks to supply the information desired by the reasoning mind of man. Its general standpoint is that of theism in its traditional form. Nothing new should be expected as regards the subject-matter under discussion. If there is anything new in the book, it is the manner of presentation.

Like the other books of the author, the present treatise is directed toward the undergraduate students in their endeavor to understand the many difficult problems connected with philosophical inquiry. Having been a teacher of undergraduates, the author realizes the necessity of simplification and clarification in so difficult a subject; this he has attempted to provide for the budding mentality of the students in writing a theodicy for their use.

The author has now completed the series of the various departments of philosophy. It is his fond hope that this book on theodicy will also enable the reader to understand the existence, nature, and operations of God, so that he will know Him and love Him more and more.

C. N. BITTLE, O.F.M.CAP.

PART I

THE EXISTENCE OF GOD

Chapter 1

NOTION AND SCOPE

HISTORY AND ANTHROPOLOGY SHOW THAT ALL PEOPLES WITHOUT exception worship some sort of divinity. Many peoples worship more than one divinity — they are ‘polytheistic.’ Some worship idols; some, natural objects; some, gods who possess human traits in a superior degree. In every form of polytheism, many deities occupy a subordinate position, while others are superior to them in power and intelligence.

In this hierarchy of deities, frequently one is supreme.

Other peoples worship but one God — they are ‘monotheistic.’ Jews, Christians, and Mohammedans profess monotheism. God, in their concept, is eternal, infinite; the beginning and end of all things; supreme intelligence; the creator and governor of the world.

No people has ever been discovered which, in the strict sense of the term, is ‘atheistic.’ Individuals may be atheists; but a people, never. This universal belief is a tremendous fact. Most persons, even when they abandon their Christian heritage, still retain the fundamental conviction of the existence of God. Apparently, then, belief in God or some sort of deity is a spontaneous and natural dictate of human reason.

The philosopher takes this universal fact as the starting-point of his investigation. He then seeks to determine, with reason as his guide, the truth-value of the idea of God — whether He actually exists, what His nature is, what His relation is to the world. This investigation gives rise to the philosophical science of *theodicy*.

Theodicy — Natural Theology

The department of philosophy treating of God usually is designated either ‘theodicy’ or ‘natural theology.’ The name *theodicy* was introduced by Leibnitz (*Essais de Théodicée sur la bonté de Dieu, etc.*, 1710), and the literal meaning of ‘theodicy,’ as used by him, is ‘the justification of God’ (Gr., θεός, God, and δίκη, right, trial, justification). Leibnitz maintained that the existing order of the universe is the best which God in His omnipotence and providence could possibly devise. Many writers attacked this extreme optimism, pointing out that the many physical and moral evils present in the world disproved such an exaggerated position. He thereupon wrote his *Essais de Théododicée* as a ‘justification of God,’ attempting to show that the physical and moral evils of the world are no valid argument against the optimism he advocated. While Leibnitz’ optimism has passed into the limbo of discarded philosophical opinions, his term ‘theodicy’ has survived in a different meaning.

In the course of time, the name ‘theodicy’ was given to any treatise or book which vindicated man’s belief in God and sought to refute the manifold objections raised against this belief, whether these objections were urged against His

existence, His providence, or any of His perfections. Gradually, then, the name was used to signify 'the science of God' as a distinct department of philosophy treating of God in His existence, His nature, His attributes, and the relation of creatures to Him. It is in this broadened meaning, as the *philosophical science of God*, that the term 'theodicy' is used in our day, and so it is used in this book.

Another name used to designate the philosophical science of God is *natural theology*. Strictly speaking, the term 'theology' should be sufficient for the purpose, because 'theology' means the science of God (Gr., θεός, 'God, and λόγος, treatise, science). However, the term 'theology' more frequently designates the application of reason and of the reasoning process to truths furnished by supernatural revelation. As a consequence, it has become customary to distinguish between 'dogmatic (supernatural) theology' and 'natural (philosophical) theology.' Many philosophers dislike the term 'theodicy,' claiming that it is too narrow in meaning. They prefer the term 'natural theology' as more expressive of the true meaning of this specific department of philosophy. On the other hand, many philosophers dislike the term 'natural theology' because of the possibility of confusion with dogmatic theology. Both terms, 'theodicy' and 'natural theology,' are current, and their meaning is identical. Names are of minor importance, so long as their signification is clear and unambiguous.

Theodicy as a Science

Briefly, theodicy or natural theology can be defined as the *science of God*. Since a science is an organized body of distinct truths regarding some special object of thought, theodicy is rightly called a 'science.'

The special object treated in theodicy is *God*. Such an object involves many problems and the proper solution of them. The truths discovered, when arranged into a system, form a true science. Nowadays, it is customary to speak of 'the sciences' as referring almost exclusively to the physical sciences, but such a use of the term 'science' is too restrictive and therefore unwarranted. A science is distinguished from mere experience. Experience pertains to isolated facts and the truths immediately evident in these facts. A science is based on fundamental principles, and these principles are applied to the facts in question, so that the final result of the investigation is a body of proved truths concerning a general subject-matter, resting on fundamental principles and arranged into a system. Such is the nature of the physical sciences, and such is also the nature of theodicy.

As a rule, the popular knowledge of God is altogether too human in conception: it is steeped in 'anthropomorphism,' because God is endowed too much by man with purely human characteristics. Man's knowledge begins in the senses, and material things are the connatural object of his intellect. He is at home in the material world, and it is only with difficulty that he attains to the immaterial. It is the purpose of theodicy to penetrate, so far as reason will permit, into the immaterial world of God's being (if He is found to exist) and strip this knowledge of all extraneous

and false notions. Not opinions and passing experiences, but certainties and scientifically established truths are the aim of theodicy as a science.

Some authors object to calling theodicy a 'science,' contending that it is an integral part of the general science of metaphysics. It is true that theodicy presupposes the principles of metaphysics and applies them to the special subject-matter of 'God.' Nevertheless, the philosophical inquiry into the existence and nature of God covers a very wide, field of facts and proofs which lead to a large body of demonstrated truths capable of being arranged into a general systematic body; and that is the characteristic of a science. While, then, it may be conceded that theodicy is not an independent Science in its own right, it is really a 'science.' Botany, for instance, is a subdivision of the general science of biology; but it is also a true science.

The characteristic *distinction* between the science of theodicy (natural theology) and the science of dogmatic (supernatural) theology consists in the source of their respective truths. The theologian approaches the question of God and His nature from the standpoint of the authority of divine revelation and therefore presupposes God's existence as given. The philosopher begins with the principles of reason; with the aid of natural reason as his sole guide he seeks to determine whether God exists. Once the existence of God is proved, he seeks to find out what God's nature is, what His attributes are, and in what relationship creatures stand with reference to God. The philosopher prescind from revelation as a source of information in his investigation, relying on human reason

and its principles as his sole instrument in acquiring knowledge.

A Philosophical Science

When theodicy is called a 'philosophical science,' it is equivalent to saying that theodicy is a *department of philosophy*, together with logic, epistemology, ontology, cosmology, psychology, and ethics.

Philosophy is defined as the science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason. The special natural sciences are concerned with the 'proximate' causes of things; philosophy, with the 'ultimate' reasons, causes, and principles. Philosophy begins where the special sciences end; it is the foundation of the natural sciences, because it tests the validity of the principles upon which these sciences rest. As such, it is the queen of the natural sciences. If the principles of philosophy are invalid, then philosophy itself and the natural sciences are all invalid.

No department of philosophy can be mastered with ease. It is always difficult to reduce things to their 'ultimate' reasons, causes, and principles. In the case of theodicy, however, the *difficulties* are greater than usual, because man finds it an arduous task to leave the sensible world and concentrate on spiritual and divine realities. This fact becomes evident when it is realized that even the best among the pagan philosophers failed to reach a conception of God which was true and clear. A Christian child, in many respects, has a sounder idea of the nature of God than the

greatest philosophers of antiquity, for instance, Plato or Aristotle. These philosophers lacked the information supplied by revealed religion and were forced to depend solely on their reasoning powers. The present-day philosopher, either directly or indirectly, has absorbed from Christianity so much of the true concept of God that he need not first discard a host of mythological teachings before arriving at a reasonably sure idea of what God really is. The philosopher, of course, may not use revelation directly in his analyses and demonstrations; but he can, at least, begin with the idea of God furnished by faith and see whether this idea is rational and justifiable. In this manner he will save himself much unnecessary trouble.

Theodicy is therefore defined as the *philosophical science of God, or the science of God acquired by means of natural reason.*

Scope of Theodicy

The *scope* of theodicy has already been outlined in the preceding sections. The starting-point of the investigation will be the theistic idea of God, namely, the concept of a Supreme Being who is spiritual in essence and endowed with intelligence and free-will. Theodicy does not take this theistic position for granted. It merely intends to begin with a concept of God which is generally accepted in Western civilization, instead of with some polytheistic deity found in the religion of a primitive race or of a nation long dead.

Theodicy does not assume that God exists. It must *prove God's existence beyond reasonable doubt.* The arguments

for God's existence must be based on indubitable facts and self-evident principles. Mere opinions and conjectures do not suffice; solid proofs are necessary. In no other way can theodicy formulate doctrines capable of withstanding logical criticism.

The existence of God having been definitely established, the next step will be to show what *God's nature* is. Since God cannot be seen or perceived, man's knowledge of His nature can only be indirect and mediate. Still, the very nature of creatures will reveal many things about Him. If it can be proved that the universe owes its being and existence to God, creatures will of necessity mirror God's *perfections* in some degree, and man can reason from the perfection of creatures to the perfections of God. Reason can thus arrive at a true knowledge of God and His nature, even though this knowledge be very incomplete and fragmentary.

After the examination of God's nature, theodicy naturally proceeds to a discussion of His operations. The nature of a being is the source of its operations: as a being is, so it does. In this respect, reason can argue either from the effect to the cause or from the cause to the effect. Thus, from the destruction caused in a city by a bomb, one can legitimately draw a conclusion as to how the bomb operated; similarly, from a thorough knowledge of the construction and charge of a bomb, experts can foretell what the bomb will do when it hits a city. So, too, man can draw valid conclusions about the operations of God by studying the universe as the effect of God's creative power (if the world is the result of creation), and he can also draw

valid conclusions about the operations of God from a scrutiny of God's nature.

Object of Theodicy

Every science has a 'material' and 'formal' object. The *material object* of a science is the general subject-matter which it treats. As a rule, a number of sciences occupy themselves with the same general subject-matter. For example, geology, geography, and geogony have the earth as their material object, because each of these distinct sciences treats of the earth in one way or another: geology is the science of the rock formations of the earth; geography, of the structural features of the earth; *geogony*, of the origin and development of the earth. Hence, the earth is the material object common to all these sciences. The *formal object* of a science is that special aspect of the common (material) object which is distinctive for a particular science, so that this science thereby differs from every other science and becomes specifically this definite science. In the example just given, the formal object of geology is the rock formations; of geography, the structural features; of geogony, the origin and development (of the earth).

As a science, theodicy also has a material and a formal object. The 'material' object of theodicy is 'God,' and this object it has in common with supernatural theology. The 'formal' object of theodicy is 'God *as known by natural human reason*,' because this characteristic distinguishes

theodicy from the kindred science of supernatural theology and makes it a specifically distinct science.

The Method of Theodicy

The two methods which can be employed in scientific research are 'induction' and 'deduction.'

Induction, or analysis, is defined as a process of reasoning in which one concludes from individual cases to the existence of general laws or principles. Induction passes from the concrete to the abstract, from the complex to the simple, from the particular to the universal, from the contingent to the necessary, from the applications of a principle to the principle itself, from the phenomena to the underlying general law, from the effect to the cause. This method gives rise to the analytic, experimental, inductive sciences, and it is the primary method used by the physical sciences throughout a great part of their research into the problems of nature. Chemistry, for example, is an inductive science in its experimental work.

Deduction, or synthesis, is the process of reasoning in which one concludes from the general law or principle to a particular instance falling under the general law or principle. It proceeds from the abstract to the concrete, from the simple to the complex, from the more general to the less general, from the necessary to the contingent, from the 'logical whole' to the 'logical part,' from the principle to the applications of the principle, from the general law to the individual cases, from the cause to the effect. Sciences which employ primarily the synthetic method are called the

rational or deductive sciences. Mathematics, for instance, is a deductive science because it begins with a few fundamental ideas and axioms and, without the aid of observation and experiment, gradually builds up a most profound and complicated system of truths.

If the physical sciences are called 'inductive,' it is due to the fact that their predominant method is induction. No science, however, is exclusively inductive or deductive; every science uses both induction and deduction, though in different proportions.

The science of *theodicy* uses both *induction* and *deduction*. In proving God's existence, theodicy begins with the physical universe and the manifold effects observed in it and reasons to the cause which alone can give an adequate explanation for their presence, namely, the First Cause or God. Similarly, from the beings of the universe, theodicy argues to the nature of God. So far the method employed is 'induction,' because the process of reasoning passes from the effect to the cause. From that point on, however, the philosopher uses 'deduction' to a great extent, arguing from the nature of God to His attributes and operations. The philosopher, like the scientist, employs whichever method is best under the circumstances for the establishment of truth. Both methods are legitimate procedures.

Postulates of Theodicy

All sciences rest upon certain postulates. A *postulate* is a proposition which is either self-evident or which is taken

over without proof by one science from another science because it has been proved by this other science. The physicist, for instance, presupposes the validity and truth of mathematics in his own science; the principles of mathematics thus are 'postulates' of the science of physics.

Some philosophers object to the use of the term 'postulate,' as having a definite Kantian meaning. Immanuel Kant (1724—1804) understood by a 'postulate' a proposition or hypothesis which, even though unproved and unprovable, must be accepted as true. Thus, according to Kant, the existence of God, the freedom of the will, and the immortality of the human soul are indemonstrable, but belief in their truth is necessary for man so that he can intelligently perform his moral duties. Obviously, our use of the term 'postulate' is not taken in this Kantian sense, as will be seen from its definition as given above. Kant illegitimately restricted its meaning, just as he used the term 'category' in a sense radically different from 'category' as traditionally used in logic.

When a term is properly defined and is used according to this definition, no one can seriously object to it, so long as this use is historically justifiable. Scientists commonly use the term 'postulate' in our sense.

The postulates of theodicy are the *existence of the physical world* and the *trustworthiness of human reason* in its search for facts and truth. These postulates can rightly be presupposed by theodicy, because they have been definitely established in epistemology, another department of philosophy.¹

The entire argumentation of theodicy is based on the reality of the physical world. And the instrument of argumentation is human reason. If the physical world is not objectively real, it would be futile to conclude from the existence and nature of the physical world to the existence and nature of God as its cause. If human reason were untrustworthy in its deliverances, no amount of argumentation would be valid. The philosopher, however, need not go to the trouble of proving the existence of the physical world and of the trustworthiness of reason, when a separate department has already proved their validity. This was done in epistemology. There it was shown that the existence of the physical world and the trustworthiness of man's reasoning powers are not unwarranted assumptions and presuppositions, but are eminently rational and philosophically well grounded. They are, therefore, valid and logical *postulates of theodicy*.

The student may, at times, find theodicy taxing and difficult. However, this cursory explanation of the notion and scope of theodicy should be enough of an indication that such a study is worth every effort one may put into it.

Summary of Chapter I

In order to understand the purpose of theodicy, one must be clear as to its *notion* and *scope*.

1. *Theodicy — Natural Theology.* — Strictly speaking, the term ‘theodicy’ means the ‘justification of God.’ Gradually, however, this meaning has been broadened, so that at present it signifies the ‘philosophical science of God.’ That is also the signification of ‘natural theology.’

2. *Theodicy as a Science.* — Since theodicy is an organized body of distinct truths regarding a special object of thought, namely regarding God, it is rightly termed a ‘science.’ Theodicy (natural theology) uses human reason and its principles as the sole instrument in acquiring knowledge; dogmatic (supernatural) theology approaches the question of God and His nature from the standpoint of divine revelation.

3. *A Philosophical Science.* — Theodicy is a department of philosophy, and philosophy is the science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason. It is in this manner that theodicy treats of God, and it is defined as the *philosophical science of God or as the science of God acquired by means of natural reason*.

4. *Scope.* — Theodicy seeks to determine the truth-value of the concept of God; whether God *exists*; what His nature and perfections are (if He exists); the extent of His operations.

5. *Object of Theodicy*. — The material object of theodicy is 'God'; the *formal* object is 'God as known by natural human reason.

6. *Method of Theodicy*. — In investigating God's existence and nature, the philosophic method is *induction*. Arguing from God's nature to His attributes and operations, the method used is mainly that of *deduction*.

7. *Postulates of Theodicy*. — A *postulate* is a proposition which is either self-evident or which is taken over without proof by one science from another science because it has been proved by this other science. The postulates of theodicy are the existence of the physical world and the trustworthiness of human reason.

Chapter 2

FIRST PRINCIPLES

EVER SINCE DESCARTES ASSUMED THAT MAN CONSISTS OF MIND and matter as two distinct substances, it has been taken for granted in many philosophical and scientific circles that man can know only his own internal conscious states.

Theoretically, such an assumption may seem plausible. Practically, however, it is unlivable. In his daily life every philosopher and scientist is a confirmed realist; he treats the external world as existing and knows a great deal about it. The excessive cleavage between mind and body, as assumed by Descartes, does not exist. Nevertheless, the influence of Descartes's teaching still continues.

Because science has made such marvelous progress during the past century, many scientists consider 'scientific' knowledge to be the only source of truth worth bothering about. 'Metaphysics' is anathema. Some scientists, and even philosophers following the scientific trend of the times, deny or doubt the validity of anything like the First Principles of being and thought: such principles are 'metaphysical' and as such are condemned without a proper hearing. Yet the First Principles are necessary for all thinking, whether scientific or philosophical.

Before beginning with the proofs of God's existence, it will therefore be necessary to establish the *validity of the First Principles*.

First Principles

Man makes many types of judgments. The 'binding force' of these judgments is by no means the same in all cases.

Some judgments are *contingent* in character; they are true, but their truth is not necessary. Consider these judgments: 'The sky is overcast today'; 'My food is warm and tasty'; 'This man wears an overcoat'; 'The boy is running.' In making such judgments we realize that the connection between the subject and predicate in each case is not necessary. The judgments express actual facts, and as such they are true; but the facts could be different, because they are 'contingent,' and then the judgments would also be different. Facts of this kind can be discovered only by *experience*; not by means of an analysis of subject and predicate.

Other judgments are *necessary* in character; they are true, and they are necessarily true. Such are, for example, the judgments: 'The whole is greater than any single one of its parts'; ' $2 + 2 = 4$ '; 'A circle is round'; 'A cube has three dimensions.' We judge such statements to be true independently of all existential conditions and all experience. They are true not only here and there, now and then, for this and that mind; they are immutably and necessarily true, everywhere, always, for every mind, without possibility of change or error.

Among the necessary judgments philosophers also place the *First Principles*. They are termed 'first' because they are the foundation of all reality and thought. The First Principles are:

The Principle of Identity: 'Whatever a thing is, it is'; 'Everything is identical with itself.'

The Principle of Contradiction: 'A thing cannot be and not be the same thing at the same time under the same respect.'

The Principle of Excluded Middle: 'A thing either is or is not (something).'

The Principle of Sufficient Reason: 'A thing must have a sufficient reason for its being and existence.'

The Principle of Causality: 'Whatever happens or becomes must have a cause for its happening or becoming.'

Like all necessary judgments, the truth of these First Principles does not depend upon our 'experience' for their discovery. If we understand the meaning of the subject and predicate of each statement, the truth should be evident through an *analysis* of the subject and predicate. The first three are comparatively simple; the last two are an amplification and application of the first three.

The First Principles are of extreme importance for all knowledge, for without them knowledge of whatever kind would be utterly impossible. For this reason the *self-evidence* of the First Principles will now be discussed.

The Principle of Identity

The *Principle of Identity* states: 'Whatever a thing is, it is.' It expresses the self-evident truth that a 'being, whatever it is, is identical with itself.'

The Principle of Identity is grounded on the concept of *being*. 'Being' is the noun taken from the verb 'to be,' and 'to be' means 'to exist' or to be 'capable of existence.' Obviously, whatever actually exists is 'capable of existence.' A thing, however, may not actually exist although it is 'capable of existing' and for that reason it also is a 'being'; such, for instance, would be the case of a flower which will or may bloom next spring.

The *opposite* of 'being' is *non-being*. 'Non-being' may be so either in a relative or absolute sense. A relative non-being is something which does not now actually exist, either because it has ceased to exist (for example, the past generation of men) or has not as yet received existence although it can exist (for example, the future generation of men); such a being, because it is 'capable of existence,' is also by that very fact a 'relative being.' *Absolute non-being* (or, *absolute nothing*) neither actually exists nor is 'capable of existence'; its very idea involves the impossibility of existing (for example, a 'one-dimensional cube,' since a 'cube' necessarily implies three dimensions).

Hence, expressed negatively, 'being' is that which is opposed to 'absolute nothing'; expressed positively, 'being' is anything which has actual or possible existence. It is thus seen that the idea of 'being' always contains a positive (actual or possible) relation to existence, while the idea of

‘absolute non-being’ contains no relation whatsoever to existence.

From the foregoing analysis it is evident that ‘being is identical with itself,’ and this fact gives rise to the *Principle of Identity* which is valid both in the realm of reality and, as a consequence, in the realm of thinking. Concretely, the principle is expressed by people in phrases like the following: ‘Iron is iron’; ‘East is East, and West is West’; ‘Justice is justice, and injustice is injustice, no matter what people say or do.’

Many philosophers consider the Principle of Identity to be merely a tautological statement. Others deny this. Because the arguments of both sides are rather abstruse,¹ we will pass on to the Principle of Contradiction.

The Principle of Contradiction

The *Principle of Contradiction* (or *Non-contradiction*, as others prefer to call it) is based on the comparison between ‘being’ and ‘non-being’ and reads: ‘A thing cannot be (something) and yet not be (it) at the same time under the same respect.’

When we compare ‘being’ with ‘non-being,’ we intuitively behold that the one is not, and cannot be, the other. We see the evident truth that ‘being is not non-being’ and that these concepts mutually exclude each other with *absolute necessity*: something ‘that is’ can never be something ‘that is not.’ Since ‘being’ and ‘non-being’ can never be identical, but must be universally and necessarily in opposition to each other, we express this self-evident

truth in the Principle of Contradiction: 'A thing cannot both be and not be (something) at the same time under the same respect.' This principle flows immediately from the concept of 'being,' and the concept of 'being' itself is drawn from objective reality; consequently, the principle itself governs the entire realm of objective reality.

The Principle of Contradiction also governs the entire realm of *thought*. Its validity is a *pre-condition for all knowledge*. Knowledge consists essentially in judgments and inferences, and these will never be valid if the Principle of Contradiction is not valid.

The Principle of Contradiction cannot be 'demonstrated.' A *demonstration* is a mediate inference in which a conclusion is drawn consistently from true premises; and the conclusion is presumed to be less known than the truth contained in the premises. The premises, however, would neither be true nor consistent, if the Principle of Contradiction were not already validly in force in the premises. 'Truth' implies that there is a difference between 'truth' and 'error,' and 'consistency' implies that there is a difference between 'consistency' and inconsistency.'

On the other hand, *no demonstration is needed* to establish the truth of the Principle of Contradiction; its truth is *self-evident*. A mere analysis of 'being' and 'non-being' suffices to establish its truth, since the intellect perceives intuitively that 'being' and 'non-being' are never the same thing. When something is perfectly clear in itself (as the Principle of Contradiction is), no 'demonstration' is needed to prove its truth: 'self-evidence' is the proof, and that is better than any demonstration.

Moreover, no one can sincerely deny or doubt the validity of the Principle of Contradiction without presupposing and affirming its validity in the very *denial or doubt*. Whoever 'denies' the truth of this principle thereby claims that his denial is the truth' and that the principle as advocated is an 'error.' Such an assertion, however, implies that 'truth' is not 'error' and error is not 'truth'; but that assertion is obviously based on the very principle which is denied, namely, that 'A principle cannot both be true and not true at the same time under the same respect.' The same thing happens to anyone who 'doubts' the truth of this principle. In doubting its truth, he implies that his reasons contain 'truth' and not 'error,' and that means that he implies that the Principle of Contradiction is valid in his doubt.

The fact is simply that the Principle of Contradiction is so necessary as a pre-condition of all thinking and all knowledge that without it we can 'know' nothing. The failure to accept this principle makes common knowledge, science, and philosophy impossible and involves the mind in *universal skepticism*. Once we admit universal skepticism, however, we may as well quit thinking entirely, for any theory or attitude which leads logically to the absurdity of universal skepticism is doomed.

The Principle of Excluded Middle

The *Principle of Excluded Middle* is expressed in different ways by different writers: 'A thing either is or is not'; 'Everything must either be or not be'; 'Any attribute must

be either affirmed or denied of any given subject'; 'Two contradictories cannot be false together'; 'One of two contradictories must be true'; 'Between affirmation and denial there is no middle course'; 'Between two contradictories a middle is excluded.' The only difference between these various statements is that some pertain more to the logical order and others more to the real order. Inasmuch as the 'logical' order of knowledge (ideas, judgments, inferences) is representative of the 'real' order (actual or possible things), both types of statements express fundamentally the same truth.

The Principle of Excluded Middle is an *immediate inference* from the Principle of Identity and the Principle of Contradiction. If it is self-evident that 'being is being' and 'non-being is non-being,' and if it is self-evident that 'A being cannot both be and not be (something),' it is also self-evident that 'A being either is or is not (something).' There is no middle thing possible between 'being' and 'non-being'; it is either the one or the other. There is no stage or state possible between 'is' and 'is not'; it either 'is' or it is not.

The reason is simple. 'Being' and 'non-being' constitute a *complete division of all things*. 'Being' includes everything actual and possible, everything conceivable. 'Non-being' is the negation, or denial, of everything actual and possible, everything conceivable; it signifies absolute nothingness. The division being so complete, it is obvious that there can be no medium or third category between 'being' and 'non-being.' If something is anything at all conceivable, it is a 'being'; if it is not a 'being,' it is nothing or 'non-being.'

Anything conceivable must be either the one or the other; it cannot be both, and it cannot be neither.

Even the merely *possible* is a 'being,' not absolute nothingness, because it has a positive relation to existence. In so far as the 'possible' has no actual existence, it is a 'relative non-being'; but in so far as it can receive existence, it is a 'relative being': in no case, however, is it 'absolute non-being.' When speaking of the 'possible' as a 'relative being' and a 'relative non-being,' we are not speaking of the same thing *under the same respect*, and so the Principle of Contradiction is not violated. In an 'absolute' sense, the 'possible' is always a *being* and is not a middle thing between 'being' and 'non-being,' because it is always a 'possible *being*.' It is thus seen that even the merely 'possible' does not violate the Principle of Excluded Middle.

In the realm of *knowledge* every attribute used as a predicate must be either affirmed or denied of any given subject; it cannot be both affirmed and denied under the same respect. Take, for example, the attribute 'chemical element.' Everything conceivable as a subject must either be a 'chemical element' or 'not a chemical element.' Thus, silver, oxygen, helium, gold — all are chemical elements. Water, salt, zinc, coal are compounds, not elements; protons, electrons, mesons are sub-elemental particles, not elements. Possible beings must be one or the other; plutonium, even before it was made by man from uranium, belonged to the class of chemical elements. No matter what attribute is applied to a subject (for instance, 'red,' 'triangle,' 'round,' 'spiritual,' 'book,' etc.), all things conceivable must either possess the attribute or not possess

it. No being exists or can exist which would both possess and not possess the attribute; and no being exists or can exist which would neither possess nor not possess it: such a 'middle' would obviously violate the Principle of Contradiction, because it would both 'be' and 'not be' something simultaneously under the same respect.

To deny or doubt the validity of the Principle of Excluded Middle, whether in the realm of reality or in the realm of thought, leads to absurdity. The principle is *self-evident* and as such *true*.

The Principle of Sufficient Reason

The *Principle of Sufficient Reason* reads: 'A thing must have a sufficient reason for its being and existence.' Gottfried W. Leibnitz² (1646—1716), who did much to make this principle better known, called it *determining reason* (*la raison déterminante*) rather than 'sufficient reason,' and his terminology seems to be a better phrase for expressing the meaning of the principle. German philosophers speak of the *sufficient ground* (*zureichender Grund*) in the sense of a 'sufficient basis or foundation.' 'Sufficient reason' refers more to the inquiring intellect and accounts for the *intelligibility* of a being, while 'sufficient ground' refers more to the reality of a being and accounts for its *existence*. Since, however, thought (intelligibility) follows being (nature, essence) and since only a being can have existence, the different expressions used in the formulation of the principle amount to the same thing.

The Principle of Sufficient (Determining) Reason is a necessary corollary from the Principles of Identity and Contradiction. To deny or doubt the validity of the Principle of Sufficient Reason would inevitably lead to the *absurdity* of denying or doubting the validity of the Principles of Identity and Contradiction, because it is *immediately derived* from these two self-evident principles.

‘Being is being’ and ‘non-being is non-being’ (Principle of Identity). It is impossible for a thing ‘to be’ and ‘not to be’ something at the same time under the same respect (Principle of Contradiction). Now, if a thing has not a sufficient (determining) reason for its being and existence, it both ‘is’ and ‘is not’ at the same time under the same respect. That is impossible and therefore absurd. Consider the following.

Everything, in so far as it is a ‘being,’ has reality. Whatever reality a ‘being’ has, it must have either of and by *itself* or from and by *another* being; in the first case it has the *sufficient reason* for its reality in itself, and in the second case it has it in the other. And if it has no reality, it is no ‘being’ at all, and this is due to the fact that it has not received reality either of itself or from another being; in both cases it is a ‘non-being’ because it has *no sufficient reason* for its reality. If it could have reality nonetheless, it would have to receive it from ‘nothing.’ But ‘nothing’ has no reality itself and can, therefore, never give reality to anything. Consequently, were such a reality without a sufficient reason for its being and existence, it would both ‘be’ and ‘not be’ at the same time under the same respect: it would ‘be,’ because that is the supposition; and it would

also 'not be,' because, having no sufficient reason to account for its reality except 'nothing,' it could receive only that which 'nothing' could give, which is precisely nothing. But 'to be' and 'not to be' at the same time under the same respect is a violation of the Principle of Contradiction; and that is an absurdity. Hence, if a being has reality, it must have it either of itself or from another, i.e., it must have a *sufficient reason for its being and existence*.

Since everything must have a sufficient reason for its 'being,' there must be a determining reason why a thing is what it is. This principle applies to everything present in the being —nature, properties, and qualifications. Hence, there must be a sufficient reason which explains why a man is a 'man,' why he is rational' (soul) and 'material' (body), why he is 'white' or 'married' or 'healthy' or 'sad.' Similarly, there must be a sufficient reason which explains why an electron is an electron and a proton a proton, why a circle is a circle and a triangle a triangle, why a horse is a horse and a rose a rose, and so forth. We may not always be able to assign the proximate reason for the being and existence of things, but we do know this: 'Every being has a sufficient, determining reason, either in itself or in another being, for the reality and existence which it possesses.'

The Principle of Causality

The *Principle of Causality* states: 'Whatever happens or becomes must have a cause for its happening or becoming.' The words 'whatever happens' mean 'whatever begins to be or to exist'; and the word 'becomes' means 'whatever

passes from potentiality to actuality,' as when a sitting person gets up and starts to run. The word 'cause' here signifies an 'efficient cause, and it is defined as a being which positively influences the production of something by its action. Hence, the Principle of Causality might also be formulated as follows: *Whatever passes from a state of non-existence into a state of existence must have an efficient cause for its existence.*

This latter formulation includes every kind of real production, whether absolute or relative. A real production is absolute, if the 'total being' passes from non-existence to existence without being produced out of the potentiality of pre-existing matter; this is 'creation.' It is *relative*, if the being is produced out of the potentiality of pre-existing matter, or if it passes from one kind of being into another kind of being; this is 'change.' In *substantial change* one substance passes over into another kind of substance, as when dead matter is assimilated and becomes living matter in a living body, for example, in an oak tree. In accidental change the substance remains unchanged in the process but acquires some new property or attribute, as when a person becomes sad or joyful. In either case the principle demands an *efficient cause* to account for the production of the *new reality which has come into existence.*

The *problem* revolves around realities which are or have been existent' but which were previously in a state of non-existence, so that they have ceased to be merely 'possible'; such a reality, whatever it may be, passes from non-existence to existence, and it is this that must be accounted for. The problem, therefore, is: Must every being passing

from non-existence to existence, whether absolutely or relatively, be brought to existence *through the active influence of an adequate efficient cause*? The answer is affirmative.

By the very fact that a being passes from non-existence to existence, it is assumed and stated that at first it was *nonexistent*. In that state it was as such only *possible*, that is to say, 'capable of existence.' In this state of possibility, 'existence' was not present in any form within the possible being; other-wise it would have been existent at the very time it was nonexistent, which is impossible because contradictory. If and when this non-existent but possible being passed into a state of existence, it must have *received* existence (because it did not have existence in its own being). Now, there are only three conceivable ways in which this possible being could have received existence: either it received it from '*nothing*,' or from '*itself*,' or from '*some other being*.'

It is impossible that it could have received existence *from 'nothing'*. If this possible being depended on 'nothing' for its existence, it could never receive the perfection of existence and would remain forever merely possible, i.e., non-existent.

It is also impossible that it could have received existence from '*itself*.' A possible being, from the standpoint of physical actuality, is nothing; this lies in the fact that it is only a *possible* being. As a 'possible' being it is as yet in a state of nonexistence, and it becomes 'actual' by receiving existence. If it were to give itself existence, it would be necessary that it *produce itself*. A being, however, that does

not as yet exist and is actually nothing, cannot act. Hence it cannot produce anything, least of all itself. Consequently, a being which passes from non-existence to existence cannot receive this existence from 'itself.'

The sufficient reason, why a possible being passes from nonexistence to existence, is not found in 'nothing,' nor is it found in this possible being 'itself.' Hence, by a process of elimination, it is clear that '*some other existing being*' must give existence to it. To 'give existence,' however, means to *produce it* by the positive influence of *its action*. If it did not exert a 'positive influence of its action,' it would not do anything and could not *give* anything; but in that case nothing would happen to the possible being, and the latter would remain in its state of mere possibility, which is non-existence. This other being must, then, be an *existing* being itself and *give existence* to the possible being by means of a *positive productive influence*. But to produce a being, that is, to bring it from non-existence to existence, by the positive influence of its own action, is the definition of an *efficient cause*.

The truth and validity of the Principle of Causality is thus established: 'Whatever passes from non-existence to existence must have an efficient cause for its existence.'

Basic Concepts and First Principles

This analysis of the First Principles, from the Principle of Identity to the Principle of Contradiction, enables us to fix the meaning of certain basic ideas which will play an important part in subsequent discussions.

There is the idea of the *impossible*. Something is said to be 'impossible' when its concept involves a contradiction, so that it *cannot exist* under any conditions and circumstances. A 'square circle,' for example, is contradictory in its very idea, and as such it has never existed and can never exist. Then, there is the idea of the *possible* being. Something is 'possible' when it does not exist but is capable of existence, so that it *can exist*. A 'mountain of gold' does not exist and probably never will exist; but it is capable of existence and therefore is 'possible.' When a 'possible' being receives existence, it is no longer merely possible but 'actual.' Even as an 'actual' being, however, its existence is a 'received' or 'produced' existence, and such a being is called *contingent*; a 'contingent' being is one which *exists* but *need not exist*. Plutonium, for instance, now exists; but a few years ago it did not exist, and the time may come again when it will no longer exist. Finally, there is the necessary being. A being is said to be 'necessary,' when it actually *exists* and also *must exist*. A 'necessary' being has always existed in the past, exists now in the present, and will always exist in the future, because existence is a constitutive part of its nature or essence.

According to the Principle of Causality, then, neither the 'impossible' being nor the 'necessary' being can ever be the *effect* of an efficient cause. The 'impossible' is absolute nothingness, so that there is no essence to receive existence. The 'necessary' being cannot receive existence, because it must always exist; what already 'is' cannot be produced.

By contrast, a 'contingent' being and a 'possible' being have a reality in which existence is not a constitutive part (not a part of the constitution) of their nature or essence, so that their existence, if and when it happens, must be produced by an efficient cause.

Empiricism

John Locke opposed Descartes's theory that all knowledge of man is derived from innate ideas. He contended that knowledge comes solely from *experience*. But he followed Descartes when he maintained that the 'object' of man's knowledge is restricted to internal conscious states, to 'ideas.' Locke's views gave rise to empiricism.

Strict *empiricists*, like Hume, admit nothing but sense-knowledge of phenomena. For them there is no such thing as a supra-sensible, or intellectual, knowledge. 'Ideas' are but refined sense-images; consciousness is a bundle' or stream of perceptions. Since all phenomena are but passing, changing realities, there can be no permanent and necessary knowledge in any form. Their theory of sensism precludes all knowledge which would possess a universal and necessary character. Yet it cannot be denied that we consider the *First Principles to be necessarily and absolutely true*. How account for this fact?

Hume finds their origin and explanation in the *association* of our ideas. Certain ideas or images are always experienced as occurring together; certain phenomena always appear in a regular sequence of time or in a definite contiguity in space. Thereupon we uniformly and

continuously 'associate' these things in our mind. This is done in virtue of the *law of association* inherent in the mind itself, because the mind is so constituted; and this is a subjective law with a purely subjective effect. Consequently, the 'necessity' of the First Principles is not due to the reality represented in these principles, but solely to the *associative force* existing in the mind. It is a *subjective* and *psychological*, not an objective and ontological, necessity. The mind does not judge these First Principles to be necessarily true because it sees that they cannot be otherwise; it cannot see them to be otherwise because the mind in its present constitution must judge them to be true. There is nothing *intrinsically* impossible in an object having contradictory properties or in a thing coming into existence without a cause.

Here is the *argument* Hume³ uses in order to show that the transition from non-existence to existence does not necessarily involve a 'cause.'

"The separation ... of the idea of cause from that of beginning of existence is plainly possible for the imagination; and consequently the actual separation of these objects is so far possible that it implies no contradiction or absurdity; and is therefore incapable of being refuted by any reasoning from mere ideas; without which 'tis impossible to demonstrate the necessity of a cause... As all distinct ideas are separable from each other, and as the ideas of cause and effect are evidently distinct, 'twill be easy for us to conceive any object non-existent this moment and

existent the next, without conjoining to it the distinct idea of a cause or productive principle.”

— DAVID HUME

In analyzing this argument, one must remember that all knowledge, according to Hume, is *sense-knowledge*; and when he speaks of ‘ideas,’ he means the vague copies of sense-impressions which exist in the *imagination*. What Hume means to say, therefore, is this: We can *imagine* something as non-existent one moment, and we can imagine it as existent the next moment; consequently, we can imagine it as coming into existence without a producing cause; and hence a productive cause is not necessary. To put it concretely: We can imagine a man as non-existent one moment and then as existent the next moment; consequently, parents and any other kind of cause are not necessary to bring this man into existence.

Imagination, and *not reason*, thus furnishes the ultimate criterion of what is real and not real, possible and not possible. Certainly, one can *imagine* something coming into existence without imagining its cause. That, however, does not prove that something can actually come into existence without a cause; it merely means that I have ‘imagined’ an effect with out ‘imagining’ its cause, but *reason* alone can tell me whether something can really come into existence as I ‘imagine’ it.

According to Hume,⁴ J. S. Mill,⁵ and empiricists generally (and this includes many present-day scientists), the Principle of Causality is but a mental expression of

‘invariable sequence’: because we observe things following each other invariably in time, we are compelled by the law of association to judge that the preceding object produces (cause) the one following (effect). And so it is with all First Principles. If we think that these principles *must* be true for all times and in all places and for all minds, we are harboring an illusion; for other minds, in other places, at other times, and under other conditions, the First Principles may not be true at all.

Empiricism fails to give an adequate account of the logical necessity existing in our judgments as expressed in the First Principles. If the theory were correct, we should perforce experience the same psychological necessity of judgment *in every case* where we observe a uniform and constant association of objects or ideas in our consciousness. This, however, patently is not the case. For instance, day follows night in an invariable sequence; however, nobody thinks that night is the ‘cause’ of day. Cars follow each other in invariable sequence on the highway on a Sunday afternoon, yet no one applies the Principle of Cause and Effect to them. Every time we lift our eyelids during the day, we invariably see; nevertheless, we do not judge that the lifting of the eyelids ‘causes’ our actual ‘seeing.’ On the other hand, we feel the necessity of applying the Principle of Causality in *isolated cases* that happen seldom and even only once. When a car, for example, suddenly ceases to run, we immediately look for the ‘cause.’ When a train leaves the track, we do not need a frequent repetition of the occurrence to establish an association of perceptions; we know that there must have

been a 'cause' of the derailment, even if this was the first derailment that ever happened. And so with a thousand and one other solitary occurrences. Hence, the necessity inherent in our judgment expressing the Principle of Causality (and the same line of reasoning applies to all First Principles) is not derived from the subjective influence of the association of our ideas.

The very *arguments* the empiricists use to prove the truth of their theory are not based on 'experience' but on reasoning. These arguments are in no way 'objects of experience' derived from sense-perception; they go far beyond the reaction of the senses. The very reasons empiricists give to impugn the validity and necessity of the First Principles *presuppose* the Principles of Contradiction and Sufficient Reason; only on the supposition that the First Principles are valid have these reasons any semblance of validity. Such a procedure, however, is illogical and inconsistent. Any theory which implicitly affirms what it explicitly denies and attempts to disprove must be false, or knowledge is impossible. Hume realized this eventually and became a skeptic.

The fact is, as we stated above, that our *intellect has an intuitive insight* into the objective validity and necessity of the First Principles.

Idealistic Monism

Georg Hegel (1770—1831) was an idealistic monist. 'Monism' is the doctrine which holds that there is but one fundamental reality or being. If this reality is matter,

monism is 'materialistic; if it is idea, it is 'idealistic.' Hegel, too, followed Descartes's basic tenet that the mind is restricted to ideas. From this, Hegel concluded that all reality is the *Absolute Idea*. Through a process of logical development the Absolute Idea becomes matter (nature) and spirit (mind).

Hegel begins by identifying all reality with the Absolute idea of *Being*. In order to explain its development, he sacrifices the validity of the Principles of Identity, Contradiction, and Excluded Middle. Consider his words,⁶ in which he denies the distinction between 'being' and 'nothing.'

"The distinction between Being and Nought is, in the first place, only implicit, and not yet actually made: they only ought to be distinguished. A distinction, of course, implies two things, and that one of them possesses an attribute which is not found in the other. Being, however, is an absolute absence of attributes, and so is Nought. Hence, the distinction between the two is only meant to be; it is a nominal distinction, which is at the same time no distinction. In all other cases of difference there is some common point which comprehends both things. Suppose, e.g., we speak of two different species: the genus forms a common ground for both. But in the case of mere Being and Nothing, distinction is without a bottom to stand upon: hence, there can be no distinction, both determinations being the same bottomlessness... Nothing, if it is thus immediate and equal to itself, is

also conversely the same as Being is... In Being we have Nothing, and in Nothing Being... In Becoming the Being which is one with Nothing, and the Nothing which is one with Being, are only vanishing factors; they are and they are not."

— GEORG HEGEL

Contradiction thus lies in the very heart of Being and Idea and makes the 'becoming' or development of the Absolute possible.

Hegel identifies 'being' and 'nought' because, as he contends, "Being is an absolute absence of attributes, and so is Nought." Since there is "no distinction" between the two, both are identical. In this Hegel was guilty of a gross misconception. *Being*, as we have pointed out, always possesses the attribute of a *relation to existence* inasmuch as it 'exists' (actual being) or at least 'can exist' (possible being). *Nought* (absolute nothing) has *no relation to existence* and as a consequence never exists' and 'cannot exist.' 'Being' thus has a *positive* content; 'nought' is purely negative in content, since it represents the negation of all being. From this it should be clear that the concept of 'being' is not empty of all content and as such indistinguishable from 'nought,' as Hegel maintained. Hence, Hegel bases his whole system of idealistic monism on this initial *misconception*.

Besides, when Hegel formulates his arguments, he always (though inconsistently) *implies* that the First Principles are valid. The very fact that he identifies 'being'

and 'nought' because of their supposed indeterminateness and emptiness really *presupposes* the validity of the Principles of Identity and Contradiction. By denying, therefore, the Principle of Contradiction and making contradiction itself the basis of all 'becoming,' he not only cuts the ground from under his own system but destroys the foundation of all knowledge. After all, *thought* and *reality* are not the same, but the First Principles apply with equal force to both because the laws of thought are taken from the laws of reality.

Pragmatism

Pragmatism is a repudiation of absolutism and idealism and a return to empiricism. It originated with Charles S. Peirce in 1878, and its chief exponents are William James, F. C. S. Schiller, and John Dewey.

It is more a *method* than a philosophical system in the strict sense of the word. Still, inasmuch as pragmatism professes certain fundamental principles, it can be classed among the philosophies.

According to pragmatists, truth is nothing permanent, necessary, universal, objective, absolute; it is relative, transient, particular, subjective, personal. Truth is 'made' by means of hypothesis and experiment, so that something is 'true' if it satisfies some human need or interest and 'false' if it does not. Good or bad *consequences* are all that count. If an idea, judgment, assumption, axiom, postulate, theory, or system of thought 'works' and satisfies our mental or emotional or social needs, it is, *so far and so long*

as it does this, valuable and true. Truth is not an inherent property of ideas or judgments: *they become true and are made true by events.* Ideas, judgments, and inferences possess only a 'functional' and 'provisional' character; among such judgments are the *First Principles*. Dewey⁷ denies that we have an "immediate knowledge" of their truth, and Schiller⁸ ridicules the attitude of accepting the truth of certain propositions because we "feel it in our bones." Consequently, a conviction may be true at one stage of development and false at a different stage; it may be true for one class of people and false for another, depending on the intellectual and cultural conditions prevailing at a particular time and in a particular locality. Truth, therefore, is entirely *subjective*.

One can admit with the pragmatists that in the *field of science* it is necessary to 'verify' a certain opinion by hypothesis and experiment rather than accept a scientific conclusion as 'self-evident.' But when they deny the self-evidence and immediate knowledge of *all truths* whatever, even that of First Principles, they destroy the foundations of the *experimental sciences* together with that of *knowledge in general*. All science is based on the existence of truth and certitude. If contradictories can be true together, if a phenomenon can occur without a cause, and if nature is not uniform in its operation, then every form of experimentation and induction on the part of science is valueless from the start. Some truths must be *self-evident*, because they are 'implied' in every form of inference, whether that inference be deductive or inductive. They are

clear to the mind through *intellectual insight*, not because we “feel it in our bones.”

And pragmatists are *inconsistent*. They identify ‘truth’ with ‘utility.’ Nevertheless, they appeal to the intellect with a great array of arguments, to prove that ‘truth’ consists in beneficial results; in doing so, they appeal to the *objective evidence* of facts and reasons to establish their case. These arguments, however, have no value except under the supposition that the First Principles are true and valid. Their own attitude and action is their best refutation.

The First Principles are thus seen to be ‘necessary’ in their truth and validity. They are *not empirical*, as if their truth and validity can be discovered only through ‘experience.’ Rather, they are *analytical*, because an analysis, based on self-evidence and intellectual insight, reveals their necessary character. Once these First Principles are understood, the proofs for God’s existence will also be more readily understood.

Summary of Chapter II

Since the *First Principles* govern all reality and thought, their validity must be established.

1. *First Principles*. — Some judgments are ‘contingent’ in character, and their truth can be discovered only by ‘experience.’ Other judgments are ‘necessary’ in character; they are necessarily true and therefore without possibility of change or error. Among these are the First Principles. *The First Principles* are the Principles of *Identity*, *Contradiction*, *Excluded Middle*, *Sufficient Reason*, and *Causality*.

2. *The Principle of Identity*. — ‘Whatever a thing is, it is’; ‘A being is identical with itself.’ This principle is grounded on the concept of being, namely, something that ‘exists’ or is ‘capable of existence.’ The opposite of ‘being’ is *non-being*, *absolute nothing*, namely, something that ‘neither exists nor is capable of existence.’ Since ‘being’ always contains a positive (actual or possible) relation to existence, while ‘absolute non-being’ contains no such relation, it is clear that ‘being is being’ and ‘non-being is non-being’ (Principle of Identity).

3. *The Principle of Contradiction*. — ‘A thing cannot be (something) and yet not be (it) at the same time under the same respect.’ A comparison between ‘being’ and ‘non-being’ makes it self-evident that the one is not, and cannot be, the other; these two concepts mutually exclude each other with *absolute necessity*, because ‘being’ and ‘non-being’ can never be identical.

4. *The Principle of Excluded Middle.* — ‘A thing either is or is not (something)’; ‘Between two contradictories a middle is excluded.’ There is no middle thing possible between ‘being’ and ‘non-being,’ between ‘is’ and ‘is not’; they represent *a complete division of all things*, so that everything conceivable must be either the one or the other.

5. *The Principle of Sufficient (Determining) Reason.* — ‘A thing must have a sufficient reason for its being and existence.’ Whatever reality a ‘being’ has, it must have either of and by *itself* or from and by *another* being; in either case it has a ‘sufficient’ reason to account for its being and existence. If it could have reality without receiving it either from itself or from another being, it would have to receive it from ‘*nothing*’; but ‘nothing’ has no reality and can give no reality. Consequently, were this reality without a sufficient reason either in itself or in another, it would both ‘be’ and ‘not be’ at the same time under the same respect. Hence, every being must have a *sufficient reason* for its being and existence.

6. *The Principle of Causality.* — ‘Whatever passes from a state of non-existence into a state of existence must have an efficient cause for its existence.’ It is assumed that a being was at first *non-existent but possible*. Such a non-existent being, if it reaches existence, must receive this existence either from ‘nothing’ or from ‘itself’ or from some ‘other being.’ It cannot receive it from ‘*nothing*,’ because ‘nothing,’ having no existence, cannot give what it does not possess. It cannot receive it from *itself*, because to give existence to itself would mean to ‘act’ before it exists. Hence, it can receive existence only from *some other being*

already in existence; but if the latter did not exert a 'positive influence of its action,' it would 'do' nothing and could not 'give' anything. Consequently, a non-existent being can receive existence only through the 'positive productive influence' of another being. Now, a being which gives existence to another through the positive influence of its action is an *efficient* cause.

7. *Basic Concepts and First Principles.* — The *impossible* is something that 'cannot exist' and therefore cannot be produced. A possible being 'does not exist' but 'can exist,' and as such it can be produced. A *contingent* being 'exists' but it 'need not exist'; it is, therefore, a produced being. A *necessary* being actually 'exists' and 'must exist'; since it always has been, it could not have been produced.

8. *Empiricism.* — We judge the First Principles to be necessarily and absolutely true. Hume and the empiricists place the 'necessity' of these principles in the *Law of Association* present in the mind; the principles need not be true in themselves.

This theory is *false*. We feel the necessity of looking for the cause in *isolated* events, when no repeated occurrences happen; in such instances no 'association' can form. Finally, empiricists present arguments not based on 'experience' but on 'intellectual reasoning,' and their reasons *presuppose* the validity of the Principles of Contradiction and Sufficient Reason.

9. *Idealistic Monism.* — Hegel identifies *Being and Nought* because, as he claims, "Being is an absolute absence of attributes" and therefore identical with 'Nought.'

‘Being,’ however, always possesses the attribute of a *relation to existence* (actual or possible being), while ‘Nought’ (absolute nothing) has no relation to existence and as a consequence never exists and cannot exist. Although Hegel, in his arguments, denies the Principles of Identity and Contradiction, his arguments (inconsistently, of course) *presuppose* their validity.

10. *Pragmatism*. — According to the pragmatists, truth is subjective and provisional; a principle is ‘made true’ and ‘becomes true’ by its consequences. Even the First Principles are not necessarily true in themselves.

Pragmatism *destroys* the foundation of all knowledge and science, if the Principles of Identity and Contradiction have no objective value. Pragmatists are also *inconsistent* in appealing to the *objective evidence* of facts and reasons to establish their case.

Chapter 3

THE POSSIBILITY OF PROOF

THE PROBLEM OF GOD'S EXISTENCE IS VITALLY IMPORTANT. THE history of human thought shows that a wrong approach either leads to serious error or ends in a blind alley.

The validity of the First Principles having been established as rationally certain, the next step will be to inquire as to the *proper method* which must be employed in proving God's existence, provided His existence can be proved at all. Some thinkers claim that man cannot prove that God exists; others, that His existence is intuitively clear to man's mind, so that a rational proof is unnecessary. Even among those who admit that God's existence can and must be proved to the satisfaction of reason, there is a difference of view as to the proper method to be used in establishing the proof. The matter of God's existence or non-existence is too grave to be left open to serious doubt concerning the proper approach to the problem.

It will be necessary, therefore, to remove some misconceptions, before a definite attempt is made to formulate the arguments for God's existence. Some of these misconceptions result from the 'scientific attitude' so

prevalent in our day; others are more 'philosophic' in nature. In either case the ground must be cleared.

Scientific Explanation

Scientists frequently state that they are concerned only with a description of *facts*, because that alone is in accord with the 'scientific temper' and the 'scientific attitude.' Science, they say, must be 'exact,' and only if science deals with facts will it be an *exact science*.

Accuracy is a necessity for any science worthy of the name. When, therefore, scientists seek to attain accuracy or 'exactness' in their findings, their endeavor is entirely praiseworthy. Hence, they seek to eliminate all prejudices and unwarranted presuppositions in their research. This, too, is praiseworthy.

However, *facts alone are not a science*. They are but the raw materials with which scientists work in order to construct a science. More is needed than facts alone. Facts must be 'correlated' and 'explained' before one can speak of having a 'science.' Relevant facts must be arranged in a definite order, and an explanation given of the operation of things, before one can speak of 'scientific knowledge.' The characteristic of science is *law*, and law is the result of the proper interpretation and explanation of facts in their relations to one another.

No real scientist is ever satisfied with a mere 'description' of facts, be these facts 'things' or 'events.' Scientists always seek to *explain why* things are as they are and events happen as they do. That is the whole purpose of

hypothesis and its *verification* by observation and experiment. Unless they sought to find an answer to the 'How?' and 'Why?' of things and events, there would be no rhyme or reason for formulating a hypothesis and proceeding to prove or disprove its truth. True to the preconceived tenet of strict empiricism, they may speak of an 'invariable sequence of antecedents and consequents'; but in reality they look for the *causes* which will explain them as *effects*.

A cursory perusal of any scientific article or book will prove that scientists attempt to give the causal *explanation* of things and events, not merely their factual or 'phenomenal' appearance and occurrence. Most astronomers, when they discuss the 'red shift' in stellar spectra, the occurrence of a 'nova' in the heavens, the movements of stars and galaxies, and other matters, almost invariably seek to give a rational 'explanation' of the phenomena. From the data as perceived and recorded, physicists and chemists proceed to 'infer' the existence and structure of atoms, molecules, and sub-elemental particles, although no one has ever actually perceived such realities. How correct their 'deductions' can be was shown by the terrific explosion of the atom bomb. Medical scientists are not content with a description of the symptoms of diseases and abnormalities, but seek to determine their 'causes' so as to remove them by surgery or medication. All scientists act in this manner, because only through inference from perceived data can their science make substantial progress; and no one will deny that substantial progress in scientific knowledge has been made.

Everyone is aware, of course, that much of the so-called 'scientific knowledge' is only approximation, resting on the foundation of hypotheses and theories which still are far from complete verification. On the other hand, many hypotheses and theories have been verified in the course of time and many more will be verified in the future. The point of the whole matter is this: *inferences are a process of reasoning*. Reason, therefore, has a legitimate place in the experimental sciences, although reasoning goes beyond the bounds of factual description. After the empirical facts are all in and have been accurately recorded, science must (and actually does) attempt to find the causal connections which 'explain' the phenomena. Man being rational, he must use whatever powers he has, including his reason, to arrive at a complete explanation of things and events through their causes.

Scientists feel satisfied with their efforts, if they succeed in specifying the 'proximate' causes of things and events present in the physical world, and they have a perfect right to restrict their field of research in this manner. But if they are justified in the restriction of their reasoning powers for the discovery of truth, they are not justified in the *restriction of reason itself*. Since reason is an adequate instrument of true knowledge in the discovery and assignment of 'proximate' causes, why should reason not be capable of penetrating farther and of discovering the *ultimate cause or causes* of the physical world? The proper test of a power is in its actual accomplishment. If reason fails in its endeavor to determine the ultimate cause or causes of the universe, well and good; but it should not be

prejudged to be incapable of doing so. After all, human reason is the same, whether it be used in the discussions of physical science or of philosophy. Philosophic knowledge is scientific knowledge, too, even though it essays to go deeper than physical science. So long as philosophy argues from the same physical world and uses the same First Principles as ordinary science does, the competency of reason must be accepted in both. To assume its competency in the natural sciences and deny its competency in philosophical science is illogical and inconsistent. Such an attitude, if accepted in principle and carried out to its inevitable consequences, would undermine the foundations of the natural sciences and lead to *universal skepticism*.

Hence, the competency of human reason in its endeavor to prove God's existence as the rational explanation of the physical world must be accepted in principle.

Deism and Agnosticism

Deism was a quasi-philosophic movement, promoted mainly by a group of thinkers in England who attacked revealed religion. *Lord Herbert of Cherbury* (1581—1648) had already defended deism, but it took the empiricism of John Locke to give it a strong impetus. Deism had no uniform system of doctrines. Chiefly, it defended a *universal natural religion*. Deists conceded that it could be proved on rational grounds that God exists and is the Creator. Many deists, however, contended that God, after creating the world, took no interest in mundane affairs. Chief among the advocates of deism were Charles Blount (1654-1693), John Toland

(1670—1722), Matthew Tindal (1657—1733), and Henry St. John, Viscount Bolingbroke (1678—1751). The movement eventually gave way to outright atheism and agnosticism.

Without passing judgment on the anti-revelationist part of deism, but merely viewing it from the standpoint of theodicy (natural theology), deism must be criticized as being *too narrow and restrictive*. It is inconsistent to admit that God's existence can be proved on rational grounds and then stop short. The deists, like the theists, prove God's existence from the character of the physical world; but the physical world may reveal many things about God besides His existence, such as divine concurrence, divine providence, and the possibility of revelation. To deny their possibility or actuality is therefore totally unwarranted.

Agnosticism has a number of meanings. Literally, it means 'lack of knowledge.' However, Thomas Huxley (1825—1895) coined the word in 1869 to mean the attitude of a person who advocated the inability of the mind to know the reality represented by man's ultimate scientific, philosophic, and religious ideas. *Modern agnosticism* is a philosophic theory which affirms the constitutional inability of the human mind to know reality, so that all investigation pertains merely to the 'phenomenal.' Behind the phenomena, most agnostics assert, is an *absolute reality* of some sort, but this reality is intrinsically *unknowable*. Such is the view of Immanuel Kant (1724—1804), Sir William Hamilton (1788—1856), Henry L. Mansel (1820-1871), and Herbert Spencer (1820—1903).

Kant divided the objects of knowledge into two general classes, 'phenomena' (appearances) and 'things-in-

themselves'; the former are all we know, the latter are inaccessibly hidden behind the phenomena and are absolutely unknowable. God is, therefore, unknowable, so far as human reason is concerned. *Hamilton* maintained that "all knowledge is relative"; of existence, absolutely and in itself, man can know nothing. Man cannot, therefore, acquire any real knowledge of God, because God is the Absolute, the Unconditioned, the Infinite; man's reasonings in this respect are mere negations of thought." *Mansel* followed Hamilton's relativism, asserting that man cannot form a positive concept of God, because man is unable to obtain an 'exhaustive' concept of God in all its 'positive' contents. While Hamilton and Mansel denied man's ability to know God on rational grounds, both affirmed that faith and revelation can impart true knowledge of God and His nature. *Spencer*, too, was a relativist. Since the 'relative' always presupposes the 'absolute' as its correlative, Spencer postulated the existence of Absolute Reality; however, neither knowledge nor belief can give man any insight into the nature of this reality, because all ideas are merely 'symbolic' of reality.

Nevertheless, he often speaks of the Unknowable as the "Power manifesting itself in phenomena."

Agnosticism rests on the fallacious basis of Hume's *unwarranted empiricism*. True, if the ideas of reality are mere constructions of the mind, so that man's mind is the sole source of all knowledge, then man's efforts to know the physical world are inextricably enmeshed in the net of *subjectivism*. But if man can perceive the external world, then his reason must be able to pierce the appearances of

things; in that case he can also know something of their nature and activity, and from their nature and activity draw rational inferences as to the nature and activity of their cause, because *every effect manifests the nature and activity of its cause* in some manner. Reason may not be able to know everything about God, but it should be able to know something, no matter how imperfectly. 'Imperfect' knowledge is not the same as 'indefinite' or purely 'negative' knowledge; though not complete, imperfect knowledge would still be true knowledge. When agnostics acknowledge that God (or the Absolute) 'exists,' or when they speak of God (or the Absolute) as the 'Unconditioned' and the 'Power manifesting itself in phenomena,' they express ideas which reveal *some* knowledge of the supposed 'Unknowable'; and thereby, on their own principles, they involve themselves in a contradiction.

Fideism and Traditionalism

Fideism and *traditionalism* are theories or attitudes which hold that human reason is incapable, of its own native ability, reaching certitude regarding any truth or at least regarding truths of the philosophical and religious order; they affirm that knowledge of truth consists in an act of *faith* (hence 'fideism'), and the supreme criterion of certitude is the authority of revelation as given to man through *tradition* (hence 'traditionalism'). Like agnosticism in general, fideism and traditionalism are based on a conviction of the natural impotence of human reason in the discovery of truths referring to God's existence and nature.

In order to combat agnosticism and empiricism, fideists and traditionalists sought the fundamental source of all knowledge of God in 'faith' and 'tradition,' rather than in the rational inferences of the human mind.

Among the chief exponents of fideism and traditionalism are Louis G. de Bonald (1754-1840), Félicité R. de Lamennais (1782—1854), L. Bautain (1795—1867), A. Bonnetty (1798—1879), G. Ventura (1792—1861), and C. Ubaghs (1800—1875). They differed in details, but their fundamental distrust of reason was the same, and so also was their demand that an act of faith in God's revelation precede any rational discussion on His existence and nature.

It does not need much reflection to see that *faith cannot precede reason* as a source and criterion of truth in philosophical and religious matters. Revelation of any kind and faith in its pronouncements can never engender conviction in the mind unless it is first clear that God exists and that He has revealed Himself. Hence, the reasonableness and validity of revelation and the subsequent act of faith must first be established; otherwise their acceptance is a blind assent. Consequently, if our assent is to be reasonable and not blind, reason must precede faith. Only if man can prove God's existence on rational grounds, will it be possible for him to know whether revelation could have occurred at all. To assume the impotence of reason as the starting-point would involve *universal skepticism*.

Ontologism

Ontologism holds that God and *Divine Ideas* are the first object of our intelligence and the intuition of God the first act of our intellectual knowledge. Ontologism stems directly from Descartes's excessive dualism, in so far as he maintained that man consists of two separate substances, namely, the body as inert extension and the soul as the exclusive source of all knowledge.

N. Malebranche (1638—1715) is commonly held to be an ontologist. He maintained that man envisions all things by means of a direct intuition of God's ideas. Just as bodies have their location in space, so our ideas have their location in God. Our ideas, he says, are the divine essence itself, inasmuch as God's essence is the model of all things. It follows from this that God is always present to our intelligence and manifests to our minds the nature and existence of all we know. *V. Gioberti* (1801—1852) also maintained that our first intellectual perception is an intuition of God as creating existences. *A. Rosmini* (1797—1855) held the view that man has a direct intuition of Being in its supreme ideality, and this innate concept or intuition makes the soul intelligent. When this Ideal Being is analyzed, it is seen to pertain to God.

The doctrine of ontologism may seem strange. Two principal reasons account for it. According to these thinkers, the presence of the idea of the 'infinite' in man's mind cannot have its origin in finite beings, because the finite does not contain the infinite; the eternity, universality, and necessity which characterize many judgments,

especially the First Principles, cannot be derived from finite reality (such a reality is temporal, particular, and contingent) but must originate in the mind from the Eternal, Universal, and Necessary Being or God.

In answer to the ontologists it must be stated that man has *no experience* of a direct intuition of God; if man had such an experience, he would have to be *conscious* of it at all times. Such an intuition of God would make all doubt or error concerning God's existence and nature utterly impossible; yet *doubt and error* in this respect can and do exist. If man knew all things in the ideas of God, man's knowledge would always be *infallibly true*, because God Himself is infinite truth. As for the reasons advanced by ontologists in defense of their position, they are based on a misconception. It is true that man has an idea of the 'infinite,' but the very word shows that it is derived from the finite ('in-finite') by removing the limitation of finiteness; hence, it must be obtained by a process of abstraction from finite beings. It is also true that our ideas and judgments frequently possess the characteristics of eternity, universality, and necessity. However, in God these attributes belong to His nature and being, while in our ideas and judgments these characteristics refer merely to their 'application to things' as a result of abstraction. Hence, these characteristics are essentially *dissimilar* to the attributes of God.

Religious Experience

Many persons appeal to *religious experience* as proof that God really exists. This experience may be either intellectual or emotional in character, and it is supposed to be 'non-inferential.' *Modernism*, for example, claims that man has a *vital experience* of God dwelling and working in him; God is present in man through 'vital immanence,' in consequence of which man is emotionally conscious of God's presence. Experience of this sort occupies considerable space in much of the religious literature of the past and present. It is claimed that many devout persons during prayer or meditation experience the presence of God in a realistic way; this is especially true in emotional crises which lead to a 'conversion.' In a similar manner, the religious experiences of 'mystics' are adduced as evidence for God's existence.

While it would be wrong to minimize the importance of religious experience in the life of individuals, its *value as evidence* is entirely too *subjective* to convince those who are not already convinced. The experience itself is incommunicable and can hardly be repeated at will. What is required is evidence of such a character that every honest inquirer can obtain it. Man being rational by nature, the evidence must be directed to his 'reason' and not merely to his emotions and intuitions. Such knowledge, therefore, must be obtained by a *process of reasoning*, by means of *inferences*. The ordinary person's inferences are often informal and spontaneous, the result of his native ability to reason; but if these inferences are valid, it should be possible to analyze them according to the laws and rules of logic, so that their validity can be tested. The philosopher,

therefore, has the right to subject the ordinary person's conviction to a thorough analysis and to formulate arguments which, though more difficult to grasp, will survive the critique of reason and be placed upon a more solid foundation.

No one is as blind as he who closes his eyes and refuses to see. No logical proofs will ever be such that one is absolutely compelled to accept them. All that can be expected of any proofs for God's existence and nature is that they be logically unassailable and as such tend to bring the honest, truth-seeking mind to conviction. Not all proofs advanced possess logical unassailability; we have already pointed out some improper Approaches in the foregoing sections. Another improper approach is exemplified in the 'ontological argument.'

The Ontological Proof

The ontological argument is famous in the annals of philosophy. It was first formulated by *St. Anselm* (1033—1109). He presented the argument in two slightly varying wordings,¹ but the fundamental thought is the same.

St. Anselm's proof for God's existence runs as follows. By the term 'God,' we understand the being than which nothing greater can be thought. But a being which not only exists in the mind as an object of thought, as possible, but which has also actual existence outside the mind, is greater than a being which exists in the mind only. Hence, if God did not exist actually outside the mind, He would not be that than which nothing greater can be thought. Consequently,

God exists actually outside the mind, as a reality, and not merely in the mind.

The argument was neither approved nor disapproved by St. Albert the Great; it was rejected by St. Thomas Aquinas; Duns Scotus considered it valid and used it. Descartes and Leibnitz were convinced of its validity and formulated similar arguments.

The ontological argument of St. Anselm must be rejected as an *illegitimate passage from the logical order of thought to the real order of things*. All one can conclude from the argument is this: If an infinitely perfect Being exists, it must have the reason for its existence in itself, and consequently it must exist necessarily. Hence, if one would *think* of this Infinite Being as 'real' and would not also think of it as existing of its own power and essence, one would certainly think something contradictory. But I can think of the *Infinite Being* as existing without, however, knowing whether it actually does exist. Whether the 'if' of the premise is verified or not is something that cannot be known from the idea alone. All the argument shows is that the idea of existence must be included *within the concept of God as such*. One must *think* the Infinite Being to have real existence, if one wants to think of an Infinite Being at all. But that does not prove the real existence of an Infinite Being, because it does not prove that a 'thing' corresponds to the 'idea' in the mind.

St. Thomas Aquinas rejects the ontological argument of St. Anselm in the following words.²

"Nor does it follow, as the first argument alleged, that as soon as the meaning of the word *God* is understood, it is

known that God is. First, because it is not known to all, even to those who grant that there is a God, that God is that thing than which no greater can be thought of, since many of the ancients asserted that this world is God. Nor can any such conclusion be gathered from the significations which Damascene (D. Ia. I, 2.) assigns to the word *God*. Secondly because, granted that everyone understands this word *God* to signify something than which a greater cannot be thought of, it does not follow that something than which a greater cannot be thought of exists in reality. For we must needs allege a thing in the same way as we allege the signification of its name. Now from the fact that we conceive mentally that which the word *God* is intended to convey, it does not follow that God is otherwise than in the mind. And thence it does not follow that there exists in reality something than which a greater cannot be thought of. Hence this is no argument against those who assert that there is no God, since whatever be granted to exist, whether in reality or in the mind, there is nothing to prevent a person from thinking of something greater, unless he grants that there is in reality something than which a greater cannot be thought of." Briefly, the argument of St. Thomas can be summed up as follows: The mere fact that I form an idea of a thing, and then express it in a name, does not prove that the thing, corresponding to this idea and name, actually exists; the actual existence must be proved through some other source.

Descartes proved the existence of God by the argument from effect to cause; but he also used the ontological argument, though the formulation is different from that of

St. Anselm. Here is the argument: Whoever says that something is contained in the nature or concept of a thing, thereby affirms that this something belongs in truth to that thing, is true of it. But now, the necessary existence of God is contained in the idea of God. Hence, it is true to say of God that necessary existence is in Him, in other words, that He exists.

The point of Descartes's argument lies in the phrase that we must affirm the existence of God as 'true,' that existence belongs 'in truth' to Him. This is an *equivocation*. Descartes gives the impression that 'true' and 'in truth' mean the same as real.' But this *need not* be so. Something can be 'true in the logical or the real order or in both. According to Descartes's first premise, the expression 'true' is used of *concepts*; consequently, the existence of God in the 'concept' of God must assuredly be maintained. But whether this also pertains to the 'real' order of things is precisely the point in question. He slips unconsciously from the ideal to the real order, because the *conceptual* truth of the Infinite and His existence remains unshaken, even if we do not consider God to be actually existent. Only then would one be wrong in his concept of God, if one would 'know' Him to exist and then deny the necessity of His existence. But just this knowledge of God's existence is not allowed to be presupposed, but must be *proved*.

Leibnitz also used a variation of the ontological argument to prove God's existence. His argument assumes the following form: It is possible for God to exist, since that does not involve a contradiction. But if God is possible, He

must exist, for a God who is merely possible is not that which is understood by 'God.' Hence, God really exists.

Leibnitz, like St. Anselm and Descartes, is also guilty of an illegitimate passage from the ideal order to the real order. Certainly, if one *thinks* God to be the 'Infinite' and at the same time 'possible to exist,' then, in order to maintain His infinity, one would be compelled to affirm His real existence *in thought*, since a God who is merely considered as 'possible' is not as perfect as one who is considered as 'real.' In *thought*, therefore, one would have to say that the Infinite is really existent. That, however, would not yet prove that God actually exists in the *reality of things*. Hence, we have here an arbitrary and unwarranted passage from the logical order of ideas to the real order of things.

The Necessity of Proof

Many devout persons are of the opinion that it is unnecessary to *prove* God's existence; it is sufficient, they say, to *believe* in Him. One can, of course, 'believe' in God and in His existence on the authority of others, because these others are judged to be worthy of trust. However, belief always presupposes a witness. Belief in God, therefore, must always rely on the testimony of some witness who has 'proof' of God and His existence; otherwise such a belief would be unreasonable and, as such, unworthy of man as a rational being.

We have *no immediate intuition* of God's existence, as each of us knows from his own conscious experience. The

testimony of certain individuals to the contrary must be discarded, because their experience is private and subjective and therefore unconvincing for humanity in general. The fact of God's existence is *not self-evident*. If it were self-evident, the fact could neither be denied nor doubted, because then the fact of God's existence would be as clear to man's mind as the truth of the First Principles and of his own existence; that God's existence has been denied or at least doubted by honest and serious thinkers, is obvious from the history of human thought. This lack of self-evidence is also manifested by the fact that philosophers and theologians through the centuries have felt the necessity of proof and formulated arguments to demonstrate the fact of God's existence.

A judgment or proposition is 'self-evident,' if its truth is revealed to the mind by an *analysis of subject and predicate*. When the concept of the predicate is contained in the concept of the subject, or the concept of the subject is contained in the concept of the predicate, then analysis will reveal that they belong together; an understanding of the one concept entails an understanding of the other, and the truth of the judgment or proposition thus becomes patently clear. Thus, if I understand what is meant by 'to be' and by 'not to be' ('being' and 'non-being'), the proposition is self-evidently true that 'A thing cannot both be and not be (something) at the same time under the same respect.' Similarly, if the judgment or proposition 'God exists' were self-evident to man's mind, an analysis of the concept 'God' and of the concept 'exists' should make it clear that 'God exists' in the *real order*. That, however, is not the case, as

was seen in the discussion of the 'ontological argument'; the proposition is true in the 'logical order of thought,' but it need not be true in the 'real order of things.' Hence, we must say that the existence of God is not self-evident to us.

Now, if man has no immediate intuition of God and His existence and if the truth of God and His existence is not self-evident to man's mind, man can have only a *mediate and discursive knowledge* of God's existence. Hence, God's existence must be *demonstrated*, if man is to have certainty of the fact.

God's Existence Can Be Proved

Since God's existence is not self-evident, the question arises: Can it be *demonstrated*? Can God's existence be known with certainty by means of an *inferential* process of man's reasoning power? We claim that it can be demonstrated to the satisfaction of everyone capable of reasoning and willing to accept the truth.

The denial of the possibility of proving God's existence would be reasonable only on the supposition that God would *not have manifested Himself* in the universe or that man is *incapable of knowing Him* with certainty from the universe. Neither supposition can be upheld.

We have not as yet proved that the physical world needs an efficient cause to account for its existence; nor (if it does need such a cause) have we proved that God is that efficient cause. However, *if* we can prove that the world demands an efficient cause, and *if* God is that cause, then the physical world, as the 'effect' of God's causality, *should reveal*

something of its 'cause.' In other words, if God is the cause of the universe, He *manifests* His being in some manner in the universe He caused. The reason is plain. Every effect must receive its being from the cause; and the reality of the effect must somehow proceed from the reality of the cause: no one can give what he does not have. It follows that the reality of an effect manifests in some manner the reality of the cause. Hence, if God is the cause of the universe, it is necessary that the universe manifest God in some manner. Absolutely speaking, therefore, it should be possible for man to argue from the existence of the world to the existence of God.

The only other supposition which would make such a proof impossible would be that man were *incapable of knowing God*. This incapability could be either 'constitutional' or 'factual.' It would be *constitutional* if man's reason were by *nature* incapable of rising above the merely phenomenal, so that it could draw no legitimate inferences from the physical world to a higher reality; God would indeed be the Unknown and Unknowable. In that case, however, it would be inconceivable how man could even arrive at the *idea of God*. The fact that man has such an idea shows plainly that he is not constitutionally unable to know God.

The incapability of knowing God would be *factual* if man were by nature capable of knowing God and proving His existence, but the conditions surrounding man were such that they lend themselves with difficulty to actual *demonstration* of God's existence. The difficulty would be psychological. However, man, in virtue of his reasoning

powers, is always making inferences from cause to effect and from effect to cause. Scientists continuously argue to the existence of 'proximate' causes. So why should it not be possible for man to reason to 'ultimate' causes and to the First Cause? Scientists conclude from the activities of bodies to the existence of atoms, electrons, protons, neutrons, and similar realities (although no one has ever actually 'perceived' them), and the legitimacy of their inferences is admitted. The inference from the world to God is of practically the same kind.

Everything will depend on the *nature of the inference*, whether it be convincing or not. People differ in individual talents and education. This psychological difficulty can hardly be overcome entirely. Philosophy naturally addresses itself to those interested and versed in demonstrations which are logically correct and convincing. The philosopher, therefore, must endeavor to arrange his demonstrations in such a manner that they comply with the laws of correct thinking and at the same time are clear. How far he will succeed in this endeavor depends on his ability to present the demonstrations and on the ability of the student to assimilate them. In any case, the arguments themselves must be logically flawless, or they will not be able to convince the logically minded.

Granted, therefore, the constitutional ability of man to reason from effect to cause, it must be considered *possible* for man to reason from the existing world to God.

Kant's Formalism

Immanuel Kant (1724—1804) maintained that man is *constitutionally incapable* of proving God's existence by means of his *reason* through a knowledge of the Principle of Causality. In order to understand Kant's position in this matter, it is necessary to go back to Descartes and Hume.

Descartes, as we know, postulated that all knowledge is derived solely from the mind, not from the things. Hume accepted this postulate, and from it he drew the conclusion that all experience is sense- knowledge and pertains to the particular things experienced by the senses; he drew the further conclusion that all 'principles of thought,' like the Principle of Causality, are invalid because they are not given in perception. Kant accepted Descartes's maxim that all real knowledge is derived solely from the mind, but became alarmed at Hume's extreme empiricism. Hume's view would destroy the *universal and necessary* character of all *scientific knowledge* and thus lead to *skepticism*. Kant, therefore, studied the entire field of human knowledge and devised his formalism as a safeguard for scientific (theoretical, philosophic) knowledge. His theory was as follows.

Kant made a distinction between *phenomena* (appearances) and noumena (things-in-themselves). The 'phenomena are what we experience in sense-perception. The appearances or phenomena are the result partly of the physical things and partly of the mind; the manifold of physical objects existing in the universe influence the mind, and the mind responds by ordering them in 'time' and 'space.' It is a postulate of Kant that everything which is 'universal' and 'necessary' in knowledge cannot come from

the things but solely from the mind. 'Time' and 'space' are universal and necessary elements in sense- perception; hence they must come from the mind and they must be *antecedently present* before sensation in the mind in order that perception be possible at all. 'Time' and 'space,' therefore, are *a priori forms* of the mind, and all impressions are clothed or molded in the 'forms' of 'time' and 'space.' 'Space' and 'time' are not attributes of reality in things; they are purely subjective in origin and character. As a result, since all phenomena are clothed by the mind in these two forms, phenomena are more in the nature of 'symbols' of objective reality. Objective reality consists of 'things-in-themselves' or 'noumena,' but these *noumena* are never known and *can never be known*.

Just as on the level of sense man's mind furnishes the forms of 'space' and 'time,' so on the level of intellectual knowledge the mind furnishes the *a priori forms of categories*. According to Kant, there are twelve types of judgments, each with its respective category. The phenomena of sense are drawn under these 'categories,' and the mind applies the 'categories' to them. These 'categories' are also antecedently present in the mind and have a purely subjective character. Whatever has a necessary and universal value in our judgments comes from the 'categories,' and so the 'categories' account for the universal and necessary validity of all principles and of all scientific and philosophic truths. Among these 'categories' or intellectual 'forms' is that of *Causality and Dependence*. The Principle of Causality, therefore, is universally and necessarily true, but *only for the intellect* in its judgments;

the principle does not apply to 'things,' because we cannot know 'things-in-themselves.' Since the Principle of Causality possesses a purely mental character, it can never be applied legitimately to the universe. Hence, man cannot draw any valid conclusions from the universe to the existence of God by means of the Principle of Causality. It follows, says Kant, that man *cannot demonstrate the existence of God*.

Kant's *fundamental error* consists in his acceptance of Descartes's supposition that all knowledge originates solely in the mind, so that the 'object of knowledge' for man consists in his own internal conscious states. On this supposition man cannot contact the outside world through his mental activity, whether that activity be of the senses or of reason, and all knowledge thus becomes vitiated with complete *subjectivism*. This fact alone should have warned Kant that Descartes's initial supposition must be false.

Kant also overlooked the fact that man can establish the universality and necessity of general principles without having recourse to *a priori forms* such as he imagined existing in the so-called 'categories.' True, the senses cannot discover such general principles, because they perceive only particular things and events. However, given the things and events as they actually occur, *reason abstracts ideas* and principles which are universal and necessary in character and are independent of time and space. In perceiving things and events, man's reason soon understands that a mere sequence in time or a mere contiguity in space is insufficient to account for the happenings in nature; something more is required, namely,

real *causality*. By a process of analysis, which is almost an immediate product of experience, man formulates the *Principle of Causality*; the child does this as soon as its reason is awakened. Later on, man links up the Principle of Causality with the concept of 'being' and the Principle of Contradiction; and from this comparison and *analysis* man, through a process of deduction, realizes that the Principle of Causality applies to all things universally and necessarily. To limit the application of this principle to phenomena is an unwarranted restriction and amounts practically to a denial of the Principle of Contradiction and of all possibility of true knowledge.

Hence, if man can know the objective, external world, and he can, and if the Principles of Contradiction and Causality are universally and necessarily true, and they are, it should be possible to apply these principles to the universe and its contents and then draw a legitimate conclusion to the 'cause' of the world, provided a cause is necessary. In other words, since man is constitutionally capable of correct reasoning, a *demonstration of God's existence should be possible*, if God is the cause of the world in its existence and being.

The Method of Proof

We cannot demonstrate God's existence from the idea of God as the most perfect being; the ontological argument, as was shown, is invalid because it involves an illicit passage from the logical order of thought to the real order of

actuality. We must, therefore, proceed in a different manner, if we expect to prove that God actually exists.

Man is a rational animal. As an 'animal,' his knowledge begins with sense-perception. As a 'rational' animal, his knowledge goes farther than sense-perception. The senses having supplied their data, *reason* becomes active and proceeds to form ideas, judgments, and inferences. By means of his reasoning, man transcends the level of sense-perception and is able to draw conclusions which reach to realities which cannot be perceived by the senses. Thus, biologists reason to the origin of living beings (for instance, when they argue about evolution), and geologists argue to the formation of earth deposits, although they are concluding to events which happened (or are supposed to have happened) in the far distant past and which they have not perceived. Unless we wish to fall into universal skepticism, we must admit the legitimacy of our reasoning processes. Reason is just as much a source of true knowledge as is the experience of sense-perception. Knowledge begins in the senses and ends in reason.

Since the proper object of man's intellect is 'material being,' it is natural for man to seek to prove God's existence from the material world by the application of the First Principles. Such arguments are called *a posteriori*, because man proceeds from the *effect* to the *cause*.

This discussion shows that the only proper approach to the problem of God's existence is an *a posteriori demonstration* of His existence.

Summary of Chapter III

The history of human thought shows that the *proper approach* the problem of God's existence is important.

1. *Scientific Explanation*. — Facts alone do not make a science. Scientists always seek to *explain why* things are as they are and events happen as they do; they look for *causes*. Scientists are not justified in the restriction of reason itself; if they may seek the 'proximate' causes, reason must be allowed to seek the ultimate cause causes of things and events.

2. *Deism and Agnosticism*. — Deists maintained that God exists and is the Creator; but that is all man can know about God. *Agnostics* affirm the constitutional inability of the human mind to know anything hut the 'phenomenal.' Agnosticism rests on the fallacious basis of Hume's unwarranted empiricism.

3. *Fideism and Traditionalism*. — These theories maintain that the knowledge of truth consists in an act of faith (hence 'fideism'), and the supreme criterion of certitude is the authority of revelation as given through tradition (hence 'traditionalism'). Reason must precede faith, or faith will be a blind assent and therefore unreasonable. Both theories lead eventually to *skepticism*.

4. *Ontologism*. — Ontologists held that God and the *Divine Ideas* are the first object of our intelligence and the intuition of God the first act of our intellectual knowledge. If the theory were true, we should be *conscious* of the

intuition of God; there would be no possibility of *error* or *doubt*; man would be *infallibly* certain of truth.

5. *Religious Experience*. — Many people claim to have a direct *experience of God's presence* during prayer. Such experiences are too *subjective* and have no value as evidence.

6. *The Ontological Proof*. — This proof argues from the *idea of God* as the most perfect Being to His existence, because an existing being is more perfect than a merely possible being. The argument is invalid, because it involves an illegitimate passage from the *logical order* of thought to the *real order* of things.

7. *The Necessity of Proof*. — Since we have no immediate intuition of God's existence, and since the fact of God's existence is not self-evident, man can have only a *mediate and discursive* knowledge of God and His existence. Hence, God's existence must be *demonstrated*.

8. *The Possibility of Proof*. — If God has *manifested* Himself in the universe, and if man is *capable of knowing* Him through the universe, it must be possible to 'prove' His existence. Every effect reveals something of its cause.

9. *Kant's Formalism*. — Kant maintained that the speculative reason of man is *constitutionally incapable* of proving God's existence from the physical world. The 'world' and 'God' are noumena, not phenomena; but man can know only phenomena, and the phenomena, due to the *a priori forms*, tell us nothing of the reality of noumena. Kant's theory must be rejected. The universality and necessity of scientific knowledge can be accounted for without having recourse to antecedent mental 'forms.' By

means of induction and deduction from the facts of the physical world, man arrives at a knowledge of causality; and by abstraction and analysis, he understands the *Principle of Causality*. Hence, a *demonstration* of God's existence should be possible.

10. *The Method of Proof*. — The only proper approach to the problem of God's existence is an *a posteriori demonstration* from effect to cause.

Chapter 4

CHANGE

WHATEVER SORT OF DEMONSTRATION IS USED TO PROVE GOD'S existence, the conclusion must embody the judgment that 'God exists.' First of all, then, we must be clear about the meaning of the words 'God' and 'exists.'

What is meant by 'exist' (and 'existence')? *Negatively*, it means to be not merely an 'idea' present in some mind, nor to be merely a 'possible' thing capable of being produced by some cause. *Positively*, it means *to be actually*, just as you and I and the sun and the rivers and everything else in the physical world are 'actual' beings. Something, therefore, is said 'to exist' or 'to have existence' when it is outside the producing power of a cause and is actually present in the world of reality, so that it has 'being' of its own.

And what is meant by 'God'? We must begin with a *provisional notion* of what we understand by the term 'God.' As we proceed in our discussion, this provisional idea, if need be, may be revised and purified. Polytheists and monotheists have different ideas of 'God.' We must make a choice. As a 'provisional definition' we will begin with the concept of 'God' which is current in the Christian Western

World, namely, the 'Maker and Ruler of the universe.' Whether this notion can be validated remains to be seen.

The first argument for God's existence is taken from the fact of change. In order to obtain a proper perspective, it will be advantageous to view the problem in the light of history.

Parmenides, Heraclitus

Parmenides (born about 544 or 540 B.C.) was one of the first thinkers to occupy himself with the problem of permanence and change, both of which seem to be a definite part of reality in nature. He became the foremost representative of the School of Elea. Parmenides was an intellectualist for whom the principles of thought and being are identical.

He began with the Principle of Identity and Contradiction: Being is being; non-being is non-being; both can never be identical.' From these principles he drew the conclusion: 'Whatever is, is; whatever is not, is nothing; from nothing nothing can become, because nothing has nothing to give; what already is, cannot become, because it already is what it is: hence, all becoming (change) is impossible.' It follows, he maintained, that every being remains unchangeably what it is and cannot become something else, and no possible being (since it is actually 'nothing') can ever become existent: nothing ever becomes, and nothing ever ceases. Being, since it cannot be separated from itself, is indivisible; and, since it is identical with itself, it is changeless. Being, therefore, is one,

immobile, and eternal, a continuous and indivisible whole; there exists only the All One absorbing all reality.

And yet, multiplicity and change appear everywhere in the universe. How account for them? Parmenides had a simple solution for the problem: they are nothing but the illusions of the senses; they do not and cannot exist, because reason assures us of the oneness and eternity of being. The final conclusion of Parmenides and his followers was that permanence alone exists and change is only apparent.

Heraclitus (535—475 B.C.) was an empiricist. As a contemporary of the Eleatics, he opposed their doctrine of unchanging being with that of continuous 'change.' Everything changes, and there is nothing permanent in the world. The one and only thing which is real is process, perpetual flux, change. While Parmenides found the essence of being to be an immutable reality, Heraclitus identified it with 'becoming' itself. The principle of change is 'fire.' Everything without exception is fire in some form or other, and fire is constantly undergoing transformation. Nothing becomes being, and being becomes nothing. Hence, being and non-being are identical; 'change' or 'becoming' is the only reality, and contradictories are fundamentally the same. The stability and permanence of being is the result of man's belief and as such is an *illusion*. Just as Parmenides placed his absolute credence in reason and its principles, ignoring and repudiating the testimony of the senses, so Heraclitus relied completely on the deliverances of sense-perception, ignoring and repudiating the reliability of reason and its principles.

Parmenides and Heraclitus were both right and wrong. Parmenides was right in affirming the permanence and stability of being; but he was wrong in denying the reality of change and becoming. Heraclitus was right in affirming the change and becoming of things, but he was wrong in denying the permanence and stability of being amid the change. Permanence and change are both present in nature. Things change, but something permanent remains throughout the process of change. Parmenides was in error when he considered 'permanence' to be absolute, and Heraclitus was in error when he considered 'becoming' to be absolute; in the things of this world *permanence and change are relative*, not absolute. The senses perceive the 'change' in things, but reason recognizes that change demands something that is a 'permanent subject' undergoing the change.

The solution to the vexing problem of permanence and change was given by the genius of Aristotle.

Aristotle

Aristotle (384—322 B.C.) saw the flaw in the reasoning of Parmenides and Heraclitus. The former relied solely on reason, and the latter solely on sense-perception. Man, since he is a 'rational animal,' has two sources of knowledge and truth, the senses and reason; knowledge begins in the senses, but is completed in the reason. Both sources are legitimate in their proper sphere, but they must be combined if man is to acquire real knowledge and attain to truth. Sense-perception acquaints us with the reality of

change and reason acquaints us with the reality of permanence; and both are correct, because change and permanence are realities of nature, independent of the mind of man. But how can 'change' and 'permanence' of being be reconciled?

The solution which Aristotle proposed was the division of all reality into *potency* (*potentiality*) and *act* (*actuality*). Whatever exists is 'actual being.' Whatever is possible is 'potential being.'

For instance, the acorn is an 'act,' an 'actual being,' and as such it exists. The oak tree into which the acorn will eventually grow is as yet non-existent; but it is 'potentially' in the acorn, because the acorn will 'become' the oak tree later on, provided the hidden life of the acorn is awakened by heat, moisture, and soil, so that it will 'become' an oak tree through growth and development. The 'potential' oak tree thus 'becomes eventually an 'actual' oak tree, and the acorn is thus seen to be an oak tree 'potentially,' even though the acorn as such is not yet an oak tree 'actually.' While the oak tree lives, it is an oak tree 'in act' and not 'in potency' to become an oak tree; but when it dies, it 'ceases to be' an actual tree and gradually changes through decay into chemical compounds and elements. What is said here of the acorn and oak tree applies with equal force to every living being. Change, therefore, occurs in *animate* beings throughout nature.

The distinction between 'potency' and 'act' is also found in *inanimate* beings. To take an example from modern chemistry, the elements of oxygen and hydrogen, while they exist as such nature, are 'actually' oxygen and hydrogen;

but 'potentially' they are whatever compound either will make through combining chemically with some other substance. Thus, when oxygen and hydrogen are viewed as having the possibility of combining to form water, water is 'potentially' (though not 'actually') present in oxygen and hydrogen, because these two the other hand, once oxygen and hydrogen have combined are capable of 'becoming' water when combined. On chemically, what is 'in act' is water. Inasmuch, however, as water can again be decomposed into oxygen and hydrogen, these elements are present 'in potency' in water.

What has been discussed so far is 'change' or 'becoming' among substances. Many changes, however, affect merely the *quantity* or *quality* of a substance, leaving the substance itself intact. Thus, during a snowstorm the quantity of snow increases, so that there is a 'quantitative change' in the amount of snow, but the snow as snow is not changed thereby; a reverse form of change occurs when the snow disappears. When the filament in a light bulb begins to glow, it undergoes a 'qualitative change,' the material of the filament remaining unchanged in the process. A similar qualitative change occurs when bodies become hot and cold, magnetized and demagnetized, pass from one color to another, and so forth. In all such cases, something becomes 'actual' which was formerly only 'potential.'

Change, or *becoming*, therefore always means the actualization of something potential; it implies the passage of a being from one state to another. Whatever 'changes,' must be *capable of receiving* some new determination and perfection through the power of a moving (efficient) cause;

it must be *in potency to be* what it can *become actually*, otherwise it could never receive this actuality. Act, therefore, is the perfection, determination, or degree of reality present in a thing as it exists. *Potency*, or potentiality, is the aptitude of a thing to receive a perfection, a determination, or degree of reality. The being in potency always possesses within itself the germ of future actualization, even though it never becomes actualized in reality. Aristotle called this actualization (the passage of a being from a state of 'potency' to a state of 'act') *movement* and defined¹ it as "the act of a being in potency in so far as it is in potency." In every case of actualization or 'movement' there is the following sequence: Before the thing 'moves' it is in potency for both the movement (process of actualization) and the final actuality to be acquired by it; when it begins to be 'moved,' it is no longer in potency for the movement (process of actualization), but has already acquired movement as an intermediary act; while 'moving' (while in the process of actualization), it still remains in potency for the final and complete actuality to be acquired at the ending-point of its movement; when the thing has acquired its final and complete act (perfection, determination, degree of being), movement ceases, and the thing comes to rest as completely actualized. Aristotle's definition of 'movement' (process of actualization) is thus seen to be very concise and correct.

Aristotle stresses the fact that all change (becoming) in nature presupposes a *subject* which persists in existence throughout the change and in which the change occurs. The subject of change, therefore, is *relatively permanent*.

That this is a fact should be obvious from an analysis of any type of change which happens in nature. Whenever an organism originates or dies, matter is present as the subject of change. Whenever a chemical compound is formed or dissolved, chemical substance in some form or other is the subject in which the change takes place. In quantitative and qualitative changes, the reality gained or lost presupposes some being which gains or loses the reality, as when a person grows larger in size or becomes sick.

Aristotle's doctrine of 'potency' and 'act' thus solved the problem of permanence and change very neatly. Aristotle showed that Parmenides was right in insisting on 'permanence,' because the 'subject of change' persists during the entire process of becoming; but also that Parmenides was wrong in denying the existence of change in things, because change is too evident to be argued out of existence through an appeal to rational principles. In a similar manner, Aristotle showed that Heraclitus was right in recognizing the presence of change in the universe, but that he was wrong in his claim that nothing permanent exists and in his assertion that the principles of reason have no value. In this way Aristotle safeguarded the validity of sense-perception and of reason as legitimate sources of knowledge and avoided the error of extremism present in the doctrines of Parmenides and Heraclitus. Neither reason nor sense may be sacrificed in a theory.

Bergson

Henri Bergson (1859—1941) was the most important exponent of ‘perpetual becoming’ in modern times. Like Heraclitus, he was an anti-intellectualist. According to Bergson, everything is a continuous flux of becoming and change, *without any underlying subject* which becomes and changes. *Change is the whole of reality*. Everything changes, but there is no thing which changes; everything is in movement, but there is no thing which moves; everything is in a state of continuous progress, but there is no thing that progresses; everything is in a process of evolution, but there is no thing that evolves: as Bergson says², movement is reality itself, and immobility is always only apparent or relative . . . there are no *things*, there are only actions.”

And yet Bergson speaks constantly of ‘man,’ ‘animal,’ ‘plant,’ ‘universe,’ ‘matter,’ and so on. This is due to his distinction between *intuition* and *intellect*. Man is characterized by ‘intellect’ rather than by ‘intuition,’ although ‘intuition’ is intrinsically more capable of grasping the flow of becoming. Intellect has as its function the formation of concepts, and concepts are mere ‘snapshots’ of reality; they represent the dynamic process of reality in static pictures. Intuition immerses itself into the very stream of life and ‘feels’ the rhythm of flux; it is a developed refinement of animal instinct and as such more in ‘sympathy’ with the process of becoming than the intellect. Intellect is concerned with ‘action’ and ‘unorganized solids,’ that is to say, with matter and its use for practical needs. Intuition reveals life and is associated with the hidden secrets of consciousness and with speculation; it comes to man in rare flashes, but it is charged with life and is the

only faculty of man capable of perceiving pure duration, pure movement, creative evolution, the very inwardness of life itself.

Movement is creative evolution. This ceaseless evolutionary movement is the result of a double factor — *matter and the vital impulse (élan vital)*. From the beginning ‘matter’ existed, and so also did the ‘vital impulse.’ Movement simply began. Since life is tendency, it surges continuously upward toward different forms of life. But matter acts as an obstacle to the surge of the vital impetus and must be overcome incessantly. The vital impulse is only finite in its action, and its tendency is not directed toward any definite goal; as a result, the vital impulse, in pushing against the refractory medium of matter, gives rise to different levels of being in the course of the evolutionary process — inanimate nature, plants, animals, and men. Intellectuality and materiality are simply an “inversion of the same movement,”³ because the upward movement or ‘ascent’ of the vital impulse always implies the downward movement or ‘descent’ of matter. Vital activity is thus “a reality which is making itself in a reality which is unmaking itself.”⁴

As far as *creation* and a *Creator* are concerned, Bergson says:

“Everything is obscure in the idea of creation if we think of *things* which are created and a *thing* which creates, as we habitually do, as the understanding cannot help doing... God has nothing of the already made; He is unceasing life, action, freedom.”⁵ In

other words, if we wish to speak of God at all, we must consider Him, not as a 'thing' or substance existing prior to the world, but as a part of the very *process of formation*. Reality is nothing but 'movement.' That we think of 'static things' instead of pure 'dynamic process,' is an *illusion of the intellect*.⁶ Similarly, our idea of the 'nought' is an illusion: "If we analyze this idea of Nothing, we find that it is, at bottom, the idea of Everything. . . It is therefore an idea eminently comprehensive and full, as full and comprehensive as the idea of *All*, to which it is closely akin."⁷

— HENRI BERGSON

It is a 'pseudo-idea,' as Bergson calls it. Bergson thus ends by denying the validity of the Principles of Identity and Contradiction.

In evaluating Bergson's system of perpetual flux a number of *adverse observations* must be made.

Bergson's description of the entire process of world evolution is mere *conjecture*. No one, obviously, ever witnessed it; experience, therefore, is lacking. Bergson uses many arguments to make his theory plausible; but such arguments are *inferences* of the intellect, and the intellect, in his view, is deceptive and erroneous. His appeal to 'intuition' is of no value, because 'intuition' is a peculiarly Bergsonian notion which is too *subjective* in character to be submitted to objective tests of evidence; its very existence is, at best, extremely doubtful. Even if it exists, its 'flashes'

are so rare and short-lived that no one can be sure of its deliverances.

Bergson's dictum that all *reality* is 'movement,' 'becoming,' 'change,' but that there are *no things* which move, become, and change, is not only strange but contrary to all science and philosophy. The world we know is a world of *things*. Things change, of course, but they are 'things' nevertheless. If we cannot trust the testimony of our senses and reason, what is the use of science and philosophy? All knowledge and all truth would be impossible if reality were nothing but process and if there were *no one to know*. Even Bergson was a permanent being, and so are his writings. St. Thomas Aquinas'⁸ remarks are true and validated by the findings of exact science:

"Every movement presupposes something immovable [permanent, stable]: for when a change of quality occurs, the substance remains unchanged; and when there is a change of substantial form, matter remains unmoved [unchanged]."

— ST. THOMAS AQUINAS

When Bergson discredited intellect and reason in favor of intuition, he overlooked the fact that he thereby *destroyed the foundation of his entire system of knowledge and reality*. It was only through his intellect and reason that he set up the arguments and drew out the conclusions that made his theory of 'creative evolution' in any way plausible. But if we cannot trust reason in its normal operations, of

what value are its arguments and conclusions? If intellect and reason are habitually deceptive and erroneous, giving us a distorted view of reality, then knowledge and truth are impossible for us, and *universal skepticism* is the logical outcome of such an attitude. Bergson showed this when he sacrificed the Principles of Identity and Contradiction by practically identifying Nought and All (being) for the sake of overcoming a difficulty arising from his theory of ceaseless flux. Every theory, no matter how ingenious, must collapse, once the fundamental principles of logical thinking are discarded.

Change and Causality

Every *change demands a sufficient reason*. Everything without exception demands a sufficient reason to account for what it is and for what it does and for what happens to it. This sufficient reason may be either inadequately or adequately sufficient. An *inadequately* sufficient reason will explain partly and proximately why a certain being exists or changes, but it will not explain the 'totality' of the occurrence. On the other hand, an *adequately* sufficient reason explains the 'totality' of a thing in all its phases, so that nothing remains to be accounted for. For example, if one were to explain the movement of a locomotive by saying that the engineer pulled the lever of the throttle, one would give an 'inadequately' sufficient reason for this movement, because one leaves out of consideration the steam in the boiler, the pipes, the pistons, the wheels, and all the other parts and activities that have a role in producing the motion

of the locomotive. In order to account for change, therefore, in its entirety, an 'adequate' sufficient reason will have to be given for its total being and existence, and this must be an *adequate efficient cause*.

Change implies the actualization of some potentiality. A being changes so as to obtain some *reality, determination, perfection* which it does not at present possess. In every change, therefore, something new is received by a being *which did not exist as such in the being before the change*; the being was merely in receptive potency (potentiality)⁹ for this perfection. This change, with its perfection, is the result of an activity of some sort and, since it is *produced* by this activity, is the effect of an adequate efficient cause. If the efficient cause is to be the 'adequate' cause of the new perfection, it must *contain* the perfection within itself either 'formally' or 'eminently.' This new perfection is a *real being* and as such must *really* exist somewhere or somehow in its (adequate) cause; otherwise there would be a remainder and part of it without a cause to account for its existence, and the being after the change would have received more than the cause could give. It is not sufficient that the new perfection be merely *virtually* contained in the cause. If one means by 'virtually' that the perfection is present in its 'entirety' in the cause, this can only be either as a *real being* (and then it is present in the cause *formally*) or as contained in the *higher perfection* of the cause (and then it is present in the cause *eminently*). And if one means by 'virtually' that the perfection is not contained formally or eminently in the cause, but only that it can be produced by the activity of the cause in some way, then one violates the

Principles of Sufficient Reason and Causality, because what a cause does not *already possess* (either as a reality or as contained in higher perfection) it *cannot give to another* — no one can give what one does not have. In the latter case, it cannot be the ‘adequate’ cause of the new perfection, but must be assisted by something else which contains the totality of the perfection and can supply the deficiency. It follows that the ‘adequate cause’ of change must contain the new perfection acquired in the change either ‘formally’ or ‘eminently’; any other supposition would involve the *contradiction* that the perfection acquired in the change is fully accounted for and not fully accounted for, is adequately produced and not adequately produced, at the same time under the same respect.

But now, it is clear that a *being which acquires* a perfection by means of change *cannot already possess* it either ‘formally’ or ‘eminently’ (namely, in its reality or as contained in a higher perfection). If it possesses it thus already, it has it, and there is no possibility of acquiring what it already possesses. Hence, a being which is changed in order to acquire a perfection cannot be its own *adequate cause* of that perfection; otherwise it would possess the perfection (that is necessary for an adequate cause, as just pointed out) and not possess it (because it is through the change that it is supposed to ‘acquire’ the perfection) at the same time — a patent *contradiction*. The being, therefore, which is changed in order to acquire a new perfection cannot be the adequate cause of the perfection that it receives by means of the change.

The *new perfection* itself cannot be the adequate cause of its own existence. The new perfection is a produced reality. This reality *could not produce itself*. To produce itself would mean to act, and activity presupposes existence; how can anything act before it exists? It would both exist (because it 'produces itself,' and to do that it must exist) and not exist (because it is supposed to 'receive existence' through its productive action in the change); but to exist and not to exist at the same time is a *contradiction*.

Since a contradiction is absurd and impossible, it is evident that neither the being receiving the new perfection nor the new perfection itself can be the 'adequate cause' of the change. It follows as a necessary consequence that the 'adequate cause of any such change must be a *being distinct* from the changing being, namely, some *external cause* producing the change. It follows furthermore that the adequate cause must be an *existing reality* capable of giving the perfection to the being which 'is to receive it by means of the change. It follows finally that the adequate cause must *contain* the perfection to be given in one of two ways: it must contain it either 'formally,' so that the reality of the perfection is actually present as such in the cause, or 'eminently,' so that the cause contains the perfection 'in a superior manner in some higher perfection. Unless all 'these conditions are fulfilled, one cannot account for the change and the acquired perfection in its *totality*. If any of these conditions were missing, it is evident that the changing being would receive a *plus-amount* of perfection not present in the producing cause. This 'plus-amount' would have no sufficient reason to account for its presence

and as such it could not come into existence at all. In no case is it possible to have more perfection in the effect than the cause is able to give: *the more perfect simply cannot proceed from the less perfect*. If it did, the 'more,' the 'plus-amount,' would both exist and not exist: it would exist (that is the supposition); and it would not exist (because the cause cannot give what it does not have).

The Universality of Change

Change affects all things in the world; nothing is exempt, whether it be living or nonliving.

That *living beings* in this world undergo constant change is attested by all the sciences which treat of them — biology, botany, zoology, physiology. Plants, animals, and men are in a constant process of change; they grow, mature, and die. The cycle of life is characterized by activity and change from the moment of fertilization until the moment of death.

Nonliving beings are also subject to constant change. Chemistry, physics, geophysics, and astronomy are based on the fact of change among inanimate bodies. The natural sciences assure us that all bodies without exception are affected by various forces, such as heat, electricity, magnetism, light, mechanical motion, gravity, and so on. Every chemical compound, element, and sub-elemental particle is a storehouse of *energy*. Energy is either *potential or kinetic*. The former is energy at rest (position); the latter is energy in action. A constant transformation of energy takes place in the universe, so that potential energy becomes kinetic and kinetic energy becomes potential. This

transformation or change occurs in the bodies, so that the bodies themselves are in a continuous process of change.

The *universe at large* consists of the same elements as are found on earth. And so it happens that the universe as a whole is also subject to ceaseless change, both in the stars and in the matter occupying interstellar space. Activity is found everywhere. And where there is activity, there is change; and change implies causality. To mention merely one fact: heat is generated all the time in the sun and stars; this heat is diffused through space uniformly and affects every particle of matter, thereby producing qualitative changes. Every kind of radiation exerts a causative influence and brings about changes of one form or another, and radiation is found everywhere in nature. Motion is universal, and motion means change. Whether the bodies be sub-visible particles or astronomical galaxies, all are active in some manner. Action, however, issues into effects. As a result, the Principle of Causality reigns over the entire world.

Extra-mundane Cause of Change

It is now time to draw the threads of our argument together and formulate the conclusion.

Both permanence and change exist in the world. Substances are relatively permanent, and changes take place in them. But substances are not absolutely permanent, because one substance may change into another. Every change, whether substantial or accidental, demands an adequately sufficient reason to account for it.

Change implies the actualization of some potentiality in the changing subject; it supposes that something new, some determination, some perfection is received which did not exist as such in the being before the change, so that this being was merely in 'receptive potency' for the perfection.

Since the change, with its resultant new perfection, is the product of activity, it is the effect of an efficient cause; and this cause must be 'adequately' efficient to produce the total effect. The adequate efficient cause of change must contain the new perfection either 'formally' or 'eminently' within itself, otherwise it could not give the perfection to another by means of the produced change; the reason is that the being acquiring the new perfection cannot already possess it, nor can the new perfection produce itself. Hence, the adequate efficient cause must be a being distinct from the being receiving the perfection. Change in the meaning here given affects all things in the world, living and nonliving.

Consider the implications.

Every single being in the universe is subject to change, i.e., is in receptive potency for new perfections to be acquired through change. But the universe is the sum-total of all the single beings present in it. The universe as a whole, therefore, is the subject of change, i.e., is in receptive potency for new perfections to be acquired through change. The actualization of a receptive potency, however, requires an adequate efficient cause to bring about the change and thereby confer the new perfection (determination) on the recipient subject. Since the adequate efficient cause must contain within itself the

reality of the new perfection either formally or eminently, and since the recipient subject does not contain the new perfection either formally or eminently, the adequate cause must be a being distinct from the recipient subject. Now, the universe as a whole requires an adequate efficient cause in order to account completely for the changes which occur in the universe. Therefore the changing universe demands an adequate efficient cause, *distinct from the universe as such*, in order to account for the changes which occur in the universe.

One cannot escape this conclusion by postulating an *eternal existence* of the universe or an *infinite series* of changes in the universe. An adequate efficient cause 'outside' the universe and 'distinct' from the universe, and therefore extra-universe or *extra-mundane*, would still be indispensable.

Even if the material universe existed from eternity, so that it had no beginning in time, the conclusion would be inevitable that an *eternal* adequate efficient cause would be required. This cause would then not exist prior to the world, but it would have to 'co-exist' eternally with it. The universe, whether eternal or temporal, would need this cause in any event.

The same observation holds true in the supposition of an infinite series of changes in the universe. The nature of the changes, as the actualizations of receptive potencies acquiring new perfections, would remain the same. An infinite process of such changes does not alter their nature and would still require an adequate efficient cause *outside the infinite series* existing in the universe, in order to make

the fact of such changes completely intelligible and possible.

Hence, whether the universe be eternal or temporal and the series of changes infinite or finite, the universe as a whole demands the existence of an *extra-mundane cause* to account completely and adequately for such changes.

Unchangeable Cause

Now, it is impossible that absolutely every being be changed by another. Eventually we must admit that there must exist a being which is not subject to change: *an unchanged and unchangeable cause of change*. The material universe, as astronomy and astrophysics testify, is a unitary system, consisting of the same kinds of elements and bodies, performing the same general types of operations, obeying the same chemical and physical laws, and following same pattern of changes. Due to this fact of unity and uniformity, the extra-mundane cause, to which these changes lead, must be a single cause.

This extra-mundane cause of the changes in the universe must itself be either not subject to change or subject to change. If not subject to change, we have arrived at the 'unchanged cause.' If subject to change, it must itself be changed by another cause. The same question then arises regarding this 'other cause.' Is it subject to change or not? If not, we have now arrived at the 'unchanged cause.' If subject to change, it must again be changed by another cause. Now we have two such causes subject to change; a new series of changing causes has arisen. This series as a

series demands an outside cause. And so the whole question comes up again. Is the series finite or infinite? No matter whether finite or infinite, the series demands an 'outside cause' as the sufficient reason and adequate cause of the change in the series. If a second and a third and a fourth Series is postulated, we have a series of series, none of which is capable of accounting for the occurring changes in all of them except by an *outside cause*. We must eventually arrive at a *cause which is not subject to change*, or the changes will not be adequately accounted for. Outside of 'all' there is nothing, and nothing accounts for nothing. Hence, if 'all beings' are changed, there would be no being outside of 'all' to start the change in the others. Consequently, there must be some being which is the adequate efficient cause of change in the others, but it is *not subject to change itself*; it is at the *beginning of all change* and as such is the *unchanged cause of change* in the others. Since no other being exists which can change this unchanged cause, it is *unchangeable* as well as unchanged.

Many people are under the impression that they can escape the logic of the conclusion by pushing the problem into the vague mist of the far-distant past or by multiplying the instances indefinitely. This procedure is followed by those who think that 'eternity' or an 'infinite number' will nullify the force of the argument. What they fail to understand is that mere succession in time and multitude of numbers does not affect the *nature* of a thing. A dog, for example, will not become rational, even if he lives for an eternity; the dog would simply be a dog eternally. Similarly,

a million or an infinite number of dogs will not make a dog's nature rational, any more than a million or infinite number of zeros can ever add up to a positive sum. And so it is with *change*, i.e., with the actualization of receptive potencies. The *nature* of such change in an existing being demands a principle of change distinct from the being which is changed and must lead to a being which is not subject to change itself; all change must emanate from this being as the *Prime Changer Unchanged and Unchangeable*.

The Argument of St. Thomas

St. Thomas Aquinas (1224 [or 1225]—1274) was undoubtedly the greatest and clearest thinker of the Christian era. He gives five main proofs for God's existence. The first is the argument based on *motion*.

Motus (motion), in the mind of Aristotle and St. Thomas, implies 'change' in the sense of local motion and in the sense of accidental or substantial change. Even local motion is merely a species of 'change.' When, therefore, St. Thomas formulates his argument of 'motion,' this wider sense of the term 'motion' must always be borne in mind.

"The first and more manifest way [to prove God's existence] is the argument from motion. It is certain, and evident to our senses, that in the world some things are in motion. Now whatever is in motion is put in motion by another, for nothing can be in motion except it is in potentiality to that towards which it is in motion, whereas a thing moves inasmuch as it is in

act. For motion is nothing else than the reduction of something from potentiality to actuality. But nothing can be reduced from potentiality to actuality, except by something in a state of actuality. Thus that which is actually hot, as fire, makes wood, which is potentially hot, to be actually hot, and therefore moves and changes it. Now it is not possible that the same thing should be at once in actuality and potentiality in the same respect, but only in different respects. For what is actually hot cannot simultaneously be potentially hot; but it is potentially cold. It is therefore impossible that in the same respect and in the same way a thing should be both mover and moved, i.e., that it should move itself. Therefore, whatever is in motion must be put in motion by another. If that by which it is put in motion be itself put in motion, then this also must needs be put in motion by another, and that by another again. But this cannot go on to infinity, because then there would be no first mover, and consequently, no other mover; seeing that subsequent movers move only inasmuch as they are put in motion by the first mover; as the staff moves only because it is put in motion by the hand. Therefore it is necessary to arrive at a first mover, put in motion by no other; and this everyone understands to be God.”¹⁰

— ST. THOMAS AQUINAS

It will be noted that St. Thomas, although he uses the word ‘motion,’ really speaks of ‘change’ in the broader

meaning of the term. His formulation of the argument is very concise, and it is skeletonized to such an extent that the various steps in his process of reasoning might be open to question and not be altogether convincing. Hence the more extensive formulation as given in the body of this chapter. As a consequence, this argument can also be called the argument proving the existence of a Prime Mover. And so it is usually designated.

Consequences

The argument as presented seems to lead to a rather vague and nondescript being, that of Prime Mover or First Changeless Changer. Yet St. Thomas says: “and this everyone understands to be God.” Is St. Thomas not guilty of a tremendous ‘logical leap’ in this statement? We usually understand by the term ‘God’ something very different from a ‘Prime Mover’ or ‘First Changeless Changer.’ However, an analysis of what is implied in the concept of the ‘Prime Mover (First Changeless Changer)’ reveals much more of this being than is apparent at the first glance.

First of all, the Prime Mover can never have passed from non-existence to existence. To have done so would mean that it was once merely ‘possible’ and was therefore in potency (potentiality) for the act (actuality) of ‘existence.’ As such, existence could only be given to it by some other being actually existing. That, however, would involve a ‘movement’ or ‘change’ radically much greater than being ‘moved’ or ‘changed’ while possessing existence. Since the Prime Mover or First Changeless Changer is the ‘principle

of change,' it is evident that such a being could not have 'received existence' from another. Hence, the Prime Mover always had existence in virtue of its own being. It follows, therefore, that the Prime Mover (First Changeless Changer) is *eternal*.

Furthermore. The living beings in this world are in many ways subject to change, so that they pass from receptive potentiality to actuality, even in matters pertaining to their vital functions. Ultimately, this reduction from potency to act must be referred back to the Prime Mover as the first 'principle of change.' Hence, the being of the Prime Mover must contain the reality of 'life' formally or eminently and as such must be a *living being*.

Again. Among the manifestations of life in this world is the intellect and volitional life of the soul of man; and man's soul is spiritual. However, the intellect, will, and soul of man are also subject to 'change'; they are not pure actuality. These changes must find their adequate sufficient reason in the Prime Mover or First Changeless Changer. Hence, the Prime Mover must possess the perfection of *intellect, will, and spirituality*.

Finally. A being which is spiritual and possesses intellect and will is a 'person,' the same as man is a 'person' in the true sense of the word. Hence, the Prime Mover is also *personal*.

Now a being which is eternal, living, intellectual, volitional, spiritual, and personal is indeed, as St. Thomas observes, what everyone understands to be God."

Therefore, *God exists*. The analysis just given is very brief. These phases of God's being will become clearer as

the other proofs for His existence are unfolded in the following chapters.

Summary of Chapter IV

We begin with the provisional notion of 'God' as the 'Maker and Ruler of the universe.' The first proof for God's existence is taken from the fact of change.

1. *Parmenides, Heraclitus.* — *Parmenides* was an intellectualist for whom the principles of thought and being were identical. He denied change and maintained the *permanence* of all being in the All-One.

Heraclitus was an empiricist. He denied the permanence of being and maintained that the only reality is process, flux, change.

Parmenides was right in affirming the permanence of things, but wrong in denying the reality of change and becoming; Heraclitus was right in affirming the presence of change and becoming, but wrong in denying the permanence of being.

2. *Aristotle.* — Aristotle solved the problem by his division of all reality into *potency* (potentiality) and *act* (actuality). Whatever exists is 'in act'; whatever is possible is 'in potency.' What is a potential being' is as yet non-existent, but it is something which can become,' provided some efficient cause can give it existence; hence, it is not 'nothingness.'

Change, or becoming, means the actualization of something potential; when the potential being is actualized, it receives some perfection, some determination, some degree of reality. All change presupposes a *subject* which

persists in relative permanence throughout change; the change occurs 'in the subject.'

3. *Bergson*. — Bergson followed the doctrine of Heraclitus that everything is a continuous *flux of becoming and change*, without any underlying subject: "There are no things, there are only actions." The intellect, in testifying to the existence of 'things,' is erroneous; *intuition*, which is always reliable, testifies to the reality of mere 'change.' 'Movement' is creative evolution and is the result of the double factor of *matter* and the *vital impulse (e'lan vital)*, giving rise to inanimate beings, plants, animals, and man. God is a part of this evolving nature. Bergson practically identified the Nought and the All (being), thereby denying the Principles of Identity and Contradiction.

4. *Change and Causality*. — In order to account for 'change (becoming)' in its entirety, an 'adequate' sufficient reason will have to be given for its total being and existence, and this must be *an adequate efficient cause*. Since change implies the reception of a new reality (perfection, determination) which did not exist as such in the being before the change, it must be produced by the activity of an efficient cause, and the efficient cause must contain this reality either 'formally' or 'eminently.' Neither the being receiving the new perfection nor the new perfection itself can be the 'adequate cause' of the change. Hence, the efficient cause, in its reduction of receptive potency into act, must be a being distinct from the changing being.

5. *The Universality of Change*. — All beings in the world, whether living or nonliving, undergo change, i.e., pass from

receptive potency into act in some form. Energy, potential and kinetic, is in a constant process of transformation in the elements and compounds. The universe as a whole is subject to ceaseless change.

6. *Extra-mundane Cause of Change.* — Every single being in the universe is in receptive potency for new perfections to be acquired through change. And since the universe is but the sum-total of all the single beings present in it, the universe is in receptive potency for new perfections to be acquired through change. Therefore, the universe demands an adequate efficient cause, *distinct from the universe*, in order to account for the changes occurring in the universe.

Even if the universe were supposed to exist from *eternity*, or if an *infinite series* of changes were postulated, the nature of change would still demand an extra-mundane cause.

7. *Unchangeable Cause.* — It is impossible that absolutely every being be changed by another. This extra-mundane cause must itself be either not subject to change or subject to change. If not subject to change, we have arrived at the 'unchanged cause.' If subject to change, it must be changed by another. This 'other cause' will either be not subject to change or subject to change. We must eventually arrive at a *cause not subject to change*, or the changes will not be adequately accounted for, because outside of 'all' there is nothing. Hence, there must be an 'unchanged cause of all change' and, since no other being exists which can change this unchanged cause, it is both *unchanged* and *unchangeable*.

There exists, therefore, a *Prime Changer Unchanged and Unchangeable*.

8. *The Argument of St. Thomas*. — St. Thomas uses this same type of argument. Usually it is called the *argument from motion*. But ‘motion’ (motus) means ‘change’ in the terminology of St. Thomas and Aristotle. The argument leads to a ‘Prime Mover.’

9. *Consequences*. — The Prime Mover or First Changeless Changer must be *eternal, living, intellectual, volitional, spiritual, and personal*. And that is what “everyone understands to be God.”

Therefore, *God exists*.

Chapter 5

DESIGN

THE VAST MAJORITY OF PEOPLE ARE CONVINCED OF THE existence of a Supreme Being above and beyond the world, no matter how imperfect their conception of this Supreme Being may be. Usually this conviction has its foundation in a contemplation of the order existing in the universe. Order presupposes *design*. Design presupposes an *intelligent designer*. Man's reason thus makes a spontaneous conclusion from the order of the world to an *Intelligent Supreme Being* who is the author of the order existing everywhere in nature.

The philosopher, however, cannot be satisfied with such a spontaneous conviction. He must dissect the argument and reduce it to its logical form; in doing this, he will test the validity and force of the argument.

Science should be of considerable help in pointing out order in the universe. The field of the sciences, however, is so vast that in most instances mere hints must suffice. A more extensive knowledge of the individual sciences will naturally tend to strengthen the *argument from order and design*.

Order and Design

Since this argument for God's existence has as its foundation the 'order' and 'design' present in the universe, an explanation of these terms will be necessary.

Order is the arrangement of various items into a system or whole according to some relationship existing or placed between them. This order will be *static*, if the items are ordered with regard to their entity or being; such is the order of books in a library and of cars in a parking lot. This order will be dynamic, if the items are ordered with respect to the performance of a unified function; for example, the parts of an automobile are arranged so. that the driver can make it travel, and the organs of digestion are arranged so that they can perform the action of digesting food. The division of order into 'static' and 'dynamic' is not necessarily exclusive. Thus, there exists a 'static' order of the various parts of a machine, if the machine is considered merely as a mechanism made up of different entitative parts; but a machine also possesses a 'dynamic' order, because the parts as a system are made to perform a definite operation.

Order will also be either natural or artificial. *Natural* order, whether static or dynamic, is the result of powers operating in the nature of the items which are ordered; the order, for instance, which exists in the organization of a plant or animal body is 'natural' order. *Artificial* order is not due to the nature of the items themselves, but is put into them by an outside agent arranging these items; the arrangement of the parts of a locomotive, for example, is

‘artificial,’ because the machinist puts the parts together in a definite manner to produce a definite result.

Design in a strict sense is planned, intended order, namely, the arrangement of various items into a system or whole, so that this arrangement is the result of plan and intention. Wherever there is design, there is purpose — the purpose to achieve a *definite end through the use of definite means*. When a student sets as the purpose of his life the following of a certain professional career, his course of studies is planned and designed to enable him to reach this goal.

Not all order is ‘designed’; there is also ‘random’ order. Order is *designed*, when all the various items are arranged so as to realize a certain purpose or aim through the use of appropriate means. In an automobile factory, for example, the purpose of producing a self-propelled vehicle effectively influences the draftsmen and mechanics in the making and assembling of all the parts which are necessary for achieving such a type of vehicle. On the other hand, order is *random*, when the effect of the cause results in some sort of actual order, although this order was never intended as the effect of this causality. Thus, the order of the cards existing in the various hands after an honest shuffle and deal is an accidental and ‘random’ order, because there is no effective intention of arranging the cards in this particular order. Of course, if this order is achieved through the deft manipulation of the dealer, it is ‘designed’ order.

Order and Chance

Chance may be defined as a mode of causal activity, not purposive in character, regarded as determining an event. Such an event, when the result of 'chance,' simply 'happens'; it is not the result of any intention or purpose on the part of the agent producing the effect.

Examples will clarify the concept of 'chance.' A strong wind blows some straw around; three pieces of straw are thrown against a fence, forming the letter 'N.' Now, it is neither the purpose of the wind nor of the three pieces of straw to form a letter of the alphabet. Hence, the effect produced is a 'chance event,' and the arrangement of the three straws is the result of 'chance.' — Two highways intersect. Two men are driving their cars, each on one of the two highways. Due to slippery roads, they collide at the intersection. Each driver, of course, intended to make his trip, and so the order of the trip was the result of a purposive action, of 'design.' However, since no mutual agreement was made by the two drivers as to the time of departure and the road to be traveled, the collision itself was not intended in any way; that they happened to meet at the intersection at the same moment was entirely due to 'chance.'

A chance event, therefore, is not the effect of a predetermining law, of a preconceived purpose, of an intelligent intention. *Regularity* is a characteristic of law, and a law produces uniform effects. Chance implies the absence of regularity, and for that reason it *excludes predictability* except on the basis of a statistical average. Insurance companies, for instance, can predict the average number of deaths or accidents which will occur in the

course of a year; but they cannot specify the individuals to whom these events will occur, because many deaths and accidents are due to chance' and as such are not amenable to law. In many cases scientists are ignorant of the causes producing certain regularly occurring events. They perceive the *order* of events, but they do not know the cause; in such cases it would be wrong to ascribe these events to 'chance.' Chance is a factor when each individual being acts on its own, without conspiring with others to produce a definite effect as the result of their *concerted action*. Whenever concerted action on the part of many individual beings occurs, there is order among their individual actions; and this order is the effect of law, not of chance in the strict sense of the word.

Chance and Probability

Scientists, in general, leave 'purposiveness' out of consideration when treating of the phenomena of nature. Materialistic scientists do this, because purposiveness implies intelligence, and intelligence in nature is something they must exclude. Other scientists do this for the reason that purposiveness is unobservable' by the senses, and sense-perception is the foundation of all experience and therefore also of all science. Because of this attitude, the *origination of all phenomena* through chance is the normal scientific view of a large number of scientists.

As a consequence, the possibility and probability of natural phenomena happening through chance must be an all-important part in the scientific method. Where pure

chance is concerned, the *mathematical laws of probability alone* govern everything. Those scientists, therefore, who rule out intelligence in the universe and attempt to explain all happenings on the basis of pure chance, must be *consistent* and apply nothing but these laws of probability in giving an explanation of the origin and operation of natural phenomena. Any other procedure would be an abdication of reason in favor of arbitrariness and wishful thinking.

Probability on the basis of chance follows the ratio of *geometrical progression*. A person flipping a coin has a fifty-fifty chance of calling heads or tails correctly, so that the statistical average of 'one-in-two' should always prevail in the long run.

There are only two possibilities in the case of flipping a coin ('head' or 'tail'), and the average of correctly calling the result is therefore $1/2$ or 0.5 .

When the number of items involved increases, the probability of success through chance becomes progressively less. In a game of dice each cube has six sides and six numbers, the numbers running from 1 to 6. The probability, therefore, of any number showing on top will be 'one-in-six' or $1/6$. Consequently, a player calling for the number 3 has a probability of $1/6$ that this number will appear. That the number 3 appears twice in succession reduces the probability to $1/36$ ($1/6 \times 1/6$, or $.0277$). The probability of obtaining the number 3 ten times in succession is $1/60,466,176$ ($0.000,000,016$).

Probability decreases enormously when higher numbers are used. Pierre Lecomte Du Noüy¹ imagines a powder

composed of 1000 white particles and 1000 black particles, all absolutely alike except for their color. After being thoroughly mixed in a container, the powder is allowed to run into a tube whose diameter is slightly larger than that of the particles so that one grain of powder follows another in the tube. "The probability that the 1000 white particles will be entirely separated from the 1000 black ones after being shaken is expressed by 0.489×10^{-600} or 489 preceded by 600 zeros to the right of the point; about twelve lines of zeros in an ordinary book. It is evident that exponents of over 100 lose all human significance."

The *probability* of an event through pure chance is the ratio of the number of cases favorable to the event to the total number of possibilities, provided all cases are equally probable. *Theoretically*, the event could happen at any time; *practically*, it will happen according to the 'law of statistical averages' as given above, and that means that in cases where fairly large numbers of items are involved the probability of the event happening is practically nil. Speaking *scientifically*, therefore, the probability of *ordered events* happening in nature through pure chance is *practically impossible*, especially when 100 or more items are regularly disposed in an orderly arrangement.

Order and Intelligence

According to the calculus of probability, the ordered arrangement of things and events might happen once in a while, but the same calculus of probability would make the *regular and constant* ordered arrangement of things and

events through chance utterly impossible. And yet, such order exists.

To account for the cases of existing order where none should logically exist, scientists often speak of *anti-chance* — a term introduced by Eddington. The term means ‘a factor opposed to chance,’ and such a term is devoid of all sense unless this factor be specified as something concrete. As such, the term ‘anti-chance’ is delightfully vague, coined to hide ignorance to supplant the intellectual urge of seeking a rationally satisfying answer to the problem. What could this so-called ‘anti-chance’ be?

‘Anti-chance’ can only mean *design due to intelligence*. If order is not due to chance, then it can only be due to intelligence designing the order by arranging the various items into a system or whole according to some definite plan. Where intelligence is absent, chance must explain everything; and where chance cannot account for an orderly arrangement, intelligence must be assumed to make up for the deficiency of chance. There is no other possibility.

*Aristotle*² was well aware of the fact that chance cannot explain the order of nature: “In general, the theory [of chance, as the dominant factor in the universe] does away with the whole order of Nature, and indeed with Nature’s self. For natural things are exactly those which do move continuously, in virtue of a principle inherent in themselves, toward a determined goal; and the final development which results from any one such principle is not identical for any two species, nor yet is it any random result; but in each there is always a tendency toward an identical result, if

nothing interferes with the process. A desirable result and the means to it may also be produced by chance, as for instance we say it was 'by luck' that the stranger came and ransomed the prisoners before he left, where the ransoming is done as if the man had come for that purpose, though in fact he did not. In this case the desirable result is incidental; for, as we have explained, chance is an incidental cause. But when the desirable result is effected invariably and normally, it is not an incidental or chance occurrence; and in the course of Nature the result always is achieved invariably or normally, if nothing hinders. It is absurd to suppose that there is no purpose because in Nature we can never detect the moving power in the act of deliberation.

That Nature is a cause, then, and a goal-directed cause, is above dispute."

Aristotle, in this passage, plainly indicates that all natural processes are for an *end or purpose*. In other words, there is, in his view, *finality* in nature. His entire argument in this chapter (Chap. 8) revolves around the finality present in nature, and finality, he argues, presupposes *intelligence*. As he says:³

"Action for an end is present in things which come to be and are by nature . . . where a series has a completion, all the preceding steps are for the sake of that. Now surely as in intelligent action, so in nature; and as in nature, so it is in each action, if nothing interferes. Now, intelligent action is for an end; therefore the nature of things also is so. Thus if a house, e.g., had been a thing made by nature, it

would have been made in the same way as it is now by art; and if things made by nature were made also by art, they would come to be in the same way as by nature. Each step then in the series is for the sake of the next; and generally art partly completes what nature cannot bring to a finish, and partly imitates her. If, therefore, artificial products are for the sake of an end, so clearly also are natural products. The relation of the later to the earlier terms of the series is the same in both.”

— ARISTOTLE

From the *relation of means to end*, both in the products of art and of nature, Aristotle concludes that the order of nature is the result, not of chance, but of *purposive intelligence*. He cites many instances to prove his point.

Scientists, unless they are also philosophers, simply refrain from considering intelligence as a factor in the order of nature. From the standpoint of ‘science’ such an attitude is permissible. To refrain from considering intelligence is one thing; to deny its existence is an unwarranted step outside their restricted field of research. Hence, when a scientist *denies intelligence* as a factor in the order of nature, he is guilty of the fallacy of *false exclusion*.

‘Purposiveness’ in nature may not readily be detectable, due to the limitations of the human mind. *Order*, however, is an *observable fact* present throughout the universe.

Order in the World of Stars

In the following discussion, relative to the order present in the universe, the philosopher relies to a great extent on the materials furnished by the scientist. The scientist operates here in his proper field. However, one must distinguish between facts and theories, data and interpretations. In the past many theories have been advanced to explain the facts. The facts remain, but the theories have often been modified or even discarded. The theories of electricity and light are such. The general philosophic system advocated by the scientist obviously has much to do with his scientific interpretation of facts, and this must be borne in mind when considering the statements of scientists.

By means of the telescope, the spectroscope, the interferometer, and other instruments, astronomers have made great strides in their knowledge of the world of stars.

The immensity of the world of stars staggers the imagination. Human words are inadequate to describe the bulk, the magnitude and the complexity of the universe. Nevertheless, *the fact of order* throughout this vast expanse is unmistakable.

One of the most remarkable facts disclosed by spectography is the sameness of the materials everywhere; the same kinds of elements built our earth and built the stars. The same kinds of *radiation* occur in our sun, in the remotest stars and galaxies, and in the entire range of interstellar space. The *structure* of the galaxies is fundamentally uniform. The same laws operate here on earth and in the farthest reaches of the world.

Mathematicians express all this in extremely complicated formulae. Such mathematical formulae, discovered after centuries of constant toil, are proof positive that the world of stars is not only 'intelligible' but the work of an extraordinary *intelligence* which grasps everything from a photon to the unimaginable immensity of the world at large.

Astronomers become almost lyrical in their praise of the beauty, the grandeur, the magnificence, and the symmetry of the universe. They speak of the *organic unity* present throughout the universe. Witness Robert Grant Aitken⁴:

"For all its gigantic dimensions, all the bewildering complexities of its structure and motions, all the endless variety of its contents, our great stellar system, our universe so far as it has come within our range of observation, is an organic whole, exhibiting an underlying structural symmetry, built up throughout of the same basic elements, and governed by the same great laws. That the mind of man has been able to reach these great generalizations and through them to attain to the power of prediction, is proof of order and rationality in the universe. It is a universe, in my belief, with thought and more than thought within it."

— ROBERT GRANT AITKEN

Order in the World of Atoms

The world of atoms is just as marvelous as the world of stars. Formerly it was thought that the atoms were solid and indivisible substances. Since the turn of the century, however, this concept has been changed completely, mainly through the research of men like J. J. Thomson, E. Rutherford, H. Mosely,

L. LeBroglie, N. Bohr, W. Heisenberg, E. Schrödinger, M. Born, P. Dirac, and M. Planck. While much of what follows still theory, the views of these scientists have been signally vindicated through the technique of 'atom-smashing' and the explosion of the atom bomb.

There are ninety-four, perhaps ninety-six, natural kinds of atoms or *elements*. The pattern of their construction is fundamentally the same. Each one consists of a *nucleus and electrons* (or, as in the case of hydrogen, of a single electron). The nucleus represents the weight or mass of the atom, and it consists of protons possessing a positive charge of electricity and of neutrons. Neutrons are electrically neutral. Electrons are particles possessing a negative charge. Both the proton and the electron have an *equal charge* of electricity, namely, 4.8025×10^{-10} electrostatic units, and this charge never varies. There are also other particles, such as positrons, mesons, neutrinos, etc., but they need not concern us here.

Each element has distinctive physical and chemical properties. Among them are specific gravity, melting point, boiling point, ductility, malleability, compressibility, hardness, coefficient of expansion, refractive index, density, heat of combustion, heat of formation, conductivity of

electricity and heat, combining weight, and so forth. These properties are *constant* for the various elements.

Elements with similar properties occur periodically. The periodic recurrence of similar elements is termed the *Periodic Law* and this law states that the properties of the elements are the periodic functions of their atomic number, not of their atomic weight. The periodic table is arranged according to groups and series.

As early as 1914 Rydberg called attention to the fact that the 'atomic numbers' of the group 0 gases can be calculated from a series of numbers now called the *Rydberg Series*, expressed in the simple formula:

$$2(1^2+2^2+2^2+3^2+3^2+4^2....)$$

According to this formula we obtain these results:

<u>Element</u>	<u>At. No.</u>	<u>Rydberg Series</u>
Helium.....	2.....	$2(1^2) = 2$
Neon.....	10.....	$2(1^2+2^2) = 10$
Argon.....	18.....	$2(1^2+2^2+2^2) = 18$
Krypton.....	36.....	$2(1^2+2^2+2^2+3^2) = 36$
Xenon.....	54.....	$2(1^2+2^2+2^2+3^2+3^2) =$ 54
Radon.....	86.....	$2(1^2+2^2+2^2+3^2+3^2+4^2) = 86$

We also discover a remarkable *parallelism* in the series. The first series, that of hydrogen and helium, is unique. Hydrogen is active, helium is inert. This small series of two

elements epitomizes within itself all the subsequent series of the periodic table. The lithium and sodium 'short' series are parallel in nearly all respects, each containing 8 elements. The potassium and rubidium 'long' series are also parallel to each other, each consisting of 18 members, of which 10 are transitional. The caesium 'longest' series is composed of 32 elements. If the last (radioactive) series, as some scientists believe, also had originally 32 elements, the parallelism would be complete; but that is only a conjecture, although the discovery of neptunium and plutonium (and perhaps other elements mentioned more recently) tends to verify this belief at least in part. The fact of periodicity and parallelism among the groups and series of elements is undeniable.⁵

When we consider that everything in the entire universe is built up from these elements and subatomic particles, we come face to face with one of the most astounding illustrations of *orderly arrangement*. This is particularly true when we also consider the chemical combination of elements into compounds.

Chemical *compounds* are never the result of haphazard, random combinations; they are always subject to definite laws. A compound is not a mere 'mixture' of chemical substances. A true chemical compound is *homogeneous* throughout; it is a chemically new substance with new properties, the original elements losing their chemical identity in the process of combination. A compound is a combination of elements in *definite proportions of weight or volume*. This *law of combining weights affects all matter*,

whether present in the test tube or on the earth or in the remotest nebula.

Electrons, protons, and neutrons *tend* to form elemental atoms, and elemental atoms tend to form chemical compounds according to the inexorable law of their combining weights. This tendency is frequently called *chemical affinity*. Such is the tremendous fact of orderly arrangement governing the entire universe.

No wonder, then, that Sir Oliver Lodge wrote:⁶ claim that the material universe with its variously designed atoms, and the way they have been used in the construction of all the objects, minerals, vegetable, and animal, that we see around us, is a sign also of gigantic Design and Purpose, and is a glorious Work of Art.”

Order in the World of Plants

The *plant* is the lowest form of life on the globe. It possesses no recognizable consciousness. Nevertheless, even the unicellular plant has a structure and performs functions which are amazing in their intricacy and inherent purposiveness. It acts almost as if it had knowledge of a definite goal and consciously strove to realize it.

The fundamental unit of life is the *cell*. Just as the physicists formerly thought that the atoms were simple substances, so the biologists thought that the ultimate constituents of living beings were relatively simple parts. However, the more biological research penetrates into the structure and function of the cell, the more mysteries it discovers.

The cell is not a mere mass of matter: it is *organized*. A watch, a linotype machine, a rotary printing press, a diesel engine, when compared to the complexity and sensitivity of a cell, are but clumsy contrivances. This fact becomes more obvious when consideration is given to the hundreds of thousands of species and hundreds of millions of *individual plants* existing on earth, all of which are different and yet are built up of single cells which are fundamentally alike as to plan. That each plant body is a *unit* is evident; it possesses organs or structural parts distinct from one another, and the different organs have specific functions to perform, as can be observed in the roots, the stem, the leaves, the flowers, and the fruits. All parts and all functions are present not for their own sake, but for the sake of the *organism as a whole*; they are mutually dependent and conspire toward the welfare of the individual as a totality. It is the individual which counts, not so much the parts. The individual is, in all truth, more than the sum of the atoms and molecules and parts which make up its body.

Two specific functions of plant life deserve special attention: metabolism and cell division. Both functions show definitely the use of proper means to realize specific ends or purposes — *self-preservation and the perpetuation of the species*.

The cell is a magnificent *laboratory*. Without electric appliances and furnaces, without the aid of heat and pressure, without technical knowledge and experimentation, the cell manufactures organic compounds and by-products which man has found extremely difficult to make synthetically and which still escape, in very many

instances, man's skill and ingenuity. Depending upon the part the cells play in the general economy of the total organism, each one will absorb only the kind of material needed and fabricate the type of compound required.

Nutrition, growth, and propagation⁷ are the main functions of vegetative life. Although the plant has many diversified activities, they are all subservient to these three. Volumes could be, and have been, written about the wonders of plant life. These few points have been stressed so as to bring out the orderly arrangement and purposiveness existing in *all plants*.

The plant is indeed a *whole-making and self-regulating structural Unit*.

Order in the World of Animals

Like the plant, the animal is a vegetant being. It is a remarkable feature of the animal body that all vegetant life is subordinated to the building of a body specifically *ordered to sentiency*.

Every animal has a nervous system of some kind, because nerves are necessary for sentiency. The basic unit of the nervous system is the neuron, or nerve cell.

The nervous system in its structures and functions is without question a very complicated but orderly arrangement of means toward end, namely, a method to bring the animal in contact with its environment through knowledge and to enable it to preserve its own life and its own kind. Each sense and organ is marvelously constructed and designed for its particular function.

Consider the eye. Long before man invented the camera, the principles of optics embodied in the camera were already existing in the eye, only in a simpler and more efficient manner. The front of the eye must be transparent, and yet the cornea is fashioned out of the opaque connective tissue of the sclerotic coat. The convex lens of the camera is also found in the eye, made out of opaque epithelium; so as to focus the picture properly, this lens is capable of changing its convexity, something the glass lens of the camera cannot do. The iris is the diaphragm of the camera; in order to correct any aberration of light rays and to block out marginal rays, and in order to obtain a clear picture, the iris is automatically adjusted by the amount and intensity of the light rays entering the eye. Like all optical instruments, which must be blackened inside in order to quench any reflecting light from the walls, the inside of the eye is covered with a black pigment (melanin). The photo-sensitive plate of the camera is duplicated in the retina of the eye. The retina, however, is far better than the photographic plate, because the retina need not be replaced for successive pictures. The retina is constructed of cones for color vision and of rods for plain luminosity. The eye, unlike the camera, repairs its damaged parts and keeps all parts in working condition. Due to accident, disease, and heredity, the eye may be defective, but it will always be superior to the camera by the fact that it enables the individual to have *conscious perception* of images in three- dimensional views. The eye is a marvelous instrument in its order.

Practically all animals have the power of *locomotion*, and the structures are perfectly adapted to their environment in the air, on the land, and in the water. Eons before the coming of man and his inventions, levers existed in the animal body; the eyeball is moved by a muscular pulley; the heart is a force-pump; valves are used in the heart and in the veins; the poison fang of the snake is a hypodermic syringe; the cilia in the windpipe are brushes to remove mucus; electric eels have charged electric batteries; the glow- worms and fire-flies manufacture heatless light; the submarine's principle of flotation and submergence is utilized in the swim-bladder of the fish; the bird is the ideal heavier-than-air flying craft. If man's inventions are the result of design and purpose, these must also be such.

In commenting on the co-ordination and adaptation of that extraordinary piece of workmanship, the bird's *wing* and *feather*, Alfred Russell Wallace,⁸ the eminent scientist, remarks as follows: "Each feather 'grows,' as we say, out of the skin, each one from a small group of cells, which must be formed and nourished by the blood, and is reproduced each year to replace that which falls away at moulting time. But the same blood supplies material for every other part of the body - builds up and renews the muscles, the bones, the viscera, the skin, the nerves, the brain. What, then, is the *selective or directing* power which extracts from the blood at every point where required the exact constituents to form here bone-cells, there muscle-cells, there again feather-cells, each of which possesses such totally distinct properties? And when these cells, or rather, perhaps, the complex molecules of which each kind of cell is formed, are

separated at its special point, what is the constructive power which welds them together, as it were, in one place into solid bone, in another into the extremely light, strong, elastic material of the feather — the most unique and marvelous product of life?

“Yet again, what is the nature of the power which determines that every separate feather shall always ‘grow’ into its exact shape? For no two feathers of the twenty or more which form each wing, or those of the tail, or even of the thousands on the whole body, are exactly alike (except as regards the pairs on opposite sides of the body), and many of these are modified in the strangest way for special purposes. Again, what directive agency determines the distribution of the coloring matter (also conveyed by the blood) so that each feather shall take its exact share in the production of the whole pattern and coloring of the bird, which is immensely Varied, yet always symmetrical as a whole, and has always a purpose, either of concealment, or recognition, or sexual attraction in its proper time and place?”

— ALFRED RUSSELL WALLACE

Wherever we look in the world of animals, we discover millions of examples of order, design, and purpose, but the animals themselves know nothing about them.

Order in the World of Men

Man is an epitome of the universe. In him are united the atoms and molecules and energies of the inanimate world, the power of nutrition and growth and reproduction of the vegetant cells found in plants, the sensory organs and functions present in the animal body.

Yet so completely are these three worlds integrated in man that he is a *unitary substance* in every respect. The atoms and molecules are subservient to his vegetant life, the vegetant structures and activities are subservient to his sensory life, and the sensory organs and functions are subservient to his intellectual life. In him everything is harmoniously united and becomes one. In this connection, little more can be done than point out a few pertinent facts.

Like every plant and animal, man originates from a single *fecundated cell*. As Alexis Carrel⁹ observes: "An organ builds itself by techniques very foreign to the human mind. It is not made of extraneous material, like a house. Neither is it a cellular construction, a mere assemblage of cells. It is, of course, composed of cells, as a house is of bricks. But it is born from a cell, as if the house originated from one brick, a magic brick that would set about manufacturing other bricks. Those bricks, without waiting for the architect's drawings or the coming of the bricklayers, would assemble themselves and form the walls. They would also metamorphose into windowpanes, roofing-slates, coal for heating, and water for the kitchen and bathroom. An organ develops by means such as those attributed to fairies in the tales told to children in by-gone

times. It is engendered by cells which, to all appearances, have a knowledge of the future edifice, and synthesize from substances contained in blood plasma the building material and even the workers.”

The formation of the *human embryo* in the mother’s womb is one of the many wonders of nature. Bones, nerves, hands, feet, eyes, ears, heart, lungs, viscera, and every other type of structure and organ are made in the dark cavern of the womb long before they can be used. The mother does not consciously form the parts of the body of the child and assemble them into the pattern possessed at birth. If the formation of the child depended on the knowledge and conscious activity of the parents, no child would be born or even go beyond the first stage of life. Nonetheless, the miracle of conception and birth happens, not once but millions and billions of times.

Among all the other things, the *hand* is formed in the embryo at a rather early period. “The hand,” says Alexis Carrel,¹⁰ “is a masterpiece. Simultaneously, it feels and it acts.

It acts as if endowed with sight. Owing to the unique properties of its skin, its tactile nerves, its muscles, and its bones, the hand is capable of manufacturing arms and tools. We never would have acquired our mastery over matter without the aid of our fingers, those five small levers, each composed of three articulated segments, which are mounted upon the metacarpus and the bones of the wrist. The hand adapts itself to the roughest work as well as to the most delicate. It has wielded with equal skill the flint knife of the primitive hunter, the blacksmith’s hammer, the

woodcutter's ax, the farmer's plow, the sword of the medieval knight, the controls of the modern aviator, the artist's brush, the journalist's pen, the threads of the silk-weaver. It is able to kill and to bless, to steal and to give, to sow grain on the surface of the fields and to throw grenades in the trenches." Similar words could be said of any number of human organs.

Or, consider the human *brain*. The substance of the brain consists of more than twelve thousand millions of cells, all connected together by fibrils, so that the cells associate several trillions of times. The entire nervous system of man centers in the brain. The brain is the seat of consciousness. Even thought is somehow connected with the activity of the brain. The brain is far more complicated and intricate in its structure and operation than the whole material universe. Notwithstanding the unimaginable number of its component parts and the immense complexity of its activity, the brain functions as an *essential unit*.

From the standpoint of physical size, man is halfway between the big stars and the infinitesimal atoms; he thus occupies the pivotal position in the universe. The crowning achievement of man, however, lies in the field of his *intellect and will*. Through these powers he surpasses the material world and the kingdoms of plant and animal. By means of his intellect man is able to penetrate the mysteries of nature and interpret it. Civilization and culture, science and art, commerce and industry, government and social service, peace and war, good and evil — all derive their beginning and fulfillment from the use of man's intellect and will. Saint or sinner, man is in truth "wonderfully made."

The more the sciences advance, the more they discover of order and design. Much more could have been said than is said here, but this brief survey will suffice.

The world is, without doubt, a *universe*, a *cosmos*.

Conclusions

A system of order is the result either of chance or of intelligence. Now, the universe is a system of order. Therefore, the universe is the result either of chance or of intelligence.

Order may be, and sometimes is, the result of *chance*. However, a chance effect must conform to the probabilities inherent in chance. Statistical averages are all that can be expected in such effects, because the calculus of probability admits of nothing more uniform than a statistical average. The greater the number of items involved in the chance effect, the smaller (in geometrical progression) the probability of occurrence. Where more than one hundred items are concerned, the statistical average is so small as to be *practically impossible*. Theoretically, of course, the chance effect may occur at any time, because no opportunities are privileged. Nevertheless, chance is governed entirely by the calculus of probability and the statistical average derived there from. Due to this fact, a chance effect involving a large number of items can only occur here and there, now and then. As a consequence, chance can never achieve anything like *uniformity*, *regularity*, and *constancy* in its effects; otherwise these effects would simply not be due to 'chance.' Where there is

uniformity, regularity, and constancy in an arrangement of entities or operations, there is *law*; and law is the very antithesis of chance. Hence, when law governs an event, chance is eliminated as the governing factor.

Now, the *universe*, as science testifies in each of its departments, *is governed by law*. The universe is a vast system of orderly arrangements, whether viewed in the light-year expanse of the material world at large or in the millimicron smallness of atoms and subatomic particles or in the beautifully designed kingdoms of plants, animals, and men. This order prevails not only here and there, now and then, but *everywhere* and *always*. Chance effects, of course, do occur; however, the order present everywhere of nature is uniform, regular, and constant. Order is the rule; chance effects are the exception. It follows then, that the order present in the universe cannot be explained and accounted for by 'chance.'

A system of order must be the result either of chance or of intelligence. The universe is a system of order. Since it cannot be the result of chance, it must be the result of *intelligence*.

Every atom, every element, and every chemical compound is based on an orderly arrangement of parts and activities; as such, they must be the effect of an intelligence as their proper cause. The entire universe, however, is composed of the same kinds of atoms, elements, and compounds. Hence, the same intelligence which is responsible for the orderly arrangement present in the atoms, elements, and compounds must also be responsible for the orderly arrangement of the entire universe. All

plants, animals, and men are composed of fundamentally the same kinds of cells, and these cells in turn are composed of atoms, elements, and compounds taken from the inanimate world (though changed considerably in the vital processes going on in the living tissues), and all cells reveal an orderly arrangement of structures and functions. Consequently, the same intelligence which is responsible for the orderly arrangement present in the atoms, elements, and compounds must also be responsible for the orderly arrangement of the kingdoms of plants, animals, and men. In other words, since the entire universe is a system of unity, the order of the entire universe and of all its parts must be referred to the *self-same ordering intelligence*.

Arthur H. Compton,^{[11](#)} one of the great modern scientists, recognized this principle when he wrote:

“If we see in nature evidence of a plan, this will imply intelligence, for a plan or purpose is otherwise meaningless. The alternative to an intelligent plan for the world is that things have happened to be as they are through chance... Here we are concerned with statistics, and the statistical probability of a world’s happening to have a form similar to ours is so fantastically small that even in the billions of years that astronomers might allow for the age of our galaxy it must be considered as a highly improbable hypothesis... If the simple yet prolific set of pushes and pulls to which the electrons are subject result from pure chance, then chance is more ingenious than the most clever of our scientists.”

Philosophy, on the strength of the Principle of Sufficient Reason, demands intelligence as the logical explanation of order. Structures and functions always exist in order to realize a definite effect; that is their purpose — they are a *means toward a specific end*. However, only an intelligent being is capable of grasping an end to be realized and of designing the means necessary to realize the achievement of this end. Philosophy, therefore, also demands intelligence as the sufficient reason for accounting for the order of the universe.

Proof of God's Existence

Order demands intelligence, when order is uniform, regular, and constant. The order in the universe, therefore, is an intelligent order and can only be the effect of an *intelligent cause*.

It should be evident that *the universe itself does not possess intelligence*. The universe as a whole is inanimate. Intelligence, however, presupposes life, because intelligence is a form of life. The great bulk of the universe outside our earth is altogether devoid of life. All the bodies existing in the vast expanse of the world are made up of the same kinds of atoms and compounds present on the earth. The single atoms, however, lack intelligence; even if they had intelligence, they are all individual units, and it is inconceivable that they would be the cause of the general order prevailing everywhere. Plants, animals, and men have

life. But the plant has no consciousness, and the animal no rational mind. Of all the beings in the world, man alone possesses a rational mind. This rational intelligence of man, however, is not due to himself; it is given with his nature, and man is not the cause of his own nature. Man is an integral part of the universe, and as such his rational intelligence must be derived from the same rational mind which ordered the entire universe; and this rational mind must be as much more powerful than man's mind as the order of the universe is greater than the order existing merely in man.

The entire universe and all its parts are *subject to the law of order*. Order has been *imposed* on them, and they *obey* the law of order in their whole being. It follows, then, that the rational intelligence which put the law of order into them *cannot be the universe itself* nor any part of the universe; otherwise it would impose the law and be subject to it, be 'orderer' and 'ordered,' at the same time under the same respect. This means that the rational mind or intelligence responsible for the order and design present in the universe is itself 'extra-universe,' *extra-mundane*, distinct in being from the universe and from all beings comprising it. And since man is an intelligent person, this rational intelligence ordering the world must also be *personal*. Now, the personal, extra-mundane designer and orderer of the universe we call God.

Therefore, *God exists*.

The Argument of St. Thomas

The proof for God's existence, based on order and design, is called by St. Thomas¹² the 'way taken from the governance of the world.' It is his fifth proof, and he formulates it as follows:

"The fifth way is taken from the governance of the world. We see that things which lack intelligence, such as natural bodies, act for an end, and this is evident from their acting always, or nearly always, in the same way, so as to obtain the best result. Hence, it is plain that not fortuitously, but designedly, do they achieve their end. Now whatever lacks intelligence cannot move toward an end, unless it be directed by some being endowed with knowledge and intelligence; as the arrow is shot to its mark by the archer. Therefore some intelligent being exists by whom all natural things are directed to their end; and this being we call God."

— ST. THOMAS AQUINAS

One cannot help but admire the brevity and penetrating logic of St. Thomas in this argument. It contains everything essential. Its brevity, however, might fail to convince the average student; and so his line of reasoning has been expanded in the foregoing sections, in the hope that the student will grasp the significance of the argument better.

We close our discussion of order and design in nature with the words of Robert A. Millikan:¹³ "Wise men have always looked in amazement at the wonderful orderliness of

nature and then recognized their own ignorance and finiteness and have been content to stand in silence and in reverence before Him, repeating with the psalmist: 'The fool hath said in his heart, there is no God.'

Summary of Chapter V

Another proof for God's existence is the one based on the *order* and *design* present in the universe.

1. *Order and Design.* — 'Order' is the arrangement of various items into a system or whole according to some relationship existing or placed between them. Order may be 'static' or 'dynamic,' 'natural' or 'artificial.'

'Design' is the arrangement of various items into a system or whole, so that this arrangement is the result of plan and intention. Wherever there is design, there is purpose.

2. *Order and Chance.* — 'Chance' is a mode of causal activity, not purposive in character, regarded as determining an event. Chance implies the absence of regularity, and for that reason it excludes predictability except on the basis of a 'statistical average.'

3. *Chance and Probability.* — Where pure chance is concerned, the mathematical laws of probability alone govern everything. Probability on the basis of chance follows the ratio of 'geometrical progression.'

4. *Order and Intelligence.* — Where intelligence is absent, chance must explain everything; and where chance cannot account for an orderly arrangement, intelligence must be assumed to make up for the deficiency of chance.

5. *Order in the World of Stars.* — The fact of order in the universe is unmistakable. This is seen in the elements, radiation, structure of the galaxies, and the laws governing the universe. The universe is a *system*, a *unit*.

6. *Order in the World of Atoms.* — The elements, the atoms, and the subatomic particles reveal an orderly arrangement, as can be seen in the Table of Elements and in the Periodic Law. Chemical compounds are regulated by the law of combining weights, and this law affects all matter.

7. *Order in the World of Plants.* — The fundamental unit of life is the *cell*. Its activities are metabolism, growth, and reproduction. Cell division in 'mitosis' and 'maturation division' are functions directed toward self-preservation and the perpetuation of the race. The plant is a whole-making and self-regulating structural *unit*.

8. *Order in the World of Animals.* — All activities are ordered to sentience. The *neuron* is the basic unit of the nervous system. The organs of perception are marvels of construction and function. The structures involved in locomotion are perfectly adapted to the environment in the air, on the land, and in the water.

9. *Order in the World of Men.* — The activities of the inanimate atoms, the vegetant functions of the plants, and the sensory functions of the animal are all subservient in man to his intellectual life. Man is a *unitary substance* in every respect. The crowning achievement of man lies in the field of his intellect and will.

10. *Conclusions.* — Chance cannot achieve anything like *uniform* regularity, and constancy in its effects. The universe, however, is governed by law, and as a result there is everywhere uniformity, regularity, and constancy. Hence, the universe, as a system of order, must be the result, not of chance, but of intelligence, and this intelligence must be

one for the entire universe. This conclusion is borne out by common sense, by science, and by philosophy.

11. *Proof of God's Existence.* — The universe itself does not possess intelligence. The entire universe is subject to the law of order. Hence, the intelligence responsible for the order in the universe cannot be identified with the universe, but must be extra-mundane. Since man is a 'person,' the rational intelligence ordering the world must also be *personal*. This personal, extra-mundane designer and orderer of the universe we call God. Therefore, God exists.

12. *The Argument of St. Thomas.*—The fifth proof of St. Thomas is the argument based on order and design. It is essentially the same as the argument developed in this chapter.

Chapter 6

CONTINGENCY AND CAUSALITY

MOST PEOPLE ARE CONVINCED OF GOD'S EXISTENCE THROUGH A contemplation of 'order and design' in the universe, because order demands intelligence, and intelligence is not found in inanimate things themselves. Many scientists accuse such persons of *anthropomorphism*, that is to say, of attributing human activities to nonhuman beings; because man has an intelligent purpose in ordering things, therefore also the order manifest in the world must have an intelligent cause. The principle, however, underlying order is a logical principle, one demanded by reason as the rational explanation of order; otherwise 'chance' must be accepted as the sole explanation of order, and chance is totally inadequate as a rational explanation. Hence, the proof from 'order' leads to the existence of God.

Another argument, more philosophical in character, is based on the *contingency* of the beings present in the universe. The argument from *causality* is closely related to that of contingency. These will now receive consideration.

Necessity and Contingency

For a clear presentation of the argument, the terms involved must be defined.

Necessity is that state in virtue of which something cannot be otherwise than it is. Something, therefore, is said to be *necessary* if it must be what it is; or, to put it negatively, something is necessary if it *cannot not be* what it is.

A distinction is made between moral, physical, logical, and ontological necessity. *Moral* necessity is the 'obligation' which a moral law imposes on the will; such is, for instance, the obligation to respect human life as required by the law 'Thou shalt not kill.' *Physical* necessity is the necessity imposed on a thing according to the law of physical nature; thus, the movements of the planets around the sun are physically necessary. *Logical* necessity is the necessity resulting from the force of a law of logic; it is, for example, a law of logic that contradictories can neither be true nor false together. Ontological necessity is the necessity which arises in a thing because of its 'being,' essence,' 'nature'; because a being is an 'organism,' it necessarily possesses 'life.' Something, therefore, may be necessary in any of these given meanings. Here we are concerned solely with 'ontological' necessity.

A further distinction is made in 'ontological' necessity. In the order of its being a thing may be either 'hypothetically' or 'absolutely' necessary. Something is said to be *hypothetically* necessary when its existence is dependent on a cause, but which, once the condition of its existence is given, must be (cannot not be) a definite reality; man need not, for example, always exist but, if he exists, he must be

an 'animal' while he exists. Something is *absolutely* necessary when it exists in such a manner that it *must exist*, independent of any condition; such a being *cannot not exist*, because its non-existence would imply a contradiction.

Since non-existence would be a contradiction in an absolutely necessary being, it is evident that it *cannot receive existence* from another being; that means that it is uncaused and must exist always. Such a being can have the sufficient reason for its existence in itself only, so that it exists entirely of itself and by reason of its *nature or essence*. Existence belonging to the constitution of its essence, the absolutely necessary being includes existence in its very concept and definition, at least implicitly. To exclude actual existence from the concept of the necessary being, or to consider actual existence as something superadded to its essence, would deny absolute necessity itself, because then this being would have the sufficient reason for its existence in itself and not have it in itself at the same time and under the same respect. In the absolutely necessary being, therefore, essence and existence must actually be identical; otherwise it would necessarily exist and not necessarily exist, and that would be a contradiction.

Contingency is that state in virtue of which something can be otherwise than it is in its being or existence or both. A *contingent* being is a being which is what it is, but could be different; if it actually exists, it exists in such a manner that its non-existence would involve no contradiction because existence does not belong to the constitution of its essence.

‘Contingency’ is the contradictory of ‘necessity,’ and a ‘contingent being’ is the contradictory of a ‘necessary being.’ A contingent being is essentially *non-necessary*: if it does not exist, it can receive existence; and if it exists, it can lose its existence (or at least be thought of as non-existent), without a contradiction being expressed or implied. It follows that a contingent being has not the sufficient reason for its existence in itself and by reason of its nature or essence; if it had, it would be a necessary being and would exist through absolute necessity.

Since the contingent being has not the sufficient reason for its existence in itself, it can have this sufficient reason only *in another*. The necessary being’s existence is uncaused, and as a consequence the contingent being’s existence must be caused. Just as ‘absolutely necessary’ and ‘contingent’ are contradictory terms and cannot be true together, so ‘uncaused existence’ and ‘caused existence’ are contradictory terms and cannot be true together.

Contingency and the World

Having explained the meaning of a ‘contingent being,’ we must now turn our attention to the different types of being present in the universe and establish the *fact of their contingency*. The first point to consider is the *mode of the physical world at large*.

Astronomers and astrophysicists assure us most emphatically that the *mode of the universe* never remains the same; it has undergone a great change in the past, is changing continuously in the present, and will continue to

do so for eons to come. Not only do 'new stars' explode into brilliance, but all the stars slowly alter their physical and chemical form without cessation, as can be observed in the emission of various kinds of radiation, particularly of light and heat. The vast galaxies, according to all evidence, are in a constant evolution of structure, as would be expected if this is an expanding universe. Motion exists everywhere, and motion means physical change.

Our *earth* is a typical planet-star. That it is presently undergoing an incessant process of form and structure, is an observable fact. The evidence accumulated by the science of geology points in a fairly conclusive fashion to the fact that the earth was a molten body in the far-distant past and has gradually cooled off through radiation; the oceans flowed together; the continents rose; the mountain ranges upheaved their massiveness; extensive deposits of rocks covered the globe. And all this happened in calculable time. What occurred on the earth presumably also took place in similar fashion on planets such as Mars and Venus and other stars, and all celestial bodies are headed toward a similar fate.

Since the mode or structure of the universe at large is continuously changing now, the conclusion is justified that it has changed in the past and will change in the future. The process may take millions or billions of years, but the time element is of no particular significance. The fact of change in the structure of the universe is positive proof that it *does not exist necessarily*; if this structure were a 'necessary being,' it would have to remain as it always has been. The *mode* of the universe, therefore, is contingent.

Contingency and Organisms

So far as we know, the earth is the only planet which contains organisms. Plants, animals, and men comprise the three kingdoms of living beings. If it should ever be established that life also exists on some other planet or star, it would still remain a fact that *organisms are contingent beings*.

Organic life cannot exist on the incandescent stars; the heat is far too intense to sustain it. Even on this earth organisms did not always exist, because the earth, as geologists point out, was formerly in a stage of incandescence; this is shown by the sequence of the rock deposits, because the oldest formations are layers of igneous rocks.

In any case, the idea of 'kingdoms' of plants, animals, and men is an abstraction. In reality, nothing exists but *individual* plants, animals, and men. That every one of them is a contingent being,' is obvious. Each one has had its origin in time. The life span of every organism is relatively short, and then it dies and *ceases to exist*.

Anything, however, which has a beginning and an end to its existence cannot be an absolutely necessary being, because a necessary being must be whatever it is and remain such at all times. Organisms, therefore, are non-necessary and, as a consequence, *contingent*.

Contingency and Atoms

Wherever there is *composition* there is *contingency*. Protons, electrons, and neutrons may exist in a 'free state' or in 'conjunction.' At one time they may exist in the one state and at another time in the other. Elements, of course, are being continuously formed and dissolved, both in the laboratory and in nature; they are, therefore, manifestly contingent. Atoms and elements do not remain the same at all times, because they are in a constant process of change, whether viewed individually or as constituents of chemical compounds; they, too, must be classified among the contingent beings. Even the subatomic particles undergo change in many ways, because their behavior is different when in the 'free state' and when in conjunction with others in an element or compound; one cannot say, therefore, that they 'must be' forever what they are at any particular point of time. For the scientist who is convinced that matter and energy are interchangeable the conclusion must be inevitable that subatomic particles, elements, and compounds are by their very nature unstable in their entity. Whether one agrees or disagrees with this view, that fact of *change* and *composition* in all bodies constituting the universe is proof positive that individual bodies are not absolutely necessary.

Subatomic particles, atoms, elements, and compounds, no matter what their size or number, are therefore *contingent beings*.

Contingency and Matter

While many persons, particularly materialistic scientists, are willing enough to admit that individual bodies and their component particles change continuously, they maintain that matter is eternal and therefore necessary. If matter is actually eternal, without a beginning and a passage from non-existence to existence, it has its existence in virtue of its essence; such a being is not hypothetically but absolutely necessary so that it *must be whatever it is*.

Now matter does not exist in the abstract but in the concrete. Matter exists in specific forms, namely, concretely as subatomic particles, elements, chemical compounds, plants, animals, men, stars, galaxies, and interstellar material. They change, and matter changes in and with them. Because of this constant change, matter cannot be said to be 'necessarily what it is.'

If matter were necessary and eternal, then it would necessarily and eternally be and remain the same, because it would be absolutely independent of every other being in its essence and existence. Regarding a state of *rest* or a state of *motion*, it would have to exist at rest or in motion, whichever is first. Both states cannot be present at the same time under the same respect, because that would be a contradiction, and contradictories cannot be true together. If matter existed from eternity in motion, then motion is necessary, because motion would be given with the essence of matter; motion would simply be a mode of the existence of this essence and as necessary as the essence of matter itself. If a state of rest is considered as being present at first, then *rest is necessary and essential to matter*. Scientists are more inclined to the viewpoint that all matter

is in motion. However, motion is always definite with regard to *velocity* and *direction*; there is no such thing as 'indeterminate' motion. Consequently, if matter were in motion eternally, it would necessarily have a motion which is definite with regard to velocity and direction, and this motion *could never change*. Now, motion changes continuously, both as to velocity and direction. Therefore, motion is not essential to matter. But neither is rest, since there is real motion in the world. Consequently, the essence of matter is not necessary, but must be *contingent*.

Materialists put forth the claim that matter is eternal. In this claim they contradict the best *evidence of science*. Thermodynamics assures us that the amount of energy available for useful work is diminishing; various forms of energy are converted into heat, and heat is being dissipated into space. Since heat can do work only when passing from a higher to a lower level, it is 'unidirectional' in its activity, with the result that the universe is caught in an *irreversible process*. This means that the universe is gradually running down and is slowly proceeding toward energy-death. The end of activity in the universe may be immeasurably far away in the future, but it is unavoidable and final because the supply of energy in the stars is not unlimited. The supply of energy being limited, the conclusion is evident that sometime in the past there was a *beginning to the universe as presently constituted*: where there is an end there must be a beginning. But if there is a beginning to the activity of the universe, there must also be a beginning to the matter of which the universe is composed. Hence, the universe and its matter is contingent in its existence.

Scientists have discovered various clues which enable them to calculate the *age of the universe*. The radioactive elements, such as uranium, thorium, and actinium, have a stable and unvarying rate of disintegration, and no known force is capable of inaugurating, accelerating, retarding, or stopping this process. The amount of radioactive elements is relatively small, and there is no indication whatsoever of the formation of a further supply. The entire supply, for example, of uranium on earth must therefore have had its beginning at *one specific time in the past*; it could not have existed from eternity, otherwise it would now, according to the established rate of disintegration, be already converted into radio-lead. Geophysicists calculate that the origin of radioactive elements occurred about two billion years ago. Astronomers, judging from the rate at which radiation takes place in the stars, also arrive at the figure of approximately two billion years for the beginning of the universe. Similarly, the cosmogonists, in their study of the velocity of the receding galaxies, calculate that the beginning of the expansion of the universe occurred about two billion years ago. All these clues indicate that the universe will come to an end definitely fixed in time and for the same reasons had a beginning definitely fixed in time. If these calculations are basically sound, the universe, together with its matter, *cannot have existed from eternity but must have had a beginning in time*. Even if one assumed (and this is a gratuitous assumption, without any foundation in fact) that a previous world existed, out of which the present world was somehow formed, one would have no rational explanation of the *collocation of matter* so as to account for

the *original formation* of the present world. After all, the only universe we know is the present one, and it is the origin of this universe which must be accounted for. The pertinent facts of our present universe, however, all lead to the conclusion that it began in time. And since matter in the concrete is identical with the present universe, matter too must have had a beginning. But if matter had a beginning, it cannot be eternal and it must be *contingent*.

The same conclusion is reached on purely *rational grounds*. An absolutely necessary being is such that its non-existence would imply a contradiction. Hence, *it cannot be thought of as non-existent without a contradiction*.

I can take any single molecule, atom, or subatomic particle (for example, any electron or proton in the ink of my pen) and think of it as ceasing to exist, without any contradiction in the thought. I see no 'necessity' in its existence; the rest of the world could and would exist without its presence. If it were possible to annihilate it, the universe would suffer no perceptible loss thereby; its non-existence would involve no contradiction. And that holds true of every single molecule, atom, or subatomic particle existing as an individual reality in the world; each one is no more absolutely necessary in its existence than the one present in the ink of my pen. Now, the universe as a totality consists entirely of such individual molecules, atoms, and subatomic particles. Hence, if the individual entities can be non-existent without a contradiction being implied, their totality (the universe) can also be non-existent without a contradiction being implied. Consequently, the totality of all material beings is not absolutely necessary. The *universe*,

and all the *matter* composing it, is non-necessary and therefore *contingent*.

Proof for God's Existence

A contingent being is the contradictory of an absolutely necessary being. The necessary being owes its existence to itself in such a manner that it has existence in virtue of its own essence. The necessary being *must be what it is*, both as regards its essence and existence; hence, it must be unproduced, independent of every other being. Non-existence would imply a contradiction in the very idea of the necessary being.

The contingent being, on the other hand, since it is the contradictory of the necessary being, cannot owe its existence to itself in such a manner that it has existence in virtue of its own essence; its essence is such that it can exist or not exist. The contingent being *need not be what it is*, both as regards its essence and existence; if it has a definite essence and existence, it is not due to the contingent being itself. The contingent being, unlike the necessary being, must be produced, because its existence is dependent on some other being. The non-existence of the contingent being does not imply a contradiction in its very idea.

Therefore, the contingent being does not contain the sufficient reason for its essence and existence in itself. Of itself, the contingent being is nothing. Whatever it is and has it owes, not to itself, but to some other being. Consequently, if a contingent being has determinateness of

essence and has actual existence, it must have *received* everything from *some other being* distinct from itself.

This 'other being' must also be either *contingent or not contingent*; this division is one of contradictories and as such exclusive. If it is *not contingent*, then we have arrived at an absolutely necessary being whose non-existence implies a contradiction in terms; and this being has the sufficient reason for its total essence and existence in itself and is absolutely independent of every other being in all that it is and has. If *contingent*, it will not have the sufficient reason for its essence and existence in itself but in some other being. Then this 'other being' must again be either contingent or not contingent; and this process of elimination will have to continue until we eventually arrive at the *absolutely necessary being* which has the sufficient reason of its own essence and existence in itself and also the sufficient reason of the essence and existence of the contingent beings throughout the universe.

To postulate an *infinite number* of contingent beings will not save the situation for those who do not admit the existence of an absolutely necessary being outside the present universe. This entire infinite series, since it is contingent in every member, would not have the sufficient reason for its existence in itself, and so the *entire series* and all its members could not exist. The mere multiplication of numbers explains nothing and does not account for their existence, if every single member of the series is a contingent being: an infinite number of blind persons will not give sight to a single one of them. Now, contingent beings actually exist, as we know from experience and the

present universe is contingent. Therefore, an *absolutely necessary being exists* outside the present universe, and the universe and everything in it depends on this necessary being for its essence and existence.

This being is absolutely necessary and therefore unconditioned and eternal. Its existence is due solely to its own essence. Since this being cannot have received its essence and existence from any other being, it is essentially and existentially *self-sufficient* and *self-existent*. Philosophers express this idea by the term *ens a se*, namely, a being which is what it is and exists 'of and by itself.' The expression *ens a se* does not mean that it 'produced' itself, because such an interpretation of the phrase would contain a contradiction. The absolutely necessary being can never have 'received' existence, neither from itself nor from another, but has always existed and will always exist; otherwise it would be 'contingent.' To 'produce itself' would involve the further contradiction that such a being would exist and not exist at the same time under the same respect: it would not exist, because the supposition is that existence was produced and given to the being; it would exist, because the being must already exist in order to produce anything. The fact is simply that the existence of the *ens a se*, of the absolutely necessary being, can never have been produced at all; existence belongs to the very *constitution of the essence* of the absolutely necessary being, so that this essence cannot be conceived except as existing. The necessity of such a being is so unconditioned and absolute that the completely sufficient reason for its essence and existence is found solely in itself, not in

another. For this reason it is said to be 'self-sufficient' and 'self-existent' or '*ens a se*.'

This absolutely necessary being or *ens a se* we call 'God.' God, *therefore, exists*; and He is the one and only sufficient reason to account adequately for the essence and existence of all the contingent beings present in the universe.

God exists, and He is eternally what He is.

The Argument of St. Thomas

St. Thomas¹ gives his formulation of the argument from contingency or, as he expresses it, possibility and necessity as follows:

"The third way is taken from possibility and necessity, and runs thus. We find in nature things that are possible to be and not to be, since they are found to be generated, and to corrupt, and consequently they are possible to be and not to be. But it is impossible for these always to exist, for that which is possible not to be at some time is not. Therefore, if everything is possible not to be, then at one time there could have been nothing in existence. Now if this were true, even now there would be nothing in existence, because that which does not exist only begins to exist by something already existing. Therefore, if at one time nothing was in existence, it would have been impossible for anything to have begun to exist; and thus even now nothing would be in existence — which is absurd. Therefore, not all beings are merely possible, but there must exist something the existence of which is necessary. But every necessary thing either has its necessity caused by another, or not.

Now it is impossible to go on to infinity in necessary things which have their necessity caused by another, as have been already proved in regard to efficient causes. Therefore we cannot but postulate the existence of some being having of itself its own necessity, and not receiving it from another, but rather causing in others their necessity. This all men speak of as God.”

A few comments will be in order regarding the formulation of the argument on the part of St. Thomas. He speaks of ‘possibility and necessity.’ It should be clear from the context that what he calls ‘possibility’ is identical with ‘contingency.’ A ‘possible’ being is evidently only contingent, not absolutely necessary. A ‘contingent’ being, by the very fact that it is not absolutely necessary, must receive its existence from another; hence, there must have been a time when it was non-existent and merely ‘possible.’

The terms ‘generate’ and ‘corrupt’ will be misleading, unless one knows the meaning of these words in the technical philosophic language of Aristotle, St. Thomas, and scholastics generally. In their language ‘generation’ means the formation of a material body through the union of matter and form; and ‘corruption’ means the dissolution of such a being through the separation of matter and form. It makes no difference whether this body be inanimate or animate. Thus, the origin of a chemical compound and of a living being (for example, of a plant or animal), would be termed ‘generation’; similarly, their dissolution would be termed ‘corruption.’ With us, ‘generation’ is commonly restricted in meaning to the origin of a living body, and ‘corruption’ has a distinctly moral connotation. The context

shows that St. Thomas used these terms in their technical aristotelian meaning.

The Principle of Causality

A *cause* is anything which assists in the production of a thing through some positive influence. There are four kinds of causes: material, formal, final, and efficient. The problem of God's existence revolves around the *Principle of Efficient Causality* which reads: That which begins to exist demands a cause (an efficient cause) for its beginning; that is to say, it demands an existing being to bring it from non-existence to existence.

The *validity* of this principle has been established before (Chap. 2). Here a few summarizing remarks must suffice. A being which does not actually exist but is capable of existence is a 'possible being.' In order that a possible being actually exist, it must pass from non-existence to existence. Now, there must be a sufficient reason to account for the possible being's passage from non-existence to existence. This reason cannot be *nothing*, because 'nothing' can produce nothing; it possesses no activity which would enable it to bring a possible being from non-existence to existence. Mere *possibility* cannot be the sufficient reason, since 'possibility' is actually nothingness, so far as existence is concerned, and as such cannot be the reason why a possible being should receive existence; otherwise all possible beings would become existent, and that is obviously not true. A non-existent, though possible, being *cannot produce itself*; because to 'produce' means to act

and 'acting' demands existence, and so the possible being would have to exist in order to make itself exist, which is absurd. Hence, whatever begins to exist (passes from non-existence to existence) demands another being, an *efficient cause*, for its existence.

As will be seen from the preceding paragraph, the Principle of Efficient Causality is an *analytical* principle, i.e., its truth is established by means of an analysis of the terms; anyone who knows what the terms mean must recognize the validity of the principle both in the order of thought and in the order of reality. The principle, taken alone, does not prove that any thing has ever passed from non-existence to existence; observation proves that.

The Fact of Causality

Observation proves that many things pass from non-existence to existence throughout nature. We behold *new things* and *realities* coming into existence which were non-existent before. The facts are innumerable. Here are a few.

Geophysics acquaints us with many realities that come into existence: hurricanes and ordinary storms are produced through the clash of air masses; volcanoes erupt violently and then quiet down; earthquakes throw up vast mountain ranges and level entire cities; heat and cold, wind and rain erode the soil; rivers rise and carry silt through hundreds of miles of flowage; lakes and pools emerge and then disappear; oceans roll tempestuously against the shores of continents, taking away and depositing land through their powerful action.

Physics tells us of the activity of various forces: electricity drives buses and streetcars, machines and appliances of a million and one kinds; magnetism generates electric currents in powerhouses and lifts tons of metal; light from the sun and stars illuminates the earth and the world; gravitation draws together the smallest particles of matter and the systems of galaxies; mechanical force makes walls crumble under the impact of cannon shells and splits a tree through the fall of an axe.

Chemistry shows the causality of things in their reactions: the elements are formed through the combination of various subatomic particles; chemical compounds are made and unmade through the interaction of different elements constantly uniting and dissolving; atoms are ionized through the addition and subtraction of electrons; radioactive substances disintegrate at a definite rate according to their own inherent laws, forming new substances in the process.

Biology deals with the activities of life and organisms: the assimilation of nutritive material in the plant, animal, and man; the vital processes going on continuously in the organic body the growth of the organism through the purposive action of mitosis; the marvelous structure and function of asexual and sexual reproduction.

Psychology describes the functions of the mind; the organs and wonderful activities of sense-perception; the formation of ideas, judgments, and inferences on the part of the intellect; the eminently useful actions performed under the stimulus of instinct and free will; the direction of

individual and societal life through moral principle and action.

These and a billion other facts are witness to the influence of efficient causes in leading realities from potentiality to actuality, from possibility to reality, from non-existence to existence. New atoms, new elements, new compounds, new plants, new animals, new men, new stars, new solar systems — they continuously appear in nature through the positive influence of producing agencies. Whenever a new reality of any kind makes its appearance, it is the result of *efficient causality*, and without efficient causality nothing new can appear. The chain of causality reaches back into the past in an *unbroken series*, one reality producing another in uninterrupted sequence. There are, of course, *many series* of such causal relationships in the world, but they are all *interrelated* and *interdependent*. In the universe there is no complete isolation.

Finite or Infinite Series of Causes

Concretely, causality means the active production of a new being or reality by bringing it into existence from a state of possibility. This production, as was pointed out before, demands the active influence of an efficient cause. Cause and effect are merely two aspects of one and the same action: in so far as this action pertains to the producing agent, we speak of a 'cause'; in so far as this action pertains to the produced thing or reality, we speak of an 'effect.' *Cause and effect* are, therefore, *correlative terms* and

mutually include each other whenever there is a question of actual production of any kind.

Obviously, something might be a cause without itself being an effect, as when it produces another thing or reality but is not itself produced; and something might be an effect without itself being a cause, as when it is produced by another but does not itself produce some other thing or reality. Every *effect*, however, *must have a cause* for bringing it from non-existence to existence. Whenever an effect is produced by a cause, and this cause is produced by a second, and this second cause is produced by a third, and so on, there is a *series of causes and effects*. Nature abounds in many such series which reach into the far-distant past.

Now, the series of causes and effects in the universe is either *finite and limited* in number or *infinite and unlimited*. In either case efficient causality inevitably leads to a *First Uncaused Cause*.

If this series is *finite and limited*, it can be counted out, because the number of effects would be finite and limited. This means that the series has an end in the past, no matter how far into the past the series may go. But if the series has an *end in the past*, there must be a *first* cause in the beginning of the series which started the chain of production. And this first cause could not itself be produced (caused), because it is the 'first' in the series and nothing can precede the 'first.' If it were itself caused, it would have to be produced by another being, since it cannot cause its own existence; then this 'other being' would be the 'first' in the series. Hence, that cause alone is the 'first' which alone

is at the end of the series and is not preceded by another cause. It follows, then, that the first cause of a finite and limited series must be a cause but *not an effect*; that is to say, it must be uncaused, it must exist in virtue of its own essence, it cannot have passed from non-existence to existence, it must have the sufficient reason for its existence in itself and not in another. If this were not so, the 'first' cause could never have been brought from non-existence to existence and there could be no effects following it. However, effects do actually occur, as we know from experience. Consequently, if the series of causes and effects is finite and limited, this finite and limited series demands an uncaused cause as the 'first.' Under this supposition, therefore, there exists a *First Uncaused Cause*.

If this series is *infinite* and *unlimited* (and atheists usually assume this, so as to eliminate the existence of a First Uncaused Cause), the conclusion is the same. There are certain properties which apply to the single parts of a whole, but not to the whole as a totality (e.g., those pertaining to the hand or foot, and so forth, of man); others, which apply to the whole as a totality, but not to the single parts comprising the whole (e.g., those pertaining to an army, a family, a society, and so forth). There are other properties which apply both to the whole and to all its parts, because they are 'essential' to the whole and to the parts together. In a series of men who descended in a direct line from one another, each one is a man, and the totality is a totality of men, no matter whether the line of descent be finite or infinite, because each member of the series is 'essentially' a man. And the same is true of a *series of*

causes and *effects*. It is essential to an effect to have a cause; and every 'caused cause' is thus 'essentially' an effect demanding an other being as its cause; i.e., it must have been produced by *another*. This property is essential to each member of the series of 'caused causes,' whether the series be finite or infinite in number. Hence, the *total series*, even though *infinite*, is always and will always remain a *caused* or *produced totality*. Here, too, the entire produced series either produced itself or was produced by some other cause outside the series of produced causes; there is no other possibility. It is self-evident that the series, even though supposed to be infinite, could not produce itself, because in that case it would exist and not exist at the same time. Hence, *a cause outside the entire series of caused causes* is required as the adequate sufficient reason for the production and existence of this series. If this extra-serial cause were itself produced by another cause, a second series, either finite or infinite, would be started, and the argumentation given above would apply to this series as well. Consequently, even an infinite series of causes and effects eventually requires an uncaused cause, that is, *a cause or being un-produced and existing of itself*.

It follows with necessity, then, that there must be a *First Uncaused Cause* to which every causal series of the universe must be referred as its ultimate producing cause. This First Uncaused Cause, because it is unproduced, is essentially and existentially self-sufficient and self-existent, an *ens a se*.

Infinite Series Impossible

In the foregoing section it was *assumed* that an infinite series of causes and effects in the universe could *possibly* exist. We will now examine this possibility itself. Can an infinite series of causes and effects actually exist?

Where there is a 'series' of discrete entities, such as causes or effects obviously are, there is 'number.' By number we understand a *collection* or *aggregate measured by a unit*. An infinite series of causes and effects thus implies an *infinite number* of causes and effects arranged in a sequence so as to form a series.

In speaking of an 'infinite number,' it is necessary to distinguish between a 'potentially infinite number' and an 'actually infinite number.' A *potentially* infinite number is a number which is finite and limited in itself, but is capable of being increased indefinitely, without limit. An *actually* infinite number is an existing number greater than which none can be conceived. It is, therefore, *incapable of increase*, because the increased number would evidently be greater than if the increase had not occurred; and it *cannot be exhausted* by successive subtractions, because a number that can be exhausted in this way is manifestly limited and as such finite. An actually infinite number is thus seen to be *positively without limit in its sum of units*. This latter, the 'actually infinite number,' is in question when we speak of an 'infinite series' of causes and effects; and we contend:

AN ACTUALLY INFINITE NUMBER IS IMPOSSIBLE.

Such a number involves a *contradiction in terms*. Every number begins with the unit 1; this is followed by 2, 3, 4, 5, and so forth, until the infinite number is reached. Half of this supposedly 'infinite' number consists of odd numbers (1, 3, 5, 7, 9, etc.) and half of even numbers (2, 4, 6, 8, 10, etc.); the sum of these two series (odds plus evens) forms the infinite number. Is the odd series infinite? Obviously not; it is only half as large as the original infinite number. If it were 'infinite,' it would be equal to a number double its size, and the original number would be equal to a number half its size; that would be a contradiction. The odd series, therefore, is finite and limited. For the same reason, the even series must be finite and limited. Both series, singly and individually, being finite and limited, each can be exhausted by subtraction of individual units or groups of units. However, the odds plus even form the original 'infinite' number. Since both can be exhausted, their sum can be exhausted. Their sum, however, is the original 'infinite' number. Consequently, the original 'infinite' number can be exhausted. If it can be exhausted, it is not infinite, but finite. Hence, the 'infinite' number is a 'finite' number — a contradiction in terms.

An actually infinite number is thus seen to be absurd. The fundamental reason for this contradiction should be evident: since any number, even a supposedly infinite number, is nothing but the sum of units or groups of units, *each of which is finite in itself*, the total collection or aggregate of such units must itself be finite. Like a 'square circle,' an 'infinite number' is simply a mental fiction, an *ens*

rationis, a logical or conceptual being, which can never become or be actual.

And so it is clear that we can indeed speak of an 'infinite series' of efficient causes, but such a series can never actually exist. Even omnipotence could not make an infinite series of efficient causes actually exist, not because of lack of power, but because there is, under such conditions, nothing to make or posit without introducing a contradiction into omnipotence itself.

When, therefore, atheistic materialists, compelled by their philosophic doctrine of materialism, appeal to an 'infinite series' of efficient causes, they can do so only upon denial of reason. No series of efficient causes can exist except it be a *finite and limited series*, and such a series logically demands a First Uncaused Cause.

Circle of Causes Impossible

Some thinkers, in order to evade the logical necessity of admitting a First Uncaused Cause, have had recourse to a *circle of efficient causes*. A circle of produced causes, however, is as *self-contradictory* as an 'infinite' series.

The circle of causes and effects operates as follows. The cause *A* produces the effect *B*; *B* produces *C*; and so forth. Eventually *X* produces *Y*; and *Y* produces *Z*. Now *Z*, in turn, produces *A*; and then the process continues. As the result of this process of production, a *circle* of producing and produced causes is brought about, and the circle goes around and around without coming to an end and to a 'first

cause.' The circle of efficient causes is illustrated in the subjoined diagram:

This idea of a circle of causes and effects is not even ingenious. The *contradiction* involved in such a circle is apparent. *A* would have to *exist and not exist* at the same time under the same respect, and that is absurd. *A*, in order to produce *B*, must exist, otherwise it could not act in the production of *B*; but at the same *A* would not exist until *Z* produces it.

Now *A*, since it does not exist until *Z* produces it, cannot produce *B*, and *B* cannot produce *C*; consequently, *X* does not exist and cannot produce *Y*, nor can *Y* produce *Z*. Since *Z* cannot be produced by the non-existent *Y*, *Z* does not exist and cannot produce *A*. Consequently, under the conditions as envisioned, the *entire circle is non-existent*; nothing exists. On the other hand, if *A* does actually exist, *Z* is too late to produce it and bring it to existence. But then, what produced *A*, if *A* is not a First Uncaused Cause? A circle of produced causes reminds one of the possibility of a man becoming the father of his great-great-great-grandfather. The whole idea is simply contradictory.

Proof for God's Existence

The *proof* for God's existence, taken from the fact of *efficient causality* in the universe, can be briefly stated.

The universe is replete with instances of efficient causality. Real effects exist. They demand efficient causes. Real effects are not brought from non-existence to existence by themselves, but by other beings through their productive action as causes. Such an efficient cause is itself either produced or not produced. not produced, it is uncaused, and we have arrived at the Uncaused Cause. If produced, it was produced by some other efficient cause. Then this 'other' efficient cause must either be produced or not produced. We will face this alternative until we arrive at an un-produced being or commit ourselves to a circle of producing causes or have recourse to an infinite series of efficient causes. However, the circle involves a contradiction, and an infinite series does not eliminate a 'first uncaused cause.' consequently, the fact of efficient causality in the universe leads irrevocably to a First Uncaused Cause. And this First Uncaused Cause, the beginning of all efficient causality, we call 'God.'

Therefore, God exists.

The Proof of St. Thomas

St. Thomas,² with his usual brevity and clarity, formulates the argument from efficient causality in few and simple words: "The second way is from the nature of the efficient cause. In the world of sense we find there is an order of efficient causes. There is no case known (neither is it, indeed, possible) in which a thing is found to be an efficient cause of itself; for so it would be prior to itself, which is impossible. Now in efficient causes it is not possible to go on

to infinity, because in all efficient causes following in order, the first is the cause of the intermediate cause, and the intermediate is the cause of the ultimate cause, whether the intermediate cause be several or one only. Now to take away the cause is to take away the effect. Therefore, if there be no first cause among efficient causes, there will be no ultimate, nor any intermediate cause. But if in efficient causes it is possible to go on to infinity, there will be no first efficient cause, neither will there be an ultimate effect, nor any intermediate efficient causes; all of which is plainly false. Therefore it is necessary to admit a first efficient cause, to which everyone gives the name of God."

Corollaries

As in the argument based on 'change,' these proofs from contingency and efficient causality seem to lead to a being which is rather drab and impersonal. But that is only apparently so.

All these proofs for God's existence have their foundation in the phenomena observed in the *same universe*, and these phenomena pertain to the *same objects*. The same objects change, are contingent, and are the subjects of efficient causality. The same objects of the same universe show order. Hence, these proofs must all be referred to the *self-same* being as regards change, order, contingency, and causality; it would be illogical to refer change to one being, order to another, contingency to another, and causality to another. Since the universe is one, though viewed in

different aspects, all the phenomena of this one universe must be referred to *one single being* responsible for them.

Now, this one single being is changeless, intelligent, necessary, and the first cause. *Intelligence* of the highest degree is manifested in the order of the universe, and this intelligence must be at least as understanding as that of man. Therefore, if man, with his intellect, is a 'person,' it is evident that the

Changeless Changer, the Absolutely Necessary Being, and the First Causeless Cause is also *personal*. There is nothing drab about a 'person,' and this Supreme Being is obviously much more than man. When, therefore, St. Thomas ends each of his proofs with some simple phrase like "This is God," he states the exact truth.

Notwithstanding the intensity of man's study of nature, he has been able to glimpse only an infinitesimal fraction of the beings in the universe. However, what he has been able to observe and understand reveals an *immense intelligence and power* extending all the way from the minuteness of subvisible atoms to the light-year vastness of billions of stars. All the potentialities which underlie every change of every body in the world, all the mathematical intricacies governing the ordered movements of innumerable interrelated beings, all the mysteries of essence and existence due to the contingency of things, all the inconceivable multiplicity of causal activities spread throughout the length and breadth and height of the universe — all owe their origin and being to the one, personal, Supreme Being who is eternal, changeless, absolutely self-sufficient and self-existent.

These are a few of the implications residing in the proofs for God's existence developed so far. Little by little our knowledge of God is taking shape.

Summary of Chapter VI

The following proofs for God's existence are based on the fact of *contingency* and *efficient causality*.

1. *Necessity and Contingency*. — *Necessity* is that state in virtue of which something cannot be otherwise than it is. A *necessary being* is one which must be what it is. Necessity may be either moral, physical, logical, or ontological. *Ontological* necessity is the necessity which arises in a thing because of its 'being,' 'essence,' 'nature.' Ontological necessity may be either 'hypothetical' or 'absolute.' Something is *absolutely* necessary when it must exist, independent of any condition; non-existence would imply a contradiction.

Contingency is that state in virtue of which something can be otherwise than it is in its being or existence or both.

A *contingent being* is a being which is what it is but could be different; if it actually exists, its non-existence would not imply a contradiction. 'Contingency' is the contradictory of 'necessity.' A contingent being is essentially non-necessary.

2. *Contingency and the World*. — The *mode* of the physical world at large is contingent, because it is subject to continuous change and never remains the same.

3. *Contingency and Organisms*. — Organisms are contingent. They did not always exist. Each has a beginning, grows, and dies.

4. *Contingency and Atoms*. — Atoms, elements, and compounds are in a constant process of formation, change,

and dissolution. Their change and composition imply contingency.

5. *Contingency and Matter.* — Materialists maintain that *matter is eternal*. Now matter does not exist in the abstract but in the concrete, namely, in actual bodies; since bodies change, matter changes with them, and matter must therefore be contingent. If matter were eternal and necessary, it would eternally and necessarily have to be in a state of rest or motion, whichever is first; but matter is now at rest and now in motion.

On purely *rational* grounds matter must be said to be contingent. A 'necessary' being *cannot be thought* of as non-existent without a contradiction. Now, any single molecule, atom, or subatomic particle can be thought of as ceasing to exist, without any contradiction in the thought. Since the universe is but the sum of such realities, it also can be thought of as non-existent without contradiction. Hence, the universe, and all the matter composing it, is contingent.

6. *Proof for God's Existence.* — The necessary being has the sufficient reason for its existence in itself; the contingent being, since it is the contradictory of the necessary being, cannot have the sufficient reason for its existence in itself but in *some other being*. This 'other being' must also be either contingent or not contingent. If not contingent, we have arrived at the absolutely necessary being; if contingent, it will be dependent on some other being. The process of elimination will continue until we arrive at the absolutely necessary being, unless we postulate an infinite number of contingent beings, one

dependent on the other. But an *infinite number* of contingent beings also demands an absolutely necessary being as the sufficient reason for its existence, because the *entire series* is contingent and as such requires an absolutely necessary being as the sufficient reason for its existence. Hence, there must exist a being which is absolutely necessary. This being is essentially and existentially *self-sufficient* and *self-existent*, an *ens a se*. This being we call *God*. Therefore, God exists.

7. *The Argument of St. Thomas*. — It is substantially the same as the argument just proposed.

8. *The Principle of Causality*. — The Principle of Efficient Causality reads: That which begins to exist demands an efficient cause to bring it from non-existence to existence. The *validity* of this principle has been established in Chapter II.

9. *The Fact of Causality*. — Geophysics, physics, chemistry, biology, and psychology show that *new things* and *realities* come into existence which were non-existent before. These new things and realities are the result of efficient causality.

10. *Finite or In finite Series of Causes*. — Causes and effects in the universe appear in various *series*. Now, such a series is either finite or infinite. If finite, the number of causes is limited and has an end in the past. Since the series has an end, there must be a first cause in the beginning of the series which started the chain of production. This *first* cause is uncaused, because it is the 'first,' and so we arrive at a First Uncaused Cause. If the series is postulated as *infinite*, the entire series is a caused

or *produced totality* and as such demands a cause outside the entire series to be the sufficient reason for the existence of the produced series. This cause is, therefore, un-produced and exists of itself. Hence, there must exist a *First Uncaused Cause* which is essentially and existentially self-sufficient and self-existent, an *ens a se*.

11. *Infinite Series Impossible*. — Where there is a series of discrete entities, there is number; an infinite series of causes and effects means an *actually infinite number* of causes and effects. Now, an actually infinite number is impossible because *contradictory*. Numbers are odd and even in a series; half are odd and half are even. Both the odd series and the even series are limited, because each is only half the total series; since each is limited, each can be exhausted. But the sum of the odds and evens constitutes the total series; therefore, the total series can also be exhausted and must be limited and finite. The ‘infinite’ series is thus seen to be actually ‘finite,’ and that is a contradiction. Consequently, an ‘infinite series’ is *impossible*.

12. *Circle of Causes Impossible*. — A circle of produced causes is as self-contradictory as an ‘infinite series.’ In such a circle *A* produces *B*, *B* produces *C*, and so forth; eventually *X* produces *Y*, *Y* produces *Z*; *Z* in turn, produces *A*, and so the circle is completed without the necessity of an ‘uncaused cause.’ The result of such a circle would be as follows: *A* must exist, in order to make *B* and *Z* existent; but *A* cannot exist until produced by *Z*. Therefore, *A* will both exist and not exist at the same time, and that is a contradiction.

13. *Proof for God's Existence.* — Every efficient cause is itself either produced or not produced. If *not produced*, we have the 'uncaused cause.' If *produced*, it was produced by some other cause, and this other cause will either be produced or un-produced. Eventually, we must arrive at an 'uncaused cause' or have recourse to a 'causal circle' or an 'infinite regress.' Since a 'causal circle' and an 'infinite regress' are impossible, there must exist a *First Uncaused Cause*; and this is *God*.

14. *The Proof of St. Thomas.* — It is the same as the one given above, only in brief form.

15. *Corollaries.* — All these proofs are drawn from the *same objects* of the *same universe*. Hence, these proofs must be referred to the selfsame being. This one being is changeless, intelligent, necessary, and the first cause. This Supreme Being is also *personal*, endowed with immense intelligence and power; He is eternal, absolutely self-sufficient and self-existent.

Chapter 7

LIFE AND PERFECTION

CONTINGENCY AND CAUSALITY ARE FACTS PRESENT throughout all nature. Nothing escapes them. Because of their universal presence, as we have seen, the things of this world demand a necessarily existing and uncaused (eternal) Supreme Being as the sufficient reason for their being and existence. An infinite regress involves a contradiction, and a contradiction involves an intrinsic impossibility. Both contingency and causality thus lead to a Supreme Being who is and must be self-sufficient and self-existent, the *ens a se*, the uncaused cause of the physical world.

From a philosophical standpoint the arguments from contingency and causality are the most cogent of all arguments. They are based on the self-evident principle that everything must have a *sufficient reason for what it is*. Whatever has not the sufficient reason for its being and existence in itself must have it in another. Such are the things in the universe, and such is the universe itself: they need an extra-mundane being as the sufficient reason for everything they have and are, and without this Absolute Being they could neither exist nor be what they are. This Absolute Being is God.

There are other arguments which prove God's existence. However, in order to possess full cogency, they must eventually be based on contingency and causality. The arguments taken from the *origin of life* and the *grades of perfection* in the physical world are of this kind. These will now be presented.

The Problem of Life

None but the most confirmed materialist will deny that a *radical difference* exists between *living and nonliving* beings. The materialist, of course, asserts that the only kind of activity which is present in both living and nonliving beings is the ordinary chemical and physical activity found everywhere in nature; a living being is simply a complicated chemical and physical system of material energy.

Observation and experiment, however, reveal a radical difference, both in structure and in function, between living and nonliving beings.

Every living being known to exist on earth (and we know of no other place in the universe where life is indubitably present) is an 'organism.' Biologically, an *organism* is an individual constituted to carry on the activities of life by means of parts and organs more or less separate in function but mutually dependent. There is more to an organism than the mere summation of all the parts present.

One of the most remarkable phenomena of the organism is its all-pervasive *unity of being*, manifested by the marvelous *co-adaptation of structure and activity*. The entire organism consists of *cells*. Each cell possesses an

intricately complicated structure. Every cell has functions which are the same as those of every other cell, namely, assimilation and dissimilation, growth and division. And yet, cells also possess individual and specific peculiarities, so that cells differ greatly among themselves. In multi-cellular organisms the cells group themselves into various kinds of *tissues and organs*; and these tissues and organs perform activities distinctively their own, over and above the general functions of the cells as the biological units of life. Again, cells, tissues, and organs group themselves into the higher unity of the organism as an *individual being functioning as a whole*.

The supreme law which governs the structure and functions of cells, tissues, and organs is the *need*, the exigency, of the type of organism of which they are the subsidiary parts. What kind of food material, for instance, shall be digested and assimilated depends entirely on the nature of the organism; the same kind of grass will be transformed into the flesh of a cow, a horse, a sheep, or an elephant, according to the needs of the animal that eats it. The entire body is built according to the requirements of the organism, all parts *being mutually dependent and harmoniously interrelated*.

Every organism manifests an unmistakable morphological and physiological *unity, individuality, and totality*. The organism is primary; the structures and functions are secondary the organism exists for itself; the structures and functions exist for the organism. The organism acts *as a whole*; the structures and functions are *subservient parts* of the whole.

If we now turn our attention to the manner of operation, we find that it is radically different in living and nonliving matter.

Action in inorganic substances is always *transient* (or transitive) in character. 'Transient' action is the action in virtue of which one being influences and changes another being. The energies of light, heat, electricity, magnetism, physical impact, gravity, etc., are such that the goal of their influence lies 'outside' their efficient causality; they tend to change other bodies. On the other hand, the inherent tendency of vital activity within an organism is the *organism's own development and perfection*. All vital action originates in the organism, remains in the organism, and has as its natural goal the well-being of the organism itself. Hence, organic action is rightly termed *immanent*. No matter how much the vegetative, sensory, and rational process may differ among themselves, they are characterized by 'immanence.' Immanence or spontaneity of vital action proceeds from the *inner constitution* of the organism which reacts as *a whole* to outside agencies. Life is essentially self-perfection through self-development.

Organisms, of course, consist ultimately of elements and compounds; but these elements and compounds now act no longer in a merely 'transient' fashion, as they do in the ordinary circumstances of nature, but partake of the 'immanence' of the organism. In the organism, atoms and molecules form *organic compounds* as the result of the *natural tendencies* operating within the organic body. The inorganic elements have no natural tendency within themselves to produce such compounds. Outside the

organism the elements combine according to the general laws of affinity, and as such they always tend to form rigid combinations with a stable equilibrium. The proteins and other organic compounds, however, are extremely complex and in an unstable colloidal state. That the *principle* operating in the formation of organic compounds is different from that operating in the formation of inorganic compounds, can be seen after the *death* of organisms. They decay, and the organic compounds dissolve, reverting again to the status of ordinary inorganic compounds and elements. If organisms and organic compounds were not the effects of some *higher principle utilizing them*, no sufficient reason can be assigned why they should not continue indefinitely in existence, even after 'death.'

Every organism is characterized by *inherent natural purposiveness*. This purposiveness follows a double course — the realization of the well-being of the individual and the preservation of the species.

That the realization of the *well-being of the individual* dominates the entire life history of an organism, should be evident. It manifests itself in the entire process of *metabolism* and *cell-division*. The purposiveness of the organism's *embryonic development* is particularly noteworthy. Here only one fact will be mentioned. If it should happen, as it occasionally does, that the first two embryonic cells are split apart, the two cells do not develop into two half-organisms, but each cell develops into a complete individual of that particular type; the entire structural plan is simply doubled and carried separately to completion. It is as if one were to cut a machine in half, and

each half-machine would then proceed to shape itself into an exact duplicate of the original machine. This 'prospective potentiality' of the germ cell is one of the most remarkable features of the embryonic organism.

The *preservation of the species* is another fundamental natural end or goal inherent in the organism. The method of reproduction varies with the different kinds of organic beings; but reproduction itself is universal and is eminently purposive. There is perhaps no greater marvel in the world, viewed from a purely organic standpoint, than the wonderful arrangement of structure and function for the purpose in view.

Action flows from a principle of action. Since the 'immanent' action of organisms is beyond the natural capabilities of ordinary inorganic matter and its physico-chemical forces, vital action must flow from a *vital principle*. Without a distinct vital principle, co-equal with matter, the phenomena of life cannot receive adequate explanation.

That vital activity is far superior to nonliving activity becomes increasingly evident in the higher forms of life. Animals and men manifest *consciousness* — the brute in sense-perception, and man in his sensory and rational activities.

Over and above the ordinary activities of cells, compounds, and atoms present in the animal body, the animal possesses *conscious perception*: it sees, hears, tastes, smells, feels, imagines, remembers, and desires. Such activities are far beyond the capabilities of inanimate beings and must therefore proceed from a totally different principle of activity. In man, the activities of forming

abstract ideas, judgments, and inferences, and the ability to strive after spiritual ideals, completely transcend the material reality of aggregations of elements and chemical compounds; they are *rational and spiritual* in nature and as such must of necessity proceed from a spiritual vital principle and essence.

Whatever we may think about the ultimate nature of living beings, this much is clear: the immanent activity of all living beings is radically and essentially *superior to the transient activity* of nonliving substances.

Abiogenesis

Since vital activity is far superior to non-vital activity, how do we explain the *origin of life*? A thoroughgoing materialist, of course, has no choice but to claim that all life has derived its origin from nonliving matter; his theory of the origin of life is 'abiogenesis.'

Abiogenesis means literally 'origin from non-life.' The term is used to designate the theory that living beings ultimately came into existence through a development on the part of the forces indigenous to nonliving matter. Another term for abiogenesis is *spontaneous generation*. What have science and philosophy to say about the fact or possibility of abiogenesis?

Up to the end of the seventeenth century even scientifically minded men believed that certain low types of animals were generated 'spontaneously,' i.e., abiogenetically. Worms were supposed to develop out of putrid flesh; frogs, it was thought, were produced from the

mud of pools through the action of the sun's rays; insects, and even rats and mice, were believed to originate without the generative action of living beings. At present, no scientist dares defend spontaneous generation on *scientific* grounds.

In 1668 Francesco Redi made a number of experiments and disproved the popular contention that maggots were produced spontaneously in meat. From that point on, one case of supposed abiogenesis after another fell before the investigations of determined scientists. The epoch-making experiments of *Louis Pasteur*, begun in 1860, exploded the theory of spontaneous generation beyond recovery. The genius of Pasteur, through a lifetime period of rigid and exact experimentation, established beyond the shadow of a doubt that germs can originate only from pre-existing germs. In 1905, John Butler Burke claimed that radioactive substances acting on gelatin media produced 'bacteria-like' cells, containing a nucleus, and that these cells grew and finally subdivided. But Sir William Ramsay, the famous investigator of radium, proved conclusively that the phenomenon was nothing more than a chemical, lifeless process. All observations and experiments of science show that *life derives its origin only from life*. Hence, so far as science is concerned, spontaneous generation (abiogenesis) never occurs.

The Origin of Life

While science, therefore, has disproved the fact of abiogenesis as occurring at the present time and under

conditions similar to the present, there still remains the problem of the *origin of life in general*. Must there be an 'origin' to life at all?

It is the unanimous verdict of geologists that living beings did not always exist on our globe. There were long ages in the early period of the development of the earth, when it was in a fiery-molten state. No organism, as we know it, could possibly have existed under such circumstances. Nor did it exist, as the rocks of the 'azoic' ('lifeless') period definitely show. Life appeared eventually. It had a beginning, an *origin*, in time. Since life did not always exist on the earth, how did it originate?

Helmholtz, Van Tiegham, Lord Kelvin, Arrhenius, and others sought to avoid the problem by advancing the theory that life might have originated on earth through life-germs carried by *meteorites* from some other stellar body; or, the germs might possibly have *floated across* the intervening space and landed on the earth. This arbitrary assumption merely defers the question without offering a genuine solution. How did life originate on these stars? They, too, were at one time in a fiery-molten state and as such incapable of sustaining organisms. Meteorites melt through friction on contact with the earth's atmosphere, and the heat would kill all germs. Nor could the germs float through interstellar space; the absence of heat and moisture in interstellar space would freeze the germs and desiccate them, so that they could not live. Becquerel placed germs in a vacuum with a temperature of liquid air, thus approximately reproducing the conditions of interstellar space, and exposed the germs to ultraviolet rays present so

abundantly in space. The result was the death of all germs. Scientists rightly concluded that all life-germs would have died in transit to the earth. This theory is hardly worthy of serious consideration, but it reveals the desperate extremity in which the defenders of abiogenesis had been placed.

When, therefore, certain scientists and philosophers maintain that the origin of life *must* have occurred by means of abiogenesis in the *bygone ages* of the earth, their assertion no longer rests on scientific grounds. Abiogenesis is then advanced as a *postulate* of science and philosophy.

From what has been discovered by science concerning the fact of abiogenesis, it is clear that abiogenesis is not a self-evident postulate; every bit of scientific evidence is against its actual occurrence. W. Branca¹ was fully aware of this when he wrote: "Whoever accepts spontaneous generation here on earth thereby believes that two diametrically opposed Laws of Nature have equal value. The first states: Life can originate only through Life. The second states: Life originates also or at least has originated in the past out of non-life. The first law is proved by billions of facts, and it is true without any doubt. The second, however, has until the present never been proved by a single fact. Both Laws of Nature contradict each other diametrically." These words of an eminent scientist show conclusively that abiogenesis is *not a scientific postulate*.

Science is based on observation and experiment. Since the origin of life in general lies beyond the scope of observation and experiment, the solution of the problem exceeds the competence of the scientist. The problem is

strictly a philosophical one. When, therefore, a scientist attempts a solution of this problem, he ceases to be a scientist and becomes a philosopher. Obviously, then, if abiogenesis is advanced as a 'postulate,' this can only mean that it is a *philosophical postulate*. In no case can abiogenesis be said to be a self-evident truth. It can be considered a 'philosophical postulate' if it is the only rational and logical explanation of the origin of life. Certainly, if a Supreme Being does not exist, life must have originated in virtue of the forces inherent in matter, because there would be no other way in which it could originate. Is the existence of a Supreme Being inconsistent with reason and logic? If not, then abiogenesis is *not the only* rational and logical explanation of the first origin of life in the universe. What do reason and logic say and demand?

God, the Ultimate Cause of Life

The Principles of Sufficient Reason and Causality are the indispensable foundation of all science and all philosophy. Reason and logic demand, according to the Principle of Sufficient Reason, that nothing can exist and be what it is except that there be an adequate reason which accounts for its existence and being; without such an adequate reason, either in itself or in another, it would simply be nothing. Reason and logic demand, if the reality in question has passed from non-existence to existence, that there be a cause for this passage and that there be *a proper proportion between cause and effect* to bring about this passage. The effect can never be actually greater than what

is contained in the cause; otherwise a part of the effect would be without an adequate cause and as such could never come into existence. It is against all reason and logic to suppose that the more perfect can receive its adequate explanation in the less perfect; a more perfect reality can produce a less perfect reality, but the reverse is a contradiction and therefore impossible.

Now, the activities and phenomena of organic life *exceed the inherent causality of inorganic substances*.

A living being, since its activity is 'immanent,' is superior to nonliving matter. It is true, of course, that organisms consist of material elements in their structure and utilize material forces in their vital functions. But that is only a part of the total picture of life. One cannot, by the wildest flight of fancy, conceive of sensory and intellectual *knowledge, consciousness, and appetitive behavior* as phenomena directly resulting from the actions and reactions of atom complexes considered strictly as such. Even the *colloidal state* of protoplasmic material and the formation of organic compounds cannot be adequately accounted for on the basis of ordinary chemical affinity between elements. The inherent natural *purposiveness* of organisms, as manifested in *metabolism, cell-division, and reproduction*, in virtue of which they plan and build for future use, is a qualitative factor far beyond the capabilities of mere atoms and their aggregates. Above all, the dynamic unity of the organism as a whole, with complete subordination and co-adaptation of all structures and functions for the well—*being of the individual* and the *preservation of the species*, is something so unique that it

cannot receive its ultimate explanation in the grouping of billions of inanimate and unintelligent atoms. The simplest forms of plant and animal life, bacteria and protozoa, are so superior to inorganic elements and compounds that even confirmed materialists admit that they belong to *different levels of being*.

Unless we wish to make the gratuitous assumption (contrary to all observed facts) that all matter without exception is 'living,' the arrival of the organism on earth and in the universe involves the appearance of something *totally new and superior*, namely, life in all its manifold forms and manifestations. Life, since it is intrinsically superior to matter and material forces, must be accounted for by some *cause outside the totality of matter and of the material universe*; and since the cause must be at least equal in perfection to the effect produced, it must itself be *endowed with life*: no being can give what it does not possess.

That the intricate structure and inherently purposive function of even the unicellular organism (not to mention the higher organic forms of plant, animal, and man) could be the result of *chance* and *without intelligent planning* would indeed be a miracle; chance is no cause of permanent order. Not only must the first organism have arisen through the chance concurrence of billions of unintelligent atoms; it must have arisen completely furnished with cytoplasm, nucleus, chromosomes, and genes, and with the *perfect mechanism of reproduction*. Unless this were so, no reproduction could have occurred in the first organism, and there would be no offspring, no

second generation; life would have become extinct immediately, and there would be no life today. Reproduction has a purpose for the *future*, but it is of no particular advantage to the reproducing organism itself. Such a purpose for the future necessitates the use of specific means for a specific end, and that implies *intelligence*. This intelligence, however, resides neither in the speck of protoplasm called 'organized matter' nor in the inorganic elements.

Besides, man is an organism and an integral part of the organic world, and any argument about the general origin of life must include the *rational life* of man. Man's psychic, rational life of intellect and will cannot be reduced to the material forces of inorganic nature. These activities are immaterial, simple, and spiritual and can proceed only from an immaterial, simple, and spiritual vital principle or 'soul.'² As such the soul of man is neither composed of matter nor intrinsically dependent on matter, while every other being in the universe is. The soul's very essence requires a spiritual cause to give it existence.

Life thus demands a *living, intelligent cause outside of matter and the material universe*. This living, intelligent, extra-mundane cause we call 'God.'

God, therefore, exists.

God and Evolution

Very many scientists, especially biologists, accept the theory of 'evolution.' The theory is even advocated by many who

are theists. What is to be said about the combination of *theism* and *evolution*?

Among the prevalent theories of evolution two deserve special consideration: 'organic' and 'emergent' evolution.

Organic evolution is the theory according to which the various species and types of animals and plants derive their origin, not through distinct and separate creative acts of God, but through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws. Organic evolution thus presupposes the existence of living beings, and it begins to operate only after organisms are already present on earth. Strictly speaking, therefore, the theory of organic evolution does not attempt to solve the problem of the 'origin' of organisms in general.

So far as the *scientific* side of organic evolution is concerned, it must be borne in mind that the theory revolves around the question whether the fact of evolution has occurred or not occurred. What may have occurred in the past ages is obviously beyond the ken of scientific observation and experiment. The evolutionary theory is at best only a conclusion, and this conclusion is usually the result of a doubtfully valid argumentation.

The evidence for organic evolution rests upon the facts, observed in the fossil remains found in the strata of the earth, that there has been a gradual change from simpler to more diversified forms in plants and animals in succeeding geologic periods and that all plants and animals are patterned according to a more or less similar plan of

structure. From these facts scientists conclude that all plants and animals are related to one another through *genetic descent*.

The general argument for evolution then runs somewhat as follows: 'If evolution occurred, we must find a gradual transition from the simpler to the more complicated structures of organisms in the fossils of the earth, together with a definite homological plan for all plants and animals; but that is precisely what we find in nature; therefore, evolution took place.' Cast into this form, the conditional syllogism lacks logical force, because it contains the *Fallacy of False Consequent*. 'Accepting the consequent' will always be a fallacious argument, unless the cause given in the antecedent is the only cause which could produce this particular effect. Here, the result contained in the consequent could be the effect of either one of two causes: creation or evolution. The argument as given does not eliminate creation. Hence, the mere fact that the consequent is true does not establish evolution as the cause; evolution *may* have occurred and be the cause, but it *need not* be, because everything could be the result of creation just as well.

If the conditional syllogism is reversed, the argument is even less cogent. The argument would then have to be formulated as follows: 'If we find a gradual transition from the simpler to the more complicated structures in the fossils of the earth, together with a definite homological plan for all plants and animals, then all this must have happened through evolution; but that is what we find; therefore, evolution is the cause.' Now the argument contains the

Fallacy of Begging the Question. The antecedent (condition) *presupposes* the very thing it is attempting to prove, namely, that 'evolution' is the *only* possible cause of the change. It omits 'creation' as a possible cause of the effect.

Even if one accepted evolution, and even if evolution were established as a fact, the *transition* from plants to animals cannot be adequately explained on the basis of natural powers alone. The *psychic* simply cannot be produced by the non-psychic, without violating the Principle of Sufficient Reason; and the *spiritual life of man* cannot derive its origin from the non-spiritual life of the animal, because these forms of life are entirely incommensurate and the higher would be produced by the lower. Without the *intervention of God* in some way, the organic processes cannot be conceived as passing from the less perfect to the more perfect, because that would entail the contradiction of an insufficient cause; and animal life is certainly of a higher order than plant life, and human life of a higher order than animal and plant life combined. We cannot sacrifice the principles of sound reason in science any more than we can deny the facts of science; both are the foundation of all our knowledge.

EMERGENT EVOLUTION, AS PROPOUNDED BY C. LLOYD MORGAN, S. Alexander, and others, is much broader in scope than organic evolution. In general, the theory maintains that nature is the product of evolution in such a manner that entirely new and unpredictable properties originate through synthesis and thereby form new and higher levels

of reality in a continuously ascending process of development. *Nature as a whole* is thus conceived as having 'evolved' in the course of time. The new properties or 'novelties' (as Morgan terms them) are not the mere resultants obtained by addition or subtraction from among previously existing properties; rather, these 'novelties' have no counterpart in the lower levels: they simply *emerge* with specific characters not discoverable in the former (lower) levels of being. It is thus that *life* and later *mind* have had their first origin; Alexander even has 'deity' emerge as the product of evolution.

The 'stuff' out of which nature evolved was at first something homogeneous, undifferentiated, indeterminate. Alexander calls it *Space-Time*; it is pure space and pure time, without limit and without beginning, the stuff of substances and of all existents, because all things evolve or 'emerge' out of it in the course of the ages. Space-Time possesses a blind, aimlessly driving *nisus* or impetus (where this 'nisus' comes from, Alexander does not properly explain) which is responsible for the continued upward advance of evolution. And so all things 'emerge' — first matter, then the material universe, then life in plants, then mind in animals and man, and finally 'deity.'

Alexander's *deity* is in no sense a 'person' who, as the uncaused cause of reality, exists prior to the universe: on the contrary, his 'god' is a finite product of evolution. As he puts it:³ "When we think of God as that to which all things owe their existence, we are reversing the order of fact and are regarding the universe of Space-Time, which does create all things, in the light of its highest empirical quality,

which is not first but last in the order of generation.” Deity is thus a creature of Space-Time, the outcome of the pre-existing finites of the world, finite in perfection, a superior quality of the evolving universe, and as such simply one of the ‘emergents’ which develop in virtue of the ‘nisus’ present from the beginning. It will, in all probability, be eventually superseded by some higher quality. Alexander makes the remarkable statement⁴ that his so-called deity is both theistic and pantheistic, but “that if a choice must be made it is theistic.” This, of course, is nothing but a confusion of words; Alexander’s deity, as the context of his exposition clearly reveals, is merely a part of the universe and therefore pantheistic.

Only a few words need be said about this theory. No adequate explanation is given concerning the *origin* of this kind of universe. It is said to be ‘eternal,’ but that is a statement which cannot be accepted, because this universe is so weak in being that it cannot be conceived as having the sufficient reason for its existence in itself. From the start, this Space-Time universe is altogether *indeterminate and undifferentiated*; all determinateness of being and differentiation ‘emerges’ in the course of time under the impulse of the nisus present from the start. The presence of this ‘nisus’ is assumed; and such a *gratuitous assumption* may rightly be gratuitously denied, because no proof is or can be given for its supposed presence. Besides, the *emergence* of such new and unpredictable properties has no foundation except in theory; it involves a definite violation of the Principles of Sufficient Reason and Causality, and if we must renounce the principles of reason to make a

theory possible or plausible we do not need emergent evolution to 'explain' the rise of the new qualities. When 'novelties' occur as effects which are not pre-contained in the being of their causes, the plus-amount is unaccounted for and really proceeds from 'nothing' (and 'nothing' is no adequate explanation for anything) unless one accounts for the deficiency of the universe as a proper cause by an appeal to an adequate cause *outside the given universe*. That, of course, Alexander's theory does not do; it is, therefore, inadequate and must be rejected as irrational.

Morgan's 'emergent evolution' is of a different kind. He is a theist and expressly refers the efficacy of this evolution to God. He states:⁵

"In surveying the evolution of terrestrial life and mind there seems to have been advance through ascending modes of mentality to that highest example which is distinctive of man as rational and self-conscious. Now it is my belief that this evolutionary ascent of mind in living creatures is due to the Creative and Directive Power of God. But that does not imply that any such phrase as 'the ascent of mind' is applicable to God, as *Spiritus Creator*. The Divine Mind or Spirit is Eternal and nowise limited by the trammels of space and time... What I find in *evolution is one great scheme from bottom to top, from first to last*. What I also believe is that this advance throughout nature is a revelation of Divine Agency. And since mind at its best is the highest term in the course of evolutionary ascent, it may well be said that the evolution of mind

reveals the agency of Mind. But it is, as I believe, Mind or Spirit infinite and timeless. Spiritus Creator as eternal and omnipresent is not the outcome of evolution, but that of which evolution is the progressive revelation."

— C. LLOYD MORGAN

As will be noted, Morgan's concept of emergent evolution is very different from that of Alexander. He finds in evolution "one great scheme" which points to an eternal Mind and Creator who arranged the scheme. Whatever we may think of emergent evolution as a general scientific and philosophic explanation of 'life' and 'mind,' the theory, as envisioned by Morgan, is conceived as a 'purposive evolution.'

God and Purposive Evolution

Viewed from a purely *philosophic* standpoint (leaving Revelation out of consideration), one must say that *purposive evolution is possible*, at least in its general outlines.

Evolution itself, obviously, is not impossible; it must, however, be a 'purposive evolution,' if the Principles of Sufficient Reason and Causality are to be safeguarded. Since purposiveness implies an intelligent foresight into the future, and since intelligent foresight cannot be ascribed to the forces of nature, the only possible alternative is the assumption that *the Supreme Intelligence endowed nature*

with a purpose and with the necessary principles of action to realize this purpose through evolution. The required intelligence would reside not in nature itself but in the Author of Nature; and it would then make little difference whether evolution were gradual or emergent in character.

Life could not originate in the *first organism* through an absolute emergence, solely from matter and its indigenous forces, because vital activity and the vital principle (soul) are by their very nature *superior to matter and material forces*. In some manner, the causality of God was necessary for the production of the first organism. Nevertheless, a direct creation was not absolutely necessary. The vital principle of the plant and animal is essentially *material* in nature, being intrinsically dependent on matter in its being and existence. All that would strictly be required for the appearance of organic life is the original *fiat* of God ordering and disposing matter and material agencies in a purposive fashion, so that at a given time and place the first organic principle or soul, the conditions being favorable, would 'emerge' or *be educed* out of the hidden potentialities of matter. Life would thus 'emerge' spontaneously, but in virtue of an *inherent tendency* placed in bodies from the beginning by the Creator. God would be the primary cause of the origination of life, with the agency of bodies as a secondary and instrumental cause. We do not say that this is the actual way the origin of life occurred; but we do think that such an origin of organic life is *possible*.

Even man's body, speaking again from a purely philosophic standpoint, *could* have been prepared from an animal body through 'purposive evolution.' Man's *soul*,

however, is a *spiritual entity* endowed with a spiritual life and as such completely transcends matter and material conditions. Since matter and material energies do not possess spirituality in any form, because materiality and immateriality are contradictory, they cannot produce or give rise to a spiritual being. Plants and animals are organisms, material systems; plant and animal souls are material in essence, completely immersed in matter and intrinsically dependent on matter. Consequently, neither the matter nor the soul of plants and animals could give rise to the existence of the human soul. Therefore, whether we view the human soul as originating by means of an *absolute emergence* from lifeless matter directly, or through a *generative process* on the part of plants or animals, or through the *transmutation* of a plant or animal soul into a human soul, the effect, not being contained in the cause, would totally exceed the capabilities of such a cause. A spiritual being must be produced by a spiritual cause; any other supposition would violate the Principles of Sufficient Reason and Causality. Hence, the origin of the human soul, since it is spiritual, must be attributed to a cause existing outside the ensemble of the material universe. Emergent evolution, therefore, must be excluded in the case of the spiritual soul of man. *Only God can produce the spiritual human soul, and that directly.*

One may say, therefore, that ‘emergent evolution’ as a general theory is, absolutely speaking, a ‘possible’ explanation of the origin of life on the globe (a ‘working hypothesis’ in the scientific sense), provided one accepts the First Cause (God) as having placed a *purposive*

direction into the material beings and their activities. Without such a 'purposive direction' it is inconceivable how the unintelligent beings and blind forces of nature could conspire to form a universal, all-embracing scheme or plan; only chance would be left as an explanation, and chance can never account for the permanent orderliness of nature, especially in the organic world. In no case, however, can the origin of the spiritual soul of man receive an adequate explanation on the basis of emergent evolution, organic evolution, or any other form of evolution.

We will conclude this discussion with a quotation from Sir J. Arthur Thomson,⁶ the great naturalist:

"As we must agree with the Aristotelian dictum that in a continuous process there can be nothing in the end which was not also present in kind in the beginning, we are led from our own mind, and the story of its enfranchisement, back and back to the Supreme Mind 'without whom there was nothing made that was made.' Facing everyday things in the World of Life, around which our scientific fingers will not meet, what can we do but repeat what is carved on the lintel of the Biology Buildings of one of the youngest and strongest of American Universities: 'Open Thou mine eyes that I may behold wondrous things out of The Law.'"

— SIR J. ARTHUR THOMSON

Notion of Perfection

The discussion on life and evolution, with its emphasis on the unity found in the organic realm and in the universe at large, leads to the argument for God's existence based on the *grades of perfection or being* found everywhere in the world. Before proposing the argument, however, it will be necessary to explain the notion of 'perfection' as used in this context.

By *perfection* we mean any *reality* or *real entity* which is present in any kind of being. Perfection or reality may be *potential or actual*: it is 'actual' if it exists; it is 'potential' if it does not exist but is capable of being brought into existence. For example, since you exist, you are an 'actual' being or perfection while you exist; all human beings which could exist in the past and will exist in the future are 'potential' beings or perfections.

Perfection or reality, whether actual or potential, is either 'mixed' or 'simple.' A *mixed* perfection is one which in its very concept implies limitation and imperfection. Examples of mixed perfections are 'heat,' 'health,' 'plant,' 'brute,' 'man,' because each of these beings involves materiality and materiality implies some sort of limitation and imperfection. A *simple* perfection does not include in its concept a limitation or imperfection (though it does not exclude it either); for example, 'wisdom,' 'goodness,' 'being,' 'life,' because they could exist without limitation or imperfection in a spiritual being.

Some perfections (realities) are 'accidental' and others 'essential.' They are *essential*, if they refer to the essences

or natures of beings; for example, 'animal,' 'rational,' 'humanity,' 'being,' 'substance.' They are *accidental*, if they do not belong to the essence or nature as such, but are connected with the essence or nature as a superadded modification and determination; 'color,' 'weight,' 'age,' 'temperature,' 'activity' are accidental perfections or realities which modify and determine an essence, but they are not a part of the essence itself.

Again, perfections (realities) will be either 'predicamental' or transcendental.' They are *predicamental* when they represent generic concepts; for example, 'animal,' 'body,' 'plant.' They are *transcendental* when they are found in, or can be applied to, all beings; of this kind are 'one,' 'being,' 'good,' 'true,' since they 'transcend' all categories or special types of being.

Grades of Perfection

In scrutinizing the beings in the universe, we find considerable diversity. They possess being (reality, perfection); but this being (reality, perfection) is distributed among the classes and individuals in varying grades, so that one can rightly speak of a *gradation of perfection*.

True, there are no varying grades of being (reality, perfection) in the essence or nature of the individuals of a certain species: a plant is always a plant; an animal, an animal; and a man, a man. Essences or natures, taken by themselves, do not admit of a 'more' or 'less,' as if one plant were more of a plant than another, or one animal more of an animal than another, or one man more of a man than

another. But grades of being (reality, perfection) vary, when *one kind of being is compared to another*. Thus, in the *inanimate* world, an electron, proton, neutron, etc., possesses less perfection in isolation than when combined into an atom or chemical compound; in the atom or compound these subatomic particles possess their own individual perfection and also partake of the perfection of the atom or compound as a totality in combination. The *organic* world possesses a higher grade of reality than the inorganic world. because 'life' or 'immanent' activity is of a higher order of being than the 'transient' activity found in subatomic particles, atoms, and chemical compounds taken by themselves. Among organic beings the *animal* has a higher grade of being than the *plant*, because it possesses the vegetative life of the plant and sensory life characteristic of animal life. *Man* has a higher grade of being than the plant and animal, because in man we observe the rational life of a human being in addition to sensory and vegetative life.

Each individual nature in the world is the result of *composition*. Such a being is a composition of *essential* and *accidental* grades of being, because accidental modifications and determinations are found in all; such are, for example, the accidental perfections of age, weight, extension, magnitude, temperature, and activity of all kinds. The accidental perfections are real and actual; but they change continuously, while the essence or nature remains the same. Composition is present even in the *essences* or *natures* themselves; in organisms, for instance, there is a composition of matter and the life principle, and a similar

situation obtains in subatomic particles, atoms, and compounds. No being in the universe realizes its being completely at once, but does so in successive stages and in *partial actualizations*. The reason for this universal composition lies in the fact that all these beings are a combination of actuality and potentiality in many ways, and the two are really distinct. Man, for example, has the potentiality of learning, but this potentiality does not become actualized except in successive stages and then never completely. That is why there are various *degrees of perfection* (grades of being) in the same individual and among individuals relative to one another. As a consequence, the same individual may become more (less) learned, wise, good, strong, healthy, and so forth, in the course of time; and that applies also to different individuals and classes of being when compared with one another. As a further consequence, it is clear that all beings in the universe are 'perfectible,' and *perfectibility* is definitely a matter of 'more' and 'less,' of 'higher' and 'lower,' in degrees of reality and perfection; perfectibility is the direct result of the potentiality in all beings present in the universe.

Limitation of Perfection

It should be evident that the grades of being (reality, perfection), as a matter of observable fact, are limited. And *limitation implies imperfection*.

The very *number* of beings in the universe is limited. There is more matter in the stars than in interstellar space;

there could, then, be more perfection in the universe, even if the universe were considered to be endless in extent in all directions. For the same reason, the higher grades of being present in atoms and compounds could be greater than they actually are. The species and varieties of plants and brutes could be larger in number, and there could be more individuals in each species and variety. The number of human beings in the past, present, and future could be greater than it actually has been, is, or will be. Wherever we see beings, there could be more of them. Limitation in number involves limitation of perfection in an *absolute* sense.

The *relative perfection* of the grades of being is also limited. There exists, without doubt, a wonderful harmony in the gradation of beings in the universe, from subatomic particles to atoms to chemical compounds to plants to animals to men. None of these beings are unlimited in being (reality, perfection); the very fact of a 'gradation' presupposes limitation in the various types of beings forming this ascending scale. The *composition* existing in each type and individual is a sign of limitation of perfection. *Potentiality* and *perfectibility* are evidence of this limitation.

Where there is limitation there is *imperfection*. The reason is clear; limitation means that there could be 'more' and 'higher' perfection; but it is not present, it is lacking. This does not imply that things are not what they are supposed to be. Absolutely speaking, however, each individual being could possess more reality, essential and accidental, than it actually possesses, and that means that it is an *imperfect* being through and through. All beings in the

universe, by the mere fact that they are 'composite' beings, consist of two or more grades of being united together; and every composite being is a 'one-made-of-many.' That alone is an imperfection, because such a being would be more perfect in its entity if it consisted of 'one' grade of being possessing the perfections of the 'many.' Man, for instance, would be more perfect (and less imperfect) if his knowledge were complete at birth rather than acquired piecemeal in the course of the years.

Potentiality definitely involves imperfection of being. Potentiality means the power to do or acquire something. Such a power is a sign that the perfection of the actuality to be done or to be acquired is absent and as yet missing. Potentiality is possibility. In comparison with actuality, possibility is a very imperfect sort of being, because it is a relative nonentity capable of becoming an entity through the activity of some efficient cause giving it existence. Non-existence, however, is imperfect, relative to existence. Every form of potentiality, therefore, is an imperfection, and all beings in the universe possess a large number of such potentialities. The act of playing a musical instrument, for instance, is obviously more perfect in itself than the mere possibility of playing it; but no musician actually plays an instrument all the time. All activities are the actualization of some potentiality existing in a being. Such activities come and go, depending on the nature of the being in which they occur. Sometimes activities are present, sometimes they are absent; but a being in act is more perfect than a being not in act.

Wherever we look in nature, we observe a hierarchy of being with relative perfection and relative imperfection. Limitation of essential and accidental perfection is found everywhere. Nowhere do we see absolute perfection. All things possess being, but they possess it in imperfect degrees. Not to possess being in fullest measure implies *limitation* and consequent *imperfection*.

God and Perfection

The argument for God's existence, based on the *limited grades of perfection* found in the beings of the universe, is Somewhat abstruse and demands close attention.

First step. Whenever a large number of beings possess *perfection arranged in a graded scale*, these beings are not themselves the sufficient reason for these perfections. As a matter of plain fact, no being in the universe is the sufficient reason of its own being and its existence. Every being, of course, is what it is; hut that it is what it is, is not the result of its own doing or making. Each of us has simply *received* our being, and it was not up to us in any way to decide what we shall be or not be; that is true of man and of every other being. When, therefore, we observe a *gradation of reality* among the beings of the universe, starting from the subatomic particle and reaching from the inorganic world through the organic world up to the spiritual life of man, this gradation of reality (perfection) cannot be attributed to the individuals in the series nor to the series as such. Not to the individuals in the series. No single beings are responsible for what they are themselves; much

less for what the other beings are. The hydrogen atom on earth has nothing to do with the hydrogen atoms in the sun and other stars; the calcium in my body is not the sufficient reason for the existence of the calcium present in the gases of interstellar space. Each element and compound exists as an individual being, but it is not the reason or cause why the other elements and compounds also exist. Not to the *series as such*. By far the greatest portion of this graded series is devoid of intelligence and does not know that such a gradation of reality exists. And man, who alone knows of the existence of the series, certainly had nothing to do with bringing the realities into existence and with arranging them into a series of graded perfections. Since no single individual and no group of individual beings in the series is the sufficient reason for the series the entire series has not the sufficient reason for its existence and arrangement *in itself*. It could be different from what it actually is. Hence, the entire series and each individual in it must have the sufficient reason for this gradation *outside the series*. Now, this series of graded perfections comprises the entire universe. Hence, the sufficient reason for the gradation of reality must reside *outside the universe*.

Second step. Diverse perfections combined into a unity do not combine of their own accord; a causal agency is required to bring about their unification in a being. "Every composite is posterior to its component parts, and is dependent on them.... Every composite has a cause, for things in themselves different cannot unite unless something causes them to unite."⁷ The very fact that such perfections (realities) are 'diverse' implies that they are

multiple in character. Multiplicity, however, is the opposite of unity. Strictly speaking, therefore, diverse and multiple perfections should, of their very nature, never combine to form a unitary being. If they do so nevertheless, the sufficient reason for their union cannot lie in these realities themselves, because what is 'multiple' is of its own nature and being not 'one.' All creatures, however, are 'one' in their being, but they are also 'composite' — made up of a diversity and multiplicity of realities, namely, essential and accidental perfections of various kinds. One may object and say that there exists an *inherent tendency* in things which urges these diverse and multiple realities (perfections) to form a unified nature. That, of course, is true. But it is also true that this 'inherent tendency' must have a sufficient reason to account for its presence. Beings, however, are subject to this tendency and as such cannot themselves account for its presence. Since the entire universe consists of composite beings with diverse and multiple realities, it necessarily presupposes an efficient cause *outside itself* in order to explain how the 'many' become 'one.'

Third step. Limitation of perfection also demands an efficient cause outside the universe. The *number* of beings in the universe is not infinite, but limited; and that means that the amount of reality (perfection) in the universe is limited. Why is this amount as large as it is and yet definitely limited? Why are there just so many subatomic particles in the universe? Why are there just so many natural elements, not more and not less, although they could be more or less? Why are there more of one kind than of another? Why are some elements active and others

inert? Why are some naturally radioactive and not all? Why do certain elements tend to combine with others to form compounds, while others show no such tendency? Why the difference in freezing point and boiling point, ductility, heat conductivity, and all other qualities? Whence the limitation of plants to vegetative functions and of animals to vegetative and sensory functions, while man has these and rational functions? Whence the limitation of perfection in the structures of plants, animals, and men? Whence the limitation of perfection in their powers and capabilities? No being is altogether perfect in its nature; every one is limited and imperfect along many lines. It is manifest that every individual and every type of being is what it is and has what it has, not through its own choice and doing, but because it 'received' its being as limited and imperfect. This limitation demands a sufficient reason. The explanation does not lie in the things themselves. Consequently, the sufficient reason for the limited perfection (relative imperfection) of all beings in the universe *must be sought in some outside intelligence* planning their number and nature. In other words, *an efficient cause outside the universe*, immensely intelligent and powerful, gave all things in the universe their being and existence and decided how much perfection they shall receive and how many of all the possible beings of a certain class shall obtain existence. Any other explanation is illogical.

Last step. Transcendental perfections are simple perfections. Such are 'being,' 'one,' 'true,' 'good.' They apply to all things. Everything, whether material or spiritual, whether a substance or an accident, is a 'being.'

Everything is undivided in itself and distinct from other beings; it is 'one.' Everything, since it is a being, can be known by an intellect and is therefore 'true.' Everything has suitability and can be desired, because being is always desirable; hence, it is 'good.' These attributes 'transcend' ('go beyond') all categories and classes; that is why they are termed *transcendental*. In themselves these attributes are *simple*, because they can be found in pure spirits. The simple, transcendental attributes are present in all beings in *varying degrees*. That such attributes are present in creatures in varying degrees and not in their absolute perfection demands a sufficient reason and an adequate cause. Since, however, the simple, transcendental attributes are found in all beings in the universe and in the universe as a whole, there must be *one cause* responsible for them all. Similar things are related, and that means that eventually they have the *same cause*. All perfections (realities) found in the universe must, therefore, be present in this one same cause, either formally or eminently; otherwise they could not be given by this cause.

Conclusion. There must exist outside the universe a *cause possessing unlimited perfection (reality)*, responsible for all the limited perfection (reality) present in varying degrees in the beings of the universe. The perfection of this cause must be 'unlimited,' because limitation of perfection demands a cause for this limitation. Hence, if the cause of the universe were itself limited in perfection, another cause would be required. Since an infinite regress is impossible, we must ultimately arrive at an *uncaused cause possessing*

unlimited perfection. This uncaused cause possessing unlimited perfection we call 'God.'

Therefore, *God exists.*

The Argument of St. Thomas

St. Thomas made no argument for God's existence based on the *origin of life*. The reason for this omission is apparently very simple. Up to the time when Louis Pasteur startled the scientific and philosophic world with his revealing experiments on the origin of subvisible organisms, it was the common belief that spontaneous generation (abiogenesis) occurred among certain classes of lower animals and plants. Since biology, as an exact science, was unknown in his day, St. Thomas also entertained this common belief. In order to ascribe an adequate cause for the fact of spontaneous generation, he referred the origin of life in these instances to the action of the sun's rays and to the causality of the intelligences who moved the celestial spheres. We are better informed in these matters than St. Thomas could be expected to be in his time. Astronomy tells us that there are no 'celestial spheres,' and biology has proved that living beings do not derive their origin from nonliving matter. Had St. Thomas possessed the more accurate knowledge which we have, he undoubtedly would have used the 'origin of life' as a proof for God's existence.

He did, however, make an argument for God's existence by using the fact of the *grades of perfection* universally found in nature. Here is his formulation:⁸

“The fourth way is taken from the gradation to be found in things. Among beings there are some more and less good, true, noble, and the like. But ‘more’ or ‘less’ are predicated of different things, according as they resemble in their different ways something which is the maximum, as a thing is said to be hotter according as it more nearly resembles that which is hottest; so that there is something which is truest, something best, something noblest, and, consequently, something which is uttermost being; for those things that are greatest in truth are greatest in being, as it is written in *Metaph. II*. Now the maximum in any genus is the cause of all in that genus; as fire, which is the maximum of heat, is the cause of all hot things. Therefore there must also be something which is to all beings the cause of their being, goodness, and every other perfection; and this we call God.”

— ST. THOMAS AQUINAS

This proof, as given above, calls for some comment. As formulated by St. Thomas, the objection has been made that it is rather *Platonic* in trend and involves an *illicit transition* from the ideal to the real order. The brevity of the phrasing is probably responsible for this serious objection. St. Thomas was by no means so inept in philosophizing that he would have been guilty of such a flagrant error. However, in order to avoid this accusation, the presentation

of the argument in the preceding sections is based on the Principles of Sufficient Reason and Causality.

Furthermore, St. Thomas has been ridiculed for his 'bad physics' in stating that "fire, which is the maximum of heat, is the cause of all hot things." St. Thomas, of course, knew nothing of modern physics or chemistry. Everybody in his age followed Aristotle's division of the terrestrial elements into 'earth, water, air, and fire.' Among these four elements (we know now that none of these realities is an 'element' in the strict sense of the word) fire was considered to be the pure principle of heat; and *it* was only natural that St. Thomas would refer all hot things to this fire as to their real cause. The illustration he used here was unfortunate, in view of our more accurate information; but his error is certainly pardonable and does not affect the validity of his argument as a whole. All in all, his argument is basically sound, especially when linked up with the Principles of Sufficient Reason and Causality so as to keep it within the realm of the 'real order' of beings.

Inferences

Since God is the ultimate adequate cause of the origin of life in the world, *He must possess life*. And since the immaterial soul of man is endowed with spiritual life, God's life must also be *spiritual*.

Beings which possess a nature characterized by 'limitation' and 'composition' cannot have the sufficient reason for this limitation and composition in themselves. If they themselves had to impose limitation and composition

upon their nature, they would have to do this before they assumed their nature, and so they would exist before they actually existed. Hence, the sufficient reason for the limitation and composition of their nature must be found ultimately in God. God cannot have limitation and composition in His nature, otherwise another cause would have to impose limitation and composition upon His nature. There can, however, be no cause prior to the First Cause. Consequently, God must be without limitation and composition in His nature and perfection. As a result, God cannot be an organism; nor can He have materiality in His nature. For the same reason, His nature cannot have potentiality. God's being, therefore, must be pure actuality, *pure act*. Having no materiality in His nature, God must be a *pure spirit*. And since there can be no limitation to His perfection, He must be a spirit of unlimited perfection. It follows that God is *Pure Act and a Pure Spirit of unlimited perfection*.

Summarizing the results of the foregoing proofs for God's existence, we find that God is the unchangeable author of all change, the intelligent planner of the universe, the necessarily existing eternal being, the being which has the sufficient reason of existence in Himself (*ens a se*), the uncaused cause, spirit, unlimitedly perfect, pure act. He is in all truth the *Supreme Being*.

Summary of Chapter VII

Here we treat of the *origin of life* and of the *grades of perfection* as proofs for God's existence.

1. *The Problem of Life.* — Observation and experiment reveal a radical difference, both in *structure and function*, between living and nonliving beings. The organism acts as an individual being functioning as a 'whole.' Vital activity is 'immanent' action, while inorganic action is 'transient.' Every organism is characterized by 'inherent natural purposiveness,' striving for the well-being of the individual and the preservation of the species. In particular, sense-perception, consciousness, and the rational activities present in man are far superior to nonliving activity and require a vital principle or 'soul.'

2. *A biogenesis.* — Abiogenesis (spontaneous generation) is the theory that living beings ultimately came into existence through a development on the part of the forces indigenous to nonliving matter. Science has proved that *life derives its origin only from life*. Abiogenesis has never been observed and never occurs.

3. *The Origin of Life.* — Life originated in time and had a beginning. Abiogenesis can only be a 'postulate' of science (or, rather, of philosophy), if it is the only rational explanation of the origin of life. That would be the case if God does not exist.

4. *God, the Ultimate Cause of Life.* — Logic and reason demand that there be a proper proportion between cause and effect. Now, the activities of organic life *exceed the*

causality of inorganic substances. The arrival of the organism involves the appearance of something totally new and superior. Hence, it must be accounted for by some cause outside the totality of matter and of the material universe. This extra-mundane cause must possess *life*. And since man has a rational, spiritual life, the origin of life demands a *living, intelligent, extra-mundane* cause. This cause we call God.

5. *God and Evolution.* — Organic evolution is the theory which maintains that the types and species of all plants and animals derive their origin through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws. The argument for evolution is valid only if it can be proved to be the *only possible cause*; it leaves 'creation' out of consideration, but does not eliminate creation. *Without the intervention of God*, the organic processes cannot be conceived as passing from the less perfect to the more perfect (e.g., from plant to animal, and from animal to man), because that would entail the contradiction of an insufficient cause.

Emergent evolution maintains that nature is the product of evolution in such a manner that entirely new and unpredictable properties originate through synthesis and thereby form new and higher levels of reality in a continuously ascending process of development. It is thus that life and mind have had their first origin. Such an emergence demands a *nisus* or impetus toward more perfect levels of being; this *nisus*, however, cannot be

accounted for except on the supposition that a *cause outside the universe* has put it there. It would then be a 'purposive evolution.'

6. *God and Purposive Evolution.* — Evolution, if it ever occurred, must be *purposive*, if the Principles of Sufficient Reason and Causality are to be safeguarded. Since 'purpose' implies the use of specific means toward a specific end to be realized in the future, only the Supreme Intelligence could endow nature with such a purpose. Even then the *spiritual* soul of man, being intrinsically independent of matter, must have been produced by God directly.

7. *Notion of Perfection.* — By *perfection* here we mean any reality or real entity which is present in any kind of being, whether this being be 'actual' or 'potential.' Perfection may be either 'mixed' or 'simple,' 'essential' or 'accidental,' 'predicamental' or 'transcendental.'

8. *Grades of Perfection.* — The plant is superior to the inorganic being; the animal superior to the plant; man superior to the animal: there thus exists a *gradation of perfection* in the universe. Each individual nature is the result of composition between essential and accidental perfection, between actuality and potentiality, resulting in a more or 'less' of reality (perfection).

9. *Limitation of Perfection.* — As a matter of observable fact, the grades of being (reality, perfection) are all limited, and limitation implies *imperfection*. Potentiality and perfectibility are evidence of this limitation in all beings.

10. *God and Perfection.* — Perfections are arranged in a graded scale; the sufficient reason for this gradation

resides neither in the individuals nor in the series. Hence, it must be found in a reason or cause outside the series (the universe). Diverse perfections combined into a unity require a causal agency outside themselves to bring about their unification in a being. Limitation of being does not find its sufficient reason in the beings subject to limitation; it must be sought in some outside intelligence. Transcendental perfections are 'simple' perfections; their varying degrees demand an adequate cause outside the beings possessing them. Hence, there must exist outside the universe of graded perfections a *cause possessing unlimited perfection*. Its perfection must be 'unlimited,' because there can be no cause capable of limiting the perfection of the Uncaused Cause. This Uncaused Cause possessing unlimited perfection we call 'God.' Therefore, God exists.

11. *The Argument of St. Thomas.* — St. Thomas made no argument for God's existence based on the 'origin of life,' because he believed in spontaneous generation as a fact of nature. He did, however, make an argument proving God's existence from the fact of the 'grades of perfection.'

12. *Inferences.* — God must possess *life*; and since man has a spiritual life in his immaterial soul, God must also have *spiritual life*. Since limitation and composition of reality demand a cause, there can be no limitation and composition in God the Uncaused Cause. Hence, God cannot be an organism, nor can He have materiality in His nature; He must, therefore, be a *pure spirit*. For the same reason, there can be no potentiality in God's nature; He must be *pure act*. Since to be without limitation means to

be 'unlimited,' God must be a pure spirit or *act with unlimited reality* or perfection.

Chapter 8

OPPOSING VIEWS

EXCEPT FOR THE ONTOLOGICAL ARGUMENT OF ST. ANSELM, medieval philosophers had no doubts about the general validity of the traditional proofs. Many moderns accuse them of being prejudiced through their Christian faith. That their faith influenced them may be admitted as undoubtedly true; but that they were prejudiced, in the sense that their faith led them into false reasoning, is an entirely different matter. It is up to the individual to judge whether the reasoning process proving God's existence is convincing or not. Accusation is not proof.

René Descartes is the one mostly responsible for the confusion which exists in modern thought. He revived St. Anselm's onto-logical argument, and the result was no happier in his hands than in the hands of St. Anselm. Mainly, however, Descartes was responsible for the excessive dualism of matter and mind in man, as found in much of modern philosophy, thereby opening the door to the empiricism of Hume. *Empiricism* still is strong in the English-speaking world, especially among a certain group of scientists. It gave rise to *agnosticism*, so prevalent in the past century. Nowadays neither philosophers nor scientists

of the secularistic type are quite so dogmatic in their assertions; but the empiricistic and agnostic trend still taints their thinking to a great extent. Much of their opposition to the traditional proofs for God's existence stems from the objections made by Kant.

It is well-nigh impossible to consider all the opposing views advanced in modern thought. The main ones will alone be considered.

Objections of Transcendentalism

Immanuel Kant (1724—1804), although he has lost a great deal of prestige as an infallible authority, still ranks highly among many modern philosophers. Most of these thinkers are acquainted with the arguments for God's existence only in the version given by Kant. Thus A. E. Taylor¹ remarks in typical fashion: "Kant's great achievement lies in having demonstrated that the whole force of the 'proofs' [for God's existence] depends upon the famous ontological argument, best known in modern philosophy in the form adopted by Descartes in the Fifth Meditation." We must, therefore, turn our attention to *Kant's objections*.

Kant apparently knew nothing about St. Thomas and the 'Five Ways,' because he admits of but three possible proofs. He says:²

"There are only three modes of proving the existence of a Deity, on the grounds of speculative reason. All the paths conducting to this end begin either from determinate experience and the peculiar constitution

of the world of sense, and rise, according to the law of causality, from it to the highest cause existing apart from the world — or from a purely indeterminate experience, that is, some empirical existence — or abstraction is made of all experience, and the existence of a supreme cause is concluded from *priori* conceptions alone. The first is the physico-theological argument, the second the *cosmological*, and the third the *ontological*. More there are not and more there cannot be.”

— IMMANUEL KANT

He then proceeds to show why these arguments are invalid.

As regards the *ontological* argument, Kant holds that it involves an illegitimate transition from possibility to existence. St. Thomas pointed out long before Kant that it is impossible to draw a valid conclusion from the ideal to the real order of things, and for this reason he rejected the ‘ontological argument’ of St. Anselm. It was the revival of this argument on the part of Descartes which prompted Kant to examine it anew. Kant’s rejection coincides with what most scholastic philosophers have always maintained, and so nothing further will be said about it.

AS REGARDS THE *COSMOLOGICAL* ARGUMENT (WE CALL IT THE ‘argument from contingency’), Kant³ states that it is framed as follows:

“If something exists, an absolutely necessary being must likewise exist. Now I, at least, exist. Consequently, there exists an absolutely necessary being. The minor contains an experience, the major reasons from a general experience to the existence of a necessary being. Thus this argument really begins at experience, and is not completely *priori*, or ontological... The proof proceeds thus: — A necessary being can be determined in only one way, that is, it can be determined by only one of all possible opposed predicates; consequently, it must be *completely* determined in and by its conception. But there is only a single conception of a thing possible, which completely determines the thing *priori*: that is, the conception of the *ens realissimum*. It follows that the conception of the *ens realissimum* is the only conception, by and in which we can cogitate a necessary being. Consequently a supreme being necessarily exists.”

— IMMANUEL KANT

It is in this manner that Kant formulates the argument from contingency or, as he calls it, the ‘cosmological argument.’

Kant advances *two main reasons* for the rejection of the argument from the contingent to the necessary.

The *first* reason is that the argument from contingency is ultimately nothing but the *ontological* argument in disguise. Kant⁴ proceeds to prove his claim. “That it may possess a

secure foundation, it bases its conclusion upon experience, and thus appears to be completely distinct from the ontological argument, which places its confidence entirely in pure *priori* conceptions. But this experience merely aids reason in making one step — to the existence of a necessary being. What the properties of this being are, cannot be learned from experience; and therefore reason abandons it altogether, and pursues its inquiry in the sphere of pure conceptions, for the purpose of discovering what the properties of an absolutely necessary being ought to be, that is, what among all possible things contain the conditions (*requisita*) of absolute necessity. Reason believes that it has discovered these requisites in the conception of an *ens realissimum* — and in it alone, and hence concludes: The *ens realissimum* is an absolutely necessary being. But it is evident that reason has here presupposed that the conception of an *ens realissimum* is perfectly adequate to the conception of a being of absolute necessity, that is, that we may infer the existence of the latter from the former — a proposition which formed the basis of the ontological argument, and which is now employed in the support of the cosmological argument, contrary to the wish and professions of its inventors. For the existence of an absolutely necessary being is given in conceptions alone. But if I say — the conception of the *ens realissimum* is a conception of this kind, and in fact the only conception which is adequate to our idea of a necessary being, I am obliged to admit that the latter may be inferred from the former. Thus it is properly the ontological argument which figures in the cosmological and constitutes the whole

strength of the latter; while the spurious basis of experience has been of no further use than to conduct us to the conception of absolute necessity, being utterly insufficient to demonstrate the presence of this attribute in any determinate existence or thing.” Put into simple words, Kant’s objection amounts to this: We go from the experience of existing and ‘contingent’ things to the idea of a ‘necessary being,’ and from this *idea* we argue to the *existence* of the necessary being; and that is the ontological argument.

Kant’s *second* reason consists in denying that the *Principle of Causality* is universally applicable to all finite realities. He maintains⁵ that the argument from contingency possesses a large number of unproved assumptions, one of which is “the transcendental principle, everything that is contingent must have a cause — a principle without significance, except in the sensuous world. For the purely intellectual conception of the contingent cannot produce any synthetical proposition, like that of causality, which is itself without significance or distinguishing characteristic except in the phenomenal world. But in the present case it is employed to help us beyond the limits of its sphere.” To understand Kant’s objection here, one must realize that ideas like ‘causality,’ ‘existence,’ ‘contingency,’ and ‘necessity’ are, according to his theory of knowledge, nothing more than *categories of the mind*, in the mind prior to all experience, *subjective forms or constructs* whose sole function it is to regulate the data of sense experience (the ‘phenomena’) in our thinking, and as such have *no objective value* in the world of realities

outside the self. Hence, the Principle of Causality cannot lead to God, because God is a 'thing-in-itself,' a 'noumenon,' which remains forever unknown and unknowable to man.

As regards the physico-theological argument (we term it the 'argument from order and design'), Kant respects it more than the other two, but he claims that it, too, is but the 'ontological' argument in disguise. He says⁶ this in the following quotation:

"After elevating ourselves to admiration of the magnitude of the power, wisdom, and other attributes of the author of the world, and finding we can advance no further, we leave the argument on empirical grounds, and proceed to infer the contingency of the world from the order and conformity to aims that are observable in it. From this contingency we infer, by the help of transcendental conceptions alone, the existence of something absolutely necessary; and, still advancing, proceed from the conception of the absolute necessity of the first cause to the completely determined or determining conception thereof — the conception of an all-embracing reality. Thus, the physico-theological, failing in its undertaking, recurs in its embarrassment to the cosmological argument; and, as this is merely the ontological argument in disguise, it executes its design solely by the aid of pure reason, although it at first professed to have no connection with this faculty, and to base its entire procedure upon experience alone."

Kant, of course, has much more to say about these arguments. The above, however, contains the gist of his thoughts.

Refutation of Transcendentalism

Kant was neither an atheist nor a pantheist. He defended the theistic position in his *Critique of the Practical Reason* while he repudiated the traditional arguments for God's existence in his *Critique of Pure Reason*. What prompted him to adopt this peculiar position? His attitude is explained by the trend of modern philosophy as inaugurated by Descartes and carried forward by Hume.

Both Hume and Kant accepted without question the (apparently evident) dictum of Descartes that *all knowledge originates solely in the mind*; knowledge is altogether a subjective product; the mind can know nothing but its own conscious states; the mind cannot go beyond itself and know what the objective world is 'in itself.' Hume, in accepting this basic tenet of Descartes, reduced all knowledge to sense-perception and the mind to a 'bundle of perceptions.' As a final result, Hume rejected the validity of reason and denied the necessary character of all rational and scientific principles; he ended as a *skeptic*.

Kant became alarmed at the outcome of Hume's philosophy and attempted to place science (and philosophy) upon a firm foundation. In seeking to do this, Kant made the *initial mistake* (fatal in the long run) of accepting

Descartes's and Hume's original assumption that all knowledge originates *solely in the mind* and that the mind can know only its own conscious states. He thought he could nevertheless avoid Hume's final conclusion of skepticism. He agreed with Hume that knowledge must be grounded in 'experience'; but, he maintained, the *necessary character of science* (and philosophy) must also be safeguarded. To do this he devised his own system of knowledge.

Kant made the distinction between the noumenon ('thing-in-itself') and the *phenomenon* ('appearance'). The 'noumenon' (for example, the external world as it actually is) is absolutely unknowable, because it is a reality which exists outside the mind. All man can perceive and know is the 'phenomenon' (for example, the 'appearances' of things as perceived by the mind), because the phenomenon is an elaboration of the mind. On the sense level, all phenomena appear in 'time' and 'space'; and this happens because 'time' and 'space' are not attributes of objective reality at all, but are purely subjective 'forms' into which all the intuitions of sense are cast. These *forms* are the conditions of knowledge and make knowledge possible. It is a postulate of Kant's system that nothing which is *necessary and universal can have its origin in experience*, because experience treats only of the particular, contingent, transitory. It follows, then, that such 'forms' must be present in the mind *prior to all experience* as subjective elements of the mind making knowledge possible; and since 'space' and 'time' are the necessary and universal attributes of all appearances (phenomena), 'space' and

'time' are *a priori forms* of sensibility. After the intuitions of sense are cast into the 'forms' of 'space' and 'time,' they are drawn under the influence of the pure understanding and cast into the *a priori* forms of the understanding, namely, the *categories*. These latter have the same relation to intellectual knowledge that 'space' and 'time' have to sense-knowledge: they are the 'conditions' which make intellectual knowledge possible; but they, like the sense forms of space' and 'time,' are purely subjective elements and tell us nothing of what the reality of the 'things-in-themselves' (noumena) is like. Since the 'categories,' of which there are twelve, possess the character of universality and necessity, they are not the result of experience but are *a priori* and present in the mind prior to all experience. These twelve 'categories' are: unity, plurality, totality; reality, negation, limitation: subsistence and inherence, causality and dependence, reciprocity (active and passive); possibility and impossibility, existence and non-existence, necessity and contingency. Every judgment, therefore, which is based on any of these relations contains the *a posteriori* element of experience and the *a priori* element of a 'category'; the multiplicity of sense intuitions is thus unified in intellectual judgments by means of the 'categories.' It is in this manner that scientific judgments are formed and obtain a necessary and universal value. Finally, in the field of reasoning, we encounter three *a priori* 'forms,' namely, the *ideas*. These are: the psychological 'idea' of the soul, the cosmological 'idea' of matter (the totality of phenomena), and the theological 'idea' of God. These 'ideas,' like the 'categories' and 'space'

and 'time,' are subjective elements of the mind, and their sole function is to regulate our thinking and to bring greater unity into the manifold of intellectual experience. As such, therefore, these 'ideas' *do not refer to any objects existing outside the mind*, because they exist in the mind as mere 'forms' and must be present prior to all experience: they make reasoning possible, but they do not lead to extra-mental reality.

We now see why Kant insisted that the 'cosmological' and physico-theological' arguments for God's existence involve the fallacy of the 'ontological' argument. They assuredly do — *according to Kant's system of knowledge*. None of the 'forms' apply to the 'things-in-themselves.' Neither the twelve 'categories' nor the three 'ideas' have any value beyond the world of sense, the 'phenomena.' If we attempt to use them in an endeavor to prove that the 'world' or 'God' actually exists *outside the mind*, we are guilty of the fallacy of an illegitimate transition from the ideal to the real order, and that is fundamentally what the 'ontological' argument attempted to do.

The question then arises: *Is Kant's system of knowledge true?*

Today practically nobody accepts Kant's system in its entirety. It is too *arbitrary* and *subjective*. If Kant's system were true, all our knowledge is nothing but a grand *illusion*: we think we know something of the world and the things in it, but actually we do not; it is a subjective construct, elaborately executed, but without any reference to objective reality. We live in a dream-world. The mind is imprisoned in a cell of its own making, from which there is

no possibility of escape. Of what value is such a knowledge? Since we *cannot help* but think that our knowledge tells us something of the things outside the mind, this knowledge is *essentially false*. The outcome is the very *skepticism* which Kant attempted to avoid, because we must naturally mistrust a power which irresistibly leads to error and misunderstanding. But in that case — of what use is Kant's system? His system is certainly not the result of 'experience'; it is the result of 'reasoning,' and all reasoning, according to Kant, is based on *a priori* forms which have subjective value only. Kant's system may satisfy Kant, but that would be no guarantee that it is true in itself; it is essentially a noumenon of which we could know nothing.

Kant's system is inconsistent with the *principles of reason*. In repudiating the arguments for God's existence, Kant criticizes the use of the Principle of Causality as applied to contingency and order. It is illegitimate, he says, to apply this principle to anything but "the sensuous world," i.e., to phenomena, because phenomena are all man can experience. Since 'contingency,' 'causality,' and 'existence' are mere empty *a priori forms, or categories* innately present in the mind, according to Kant's theory of knowledge, one can understand how he could make such a remarkable statement. Kant, however, overlooked the fact that man, besides having sensuous powers, also has *rational* powers. Man is a 'rational animal,' and his rational knowledge has as much validity as his sensory knowledge. Now, rational knowledge is acquired through the application of *reason and rational principles* to the data

acquired through sense-knowledge. To deny this is to deny the validity of intellectual knowledge. In that case, however, the foundation of Kant's own system is invalid, because it is essentially a system of intellectual knowledge which he proposes. To deny the validity of intellectual knowledge always leads to *skepticism*. Furthermore, the *Principle of Causality* is but an extension of the Principle of Sufficient Reason, as the latter is an extension of the Principle of Contradiction (see Chap. 2). If the sufficient reason of a thing cannot be found in the thing itself, it must be found in another; and if the sufficient reason for the existence of a thing cannot be found in the thing itself, then this thing is 'contingent,' and the sufficient reason for its existence must eventually be found in a being which is not contingent but 'necessary.' That, however, is equivalent to saying that its existence is 'caused' by this other; otherwise it would both exist (for that is the supposition) and not exist (because there is no sufficient reason for its existence). Hence, the Principle of Causality, like the Principles of Contradiction and Sufficient Reason, must have *universal application* both in the realm of thought and of being, or man's rational knowledge is intrinsically illusory.

Even from the standpoint of Kant's own transcendentalism, there must be a sufficient reason to explain the existence in man's mind of all the 'forms' which he claims are present there prior to all experience. Man himself certainly is not responsible for the presence of these 'forms'; they are there without his doing. Man's mind, however, did not always exist, neither individually nor collectively. Therefore, man's mind and its entire apparatus

of knowledge is 'contingent' and must have been *brought from non-existence to existence*, or there would be no sufficient reason why they exist in this particular manner or why they exist at all. The Principle of Sufficient Reason thus demands that *some other being* gave them existence, i.e., is their *cause*. And since the entire question here hinges on the existence of 'intellectual life' in man, this efficient cause must be a being possessing intellectual life, otherwise the sufficient reason for the existence of man's intellectual life would be lacking, and then man's intellectual life could not exist at all. Consequently, since nothing can be in an 'effect' which is not in its cause,' the cause of man's intellectual life must also be endowed with intellectual life. This cause we call 'God.'

The same criticism applies to Kant's objection to the argument from *order and design*. As in the argument from 'contingency,' Kant claims that the 'school' (scholastic philosophers) argues from the world of phenomena to the 'pure conception' or 'idea' of God and then *deduces* the existence of God From this 'pure conception' or 'idea'; in this manner, he says, scholastics are guilty of a surreptitious 'ontological' inference. To put it mildly, Kant labors under a misapprehension. Neither St. Thomas nor the scholastics in general argue in this fashion. All anyone has to do is to examine the arguments for God's existence as formulated by them. It is to their everlasting credit that St. Anselm's ontological argument has always been repudiated as an illegitimate transition from the ideal to the real order of things. Certainly, they conclude from the existence and properties of the visible universe to an extra-mundane God;

but they do this by applying the rational Principles of Sufficient Reason and Causality to the *data furnished by the visible universe*. If this procedure is illogical, well and good; but that is something very different from Kant's accusation of introducing an 'ontological' line of reasoning into their arguments, as was done by St. Anselm, Descartes, Leibnitz, and others. That a 'transcendent inference' from phenomena to noumena is permissible, can be seen by Kant's own system (although, from the standpoint of his own premises, Kant was guilty of gross inconsistency), because Kant concludes to a *world of noumena* as existing beyond and outside his own mind. He accepts this 'world of noumena' on the basis of the Principles of Sufficient Reason and Causality, because otherwise he could not account for the 'sensations' which give rise to empirical knowledge; and yet he claims that the 'noumena' are unknown and unknowable. But if Kant can argue to the existence of an unperceived and unperceivable 'world,' why should it be illogical to argue to the existence of a Being beyond the world, if the rational principles employed demand such a conclusion?

All in all, Kant's transcendentalism and the resultant objections to the arguments for the existence of God are unfounded in fact and illogical in principle.

Objections of Materialism

Kant's transcendentalism, since it reduced everything to a form of knowledge, was at bottom idealistic. He thus followed the mental side of Descartes's excessive dualism of

mind and body in man. Others followed the bodily side of Descartes's dualism and reduced everything to matter. Materialism was the result.

Materialism is the philosophic system of thought which considers *matter to be the only reality* and attempts to explain everything in the universe as the result of the *conditions and activities of matter*. As a consequence, materialists deny the existence of every kind of spiritual or even truly psychical reality, including God. To be consistent, materialists are, or at least should be, atheists. If they speak of 'God' at all (and some do), they interpret the word in the sense of 'world-force' or 'world-energy.'

Materialism, as a philosophy, is as old as Greek thought. The first efforts toward philosophic explanation were more or less materialistic; one must not overlook the fact, however, that the polytheistic religion of ancient Greece was not of a kind to appeal to earnest thinkers. *Systematic materialism* began with *Democritus*, who taught that everything results from the combination and division of atoms which are infinite in number and separated by empty spaces. *Epicurus* was a thoroughgoing materialist. Bodies alone exist, and they are ultimately composed of unchangeable atoms falling downward through space. Since space is infinite, an infinite number of atoms also exists. Some deviate from their original direction of motion, and so collisions occur and combinations are made. Atoms themselves are not qualitatively different; their difference consists merely in size, weight, and shape. Man's soul is simply a kind of vapor diffused through the body. *Lucretius* gave poetic expression to materialism. While Epicurus

sought to explain the origin and order of the present world through chance, Lucretius was somewhat more philosophical; he maintained that the world is nothing more than one of the infinitely numerous possibilities in atomic arrangement, and the present arrangement was as possible as any other. Soul and mind are material in nature, consisting of the smallest, roundest, and most mobile types of atoms. The materialism of these earlier philosophers was, as will be noted, rather crude.

The victory of Christianity over paganism put an end to ancient materialism. The reign of Christian thought lasted through sixteen centuries. The rise of the Renaissance, together with the general waning of faith in Europe, gradually developed into a materialistic attitude in some intellectual quarters. Descartes's splitting up of the human person into a thinking mind (soul) and quantitative extension (body), both practically independent of each other, led many thinkers either to idealism or to materialism.

The *Age of Materialism* began in France with Julian O. de la Mettrie (1709—1751), Baron Paul H. d'Holbach (1723—1789), and Pi  rre J. G. Cabanis (1757—1808). The latter not only identified man's mind with his nervous system but frankly asserted that thought is only a secretion of the brain. In Germany Karl Vogt (1817—1895), Jakob Moleschott (1822—1893), Ludwig B  chner (1824-1899), and Ernest Haeckel (1834-1919) were ardent defenders of materialism. English materialism stemmed from the empiricism of John Locke (1632—1704) and David Hume (1711—1776); the chief advocates were John Tyndall (1820

—1893), Thomas H. Huxley (1825—1895), and Herbert Spencer (1820–1903). Spencer, the most important philosopher of this group, claimed to be a mere agnostic; in reality, however, he was a materialist. There were, of course, many lesser lights in all countries who followed the tenets of materialism.

The marvelous success of the *natural sciences* provided the materialists with a great opportunity to defend their thesis that every event in nature receives its full and adequate explanation in the configurations of matter and its activities. Nature, according to the general teaching of scientists, is a ‘closed system of causation’; each natural phenomenon is based on another as its cause, and the chain of natural causes is a determined series complete in itself. The materialists seized upon this idea. Since this chain is a series of ‘material’ causes, there is no place in it for a free-will and a spiritual soul, because they would break the chain of ‘natural events.’ By postulating the *eternity of matter*, materialists obviated the necessity of a ‘beginning’ in the world and its causal events, and so the idea of God was eliminated. When R. Mayer (1814—1878), J. P. Joule (1818—1889), and Herman L. F. von Helmholtz (1821—1894) formulated the scientific *Law of the Conservation of Energy*, materialists were convinced that they now possessed a definite proof of the nonexistence of a spiritual soul. The law, they argued, proves that energy can neither be created nor destroyed. Kinetic energy may be transformed into potential energy, and potential energy into kinetic; but the sum-total remains always the same, because the world is a ‘closed system.’ If a spiritual soul existed, it

would produce energy and pour it into the events, thus increasing the sum of energy present in the closed system; and every external stimulus influencing the soul would produce sensations which are not a form of energy in a physical sense, and thereby the sum of energy in the closed system of the world would be decreased. However, the Law of the Conservation of Energy precludes any increase or decrease in the sum-total of energy present in the universe. Therefore, they concluded, the soul of man as a spiritual entity does not exist. It is material, or it does not exist at all. In this manner materialists utilized the findings of the natural sciences to support their theory.

The upsurge of *evolutionism* in consequence of Charles R. Darwin's (1809—1882) epoch-making *Origin of Species* gave a new impetus to materialism. The question of teleology (purposiveness) in nature, especially in the plant and animal kingdoms, had always been an awkward problem for materialists. Darwin's theory of organic evolution, however, disposed of 'design' completely; everything was the result of 'fortuitous variations' effected in the course of natural events, so that a 'Designer' was superfluous. Natural evolution accounted for everything through pure mechanism. The theory pleased the materialists immensely. It was a simple matter to expand the evolutionary concept to embrace the entire universe. Given an infinity of time to work in, the mechanical operations of the atoms could make every conceivable combination, including the present form of the universe in all its complexity. Hence, an extra-mundane God was no longer required in order to explain the origin and

development of the world. Science thus accounts for inanimate and animate nature, and nature is a completely *material system*. The materialists, without question, had achieved a very advantageous position and boldly proclaimed their doctrine.

That materialism in our times has many adherents among the educated and uneducated, is an obvious fact. However, a reaction has set in, especially among the scientists themselves. Having examined the foundations of the sciences more closely, scientists and philosophers have become increasingly aware that materialism does not contain the full solution for the problems which agitate man's mind.

Refutation of Materialism

Materialism is the very opposite of idealism. Idealism attempts to reduce all material reality to the knowledge state of the conscious subject. Materialism does the reverse. It attempts to reduce everything that is 'psychical' to the 'physical.' Both views are extremes and are wrong.

Materialism is an *oversimplification*. It is right, of course, in stressing the material realities present in nature. It is wrong in *denying the psychical realities*. In man, for instance, we observe both the physical and the psychical. The body of man is physical in its composition, composed as it is of the ordinary chemical elements found everywhere in nature. Materialists claim that 'nothing but' chemical elements and their material activities are present in the human body. It is in this 'nothing-but' that materialists are

guilty of the *Fallacy of False Exclusion*. Organic compounds are the result of natural activities in man's body (and also in plants and brutes), but nowhere in nature do the ordinary elements form such compounds when left to themselves. These compounds conspire to develop various tissues and organs in the organic structure of the body, some thing they never do otherwise. There is a unity of structure and function in the body which transcends the capabilities of the atoms and elements in their ordinary status. In other words, *life* is an *immanent* activity totally different from that of the atoms as the physicist and chemist know them. Life, too, is an integral part of nature and must be explained; and this explanation is not forthcoming on the basis of an out-and-out materialistic interpretation of nature.

Then, there is the *psychic* factor which materialism simply denies. A mere denial is easy; but it does not prove the nonexistence of the psychical. Even the materialist cannot deny the fact of *sensation*. He tries to explain it as a complicated form of atomic motion of some kind. That atomic motion is present in sensation, is true enough. Such motion, however, by no means explains the fact of conscious perception. *Conscious perception* is something 'over and above' the motion of atomic and subatomic particles accompanying the act of sensation. Here again we encounter the 'nothing-but' fallacy. Certainly, every act of sensation is a bodily function involving movements of parts consisting of elements, atoms, and sub-atomic particles; but that is only a part of the phenomenon. While these movements occur, man actually 'sees,' 'hears,' 'smells,' 'tastes,' and 'feels' objects; and he is 'conscious' of

perceiving these objects. Perception and consciousness, however, though they are accompanied by material movement, cannot be said to be 'nothing but' material movements. They represent a 'psychical factor' of life distinct from the merely material. This fact becomes evident when a living body is compared with a dead body; both possess the same organs and material components, yet the former is capable of perception and the latter is not.

The same observations must be made concerning the *intellectual activity* of man. To deny that intellectual activity exists is both futile and foolish. It is experienced by each one of us. We all use 'ideas,' 'judgments,' and 'inferences.' But they are in no sense 'material' like electrons, atoms, elements, and their respective activities. Every material reality can be measured quantitatively. What quantitative measure of length and weight can be applied to an 'idea' or a 'judgment' or a 'process of reasoning'? They have no size, color, or temperature. They are realities, assuredly, and as such their existence and presence as a part of the universe cannot be denied; but if material standards used in chemistry and physics fail to apply to them. Similarly, man's mind is capable of thinking about things that have *no material existence as yet*. Our ideas, in the view of materialists, are 'nothing but' refined sense-images.

Sense-images, however, are the product of stimuli which proceed from objects at a specified time from a specified place. The *future* is thus barred to the senses, because future events cannot send stimuli to the sense organs existing in the present; otherwise a non-existent cause would produce an actual effect. Nevertheless, we have

ideas of the future, and the scientists predict future happenings in many instances.

G. T. Ladd,⁷ recognizing these facts, did not hesitate to write:

“With no mere figure of speech we are compelled to say, every mind thus *transcends* completely, not only the powers of the cerebral mechanism by springing into another order of phenomena, but also the very existence, as it were, of that mechanism by passing into regions of space, time, causality, and ideality, of various kinds, where the terms that apply to the existence and activity of the cerebral centers have absolutely no meaning whatever. For example, the human mind anticipates the future and predicts, on a basis of experience in the past, the occurrences which *will* be but are not now. Into this future, which is itself the product of its own imagining and thinking, it projects its own continued and yet characteristically altered existence, as well as the continued similar existence of things. But the existence of the brain, and of its particular forms of nerve commotion, is never other than a purely here-and-now existence. This physical existence is, therefore, transcended in an absolute way by every such activity of the mind.”

— G. T. LADD

Man is without doubt a material organism. However, besides the physical component of his nature there is also a

psychical component. Both are real. For materialists to accept only the 'physical' and to deny the very existence of the psychical,' is an unpardonable error.

Materialists have referred to the *Law of the Conservation of Energy* as a positive proof of the non-existence of spiritual reality, such as the human soul and God. However, even this law has been dethroned; it no longer holds absolute sway over the domain of matter. Modern physicists are convinced that matter can be, and actually is, transformed into energy, and energy into matter. The law has therefore been altered to read The Law of the Conservation of Energy and Matter. It may be disputed whether the theory of the transformation of matter and energy is a correct interpretation of the facts in the case. This much, however, is clear; the law is empirical and subject to change. Consequently, when the materialists appealed to it as a proof of the non-existence of the human soul and of God, they appealed to a law which had only 'provisional value' and was not as sound as they imagined it was. Besides, it is very questionable whether *thinking* (accepting 'thinking' in the strict sense of an activity of the spiritual soul) is accompanied by any expenditure of physical energy. That ordinary vital activities, such as occur in the human body, involve energy, can be admitted; this energy would come from the elements and atoms composing the bodily tissues and organs. The activities of the spiritual soul, however, should neither increase nor decrease the sum-total of energy, because the soul is not material. All experiments made show that 'thinking'

apparently does not involve the expenditure of energy. Consider the words of Alexis Carrel:⁸

“Intellectual work, strange to say, does not increase metabolism. It seems to require no energy, or to consume a quantity of it too small to be detected by our present techniques. It is, indeed, an astonishing fact that human thought, which has transformed the surface of the earth, destroyed and built nations, discovered new universes in the immensity of siderial spaces, is elaborated without demanding a measurable amount of energy. The highest efforts of our intelligence have incomparably less effect on metabolism than the contraction of the biceps when this muscle lifts a weight a few grams. The ambition of Caesar, the meditation of Newton, the inspiration of Beethoven, the passionate contemplation of Pasteur, did not modify the chemical exchanges of these great men as much as a few bacteria or a slight stimulation of the thyroid gland would easily have done.”

— ALEXIS CARREL

Provided these scientific findings are substantiated, they show that thinking, precisely as such, is not a material process but an immaterial operation. Whatever minute metabolic changes might occur, could be attributed to the cerebral activity which normally accompanies all acts of thinking. It is thus seen that the Law of the Conservation of

Energy does not militate in any way against the existence of the soul or of God.

The materialist's appeal to the universe as a *closed system of causation* fares no better. No scientist has ever proved through observation and experiment that the entire universe is such a 'closed system.' The inductive method of science does not reach that far. This claim is a *conclusion*, but it is not subject to an actual proof. At best, the claim has merely 'empirical value' and is 'provisional' in its very nature. The principle of the 'closed system' is true in a limited and well-defined sphere; but to extend it to the universe at large goes far beyond the premises of scientific induction. Even if admitted to be valid for the whole world, it would apply only to *material causes*, riot to spiritual causes, such as the soul and especially God.

Materialists postulate the *eternity of matter* and the *infinity of time* in their theory. Neither the eternity of matter nor the infinity of time-moments is in accord with the findings of science. Einstein's 'curved space' and the theory of an 'expanding universe' imply a limited space, and a limited space implies limited number of particles; hence, there can be no such thing as an infinite number of possible combinations for the particles of matter to form the universe. It is fairly well established, too, that the present world, as we know it, has existed for only a *limited time*, not from eternity. The calculations differ, as is to be expected, but practically all scientists agree that the indications point to the fact that the duration of the universe can be measured in a number of billions of years.⁹ Billions of years are, of course, a long period of time, but such a period is

definitely limited. When materialists, therefore, set up the postulate that matter is eternal, they do so for the sake of their theory, because they wish to eliminate God as the author of the universe; in doing so, however, they run counter to the findings of science and the principles of philosophy, and that is fatal to any theory.

Scientists begin their research with the universe as given. The *origin of the universe* lies beyond the scope of scientific investigation. Very properly, then, scientists may omit God from their discussions. When, therefore, they refer to God, they no longer speak as scientists but as philosophers and lose their status as experts in a particular field of science. This should always be borne in mind.

The better scientists, as a class, are not in sympathy with materialism. To them the world is an *intelligible and rational universe*, with an order and harmony that can be expressed in precise mathematical formulae. No wonder, then, that most of them are *theists*.

Neither idealistic transcendentalism nor mechanistic materialism can satisfy the inquiring mind anxious on discovering the truth. Both are extremes, and extremes are always a one-sided distortion of truth. Honest thinking invariably leads to God.

Summary of Chapter VIII

Kant's *transcendentalism* and the teachings of *materialism* are, in the main, the views which oppose the traditional proofs for God's existence.

1. *Objections of Transcendentalism.* — Kant says that there are only three proofs for God's existence, and all three are invalid; the ontological, physico-theological, and cosmological.

He rejects the *ontological* proof as an illegitimate transition from the ideal to the real order. We do the same.

He rejects the *cosmological* proof, because in it we go from the experience of existing and contingent things to the 'idea' of a necessary being, and from this 'idea' we argue to the existence of the necessary being; and this is the ontological argument in disguise. The Principle of Causality is valid in the world of 'phenomena,' not in the world of noumenal reality.

He rejects the *physico-theological* proof (order and design), because we pass from the empirical order, with the help of transcendental conceptions alone, to the existence of something absolutely necessary, and from this 'idea' deduce God's existence; this, too, he says, is nothing but the ontological argument.

2. *Refutation of Transcendentalism.* — Kant made the initial mistake of accepting Descartes's and Hume's assumption that all knowledge originates solely in the mind and that the mind can know only its own conscious states. To safeguard the necessary character of science, he made

the distinction between phenomena (which are known through experience) and *noumena* (which cannot be known). All phenomena are necessarily clothed in 'space' and 'time' and these are *a priori forms* of sensibility. On the intellectual level there are twelve such 'forms,' called *categories*. On the level of reasoning there are three 'forms' or *ideas*, namely, the soul, the world, and God. Since these 'forms' make knowledge 'necessary,' they exist prior to all experience and are, therefore, not the result of experience; they are subjective and make necessary knowledge possible. It follows, then, that all arguments for God's existence are deduced from the 'idea' of God, and such arguments are therefore 'ontological.'

Kant's theory is *arbitrary* and *subjective*. Since we cannot help but think that our knowledge tells us something of the things outside the mind, our knowledge would be *essentially false* and end in skepticism. It is contrary to the *principles of reason*, because one cannot deny the objective validity of the Principles of Sufficient Reason and Causality without destroying the validity and trustworthiness of reason itself.

3. *Objections of Materialism.* — Materialism is the philosophic system of thought which considers matter to be the only reality and attempts to explain everything in the universe as the result of the conditions and activities of matter.

Modern materialism bases its contention on the findings of the *natural sciences* and especially on *evolution*. It postulates the eternity of matter.

4. *Refutation of Materialism.* — It is an *oversimplification*. By denying the existence of psychical realities, it is guilty of the Fallacy of False Exclusion. Conscious perception and intellectual activities are as real as physical bodies, but are *psychical* in nature and transcend the capabilities of matter and material activity. The *laws of science* are empirical and provisional, not absolute. The materialistic *postulate* of the eternity of matter and the infinity of time is not in accord with modern science; science is reasonably certain that the universe is limited in extent and had a definite *origin in time*.

Neither idealistic transcendentalism nor mechanistic materialism, therefore, disprove the arguments for the existence of God.

PART II

THE NATURE OF GOD

Chapter 9

GOD'S ESSENCE

SECTION I: ABSOLUTE ATTRIBUTES

THE PROOFS FOR GOD'S EXISTENCE REST ON A TWOFOLD foundation: experience and reason. Experience provides the data taken from the universe as supplied by common sense and scientific research. Reason provides the First Principles and applies them to the data of experience. In this way the mind is led inevitably to the conclusion that a personal Supreme Being, or God, exists.

One cannot refuse to accept the data of experience without denying the validity of common sense and science; and one cannot refuse to accept the First Principles without denying the validity of reason. Such a refusal means the denial of the fundamental sources of all human knowledge and, when consistently followed, must end in skepticism, the bankruptcy of the mind.

The individual proofs for God's existence must not be taken in isolation. Since all are derived from an analysis of the *selfsame, one universe*, they refer to the *selfsame, one cause*. This selfsame, one cause is the First Cause, absolutely uncaused, changeless, self-sufficient, self-existent, a spirit of unlimited perfection, pure act without potentiality and composition of any kind. This being we call God.

Having proved God's existence, it will now be necessary for us to investigate God's *essence* and *attributes* more in detail. Some attributes of God are 'absolute,' in the sense that they pertain to His essence as such; some are 'relative,' in the sense that they have a relation to things other than God. Both kinds of attributes must be considered, because

they reveal to us the perfections of God and thus increase our knowledge of 'what God is.'

Man's Knowledge of God

We have no intuitive knowledge of God, because we cannot perceive Him directly. The proper object of man's intellect is the 'sensible,' namely, material beings. Material beings stimulate man's senses in various ways and give rise to sense-images, which represent material beings in a concrete manner. From these images man's intellect forms (not by means of a 'conversion' of any sort, but through a process of 'abstraction') its 'ideas' of the material things. Once such ideas are formed, the intellect proceeds to build up a system of knowledge, partly by analysis and partly by discursive reasoning. Ultimately, of course, all human knowledge is based on the data of the senses, according to the axiom: 'nothing is in the intellect which was not beforehand somehow in the senses.'

Because of the fact that all man's knowledge has its beginning in sense-perceptions, agnostics contend that man cannot know the nature of God in any way. At most, they say, man can arrive at the judgment that there exists some kind of *ultimate ground for the reality of the universe*, but that is as far as man's mind can go; the ultimate ground itself ('God,' if we wish to call it that) is absolutely unknowable, because man's mind simply cannot transcend the material world. Oddly enough, in making this statement, agnostics do the very thing they say cannot be done: they transcend material reality, because they make a statement

the content of which is not found in material reality. Agnostics overlook the fact that man is not only an 'animal' but is also 'rational.' It is man's rationality which enables him to apply rational principles to the data of sense and by their help to draw *conclusions to non-sensible reality*. The agnostics do this continuously, as anyone reading their articles and books can see for himself.

Much of the knowledge acquired through the *physical sciences* is the result of discursive reasoning, not of direct observation. No physicist has ever seen, for instance, an atom, an electron, a proton, a neutron, or a chain reaction; yet he does not on that account doubt their existence and nature. No chemist has ever observed the actual process of electrolysis or, for that matter, of chemical combinations in general; nevertheless he is firmly convinced that they occur. No biologist has ever perceived with his senses the growth and metabolism of plants and animals; but he accepts them as established facts. Why are scientists certain of these things? Because they form the only conclusion consonant with observed facts. Reason, not observation, certifies their existence and nature. Without the validity of man's reasoning power, science would be nothing but guesswork.

The same principle guarantees the validity of man's conclusion as to the existence of God and His nature. True, our knowledge of God is only *indirect* and *discursive*; but indirect, discursive knowledge is valid and genuine, so long as it is logical. Science has no privileged position in this matter. If indirect, discursive knowledge is valid and genuine for science, it is also valid and genuine for philosophy. Hence, if the scientist can draw valid

conclusions concerning the nature of physical realities, the philosopher can also draw valid conclusions concerning the nature of spiritual realities, provided the facts demand such conclusions.

The scientific and philosophic principle underlying all such conclusions is the *Principle of Causality*. No effect can possess any reality except in so far as it receives this reality from its cause, and no cause can give to its effect any reality which it does not itself possess. From the nature of the effect, therefore, we can legitimately draw a valid conclusion as to the nature of the producing cause: as the effect, so the cause; and the cause, so the effect. To deny the validity of this line of reasoning is to deny the validity of all common sense and science and philosophy.

The application of the principles of reason to the data of the material world leads the mind to the existence of a Supreme Being behind and beyond the world. And it does much more than this. It reveals at the same time a great deal about what this Supreme Being is. *That a reality is*, refers to its existence; *what it is*, refers to its essence or nature. The proofs given in the first part of the book not only tell us that God exists; they also tell us very much about His essence. The reason is clear: the nature of the effect reveals something about the nature of the cause. Since God is the cause of the universe, the nature of the universe must declare, to some extent, the nature of God.

Ways of Knowing God

The 'sensible' is the proper object of man's knowledge. As a consequence, the 'sensible' alone can be known by man directly and intuitively. Any reality that is immaterial can only be known indirectly and discursively. God is an immaterial being. It follows that man cannot attain to a knowledge of God except by leaning upon knowledge of material reality. This fact is the result of the constitution of man, because man is not a pure spirit but a 'rational animal.' Since man is limited and relatively imperfect (when compared to a 'pure spirit'), his knowledge of God is necessarily also limited and relatively imperfect. How, then, does man arrive at a true knowledge of God?

Man acquires and also expresses his knowledge of God *in three ways*.

First, the *way of affirmation*. There are many perfections which are styled 'pure perfections,' namely, such as contain no imperfection in their concept and reality; for example, 'being,' 'good,' 'life,' 'person,' 'substance,' 'intelligence.' Although these perfections are also found in creatures, they need not be restricted to creatures. To be an 'organism' or 'body,' for instance, is a perfection, but it is restricted to a material being and cannot be applied to a pure spirit; such a perfection is termed a 'mixed perfection.' God is not a material being, and therefore any perfection based strictly on materiality cannot be attributed to Him. 'Pure perfections,' however, not being based strictly on materiality are found in all their purity in spiritual beings. Hence, *pure perfections can be affirmatively predicated of God*. Nevertheless, such 'pure perfections,' when predicated of God, must be affirmed of Him in such a way

that all creatural imperfection is definitely excluded. The 'way of affirmation' must therefore be combined with the 'way of negation.'

SECOND, THE *WAY OF NEGATION*. ST. THOMAS CALLS THIS 'THE WAY of removal — *via remotionis*.' Joseph Rickaby renders St. Thomas' expression into English by the term 'negative differentiation.' The meaning is the same. The 'way of negation' consists in denying of God every sort of imperfection and in attributing to Him the corresponding perfections in such a manner that they apply to Him alone. Even 'pure perfections' are found in creatures, but they are always limited. This limitation must be removed, when such a perfection is affirmed of God; otherwise there would be no essential difference between God and creature. Thus, all creatural being, whether material or spiritual substances, are by their very nature 'limited' in perfection; they are substances of limited perfection. There can be, however, no limitation in the perfection of God's substance; and so we must remove ('negate') this limitation of perfection by saying that 'God is a substance of unlimited (or infinite) perfection.'

Strictly speaking, the 'way of negation' expresses what God *is not* rather than what He *is*. As St. Thomas¹ puts it: "Now in treating of the divine essence the principal method to be followed is that of remotion. For the divine essence by its immensity surpasses every form to which our intellect reaches; and thus we cannot apprehend it by knowing what it is. But we have some knowledge thereof by knowing *what*

it is not: and we shall approach all the nearer to a knowledge thereof according as we shall be enabled to remove by our intellect a greater number of things there from. For the more completely we see how a thing differs from others, the more perfectly we know it: since each thing has in itself its own being distinct from all other things. Wherefore when we know the definition of a thing, first we place it in a genus, whereby we know in general what it is, and afterwards we add differences, so as to mark its distinction from other things: and thus we arrive at the complete knowledge of a thing's essence.

“Since, however, we are unable in treating of the divine essence to take what as a genus, nor can we express its distinction from other things by affirmative differences, we must needs express it by negative differences. Now just as in affirmative differences one restricts another, and brings us the nearer to a complete description of the thing, according as it makes it to differ from more things, so one negative difference is restricted by another that marks a distinction from more things. Thus, if we say that God is not an accident, we thereby distinguish Him from all accidents; then if we add that He is not a body, we shall distinguish Him also from certain substances, and thus in gradation He will be differentiated by suchlike negations from all beside Himself: and then when He is known as distinct from all things, we shall arrive at a proper consideration of Him. It will not, however, be perfect, because we shall not know *what* He is in Himself.”

We observe the ‘way of negation’ in many expressions used to designate the perfections peculiar to God alone; for

instance, in expressions like 'unchangeable,' 'uncaused,' '*infinite*,' 'immense,' 'unlimited,' 'ineffable.' Perfections expressed in this negative manner plainly show their creatural origin. The original notions are derived from the sensible world, with all the limited perfection characteristic of this world. Obviously, a 'limited perfection,' when viewed from the standpoint of God, is a relative 'imperfection.' This 'imperfection' must be removed when applied to God, and this is done by the 'way of negation.

THIRD, THE *WAY OF EMINENCE*. JUST AS ALL IMPERFECTIONS MUST be denied of God, so all pure perfections must be ascribed to God in a superlative degree, without any kind of limitation. In other words, all pure perfections in God, as we shall see later, are without limit, infinite. This is usually done by ascribing to God a pure perfection and then raising the perfection to the highest degree conceivable by 'way of eminence.' It is thus that we speak of God as being 'infinitely good,' 'infinitely wise,' 'omniscient,' 'omnipresent,' and so forth. God is really good in Himself, but so are creatures; in order, then, to distinguish the goodness of God from the goodness of creatures, we say that God is 'infinitely good,' 'good without limit,' because that is what God's goodness is and that applies to God alone. Similarly, knowledge is found both in God and in creatures; but knowledge in creatures is essentially limited, while in God it is essentially unlimited, and so we say that God is omniscient' and thereby distinguish His positive

perfection of knowledge from the positive perfection of the knowledge present in creatures.

Analogical Knowledge of God

Many perfections are, in a sense, *common* to God and to creatures; for instance, the perfections of 'substantiality' and 'intelligence' are present in God and man. Evidently, however, such perfections differ in manner and in degree when attributed to God and man (and to creatures in general).

A term may be applied to a number of things either in a univocal, equivocal, or analogical sense. It will be applied *univocally*, when the sense of the term is identical in all the realities to which it is applied; the term 'man,' since the meaning is identical in all human beings, is used univocally of all men. An *equivocal* term is applied to a number of realities in entirely different meanings; such is the use of the term 'coach' as applied to a vehicle and to an athletic director. An *analogous* term applies to unlike, but related, things, so that it is used in a meaning that is partly the same and partly different. There is always some relation between such things, entitling the mind to designate them by the same term; hence, the term is not equivocal. Due to the partial unlikeness in the things, however, the term is not used in a strictly univocal sense; hence, the term is not univocal either. An analogous term designates related things in such a manner that it applies primarily to one thing and secondarily to other things.

In what sense do we use the terms signifying perfections *common to God and creatures*, when they are applied to God and creatures? In a univocal sense? equivocal sense? analogical sense? Practically all Christian philosophers claim that such terms are used in an *analogical* sense, and we subscribe to this thesis.

For one thing, pure perfections common to God and creatures are *not* ascribed to them in an *equivocal* sense. For example, the term 'existing being' is applied to God and to every being in the universe; each one is said to be an 'existing being.' Is this term ('existing being') applied to God and to the creatures in the universe in entirely different meanings, as the term 'coach' is used of a vehicle and of an athletic director or the term 'pitcher' is used of a vessel and of a person throwing a ball at a batter? Evidently not. What is meant by an 'existing being'? Anything which is not 'nothing,' not a 'non-being.' God is assuredly not 'nothing'; and He is assuredly not a 'non-being.' God actually exists, and the creatures in the universe actually exist. God and the creatures in the universe must, therefore, be 'existing beings' in the true sense of the word. Consequently, the term 'existing being' does not apply to God and the creatures in the universe in an equivocal sense, as if the term had entirely different meanings in its application to them.

Nevertheless, terms which apply to creatures are *not* applied to God in an absolutely univocal sense, as if there were no real difference in their meanings. In God all perfections are un-derived, uncaused, and unlimited; while in creatures all perfections are derived, caused, and

limited. God is the source and origin of all perfections found in creatures; creatures, however, are in no sense the source and origin of God's perfections. God 'gives' perfections to creatures as their 'cause'; creatures 'receive' these perfections from God, and their whole being is an 'effect' produced by God. God's perfections are identical with His essence and are therefore essentially infinite (as will be shown later); the perfections of creatures are not identical with their essence and are essentially finite. As a consequence, the terms designating the perfections of God and the creatures are not absolutely identical in meaning and are not, therefore, absolutely 'univocal.' When we, for instance, say that 'God is wise' and that 'man is wise,' the term 'wisdom,' though not equivocal in its use, is not absolutely univocal; God's wisdom is essentially infinite and eternal, while man's wisdom is essentially finite and temporal.

The conclusion is evident. Since the terms referring to the perfections common to God and creatures are neither absolutely identical nor absolutely equivocal in meaning, but are used in a sense which is partly the same and partly different, they are rightly said to be *analogous* terms. The use of these terms is not purely 'metaphorical.' The analogy underlying the application of the same terms to God and creatures is an *analogy of intrinsic attribution based on the fact of causality* (or, as many prefer to call it, an analogy of 'proper proportionality'). As such, therefore, all pure perfections are present in God 'primarily,' because He is the essential source of these perfections in Himself and in creatures; they are present in creatures 'secondarily,'

because ultimately they have their essential source in God who gave them to the creatures. Hence, pure perfections are attributed to God in a 'primary meaning' and to creatures in a 'secondary meaning,' because all creatural perfections are utterly dependent in their being and existence on the causality of God.

It is thus seen that the terms used to designate pure perfections common to God and creatures have a meaning which is partly the same and partly different; that is to say, they are analogous terms — not univocal and not equivocal.

So far as man's knowledge of God is concerned, it is *neither intuitive nor comprehensive*. Man in his natural life never knows God as He is in Himself, for the simple reason that He cannot see God directly. Intuitionists and ontologists have put forth the claim that man has a direct knowledge of God through intuition; that their view is erroneous is evidenced by the fact that all man's terms of God show an unmistakable derivation from creatural conditions. Man's knowledge of God, being indirect and analogical while he lives here on earth, will always be incomplete and fragmentary; as such, it can never be comprehensive. God exists 'in light inaccessible.' For man, therefore, as a creatural being limited in mental power, God must always be *incomprehensible and ineffable*. All man's concepts of God contain a core of impenetrable darkness, and this darkness can never be completely dispelled.

The indirect, discursive, and analogical character of man's knowledge of God and His perfections must always be borne in mind in the subsequent discussions of His essence and attributes.

Notion of Essence and Attribute

Essence in general is defined as *that through which a being is just what it is (id quo res est id quod est)*. What for instance, is the essence of man? That which makes him to be simply and positively a 'man,' and not a brute or a plant or an inanimate object or anything else. 'Animality' and 'rationality' are found in every individual 'man' and distinguish him from every other being. 'Rational animal,' therefore, is the essence of man.

Every being present in the natural order of the universe consists of essentials and nonessentials; altogether, the concrete realities existing in a being form a complex whole. And for all this complex whole of reality or entity there must be a common source and fountainhead of being and operation. This source or ultimate principle in the thing, from which it derives whatever it possesses in the line of 'being' in any form, is appropriately designated the thing's *essence* (Lat., *esse*, to be; *essentia*, being).

The 'essence' of a thing is sometimes called *nature*. Out of the essence as out of a matrix all being of a thing is, so to say, born (Lat., *nasci*, to be born; *natus*, born; *natura*, nature, that which is given by birth); the elements of a thing, which constitute its being, have existence only in so far as they flow (are born) from the essence. Specifically, 'nature' is an essence considered as the ultimate principle of operation in a being. 'Essence' is more static, and 'nature' more dynamic, in its meaning; in reality, of course, both mean fundamentally the same thing, viewed from different standpoints.

A distinction is made between 'physical' essence and 'metaphysical' essence. The distinction is important.

A *physical essence* is an essence in so far as it is, or can be, something in the order of reality, independent of the consideration of the mind contemplating it. The term 'physical,' as used here, must not be interpreted in the sense of 'material,' although that is the sense in which the term is frequently used. 'Physical' here means the same as 'natural,' 'pertaining to the nature of a thing' (Gr., *φυσικός*, natural; from *φύσις*, nature, constitution of a thing); as such, therefore, a 'physical essence' may be either material or spiritual. Thus, when 'man' is defined as 'an organism composed of a (material) body and a (spiritual) soul,' the definition gives the 'physical essence' of man, because that is what makes man to be man in the order of reality; 'body' and 'soul' are the actual, physical constituents which exist as such in man, independent of the mind that thinks of man. The 'physical essence' of an angel is its simple substantial entity, excluding all accidental reality modifying the substance. As it will be noted, the 'physical essence' of a thing is understood to be the complex of all the fundamental elements without which this thing cannot exist.

A metaphysical essence is an essence consisting of all those elements which are necessary for the concept of the thing and without which this thing cannot be conceived. The 'metaphysical essence' of a being consists of two elements, distinct in concept (meaning), one of which is conceived as being 'common' and the other as 'differentiative.' Because of the 'common element,' the

thing in question agrees with two or more other beings; and because of the 'differentiative (differentiating) element,' it differs from all beings which are not itself. The definition of 'man' as 'a rational animal' expresses his metaphysical essence: 'animal' expresses the constitutive element which man has in common with other sentient organisms (for instance, with dogs, cats, horses, and so on), while 'rational' expresses the constitutive element which distinguishes man from every other type of animal (for he alone possesses 'rationality'). Hence, a 'metaphysical essence' is the sum of the various grades of being which constitute a thing in the concept of the mind; we do not consider an object as it exists concretely in the world of reality, but according to the manner in which it is conceived by the mind in its thinking.²

While, therefore, the 'physical essence' of a thing is the complex of all the fundamental elements without which this thing cannot *exist*, its 'metaphysical essence' is the sum-total of the various grades of being without which it cannot be *thought*.

AN *ATTRIBUTE* IS DEFINED AS *THAT WHICH FOLLOWS BY NATURAL necessity upon a fully constituted essence*. Given the essence, the attribute is also given. The attribute always characterizes the essence, since it flows necessarily from the essence. Another term for 'attribute,' practically synonymous with it, is property. As the word indicates (Lat., *proprium*, one's own), a 'property' belongs to an essence in such a manner that it is 'proper to this essence. Thus, the

‘power of speech’ is an attribute or property of man as a rational animal: only an ‘animal’ can have organs capable of emitting articulated sounds; and only a ‘rational’ being has ideas which can be communicated to others by means of speech.

Attributes reveal the underlying essence. They lie closer to the surface of things than does the essence. Hence, man in his knowledge recognizes the attributes sooner than he does the essence. Since the attributes flow necessarily from the fully constituted essence, there exists an intrinsic connection between the attributes and the essence, and so the mind of man naturally goes from a knowledge of the attributes to a knowledge of the essence itself. Oftentimes man is incapable of defining an essence by means of proximate genus and specific difference; in that case a descriptive definition by means of attributes is the only way of arriving at a knowledge of the essence. Such a form of knowledge will be *imperfect*, but it will be *true*.

When speaking of God, we understand by the *divine attributes* all those perfections which flow necessarily from the divine essence and which are found in no other being but God. First, though, we must try to discover the metaphysical and physical essence of God, before making a detailed investigation of God’s attributes. Ordinarily, this procedure should be reversed; inasmuch, however, as the proofs for God’s existence have revealed many of His attributes, this procedure is logical.

God’s Metaphysical Essence

By the *metaphysical essence of God* we understand God's essence, not as it 'exists' objectively in itself, but as it is *known by the human mind*, namely, God's essence in so far as man's mind can signify it by a definition or quasi-definition which embraces the element (or elements) common to it and to all other beings and the element differentiating it from all other beings. A strict definition, of course, would be by proximate genus and specific difference; God, however, does not properly belong to any genus, and therefore a strict definition of God is impossible. A *quasi-definition*, however, is possible, for a description, containing a common and a differentiating element, can be made.

It is not a question here of giving a quasi-definition of the essence of God as it exists objectively in itself; that would be a definition of the 'physical essence' of God rather than of his 'metaphysical essence.' It is a question of what *man in his way of thinking must consider to be the most fundamental element in God's being*, the one from which all other elements and attributes are ultimately derived. It is, therefore, that reality in God's being which, for man's thought, must be considered to be the root-principle of all the realities which can be predicated of God; or, in other words, the primary and foremost characteristic by which man recognizes God as God. Some one perfection of God's being must, to man's mind and his way of thinking, be regarded as primary among His perfections, so that it is the root that gives rise to all His other perfections and distinguishes Him from any and every type of being which is not God. Because of the imperfection of his intellect, and

because his concepts of God are acquired through various considerations of creatural things, man has many different concepts pertaining to God; among these concepts, some refer to perfections which are absolute and some to perfections which are derivative. That *perfection which is conceived by man as being the most basic* to an understanding of God is what is meant by the 'metaphysical essence' of God. Even if man disavows any division in God, he cannot avoid making mental distinctions in the concepts about God. Hence, the need of discovering which of these concepts represents God's 'metaphysical essence.'

All authors agree that in God's metaphysical essence the element or item which is *common* to Him and creatures is 'being'; and by the term 'being' is here meant 'existing being,' not being which is merely possible. There is, however, considerable dispute about the element or item which *differentiates* God from every other being.

A number of *theories* have been advanced regarding this differentiating element in God's metaphysical essence.

Duns Scotus and many *scotists* maintain that the primary differentiating element in God's essence is *infinity*. Infinity may be either extensive or intensive. 'Extensive' infinity means the possession of all possible perfections, viewed from a quantitative standpoint. 'Intensive' infinity means the possession of divine perfections in an infinite degree. Some scotists, and also Palmieri and others, claim that 'radical infinity' constitutes God's metaphysical essence, and by 'radical infinity' they understand the exigency of God's being for both extensive and intensive infinity. Very recently, A. Antweiler has come out in defense

of 'infinity' as the metaphysical essence of God. Other defenders are: Van de Woestyne, Belmond, and Minges.

Ockham and the *nominalists*, and also Descartes and Leibnitz, claimed that the divine essence is but the *sum of all His perfections*: hence, no single fundamental perfection can be mentioned which would logically explain the rest.

Another theory has been advocated by *some thomists*, among whom are John of St. Thomas, Gonet, and Billuart. According to their view, the primary difference which distinguishes God from all other beings lies in *intelligence* or in the subsistent act of divine *intellection*. These authors feel that the metaphysical essence of God must be sought and found in His highest attribute; but this is the divine intellection, not radical but actual, viewed from the standpoint of supreme actuality which is *per se* subsistent. Some, however, defend the 'exigency' for knowledge, rather than actual intelligence, as the fundamental differentiating note of the divine essence.

Relatively few authors have favored the view that the primary distinguishing mark of God's essence is divine *love* and *life*: God is love, and God is life.

Some modern *voluntarists*, such as Secrétan, Lequier, and Boutroux, look upon God's *absolute liberty* as the most characteristic item which differentiates God from all other beings. God, being a pure spirit of the highest order, consists only in what He does; and for that 'absolute liberty' is necessary.

Many modern scholastics defend the thesis that the primary differentiating element in the metaphysical essence of God is His *aseity* (*aseitas*), namely, that God is *a se*, the

being who exists of and by Himself, the self-existent being. This is the thesis of J. Hontheim, B. Boedder, J. Donat, and others.

F. Suarez and most modern scholastic philosophers place the primary characteristic of God's metaphysical essence in His *self-subsistence*. Among prominent thomists who hold this view are Gapreolus, Bañez, Gotti, Contenson, Ledesma, Del Prado, and Garrigou-Lagrange. Among nonthomists, besides Suarez, authors like Molina, Vasquez, Torres, G. H. Joyce, J. Hellin deserve mention. God is 'subsistent being,' and by that term is understood 'being subsisting independently of any potentiality, absolute reality, reality excluding all non-actuality.' A being is said to be 'subsistent' when it is an existing substance, complete and autonomous; it is said to be 'self-subsistent' when it owes its subsistence to its own self and its own constitution, and not to any kind of supporting cause. Creatural substances possess subsistence, but their subsistence is derived ultimately from the causality of God. God's subsistence is underived, unconditional, absolute, necessary, uncaused; and for this reason God *is* self-subsistent being, while all other beings can only be said to *have* subsistence. 'Self-subsistent being,' these thinkers contend, constitutes God's metaphysical essence.

Evaluation of Theories

As was stated at the beginning of the last section, by the 'metaphysical essence of God' is understood God's essence in so far as it can be expressed in a definition or quasi-

definition which embraces the element (or elements) *common* to it and to all other beings and the element *differentiating* it from all beings which are not God. The element which is 'common' to God and all things is 'existent being'; about this there is practically universal agreement among scholastics. The difficulty arises in determining the 'differentiating element' and the problem of determining it has led to the formation of a number of divergent theories. These theories must now be evaluated.

The first theory to be examined is the scotistic theory of infinity. If the term 'infinity' is taken primarily in its literal meaning of 'without limits,' then the term has a negative connotation. The negative, however, always presupposes something positive. God's being is absolute and supreme actuality. Hence, negative infinity, in God, presupposes positive infinity; and so negative infinity cannot be the primary and constitutive element which differentiates God's essence from all other beings: this differentiating element must be something positive. If the term 'infinity' is taken in a positive sense, it can mean either the aggregate of all perfections ('extensive' infinity) or the supreme degree of God's perfections ('intensive' infinity) or the exigency of God's being for both extensive and intensive infinity ('radical' infinity). Now, none of these three possibilities is satisfactory as the primary differentiating element. Taken as 'extensive infinity,' the term signifies the sum-total of God's perfections as they exist in reality, and in this sense the term means what is commonly understood to be God's 'physical' essence; the problem would still be unsolved as to which of these divine perfections is the root-perfection

which, for man's mind, explains all the other divine perfections. Taken as 'intensive infinity,' the term signifies primarily the 'degree' of perfection, and as such expresses the 'mode' in which these perfections exist in God's essence; all divine perfections have the 'mode' of infinity, and therefore this 'mode' offers no explanation to man's mind of how the various perfections are derived from the essence. Taken as 'radical infinity,' the term still characterizes the 'mode' or 'way' in which God's essence exists rather than the essence itself. According to man's thinking, man conceives God's essence *to be* before he conceives it to be *infinite*. 'Infinity,' whether extensive or intensive or radical, is conceived as being more in the nature of a 'property' of the divine essence and its perfections than a characterization of the essence itself. If 'radical infinity' is interpreted as meaning 'being through essence' or 'subsistent being,' then there is only a verbal distinction between this view and the Suaresian view.

The *nominalist theory* must be rejected. The metaphysical essence of God must be expressed in a manner that gives the differentiating element which distinguishes God from all other beings and at the same time gives the root of all the perfections existing in God. The nominalist theory fails to do this. The *sum-total of God's perfections* is merely a confused expression of all the reality which exists in God, but it does not express the root of all perfections existing in God. 'Omni-perfection' expresses God's being as it exists objectively in the order of things; and thus the nominalist conception expresses God's physical essence, not His metaphysical essence.

The theory which places God's metaphysical essence in *intellectuality* or *actual intellection* must also be adjudged inadmissible. If this term is used in the sense of 'actual' comprehension and understanding, it should be obvious that it is not the metaphysical essence of God. 'Actual intellection' is conceived as an operation,' and an operation always presupposes a person who performs the operation; hence, 'actual intellection' flows from the essence, but only as something secondary to it, just as the exercise of a power is secondary to the power itself. If this term is used in the sense of 'radical' comprehension and understanding, it signifies the intellect of God; but the intellect itself is conceived as a vital power resulting from the spirituality of the essence, and as such is not primary but secondary. In no case can intelligence be considered to be the root and foundation of all the perfections existing in God: what is itself conceived as derived from something else cannot be conceived to be the root-perfection from which all other divine perfections are ultimately derived. There must be something in God more ultimate than intelligence, whether actual or radical.

For a similar reason, the theory must be rejected that *life or love* is the metaphysical essence from which all other perfections in God are deducible. True, God is life, and God is love. But 'life' and 'love' are not conceived as being the ultimate perfections of God's nature. 'Love' is definitely conceived as an act of the divine will, and the will is dependent on the intellect for the object which it loves; hence, 'love' is not conceived as the primary source of divine perfections and as the distinguishing characteristic

of the divine essence. Even 'life' is not conceived as primary. In the case of God's 'life,' it is a manifestation of God's spiritual substance; hence, spirituality and substantiality would be more ultimate, from the standpoint of man's knowledge, than 'life.' We must therefore conclude that 'life' and 'love' are not the metaphysical essence of God.

Neither is *liberty* the characteristic feature which is the distinguishing mark of the divine essence. 'Liberty' is a mode of the will's action and presupposes the will itself; it also presupposes spirituality and substantiality in God's nature. How, then, can it be conceived by man as being the source, the root-perfection from which all divine perfections are logically deduced? In the logical order of thought, the intellect is prior to liberty, because we cannot think of liberty except as following the judgment of the intellect; liberty without consciousness is inconceivable, and consciousness in God is conceived by man as being a function of the divine intellect. Consequently, the theory of the voluntarists that God's metaphysical essence consists in God's will and its absolute liberty is totally inadequate.

The view that *aseity* constitutes the metaphysical essence of God is held by many prominent philosophers. According to this theory, the fact that God is *ens a se, self-existent being*, is the fundamental perfection of God's essence from which all other perfections are deduced and the ultimate characteristic differentiating His essence from all beings which are not God. Because of the prominence of the philosophers who support this theory, their view deserves careful consideration.

The term 'aseity' may be taken negatively or positively. If taken *negatively*, the term implies that God does not owe His existence 'to another' as the contingent creatural beings do; and this negative sense of *ens a se*, or self-existent being, we can hardly accept as an expression of the metaphysical essence of God. A negative element is always grounded in some positive element, and so we would be forced to seek this positive reality in God by asking the further question: 'What is the reality in the divine essence which precludes the possibility of God being from another and necessarily being an *ens a se*?'

As George Hayward Joyce³ rightly observes:

"The objection to regarding this attribute as God's metaphysical essence is that it does not really express what we conceive as an internal constitutive principle of the Divine nature. The real significance of the notion *Ens a se* is to deny that God is, like creatures, caused by another. He is conceived as self-existent in the sense of 'un-originated.' Undoubtedly this is the first aspect under which we conceive God, as we reason from the existence of contingent things to that of a necessary Being. But it still remains for us to ask what is the internal constitutive, in virtue of which He is un-originated and needs no cause. And to reply to this question we must fall back on our concept of Him as subsistent existence — as *the Being whose existence is His nature.*"

— GEORGE HAYWARD JOYCE

If the term 'aseity' is taken in its *positive* meaning, the meaning seems to be identical with *self-subsistence*. The words are different but the meaning is the same. This being the case (as a close examination of the arguments advanced by these authors reveals), we feel that the metaphysical essence of God lies in 'self-subsistence.'

God, the Self-Subsistent Being

The metaphysical essence of God must be expressed in a definition or quasi-definition which contains the element common to other beings and also the primary differentiating element which distinguishes Him from all other beings. This is what is understood by 'metaphysical essence,' in so far as man's knowledge of God is concerned. Now, the expression 'self-subsistent being' contains both this 'commons element and this 'primary differentiating' element; as such, therefore, the expression 'self-subsistent being' is a definition, or rather a quasi-definition, of God's metaphysical essence.

That the expression contains the element which is *common* to God and all other creatures, is clear from the fact that both God and creatures are 'beings'; the term 'being' applies to all possible and actually existing things, and it also applies to God. That God is conceived as the 'self-subsistent' being, certainly differentiates Him from all other beings, whether they be possible or actually existing. And this *differentiating* element is undoubtedly 'primary.' This latter point will now have to be proved.

In order that the 'differentiating' element in a metaphysical essence be truly *primary* the following conditions must be fulfilled: the primary differentiating element must be something real and positive; it must be characteristic; it must be a reality which is not derived from a prior intrinsic perfection; and it must be a reality from which all other necessary attributes (realities, perfections) are deducible and receive their logical explanation. Each of the conditions will have to be shown to be required, in order that the differentiating element can be said be 'primary.'

The primary differentiating element of a metaphysical essence must be *real*; when it is a question of realities, as is the case here, only something that is 'real' can bring about a 'real' differentiation. It must be something *positive*; if it were 'negative it would ultimately have to be grounded in something 'positive,' and then this positive reality would have to be conceived as prior to this differentiating element. It must be something *intrinsic*; otherwise it would not characterize the essence itself, but something else. It must be *necessary*; God is a necessary being, and anything belonging to His essence must also be necessary. It must be *characteristic*; if it were not something 'exclusive' and 'proper,' it would not distinguish God's essence from that of every other being and would thus fail in its 'differentiating' function. It must be a reality which is *not derived* from a *prior* intrinsic perfection; if it were so derived, it would be secondary, not primary, and this other prior intrinsic perfection would be the primary differentiating element. It must be a reality from which all other attributes (realities,

perfections) are *deducible* and receive their *logical explanation*; it would not be the characteristic mark of the divine essence, distinguishing God from all other beings, if it were not the 'primary' attribute from which all other attributes are deducible and thus were not the radical principle explaining the presence in God of His other perfections.

The term '*self-subsistent being*' fulfills these conditions adequately, so far as man can know God's essence at all. A 'self-subsistent being,' as was stated before, means a being which exists as a complete, autonomous substance and owes its existence to no other reality but to its own essence; to be 'self-subsistent,' therefore, is equivalent in meaning 'to exist in virtue of the being's own essence,' so that 'essence' and 'existence' are identical.

That the *conditions* required for the 'primary differentiating element' are verified in the 'self-subsistent being,' can be shown as follows: The 'self-subsistent being' is evidently something *real*, some thing *positive*, and something *intrinsic* to the nature of God. It is, furthermore, a reality which is a necessary constituent of God's essence, because it is God's essence or nature itself; if God were not a reality 'self-subsistent in virtue of His essence,' He would have received His existence from some other being and would not be an *ens a se*. 'Self-subsistence' is also a characteristic, or exclusive and proper mark, of God; no other being can be said to possess the perfection of 'self-subsistence,' because all other beings are contingent and as such have received existence from God. The 'self-subsistence' of God's essence *is not derived* from any other

prior intrinsic perfection, because no such perfection can be found; the only other perfections, which could come into consideration, would be 'aseity' or 'infinity,' and these perfections really have their foundation in the self-subsistence of God, since the only intrinsic reason why God can be said to be 'of Himself' and 'infinite' is the fact that He subsists in virtue of His essence (as will be shown later in detail). That the other divine perfections have their *ultimate foundation* in the self-subsistence of the divine essence, will become increasingly clear as we proceed in the discussion of the attributes of God; let it suffice to repeat the remark of St. Thomas:⁴ "Although existence does not include life and wisdom, because that which participates in existence need not participate in every mode of existence; nevertheless God's existence includes in itself life and wisdom, because nothing of the perfection of being can be wanting to Him who is subsisting being itself."

It is for these reasons that very many scholastic philosophers prefer the view that the 'primary differentiating element' in God's metaphysical essence is His *self-subsistence*. In this they follow in the footsteps of the greatest of all Christian philosophers, St. Thomas,⁵ who says:

"The fact that the being of God is self-subsisting, not received in any other, and is thus called infinite, shows Him to be distinguished from all other beings, and all others to be apart from Him."

— ST. THOMAS AQUINAS

In the Book of Exodus (3.13, 14) it is related that, when the Lord told Moses to lead the Israelites out of Egypt, Moses asked Him, "If they should say to me, 'What is his name?' What shall I say to them?" And the Lord answered him: "Thus shalt thou say to them, 'He Who Is,' hath sent me to you." St. Thomas⁶ gives three reasons why he considered '*He Who Is*' as most properly applied to God:

"First, because of its signification. For it does not signify form, but simply existence itself. Hence since the existence of God is His essence itself, which can be said of no other (qu. 3, art. 4), it is clear that among other names this one specially denominates God, for everything is denominated by its essence.

"Secondly, on account of its universality. For all other names are either less universal, or, if convertible with it, add something above it at least in idea; hence in a certain way they inform and determine it. Now our intellect cannot know the essence of God itself in this life, as it is in itself, but whatever mode it applies in determining what it understands about God, it falls short of the mode of what God is in Himself. Therefore the less determinate the names are, and the more universal and absolute they are, the more properly are they applied to... Now by any other name some mode of substance is determined, whereas this name '*He Who Is*' determines no mode of being, but is indeterminate to all; and therefore it denominates the *infinite ocean of substance*.

"Thirdly, from its consignification, for it signifies present existence; and this above all properly applies to God, whose existence knows not past or future."

— ST. THOMAS AQUINAS

The name '*He Who is*' can hardly mean anything else but the *self-subsistent being*, and St. Thomas considers it to be the one name most properly applicable to God.

All things considered, therefore, we think we are justified in favoring the theory that 'self-subsistent being' is the quasi definition which best expresses the metaphysical essence of God as conceived by man. Our next choice would be *ens a se* or *radical infinity*. However, if these terms are interpreted in a positive manner, they signify practically the same thing as what is expressed by the term 'self-subsistent being.' Hence, the latter term seems preferable, because it contains the element common to God and creatures and the differentiating element which is most fundamental in God's essence and which distinguishes Him primarily from every other being; and that is precisely what the 'metaphysical essence of God,' viewed from the standpoint of man's imperfect and limited knowledge, is supposed to do.

God's Physical Essence

The *physical essence* of a thing is defined as the essence of a thing in so far as it exists in the actual order, independent of all mental consideration and distinction. Taken concretely, the physical essence of a thing is its *total reality*,

not including accidents and properties. 'Accidents' ('accidental realities') are excluded because they are superadded to the essence and are not a part of the essence itself. 'Properties' are excluded because, although they flow necessarily from the essence as fully constituted, they are not constitutive of the essence itself.

As applied to God, His physical essence consists in His *omni-perfection*, namely, in the sum-total of all His perfections. The proof is simple.

In the concrete, the 'physical essence' of a thing is its total reality, taking this reality as distinct from all its accidents and properties (in the sense given above); that is what is understood by the term 'physical essence,' and that is its definition. Now, in God there are no 'accidents' and no 'properties' (in the sense given above); otherwise there would be a composition in God between His essence and these accidents and properties. Composition, however, is impossible in the being which is pure actuality (as was shown in the proofs for God's existence), because composition would presuppose a being prior in existence to God, so as to bring together the composing realities; but there can be no being prior in existence to God who is the First Being. Hence, since there are no accidents and properties in God's essence, the absolute omni-perfection of God is His total reality. Consequently, *God's absolute omni-perfection is His physical essence.*

THE *DIFFERENCE* BETWEEN GOD'S PHYSICAL AND METAPHYSICAL essence should be evident. His 'physical essence' is His

reality as it exists in the objective order of things, irrespective of man's mode of thinking. His 'metaphysical essence' is, from the standpoint of man's mode of thinking, the quasi-definition which enables him to grasp intellectually and then express God's essence in such a way that this quasi-definition contains the element 'common' to God and all other beings and also the element which 'primarily differentiates' God from all other beings. Man's knowledge of God is derived from creatural reality and as such is only indirect and analogous; yet this knowledge is true and genuine, even though it is incomplete and fragmentary. This fact is, naturally, reflected in the attempt to determine God's physical and metaphysical essence.

It was stated that God's physical essence consists in omni-perfection.' Just what are God's perfections or attributes? The following chapters should give an answer to this question.

Summary of Chapter IX

This chapter treats of man's way of knowing God and of God's *metaphysical and physical essence*.

1. *Man's Knowledge of God*. — Much of the knowledge acquired through the *physical sciences* is the result of discursive reasoning, not of direct observation. In a similar manner, man applies rational principles to the data of experience and draws conclusions as to the nature of God.

2. *Ways of Knowing God*. — Man acquires and expresses his knowledge of God in three ways: the way of *affirmation*, the Way of *negation*, and the way of *eminence*.

3. *Analogical Knowledge of God*. — The terms man uses to express his knowledge of God are neither univocal nor equivocal, but *analogous*.

4. *Notion of Essence and Attribute*. — 'Essence' in general is that through which a being is just what it is. Essence, considered as the ultimate principle of operation in a being, is called 'nature.' *Physical* essence is an essence in so far as it is, or can be, something in the order of reality, independent of the consideration of the mind contemplating it. *Metaphysical* essence is an essence consisting of all those elements necessary for the concept of the thing; its definition or quasi-definition contains a common' and a 'differentiative' element. An *attribute* is that which follows by natural necessity upon a fully constituted essence. The *divine attributes* are all those perfections of God which flow necessarily from the divine essence.

5. *God's Metaphysical Essence.* — By this we understand God's essence in so far as man's mind can signify it by a definition or quasi-definition which contains the element (or elements) 'common' to it and to all other beings and the element 'differentiating' it from all other beings; it is that perfection which is conceived by man as being the most basic.

The element *common* to God and to other things is 'being.' A number of theories have been advanced regarding the element *differentiating* God from all other beings:

Some authors have considered this differentiating element to be *infinity* (either extensive or intensive or radical). Others, *the sum of all perfections* in God. Others, divine *intelligence* (radical or actual). Others, God's *love and life*.

Others, absolute *liberty*. Others, *aseity*. Suarez and very many modern scholastics place the primary characteristic of God's metaphysical essence in His *self-subsistence*.

6. *Evaluation of Theories.* — 'Infinity' is a mode of the divine perfections rather than of the essence itself. The 'sum-total of all perfections' represents God's physical essence, not His metaphysical essence. 'Intelligence' is not primary, because it presupposes the substance of God. 'Love' presupposes will; and 'life' presupposes spirituality and substantiality. 'Liberty' presupposes will and intellect. 'Aseity,' taken negatively, presupposes some positive perfection in which it is grounded; taken positively, it seems to be identical in meaning with 'self-subsistence.' We

consider 'self-subsistence' to be the differentiating element in God's metaphysical essence.

7. *God, the Self-Subsistent Being.* — When we say that 'God is the self-subsistent being,' we give a quasi- definition which contains an element *common* to Him and to all things ('being') and an element which *differentiates* Him from all other things ('self-subsistent'). In order that the differentiating element be the truly distinguishing mark in God's metaphysical essence, it must fulfill certain *conditions*: it must be something real, positive, intrinsic, necessary, characteristic, not derived from a prior intrinsic perfection, and a perfection from which all other perfections are deducible. 'Self-subsistence' verifies all these conditions. Consequently, 'self-subsistent being' represents God's metaphysical essence.

8. *God's Physical Essence.* — Taken concretely, the *physical* essence of a thing is its total reality, not including accidents and properties. In God, the physical essence is His *omni-perfection*, namely, the sum-total of all His perfections in an absolute sense.

Chapter 10

SIMPLICITY, INFINITY, UNICITY

MAN KNOWS GOD PIECEMEAL. THE PROCESS IS SIMILAR TO photographing an object from different angles: each photograph represents the same object in a particular aspect, though none represents the object in its entirety; and all the photographs must be assembled and viewed together, in order to obtain a fairly complete view of the object. It is thus that man speaks of the various *attributes* and *perfections* of God: they are man's way of conceiving God's reality, although this reality, as will be seen, is fundamentally one and not multiple. Hence, we really know God Himself, but in our characteristically human manner — by means of diverse concepts.

Some attributes of God pertain to His being or *essence*, and some pertain to His operations. These attributes are *absolute*, in the sense that they are present in God irrespective of any creatural beings. Other attributes are *relative*, in the sense that they have reference to the existence of beings other than God Himself.

First, then, we must treat of the *absolute* or *essential* attributes of God. And among the various essential

attributes, the ones first to receive attention are *simplicity, infinity, and unicity*.

Notion of Simplicity

A thing is said to be 'simple' when it is not a 'compound,' that is to say, when it is devoid of composition. A 'compound' is a unit made up of a number of parts; in other words, a 'compound' is one and undivided in such a manner that it can be resolved into a number of components called its parts. Hence, a 'compound' is actually undivided (and therefore a unit) but divisible. On the other hand, a thing is said to be 'simple' when it is neither divided nor divisible.

Simplicity is thus the opposite of 'composition,' and it is defined as *the absence of composition in the reality of a being*. This definition is negative in form but positive in content. The reason for this negative form of the definition lies in the derivation of the concept of 'simplicity.' All the things man perceives in this world are affected by composition in some way. Hence, man arrives at the notion of 'simplicity' by denying composition. Since, however, it is some 'reality' which is said to be devoid of composition, the definition is positive in content. Composition may be of various kinds; and simplicity, correspondingly, may also be of various *kinds*.

Where there is composition, there are components or parts united into some sort of totality. And where there are components or parts, a distinction can be made between them. There will, then, be as many kinds of distinction as

there are kinds of composition. What are these different kinds of distinction?

The *two main kinds of distinction* are 'real' and 'logical,' inasmuch as they signify the absence of a real or logical identity between things or concepts.

Real distinction is the absence of sameness between *things different in their reality*, independent of the consideration of the mind. The entity of the one is not the entity of the other, even though they be components or parts of the same totality. Thus, the leaves and branches and fruits of a tree are 'really distinct' among themselves, although they are parts of the same tree; and the foundation and walls and fixtures are 'really distinct' with respect to each other, even though they belong to the house as a whole.

Besides a real distinction, we have also a 'logical' distinction. Our experience shows us that the universe consists of a multitude of beings. They are different entities, and as such they are distinct in thought and thing; there is a real distinction between them. It is equally true, however, that we often have different concepts of things that are really one in nature; they differ in thought, but not in the thing.

Such a distinction is called a *logical* or *mental distinction*, and it is defined as the *absence of sameness between concepts of the same reality*. In making this distinction between concepts of the same thing, there is either a reason in the thing itself for making it, or the reason for making it is only in the mind. Correspondingly, we have a 'virtual' or a 'purely mental' distinction.

A purely mental distinction (*distinctio rationis ratiocinantis*) is the distinction we make between concepts of one and the same reality, *without a foundation in the object itself* (*ratio ratiocinans*). The content of the different concepts is identical, and so the meaning is the same; the difference between them lies merely in the difference of the manner of their representation or expression. Such a distinction exists between terms and ideas which are 'synonymous' in meaning; for example, 'lance' and 'spear,' 'water' and 'H₂O,' 'twelve' and 'dozen,' 'century' and 'one hundred years.' It also exists between a definition and the thing defined; for example, 'man' and 'rational animal,' 'brute' and 'sentient organism,' 'clock' and 'mechanism for measuring time.'

A virtual distinction (*distinctio virtualis, distinctio rationis ratiocinatae, distinctio rationis cum fundamento in re*) is the distinction which exists between concepts of one and the same reality, with a foundation in the object itself for making the distinction. The mind is induced to make the distinction because of the nature of the object itself. The object is by nature complex, and the limited power of the human mind is incapable of expressing the entire reality of the object in one adequate concept and so expresses it in a number of concepts, each of which expresses a phase or aspect of the one reality. The concepts are, therefore, not identical in meaning, when compared to one another, but they all refer to the one same reality taken as it is in itself. This distinction will become clearer when we consider the two kinds of virtual distinctions, based upon the two kinds of 'foundations' which are possible: they are the virtual

distinction with a 'perfect' foundation and the virtual distinction with an 'imperfect' foundation in the thing.

The foundation of the virtual distinction is *perfect*, when the concepts are so distinct in comparison to each other (although they apply to the same reality) that they are *objectively different in content*; each has a definition objectively different from that of the other. When the mind forms objectively different concepts of the same reality, and these concepts have as their foundation the fact that they can be separately realized in different kinds of being (though in this individual kind of being under consideration they stand for one and the same reality only), then the distinction between such concepts is a 'virtual' distinction with a 'perfect foundation' in the nature of the thing itself. A case in point is the distinction made between the concepts of the soul in man, when we speak of it as a 'vegetant' soul, a 'sentient' soul, and a 'rational' soul. A plant demands a vegetant soul for its vegetant functions; a brute demands a sentient soul for its sensory functions; man demands a rational soul for his rational functions. Since man has the triple vital functions of vegetancy, sentiency, and rationality, we are justified in speaking of a vegetant and sentient and rational soul in man. As a matter of fact, however, there are not three souls in man but only one soul performing these three kinds of functions. Since, though, we have the foundation or reason in the nature of the human soul itself for making this threefold distinction, the distinction between a vegetant, sentient, and rational soul in man is a 'virtual distinction with a perfect foundation.'

A *virtual* distinction with an *imperfect foundation* in the thing is one in which the different concepts of the one reality are distinct in such a manner that they are not mutually exclusive but rather *include each other implicitly*. Because each includes the other implicitly, they can never be realized separately in different kinds of beings. The reason for the distinction between such concepts lies in the object itself, and thus there is a 'foundation in the thing'; but it is not as adequate a foundation as that of the virtual distinction with a perfect foundation. Consider the concept of 'being' and its inferiors. In man, for instance, there is no complete and perfect difference between the concepts of 'being' and 'substance,' 'being' and 'body,' 'being' and 'life,' 'being' and 'sentiency,' 'being' and 'rationality.' The concept 'being' means everything that is 'not nothing'; consequently, 'being' includes within itself implicitly also 'substance,' 'body,' 'life,' 'sentiency,' and 'rationality.' Similarly, each of these various concepts includes within itself implicitly the concept of 'being,' because their reality is but a form of being. Hence, the distinction between the concept of 'being' and the concept of any particular kind of being is a virtual distinction with an 'imperfect foundation in the thing.'

Since distinctions presuppose a plurality of things or concepts, it must be obvious that 'composition' also implies distinctions. Everything will depend upon the type of composition; but every type of composition consists in some manner of a plurality of things or concepts united into a whole, a totality. The very fact that a compound consists of components or parts shows that it is made up of a plurality

of *things or concepts which are distinct among themselves*. Hence, composition follows distinction very closely.

FOLLOWING THE LINES OF DISTINCTIONS IN SO FAR AS THEY AFFECT compounds, *composition* may be either *real* or *logical (mental)*, *substantial* or *accidental*.

Simplicity being the absence of composition, the denial of composition in a being implies the affirmation of simplicity in that being. Since a simple being is undivided in itself and indivisible (in the order in which it is said to be 'simple'), the two main kinds of 'simplicity' are 'absolute' and 'relative.'

Simplicity is *absolute*, when the being *excludes all parts* of whatever nature, be they real or conceptual. An absolutely simple being, therefore, is not only actually undivided but also potentially indivisible. A 'composite being' is actually undivided, because it is a unit, a whole, a totality; but it is potentially divisible, because it consists of (real or conceptual) parts which make it to be a compound and into which it can be divided. An 'absolutely simple being,' because it is devoid of all parts, is incapable of being divided.

Simplicity is *relative*, when the being excludes parts of one kind but has parts of another kind. Hence, the 'relatively simple being' is indivisible in one respect but divisible in another. The fewer parts such a being has, the more simplicity it possesses. Man, for instance, has a composite nature, consisting of body (matter) and soul (form). Man's body is a compound, because the substance

of the body is made up of a number of different integral parts (head, trunk, arms, legs, etc.); man's soul, however, is simple, because it does not consist of substantially different parts. However, a composition exists between man's substantially simple soul and many types of accidents (acts of thinking and willing). Similarly, besides this 'physical' composition, there also exists a 'metaphysical' composition in man between his essence and existence, his genus (animality) and specific difference (rationality), his nature and individuality, and his nature and personality. Man thus possesses 'relative simplicity' in the simple substance of his spiritual soul; but in many other respects he is a 'composite being.' In no case, however, can he or any other creatural being be said to be 'absolutely simple.'

After this general exposition of the notion of 'simplicity' and allied concepts, we are now in a better position to understand the problem of God's simplicity.

The Problem of God's Simplicity

The question of God's simplicity presents the following problem for solution: Is God's being composite or simple? If 'composite,' what sort of composition exists in His being? If 'simple,' is His simplicity absolute or only relative?

Where there is composition, there must be *parts* distinct from one another. Parts which are 'really' distinct effect a physical composition in a being; parts which are 'virtually' distinct with a 'perfect foundation in the thing' effect a metaphysical composition in a being; parts which are 'virtually' distinct with an 'imperfect foundation in the

thing' are not parts in the strict sense of the term, and their union effects a logical composition (a composition improperly so called). Hence, if God is a composite being, He must consist of parts which are either really distinct or virtually distinct with a perfect foundation.

Reversely, if God is a simple being, He must be either 'absolutely' or 'relatively' simple. If only 'relatively' simple, He would be simple in some aspect of His being but composite in some way or other. If 'absolutely' simple, His Being would be devoid of all parts, so that composition in the proper sense of the term would be totally absent.

WE CLAIM THAT *GOD IS ABSOLUTELY SIMPLE*.

The *opponents* to the doctrine of the absolute simplicity of God's being naturally teach that some form of composition exists in God, so that He consists of parts which are distinct. Among these opponents the following may be mentioned:

The *stoics* maintained that God is something *material*, because the material alone is real. The stoics had a number of appellations for the Deity, such as '*fire*,' '*ether*,' '*air*'; they even called the Deity '*soul*,' '*mind*,' '*reason*,' '*providence*,' '*destiny*.' Their fundamental doctrine, however, was materialistic and pantheistic.

The *spinozists* (followers of Spinoza) held that there exists but a single substance, God. But this single substance consists of many attributes, of which two are known to us, namely, '*extension*' and '*thought*.' Spinozism is pantheistic; God has evolved into the physical world ('*extension*') and

the conscious world of man's mind ('thought'). God is identified with the corporeal and spiritual worlds, and thus God is a composite being.

Most pagan religions are *polytheistic* and *anthropomorphistic*. Their gods and goddesses are at best beings which possess a human nature with superhuman powers and affections.

Modern *pantheists* either identify God with the visible world as such or consider Him to be the 'soul' of the universe. He may be looked upon as spiritual in nature or only as a world force. Many modern pantheists consider the beginning of things to have been the Absolute, which then evolved into the present world; this Absolute (as with Hegel, Fichte, etc.) is nothing more than 'being-in-general,' or 'indeterminate being.' The idealistic philosophy of the Absolute is now no longer in vogue. Its place has been taken by the secularistic philosophy of *evolutionism* and *finitism*. God is a man-made deity, fashioned in the image of man, the result of evolution and finite in all respects. This 'finite, evolving' God is replete with potentialities, continuously being perfected; composition is definitely a characteristic of His essence, if He is judged to exist at all. For many of these moderns 'God' is nothing more than an ideal, the personification of the human desire for assistance in time of trouble and distress, not an objective Supreme Being existing independent of man's mind. That such views are hardly more than a veiled atheism, is evident.

We are not interested in a sublimated human god, manmade as a friend or protector to satisfy some human need and emotion, but the God of Reason whose existence

as an extra-mundane Supreme Being has been proved by the application of incontrovertible rational principles to the data of our experience of the physical world. These objective proofs not only establish God's existence but also show that He is *absolutely simple*.

Proof of God's Absolute Simplicity

As was pointed out in Chapter 7, every composite being consists of parts which are distinct. The union of these parts into a whole forms the un-dividedness of a composite being. Hence, the parts are *potential* to the whole; the composite being becomes *actualized* into the whole or unit only through the unification of the parts, so that the existence of the composite being is *contingent* upon this unification.

The composite being is posterior to its component parts and thus, by its very nature, was originally merely *in potentiality* to their union; as such, it cannot have passed from this state of 'potentiality' to the state of 'actuality' except under the influence of another being already in act. In other words, parts, in themselves distinct and different, cannot of their own accord unite to form a composite being; they necessarily demand a *pre-existing cause* to bring them together and make them unite into a whole.

Now, God exists, and He is first, necessary, and uncaused. It is contradictory to suppose that something should exist *prior* to the first being. It is contradictory to suppose that the necessary being should be contingent upon the action of a prior being bringing the component parts of His being together. It is contradictory to suppose

that the uncaused being should require a *cause*. But all this would be necessary under the supposition that God is a composite being consisting of parts. Hence, God is not, and cannot be, a composite being consisting of parts. Consequently, there are *no parts of any kind in God*, since the argument applies to any and all parts.

A being, however, which is devoid of any and all parts is absolutely simple. *God, therefore, is absolutely simple*. The proof just given applies to any kind of composition in God's being. A number of *corollaries* follow as a necessary consequence.

GOD IS A *SUBSTANCE*.

Ever since Hume attempted to show that the notion of 'substance' is but a chimera of the human mind, it has become customary for many modern philosophers and scientists of the empiricistic school to deny the existence of anything like a 'substance.' Notwithstanding the prevalence of this view, it is easy to show that the notion of 'substance' is valid. Everything that exists must be either something which exists in itself and does not exist in another as in a subject of inhesion or something which does not exist in itself but exists in another as in a subject of inhesion; in the first case it is called a 'substance,' and in the second case an 'accident.' Everything must be either the one or the other, because there is no middle ground between contradictory ideas. Therefore, everything will be either a substance or an accident. Not everything, however, can be an 'accident,' because every accident demands a subject

(substance) in which it exists. It is impossible for an 'accident' to exist without a subject of inhesion; an accident without a 'substance' to inhere in would be like motion without a moving body. If nothing existed but 'accidents,' they would exist without a subject in which they inhere, and thus, by definition, all accidents would in the very nature of things become automatically 'substances.' Hence, substance there must be. And a substance, by the very fact that it is the subject in which the accidents inhere, must be *prior in nature* (in the order of dependence) to the accident (or accidents) it supports.

Now God exists in and for Himself, because He is the first and uncaused being. Therefore, God does not exist in another as in a subject in which He must inhere. God, therefore, is a *substance*.

God is a spiritual substance, a *spirit*. His essence contains *no matter* of any kind. If matter were a part or component of God's substance, 'composition' would be necessary. A material substance always consists of physical and extended parts, of which one is not the other. Hence, though actually undivided, such a material reality is potentially divisible. An absolutely simple being, however, is not only actually undivided but potentially indivisible; hence, it cannot consist of matter. Now, a substance which does not contain matter in its nature is a spiritual substance, a spirit. God, therefore, being devoid of all parts and composition, is a spirit. As a result, He is neither a purely material being, such as an inanimate metal, nor a being which is partly spirit and partly matter, such as man. As a further result, since matter is no part of His nature, He

cannot be dependent on matter in His existence and operations. But a substance which is neither composed of matter nor dependent in its existence and operations on matter is a 'pure spirit.' Consequently, God is a *pure spirit*.

THERE CAN BE *NO ACCIDENTS* IN GOD'S SPIRITUAL NATURE.

Accidents are determinations and modifications of the substance in which they inhere; as such they are actualizations of the potentialities of the supporting substance as the subject in which they inhere. The combination of substance and accidents in a being always presupposes *potentiality*, because the existing substance is in potency toward the reality which the accidents confer upon it. Whenever, therefore, there is a combination of accidents with a substance, there is a resultant *composition*. In God's essence, however, all composition and potentiality must be excluded, since He is the first, uncaused, and necessary being. Hence, His spiritual substance cannot be perfected by accidents supervening upon His essence; whatever reality the accidents could possibly confer must be present in God's substance from the very beginning. Consequently, God is a pure spirit without accidents, absolute spiritual substantiality.

Just as there can be no 'physical' composition in God, so *metaphysical composition* must be absent. Instances of metaphysical composition in existing beings are: the union of essence and existence, of genus and specific difference, of nature and individuality, of nature and personality. In order that a creature exist in the actual order of things,

such a union is required. In every instance mentioned, the first of the dual members is in potentiality toward the determination or perfection contained in the second: the essence is determined by existence; the genus is determined by the specific difference; a nature is determined by individuality; a (rational) nature is determined by personality. Where there is a union of metaphysical parts, there is metaphysical composition; and where there is composition, another being is required to bring them together. Since God is the first, uncaused, and necessary being, no other being can be conceived as being prior to Him. Hence, in God there can be no metaphysical composition, because he cannot be dependent on anything or anybody. All perfection, determination, and actualization which would or could result from a metaphysical composition must be His always without such a composition.

Since God is 'absolutely simple,' whatever is in God is *absolutely one reality*. Hence, God *is* His existence, His essence; God is mercy, justice, knowledge, love, and so forth.

Notion of Infinite Perfection

Before discussing whether or not 'infinite perfection' should be predicated of God, we will have to know the meaning of 'perfect' and 'infinite.'

In general, *perfection* means reality or actuality. A thing possesses perfection in so far as it possesses reality or actuality. In particular, a being is said to be 'perfect' when it possesses all the reality (actuality) it is supposed to have in

order to be *the kind of thing* it should be. A being would be 'imperfect' if, and in so far as, it lacks something required by its respective type of being. As such, 'perfection' is independent of the place a thing occupies in the general scale of being, so that a rose can be as perfect in its own line of being as a horse is in its line of being.

However, because of the *types of being* in the general scale of being among themselves, the amount of reality present in these various types forms a graduated series, so that one type of being possesses more reality (perfection) than another. Thus, a rose is more perfect than gold, a horse more perfect than a rose or gold, and man more perfect than a horse or a rose or gold. Perfection, therefore, differs.

Perfection is either 'relative' or 'absolute.' Perfection is said to be *relative* when it pertains to a certain *type of being*. The perfection pertaining to gold or a rose or a horse or a man or any particular type of being is thus seen to be 'relative,' namely, relative to the type or nature of the being in question. Perfection is absolute when it pertains, not to a certain type of being, but *to every line of being without restriction*. 'Relative' perfection, since its concept is restricted to a particular type of being, is always 'limited' in its meaning and application. Does 'absolute' perfection, then, involve the further concept of 'infinite'? Just what is the meaning of 'infinite' and 'infinity'?

Infinite, as the word indicates (Lat., *in*, not, non-; *finis*, end, limit, boundary), is that which is without limits or bounds. The form of the term is negative, but the content is positive; it means a reality or actuality which is limitless or

boundless. Originally, the term had a quantitative signification, inasmuch as it was applied to extension or magnitude. Gradually, however, the term was also applied to qualities and perfection (reality) in general. *Finiteness* means being with limitation.

Infinity is either 'potential' or 'actual.' A being is said to be *potentially infinite*, or to possess *potential infinity*, if its reality can be increased without limit. Such a being, therefore, is always actually finite and always in potency to a further increase of reality, without ever reaching the ultimate limit of an increase in its reality. It would be more accurate to call such a being 'indefinite' rather than 'infinite.' A being is *actually infinite*, or possesses *actual infinity*, if its reality exists without limitation. Actual infinity will be either 'relative' or 'absolute.' A thing possesses relative actual infinity if it is actually infinite in a certain line of being only; for instance, in the line of substance or quantity or quality or some other reality, but not in them all. It possesses *absolute* actual infinity if it is actually unlimited (infinite) in every line of being. A being, therefore, which possesses absolute actual infinity is so unlimited in its being or reality that a greater or better being cannot exist nor be conceived in thought; it is an existing being possessing an absolute *plenitude of reality*.

When the concepts of 'perfection' and 'infinity' are combined, *infinity of perfection* is perfection which is actually and absolutely without limit. Infinity of perfection is either 'extensive' or 'intensive' or 'radical.' It is *extensive* when an essence possesses all perfections possible. It is *intensive* when an essence has the supreme degree of all

perfections possible. It is *radical* when an essence is intrinsically determined in such a manner that the essence demands both extensive and intensive infinity of perfection.

The Problem of God's Infinity

'Absolute perfection' in an existing being means the same thing as 'actual infinity of perfection.' An absolutely or infinitely perfect being is a being that possesses a *limitless plenitude of reality* in every conceivable manner, and that without imperfection of any kind.

It is clear that the 'infinite' cannot be the result of a summation of finite realities. Finite reality, by the very fact that it is 'finite,' implies limitation, and a mere summation does not remove this limitation in the single realities. No matter how large the number may be, each and every one of these realities is and remains limited; and since the total sum consists of the single units which comprise the sum, the total sum must always be and remain limited in its perfection. Such a sum would always be merely 'potentially infinite' by its very nature, because another unit could always be added to it. The 'potentially infinite,' however, since it is 'actually finite,' can never equate the 'actually infinite.' If God, then, is infinitely perfect, His essence cannot be a summative totality of finite perfections.

In making the claim that God is infinitely perfect, we must prove that He contains within His essence the *plenitude of reality without limitation*. It must, therefore, be inexhaustible. If His perfections could be exhausted by continued subtraction, it would evidently be limited and

finite. It would not be actually infinite extensively and intensively.

Opponents are the pantheists, who believe that the world is an evolution of God (such as B. Spinoza, G. Hegel, J. Fichte, F. Schelling, and their followers); the *materialists*, who deny the existence of anything spiritual (such as T. Hobbes, J. Moleschott, L. Büchner, E. Haeckel, and others); the *positivists*, who claim that man's knowledge cannot reach beyond the phenomenal (such as J. Stuart Mill, H. Spencer, and a host of scientists); the *finitists*, who maintain that God is always in a process of 'becoming' (such as F. C. S. Schiller, W. James, H. G. Wells, H. A. Overstreet, A. C. McGiffert, M. Calkins, and many moderns).

Proof of God's Infinity

We claim that God is *infinitely perfect* and that this truth can be known and demonstrated to the satisfaction of an unprejudiced and truth-seeking mind.

THE FIRST ARGUMENT IS *INDIRECT*.

No finite being can be an *ens a se*, so that it is a self-subsistent being. An *ens a se* has its existence in virtue of its essence, since it has no 'cause' for its existence. Hence, if a finite being could be an *ens a se*, a self-subsistent being, it would also have its existence in virtue of its essence. But then all the *possible* beings of the same class would also have to have their existence in virtue of their essence and consequently also *actually exist*: a *like essence* would then

entail a *like existence*. But this is evidently not a fact, since there are many more beings of a particular class which are merely possible than those which actually exist. For example, many more human beings 'could' exist than actually 'do' exist; and this is true of all classes of beings. Consequently, no finite being can be an *ens a se*, a self-subsistent being. God, however, as was shown in the arguments for His existence, is truly an *ens a se*, a self-subsistent being. Therefore, no finite being can be God, and God cannot be a finite being.

An actually existing being that is not a 'finite' being is of necessity an 'infinite' being: 'finite' and 'infinite' are contradictory concepts, with no middle ground between them, and every being must be one or the other. Hence, since God is not finite, He is the Infinite Being and as such must possess all reality and perfection (for 'reality' and 'perfection' are identical) infinitely.

THE SECOND ARGUMENT IS *DIRECT*.

'Being' is everything that is not nothing; it therefore includes *all* reality and perfection without restriction, limitation, curtailment. Nothing can be thought of that would be a perfection and would not be contained in 'being': there can be no more reality, and no reality could be added. Absolutely everything without exception is included in the concept of 'being' as such. Essence, existence, beauty, power, goodness, mercy, justice, wisdom, individuality, personality, substance, and so forth, are simply so many forms of 'being,' because they are forms of reality

or perfection. Not only this or that reality, or this or that degree of reality, belongs to 'being'; absolutely every conceivable kind of reality and every conceivable degree of reality are included in the concept of 'being,' and that both extensively and intensively. Since, therefore, the concept of 'being' includes every conceivable kind and degree of reality (perfection) both extensively and intensively, 'infinite perfection' is *intrinsically possible of realization*, so long as the perfection itself is not limited for some reason.

A limitation of perfection exists (1) either because the reality itself as such is a limited perfection (e.g., 'whiteness,' 'materiality'); or (2) because the subject of the reality has only a limited passive capacity for receiving it (e.g., man's capacity for receiving knowledge is limited, since the intellect itself is limited); or (3) because the one giving the reality cannot, or does not want to, give more than a limited amount (e.g., everything man does and gives is limited in perfection). So far as the first source of limitation is concerned, it would not apply to God's essence and perfection; in His case it is only a question of 'pure' perfections, not 'mixed' perfections, because He is, as was shown, absolutely simple.

The second and third source of limitation can be taken together, because in both sources a limited amount of perfection is received. In this case God either limited Himself or another being limited Him in the reception of reality. Neither alternative is possible. God cannot have received a limited (finite) amount of reality from another. Under that supposition He would have received essence and existence from a being other than Himself; God,

however, since He is *ens a se* and consequently self-subsistent, did not receive His reality from another being. Neither could the limitation come from Himself. If God imposed a limitation of perfection upon Himself, this would mean that He either had infinite perfection first and limited it later, or that He was at first in potency toward an infinite and finite amount and then (voluntarily or involuntarily) gave Himself only a finite amount. The first of these two alternatives is impossible; because, if He had infinite perfection first, He had to have the perfection of 'necessity' in His being and so could not discard any amount of reality (perfection). The second of these alternatives is also impossible; because potency is excluded in the 'absolutely simple being' and, if He were first in potency toward a finite or infinite amount, He could never have passed from potency to actuality except through the agency of another being (and that cannot Occur in the being who is first, uncaused, and necessary). It follows then, that a *limitation of perfection is excluded* in God's essence and existence.

Consequently, since the concept of 'being' as such includes infinite perfection in God, the Supreme Being, and since no cause can be assigned for any limitation of being (perfection, reality) in God, God must be infinitely perfect.

HENCE, GOD IS *INFINITELY PERFECT*.

A formidable *objection* has been raised against the 'infinite perfection' of God. It runs somewhat as follows: Besides the essence of God there exist many other essences and beings, namely, the *physical world* and everything in it.

These essences and beings, and therefore also their perfections, are not present in God. Consequently, their perfections are missing in the essence and being of God, and He is not infinitely perfect.

The *answer* to this objection is not difficult. The infinite being must certainly possess all the perfections found in the beings present in the universe. However, it is not necessary for Him to possess them according to their individual existence; it suffices, if He possesses these perfections according to their worth or value virtually and eminently. These things do not and cannot possess any perfection greater than His nor independent of Him; whatever they possess in the line of reality and perfection, they have *received* from Him. So long as God does *not lose* any perfection of His own thereby, one cannot say that these things possess perfections which He does not possess. Their existence merely multiplies the number of beings possessing perfection, but the *perfection itself* does not thereby become any greater. A teacher imparting knowledge to his pupils does not lose his own knowledge, nor do the pupils have a more perfect knowledge than the teacher, nor does the addition of the knowledge of all the pupils to that of the teacher make the knowledge as a whole greater or more perfect. The knowledge has the same amount of perfection, whether communicated or not; the number of knowing individuals has been increased, but not the perfection of the knowledge itself. The objection is thus seen to be invalid.

A somewhat *similar objection*, though different in form, is also made against God's infinity. The beings in this world

possess a certain amount of real perfection. Let us suppose that God's perfection is infinite. Then the addition of the perfections of the creatures to the perfection of God gives an amount of perfection which is *greater than infinite*. But that is impossible. Now, one cannot deny the existence of creatural perfections. One must, therefore, deny the infinity of God's perfection.

The answer to this objection is about the same as that to the foregoing objection. By adding the perfections of creatures to the perfection of God one does not increase 'perfection as such,' since perfections are predicated of God and creatures only in an analogical sense; one merely increases the number of those possessing perfection. The number of creatures is only *finite*, though it is potentially infinite; adding God as another number to the number of creatures does not increase this number to such an extent that its magnitude would be 'actually infinite.'

God is a substance, absolutely simple, possessing infinite perfection (reality), devoid of all potentiality and composition. God, in other words, is *pure act (actuality)*.

The Unicity of God

Unicity is singleness or uniqueness, the absence of plurality. The phrase 'unicity of God,' therefore, is equivalent to the assertion that there is and can be *only one God*.

Unicity may be 'imperfect' and 'perfect.' Unicity is *imperfect* when no one other being of the same kind actually exists, but another being of the same kind is

possible. Thus, when the first human being came into existence, he at that time possessed 'unicity,' because he was the only human being in actual existence; this unicity, however, was 'imperfect,' since other human beings were possible. Unicity is *perfect* when no other being of the same kind actually exists, and another being of the same kind is impossible; such a being is truly 'unique.'

Of *God* we assert that He possesses *perfect unicity*, so that no other God is even possible. There is, and can be, but one God.

Opponents to the doctrine of the unicity of God are the *polytheists*, who admit a plurality of gods, and the *Manichaeans*, who assumed the existence of two supreme principles, one good and one evil.

THAT THERE IS *ONLY ONE GOD* FOLLOWS NATURALLY AND necessarily from the *infinity* of God's essence.

If a plurality of Divine Beings existed (or, for that matter, *could* exist), they would either be alike or not alike. If they are *not alike*, they are different; if different, then one must have some perfection which the other does not possess. In that case, however, the latter lacks some perfection and by that very fact would not be infinitely perfect; the former alone would have supreme perfection and be God. If they are *alike*, there can be no difference between them. In order to simplify the argument, let us assume that there are two infinite beings in existence. Both are infinitely perfect, according to the supposition. However, the one's infinite perfection is exclusively His own, because He is a self-

subsistent being, an *ens a se*; as a result, His perfections are not present in the second infinite being, and the second lacks the perfection of the first and is not infinitely perfect at all. But the same situation applies to the second infinitely perfect being. The second's infinite perfections are also exclusively His own and are not present in the first; therefore, the first lacks the perfections of the second and is not infinitely perfect either. Hence, if both are alike, they would be infinitely and not infinitely perfect at the same time under the same respect. That, however, would be impossible because *contradictory*. Consequently, a plurality (or even duality) of infinitely perfect Supreme Beings is impossible.

Again. If two infinitely perfect Beings could exist at the same time, either they would be mutually dependent upon each other; or one would be dependent, while the other is independent; or both would be independent of each other. They cannot be *mutually dependent* upon each other; because under that supposition neither would be infinitely perfect, since both would lack the perfection of being 'independent' of the other. One cannot be *dependent* on the other, while the other is independent; because under that supposition the 'dependent' being would not be infinitely perfect, since such a being is obviously less perfect than an 'independent' being. They cannot be *mutually independent* of each other; because under that supposition neither would be infinitely perfect, since each would lack the perfection of having the other dependent on himself. These two supposedly infinite beings must exist, if they exist at all, in one of these three ways. But all three ways destroy the

infinity of perfection either in both or in one of the two. The only way in which the infinitely perfect Being can exist is to be independent of every other being and have every other being *dependent*; in that case, however, the independent Being alone is infinitely perfect. Hence, no two infinitely perfect beings can exist at the same time. But God exists and is infinitely perfect. Therefore, there can be no other infinitely perfect being besides God; He alone is and can be God. Consequently, a duality or plurality of deities is impossible.

Unicity, therefore, is an *attribute of God*.

Distinctions in God

The absolute simplicity and infinite perfection of God preclude 'composition' in His Being. Where composition does not exist, division is impossible; division presupposes parts of some sort, and in the absolutely simple Being there can be no parts.

Then what about *distinctions* in God? Are they also precluded? Or are they admissible? If these distinctions are based on 'actual' composition, they are manifestly inadmissible in God, because in the absolutely simple and infinitely perfect being there can be no actual composition. The question therefore arises: Does every distinction involve actual composition? If so, all distinctions are inadmissible; if not, those which involve no actual composition should be admissible. Are there distinctions of this latter kind?

There can be no question about the fact that man's concepts of God *differ*. Man's concept of God's essence is different from that of His goodness or power and so forth, so that man makes a distinction between God's essence and His *perfections*. Man's concept of God's mercy is different from that of His justice, of God's power is different from that of His wisdom, and so on, so that he makes a distinction between the *attributes or perfections among themselves*. What is the nature of such distinctions?

Gilbert de la Porrée (died 1154) maintained that the distinction between God and His divinity (essence) and between God's essence and attributes is a *real distinction*, based on a difference of realities in God. This doctrine must be *rejected*, because God is absolutely simple and infinitely perfect. A real distinction implies real composition, which is excluded in God's being.

Eunomius the Arian and the nominalists of the Middle Ages (Gregory of Rimini, Gabriel Biel, and William of Ockham, as many claim) asserted that all the names and attributes ascribed by man to God are *synonymous*, so that the distinctions man makes between God's essence and attributes are 'purely logical and mental,' without any sort of foundation in God's being. This view must also be *rejected* as inadequate. When we speak of God's mercy and justice, intellect and will, power and wisdom, and so forth, we do not use synonymous terms. These terms do not represent the same objective concept; each term has a different thought-content, and for that reason each has a different definition. We admit that the *objective reality meant* by these different concepts and terms is identically

the same reality in the divine substance, because of God's absolute simplicity. But we contend (and an analysis of the concepts and terms shows this to be true) that each concept *explicitly* signifies something different from that signified by the other concepts, although each one *implicitly* contains the other. Hence, these terms and their corresponding concepts are *not synonymous* like 'lance' and 'spear,' or 'twelve' and 'a dozen.'

The distinction between essence and attributes and between the attributes themselves thus is neither a real distinction nor purely logical (mental) distinction. By way of elimination, then, the distinction must be a *virtual distinction* (*distinctio ratio nis ratiocinatae*), with a foundation in God Himself for the distinctions.

The foundation in God's being for the distinctions *cannot be a perfect foundation*. If the foundation were 'perfect,' the essence and attributes could be *realized separately* in other beings, even though in God they are only one reality. That, however, is impossible. The essence and attributes of God are 'infinite perfections,' and infinite perfections can never be realized separately in other beings; they are realizable solely in God, because God alone is infinite. Whenever the foundation for distinction is 'perfect,' so that the items in question are 'realizable separately,' they are combined by means of a 'metaphysical composition' in the being possessing them. In God, however, metaphysical composition is also excluded, due to His absolute simplicity. Consequently, the distinction man makes in God cannot be a 'virtual distinction with a *perfect* foundation.'

But a *foundation is present* in God. It consists in the infinite wealth of reality in God's being. Man's finite intellect is incapable of exhausting and expressing this infinite wealth of reality in a single concept. As a result, man is compelled to form *successively* a number of *varying attributive notions* of God; in this manner the limited intellect of man seeks to express God's infinite being. And so the foundation for man's distinct concepts of God and His perfections lies in *God's infinite perfection itself*.

This foundation in God, however, is not perfect. On the contrary, it is necessarily an *imperfect foundation*, because the divine attributes are not distinct parts in God but an inseparable identity. So far as their reality is concerned, God's essence and attributes are all identical with each other: God is one reality, absolutely simple and infinitely perfect. That is why the distinction man makes in God between His essence and attributes and between the attributes themselves can only be a virtual distinction with an imperfect foundation.'

It follows, therefore, that the distinctions formed by man about the Divinity are *virtual distinctions with an imperfect foundation in the thing*. Such distinctions are valid and alone admissible.

It is evident, of course, that a knowledge of God, expressed in distinct concepts and terms, is very inadequate. The inadequacy, however, results from the constitutional limitation of man's intellect, which must grasp piecemeal what it cannot grasp all at once. No finite intellect can fully grasp the plenitude of the Infinite.

To sum up: God is an absolutely simple, spiritual substance, devoid of all composition and potentiality; God is infinitely perfect in every respect; God is unique so that a duality or plurality of divine beings is impossible. The distinct concepts and forms of God's being are 'virtually distinct, based on an imperfect foundation,' and they introduce no composition in God's nature and perfections.

Summary of Chapter X

God's *simplicity, infinite perfection, and unicity* are the attributes treated in this chapter.

1. *Notion of Simplicity.* — Simplicity is the opposite of composition, the absence of composition in the reality of a being. Composition is either real or logical, depending on the distinction between the components or parts. *Real* distinction is the absence of sameness between things different in their reality. *Logical* or *mental* distinction is the absence of sameness between concepts of the same reality; it is either 'purely mental' or 'virtual,' and the virtual distinction has either a 'perfect' or 'imperfect' foundation in the thing.

Composition may be either 'real' or 'logical (mental),' 'substantial' or 'accidental.' *Simplicity* is either 'absolute' or 'relative.'

2. *The Problem of God's Simplicity.* — We claim that God is *absolutely simple*, so that composition in the proper sense of the term is totally absent from His Being.

3. *Proof of God's Absolute Simplicity.* — Every composite being consists of parts which are distinct. The parts are 'potential' to the whole; the composite being becomes 'actualized' into a whole through the unification of the parts. Parts of themselves distinct and different cannot unite of their own accord to form a composite being, but demand a *pre-existing cause* to make them unite. Now, God exists, and He is first, necessary, and uncaused. Hence, if He consisted of parts united to form His being, a being

prior in existence to Himself would be required to bring the parts together and lead Him from potentiality to actuality. Since God is the first, necessary, and uncaused being, this is impossible. Hence, there can be no parts in God. God, therefore, is *absolutely simple* in His being. Corollaries: God is a substance, a pure spirit; in God there are no accidents; God is absolutely one reality.

4. *Notion of Infinite Perfection.* — In general, *perfection* means reality or actuality; in particular, it means the reality a being should have in order to be the kind of being it is supposed to be. Perfection is 'relative' when it pertains to a certain type of reality; 'absolute,' when it pertains to every line of reality without restriction.

Infinite is defined as being without bounds or limit; it means boundless, endless, limitless. Infinity is said to be 'potential' if the reality is always finite and in potency to a further increase of reality; it is 'actual' if the reality exists without any limitation. Actual infinity is 'relative' if the reality is actually infinite in a certain line of being only; it is 'absolute' if unlimited in every line of being.

Infinite perfection is perfection which is actually and absolutely without limit; and it is either 'extensive' or 'intensive' or 'radical' infinity of perfection.

5. *The Problem of God's Infinity.* — God is infinitely perfect; He contains within His essence the plenitude of reality without limitation and imperfection.

6. *Proof of God's Infinity.* — In direct argument. No finite being is an *ens a se*; God is an *ens a se*; therefore, God is no finite being. But, if a being is not finite, it must be infinite

(because 'finite' and infinite' are contradictory ideas); now, God is not finite; therefore, God is infinite.

Direct argument. 'Being' is everything that is not nothing; it therefore includes all reality without limitation. 'Infinite perfection' is, consequently, intrinsically possible, so long as the perfection is not limited for some reason. A *limitation* of perfection, however, can exist only for a threefold reason: (1) either because the perfection as such is a limited perfection; or (2) because the subject has only a limited capacity for receiving it; or (3) because the one giving the reality cannot, or does not want to, give more than a limited amount. None of these alternatives apply in the case of God, because He is the first, necessary, and uncaused being. Therefore, God is *infinitely perfect*.

7. *Unicity of God.* — Unicity means 'singleness' or 'uniqueness. God possesses perfect unicity, so that no other God is even possible.

If a duality (or plurality) of Divine Beings existed or could exist, they would either be alike or not alike. If *not* alike, one would lack a perfection which the other possessed, and so would not be infinitely perfect. If *alike*, the perfections of each, being exclusively his own, would not be present in the other; hence, neither would be really infinitely perfect. Yet God is infinitely perfect. Therefore, plurality (or even duality) of Supreme Beings is impossible.

Again. 'Independence' is a perfection; 'dependence,' an imperfection. If two (or more) infinitely perfect Beings could exist simultaneously, either they would be mutually dependent; or one would be independent and the other dependent; or both would be mutually independent. If both

are *mutually dependent*, neither is infinitely perfect. If one is *independent* and the other *dependent*, only the first would be infinitely perfect; the dependent would be limited and finite. If both are *mutually independent*, neither is infinitely perfect, because it would be more perfect to be independent and have the other one dependent. But God exists and is infinitely perfect. Therefore, there can be no infinitely perfect being besides God. Consequently, a duality or plurality of Gods is impossible. *Unicity*, therefore, is an *attribute of God*.

8. *Distinctions in God*. — Man has distinct concepts concerning the essence and attributes of God. A *real* distinction cannot be admitted, because they presuppose a real composition. A *purely logical (mental)* distinction cannot be admitted, because man's concepts of God are not synonymous. A *virtual* distinction with a *perfect* foundation cannot be admitted, because such a distinction implies a metaphysical composition. The distinction, therefore, is a 'virtual distinction with an *imperfect foundation*.' The concepts are 'explicitly' distinct, but each 'implicitly' includes the reality contained in the others, because God is one absolutely simple reality and man can grasp God's plenitude of reality only piecemeal and in distinct concepts.

Chapter 11

IMMUTABILITY, ETERNITY, IMMENSITY

WHEN SPEAKING OF MAN'S KNOWLEDGE OF GOD, ST. THOMAS Aquinas seems to be inconsistent. In one place¹ he says: "Because we cannot know what God is, but rather what He is not, we have no means for considering how God is, but rather how He is not." Soon after that, however, he² states: "Hitherto we have considered God as He is in Himself." It is hardly conceivable that so acute a thinker would contradict himself in such a short space. Then how reconcile the two statements?

When St. Thomas remarked that "we cannot know what God is, but rather what He is not," he meant to say that man in this life has no 'intuitive' knowledge of God as He exists in Himself. Man derives his knowledge of God from creatural beings, and their imperfections and limitations must be denied of the essence of God; hence, man's knowledge of God is acquired by 'way of negation,' rather than 'directly.' Since man does not know God infinitely, he does not really 'comprehend' God as He is in Himself. Nevertheless, man can reach God through his knowledge, even though only indirectly. Negation always presupposes and implies affirmation. By denying composition and

potentiality in God, man affirms His simplicity; by denying limitation in God, man affirms His infinity; by denying multiplicity in God, man affirms His unicity. We consider God as He is in Himself," even though our knowledge is imperfect and inadequate. Thus, the inconsistency in St. Thomas is more apparent than real.

Man's knowledge of God's *immutability, eternity, and immensity* is of a similar character. These attributes will now be discussed. The falsity of *pantheism* will then become clear.

Notion of Immutability

As the word indicates, 'immutability' is the negation of 'mutability.' In order, then, to understand the meaning of 'immutability,' we must begin with the concept of 'mutability.'

Mutability means capability of change (mutation). A thing is said to 'change' when it passes from one state into another state. Every change involves two things: a subject which acquires or loses something, and a reality which is acquired or lost by the subject. Change is 'extrinsic' or 'intrinsic.' Change is *extrinsic* when it is the result of an extrinsic denomination. An illustration will clarify this rather abstruse definition. I see, for example, a tree, and then I walk away and no longer see the tree; the tree has changed from a 'seen' tree to a tree 'no longer seen.' The tree has obviously not undergone a real change in its own being by passing from the state of an 'unseen' tree to the state of a 'seen' tree and then from the state of a 'seen' tree

to that of a tree 'no longer seen.' Whatever real change occurred took place in me and not in the tree, because the act of sight affected my being but not the tree; I acquired and lost some reality (the 'act of sight'), but nothing happened to the being of the tree thereby. Since no reality was acquired or lost by the being of the tree in its change of status ('seen' and 'no longer seen'), such a change is termed 'extrinsic'; the knowledge relation affects the knower in a real fashion, but not the object known. Change is *intrinsic* when some reality is either acquired or lost in the passage of the subject from one state to another. Intrinsic change is either a change 'properly so called' or 'improperly so called.' When the change is of such a nature that the entire being of the subject either passes from non-existence to existence (creation) or from existence to non-existence (annihilation), the change is *improperly so called*, because the subject undergoing this change does not remain throughout the change. In 'creation' the subject was not in existence before it was created, and in 'annihilation' the subject ceases to exist after it is annihilated. When, however, an existing subject undergoes change, so that it acquires or loses some reality while remaining in existence, the change is an intrinsic change *properly so called*. Thus, when a piece of iron changes from hot to cold or from cold to hot, such a change is 'intrinsic' and it is 'properly so called,' because the piece of iron has actually acquired or lost the quality of heat. A change 'properly so called' is also styled an intrinsic change in the 'strict sense' of the term, while a change 'improperly so called' is styled an intrinsic change in a 'wider sense.

An intrinsic change in the strict sense of the term (or an 'intrinsic change properly so called') may be either 'physical' or 'moral' or 'intellectual' in nature. A *physical* intrinsic change in the strict sense consists in the acquisition or loss of a substantial or accidental reality. When, for example, nonliving matter is converted into living matter by a plant, animal, or man, its substance is changed, and such a change is a *substantial* physical change; but when a piece of iron is heated, it undergoes an *accidental* physical change, because the substance of iron remains the same in the (accidental, qualitative) change. A change is *moral*, when there is a passage from one resolution of the will to another. It is *intellectual*, when there is a change from one judgment to another.

When these notions are applied to God, it is obvious that an 'extrinsic' change occurs in relation to Him: He is known and not known, loved and hated, and so forth; but in all such cases, the change really occurs in the creatures, not in God Himself. Intrinsic change in the 'wider sense' of creation or annihilation, does not apply to God; as the 'first being' He cannot be created, and as the 'necessary being' He cannot be annihilated. The question here is that of *intrinsic change in the strict sense*, namely, of a 'physical' or 'moral' or 'intellectual' change in the true meaning of the terms.

Proof of God's Immutability

The opponents of the immutability of God are the polytheists and the pantheists.

As *theists* we maintain that God is in no way changeable. *God is immutable*. Not only does He not change as a matter of fact, but He is incapable of intrinsic change.

FIRST, A *GENERAL* PROOF OF GOD'S IMMUTABILITY.

An *intrinsic* change is the passage of a subject from one state to another state, the subject thereby acquiring or losing some reality. If a reality is 'acquired,' the subject does not already possess it; if the subject possessed it already, it could not 'acquire' it by means of the passage from one state to another. It follows, therefore, that the changing subject does not possess it already and 'acquires' the absent and missing reality by means of the change. Hence, if God could 'acquire' some reality, He would, of necessity, have to receive it, either *from Himself or from some other being*. Now, He could not receive it from Himself, because in that case He would already possess it, since no one can give what he does not have; but if He already possesses the reality in question, He cannot 'acquire' it, not even from Himself. Neither can He receive it from some other being. This follows from the fact that God is the first being, as was shown in the proof of His existence, and the first being is the necessary being, because He exists in virtue of His essence. Hence, whatever God is, He is necessarily whatever He is. If, then, God would not have a certain reality, He would 'necessarily' lack this reality and could never 'acquire' it from another being. God, therefore, cannot 'acquire' any reality through passing from one state into another state.

Nor can God 'lose' reality. When reality is lost, the subject possesses it already and then loses it in the change. Now, if God could lose reality, this loss of reality would have to be due either *to His own action* or *to the action of some other being*. Neither case is admissible. God is the necessary being; He is necessarily whatever He is. But if He could lose some reality He possesses, whether through His own action or the action of some other being, He would not be 'necessarily' what He is. God, therefore, cannot lose reality by passing from one state to another state.

The same consequence follows from the *infinite perfection* of God. If He could 'acquire' reality by means of change, He would not be infinitely perfect *before* the change; He would certainly be more perfect if He did not acquire it but possessed it already. And for the same reason He cannot 'lose' reality in any manner. All reality being a form of perfection, God would be less perfect *after* giving up some reality than He was when He possessed it. Besides, to be capable of acquiring or losing reality involves passivity and potentiality; a being, however, with passivity and potentiality is not infinitely perfect.

Again, the *absolute simplicity* of God's essence makes it impossible for Him to 'acquire' or 'lose' reality through change. Because of this absolute simplicity, everything in God's essence is one single reality; composition of any and every kind is excluded. However, if any reality could be acquired by God through change, there would be an addition to His being, and that would entail a composition between His absolutely simple being and the new reality; but composition is excluded in an absolutely simple being.

Similarly, God cannot lose any reality through change. Since His being is an absolutely simple essence, the loss of any reality at all would mean the loss of His entire essence, and that would be equivalent to annihilation; God, however, cannot lose His essence and cease to exist, because the necessary being cannot cease to exist.

It is evident, therefore, that change is impossible in God, and He must, consequently, be *immutable*.

SECOND, A *SPECIFIC* PROOF OF GOD'S IMMUTABILITY, IN SO FAR AS the single types of intrinsic change are impossible.

God is *physically* unchangeable. Whatever is capable of change cannot be infinite in perfection, because it can be augmented in its being by the acquisition of some new reality or be decreased in its being by the loss of some reality it possesses. God, however, is absolutely infinite in His being. Therefore, He cannot change by passing from one state to another through the acquisition or loss of physical reality. Besides, every changeable being has potentiality, since it is capable of receiving what it does not possess and of losing what it possesses. God, however, is pure actuality and, therefore, without potentiality.

God is *morally* unchangeable. If God ever changed morally, so that He would begin to will something He did not will before, we would have to conclude that He either made no decision before regarding this matter and then began to exercise His will regarding it or that He changed the decision made before. Neither alternative, however, is possible. In either case God would acquire the reality of a

decision, and this reality would be something new in God's being, since it was not there before. God, however, since He is infinitely perfect, cannot acquire such a reality, because every reality is a perfection for the one possessing it.

God is *intellectually* unchangeable. God could undergo intellectual change in one of two ways, either by acquiring knowledge of something He did not know before, or by losing knowledge already possessed. In the first case He would pass from a state of ignorance into a state of knowledge, and in the second case from a state of knowledge into a state of ignorance. Ignorance, however, is an imperfection, and God would be more effect if He had this knowledge and retained it always. Now God is infinitely perfect. Hence, ignorance, whether antecedent or subsequent, must be excluded from Him. God, therefore, can neither acquire nor lose knowledge, and intellectual change is thus impossible in God.

It follows that God is *immutable* in every respect.

Not only is God immutable; *He alone is immutable*. Every creatural being is subject to change. All creatures, as a matter of observable fact, undergo change in one form or another. All are contingent and potential. All are composites of substance and accidental determinations, and they realize their being successively through passage from potentiality to actuality. The entire world is in a continuous process of 'becoming,' so that some form of reality is always being acquired and lost through change; this is true of all inanimate and animate beings, of all material and spiritual beings. Consequently, since all beings outside of God

undergo change or are at least capable of undergoing change, God alone is immutable.

Extrinsic change does not involve mutability in God Himself, in the sense that there is *real* change in Him. He is more the 'object' of the change, rather than the 'subject' which undergoes real change. Creatures like men, for instance, at first do not know God and then know Him. God, of course, can be said to change from 'not being known' to 'being known.' The subject undergoing the 'real' change in this process of acquiring knowledge is, obviously, the creature; the creature really acquires the act of knowledge and thus passes from the state of ignorance to a state of knowledge. In the creature, therefore, a 'real' change takes place, because he actually receives a new reality when he knows God. God, however, since He is merely the 'object' of this knowledge and not the 'subject,' does not undergo real change by passing from 'not being known' to 'being known'; He is merely the 'term of extrinsic denomination,' as philosophers call it, because the real change, while 'intrinsic' in the knowing subject, is altogether 'extrinsic' in the object known. God's being is not affected in any way by the real change which takes place in the creatural mind. While, then, the word 'extrinsic change' is applied to God in such a case, it must be understood to mean that God does not undergo a real change in His being. Hence, notwithstanding this extrinsic change, God remains absolutely what He was before. It is clear, therefore, that an 'extrinsic change' does not imply mutability in God's being.

Notion of Eternity

Eternity is duration in existence which is essentially without beginning and end and which is essentially without real succession and intrinsic change. As such, therefore, eternity is a type of duration and must be viewed in the light of the meaning of duration. Duration is the permanence of a being in its existence. Existence, as was noted before, is the actuality of a being in so far as the being is outside any causes it may have; in other words, a being is existent when it is neither 'nothing' nor merely 'possible.'

Duration is either 'divine' or 'creatural.' Divine duration is proper to God and is necessarily infinite and immutable, because God Himself is infinite and immutable in every respect. Divine duration goes under the special name of 'eternity,' and its definition has been given in the preceding paragraph. Creatural duration is proper to all beings outside God; it is the type of duration characteristic of creatural beings. Such beings are 'capable' of having a beginning and (or) end in their actual existence, even though, as a matter of fact, they have been produced from eternity and would last forever.

Creatural duration is either 'successive' or 'permanent.' It is successive when one part of the duration continuously follows the other; the being having successive duration is in a continuous process of change, whether this change be local motion or qualitative alteration or quantitative increase or decrease. Thus, the flow of an electric current (not the electrons as such) is successive in nature. Creatural duration is permanent when the being remains

constant and intact in its existence. For instance, the electrons, even though in a continuous state of agitation, are practically the same at all times, considered as entities. Permanent creatural duration is mainly of two types, depending on whether a being is by nature corruptible or incorruptible. Being which is by nature 'corruptible' can be dissolved into its component parts at some time or other, although it is endowed with a relatively permanent existence as a composite being; its duration is by nature not everlasting but temporal. For example, a plant or animal or man is a composite being possessing a relatively permanent duration in existence as a plant or animal or man, but this duration is 'temporal' in character; its existence began in time and will end in time, so that its duration is not everlasting. On the other hand, a being which is by nature 'incorruptible' does not consist of component parts, so that it cannot be dissolved into component parts; as a result it possesses a permanent duration which is by nature everlasting. Beings which are 'simple (now composite)' in their constitution are by nature incorruptible; in other words, this type of duration is proper to spirits or spiritual entities. The only kind of spiritual being known to man here on earth is man's immaterial soul; angels, too, are spirits, but they are outside the purview of man's natural knowledge. This kind of everlasting duration is termed *eviternity*, and it is defined as the everlasting duration of a naturally incorruptible being in its existence. Such a being is said to be 'eviternal.'

The difference between God's eternity and all other types of duration is clear. It differs from creatural duration:

creatural duration can have a beginning and an end; God's eternity, on the other hand, is an absolutely necessary existence, incapable of having a beginning or end. It differs from eviternity: such a duration, though permanent and by nature everlasting, is in itself capable of having a beginning and, absolutely speaking, an end, and it is also capable of intrinsic change in its accidental determinations. All this is impossible in the duration of God's existence, due to His immutability and infinity. It differs from the temporal permanence of corruptible composite being, because God is incorruptible in His being and so is His eternal duration. It differs from the successive duration of time: such a duration changes from moment to moment, so that there results a past, a present, and a future; God's existence, however, is always a 'present' without past and future, without succession and change, everlastingly immutable.

The definition which Boethius (480-525) gave of eternity has been famous through the centuries. It reads: *Aeternitas est interminabilis vitae tota simul et perfecta possessio*: **Eternity is the simultaneously complete and perfect possession of interminable life.** Eternity is 'life'; the eternal Being must be a living being, and 'life' designates both being and operation, so that the eternal Being possesses vital being and operation. Eternity is the 'possession' of life; the term expresses the full and absolute enjoyment of life on the part of God. Eternity is the possession of 'interminable' life; the eternal duration of God's existence excludes the possibility of a beginning or end in His life. Eternity is the possession of interminable life, and this possession is 'simultaneously complete'; this

means that God's life is without succession or change in its being and operation. Eternity is the 'perfect' possession of interminable life; this expression signifies that the eternal Being possesses life so as to include absolute perfection and exclude every imperfection. A comparison between the definition given by Boethius and the one given at the head of this section will show that both are identical in meaning.

Proof of God's Eternity

Eternity is understood to be a duration in existence which is essentially without beginning and end and which is essentially without real succession and intrinsic change. This statement represents the definition of 'eternity.' The question now is whether the definition applies to God. It does. God exists. His existence is absolutely necessary like His essence, since God's existence is in reality identical with His essence; and God's essence is absolutely necessary. To say that the absolutely necessary essence could 'not exist,' is a contradiction. Hence, God's duration in existence must be without beginning and end, and that in virtue of His essence; in other words, God's existence is essentially without beginning and end, because He is the 'necessary being.'

That God's duration in existence is essentially without real succession and intrinsic change, follows from His absolute immutability. Where there is 'real succession' and 'intrinsic change,' there can be no immutability.

Hence, God is essentially *eternal*.

GOD ALONE IS ETERNAL.

Every creatural being is contingent in its essence and existence; not a single one can be said to be a strictly 'necessary' being. As such, it is dependent in its essence and existence on God, the necessary being. Even though a creatural being had received its existence from eternity, it would have been possible for the being to have received existence in time and it is also possible for its existence to end. In any case, its existence had a beginning, even under the supposition that God created it from eternity. A necessary being, however, is absolutely incapable of having a beginning and (or) end in its existence. Furthermore, every creatural being is subject to change either in its substance or in the accidental determination of its substance, because every creatural being possesses potentiality in some form or other. Hence, no creatural being can be essentially eternal. God, however, is essentially eternal.

Therefore, *God alone is eternal.*

From the fact that God alone is essentially eternal, it is manifest in what manner we make statements of God which *imply temporality*. Strictly speaking, there can be no 'past' or 'future' in God's duration. *Past* and *future* are terms which imply the succession peculiar to time, where one moment follows after the other. Creatural beings exist in time; and 'past' and 'future' apply to their essence and existence, but not to God. God's existence is absolutely eternal, so that He lives in an absolute present; His duration is an *eternal 'now'* without 'past' or 'future,' and He co-exists eternally with the successive and continuously

changing duration of creatural beings. It is plain, then, that any expressions involving temporality can be used of God and His activity only in a *metaphorical* sense or, as the technical language of philosophy puts it, by means of an *extrinsic denomination* derived from the creatural beings existing in time. Thus, we say that God 'has created' the world (as if it were a past act) and 'will reward' the just (as if it were a future act); such acts, however, are really one with His immutable essence and exist from all eternity in an everlasting present.

Notion of Immensity

Immensity is taken here as that intrinsic attribute of God in virtue of which He is necessarily present wherever any being exists which is not God.

This attribute is *eternal*, because it is really identical with God's eternal essence and is independent of whether creatural things exist or do not exist. Even if no creatural beings existed, the attribute of God's immensity would be intrinsic to Him and would require that He be present to all creatural beings as soon as they began to exist. This attribute is *infinite*, and as such it is not delimited or measured by place and space. It demands that God be present to all beings in place and space, if and as long as these beings exist, even if they could be infinite in number and space itself could be infinite in extent; if their number is increased indefinitely, God would be present to them without any intrinsic change on His part. This attribute is *intrinsic* to God, not a mere extrinsic denomination derived

from existing creatural beings. It is a character of the wine essence, so that He would be immense in His essence, irrespective of the actual existence of beings other than Himself. The necessity of His presence is not to be conceived as a 'potentiality' of some sort, but as the fullness of the divine being requiring His presence in every being. This attribute is *absolute*, because it is unconditioned by creatural existence or non-existence. On the part of God the existence of creatural beings does not introduce a 'real relation,' but only a 'logical relation,' between God and such beings; nothing is added to God's being by the fact of creatural existence, because He is essentially immutable and infinitely perfect.

Some authors have tried to construe the nature of God's immensity' as *its reference to absolute space*, in the sense that immensity is the presence of God in absolute space. 'Absolute space' is taken here in contradistinction to 'real' or 'filled space'; absolute space is considered to be infinite in extent, whether it be empty or filled. For those who are convinced that the universe is limited in extent, 'absolute space' is conceived as the space extending beyond the boundaries of the existing universe (or universes). Such an interpretation of God's immensity, however, is inadmissible. Absolute space is the same as 'imaginary space,' and the immensity of God would also be nothing more than a fiction of the mind.

Others have sought to explain God's immensity as the *relation of His presence to extended things*. This explanation must also be rejected. The reason is obvious. The existence of extended realities is altogether finite and

temporal. Hence, if God's immensity were nothing more than the relation of His presence to extended things, it would of necessity begin to exist and cease to exist with the existence of extended beings. However, God's immensity is independent of the actual existence of extended reality, because it is eternal and actually identical with His divine essence, as will be shown.

There is a difference between God's immensity and 'omnipresence' or, as it is often termed, 'ubiquity.' By *omnipresence* or *ubiquity* one understands the relation of God's presence to the beings which actually exist and to the real space which they occupy. Omnipresence is a consequence of God's immensity; because He is immense by nature, He must be actually present in all beings which exist. The *relation* of God's presence to existing creatural beings is 'real' on the part of creatures, because their very reality is dependent on God's presence; on the part of God, however, this relation is only 'logical,' because creatural beings cannot exert real influence on God's being. Since omnipresence implies the existence of creatural beings, and since this existence is entirely temporal in character, omnipresence is an attribute of God which is *relative* and *temporal*. The immensity of God, on the contrary, is prior to the existence of creatural beings and is an eternal and infinite perfection.

Proof of God's Immensity

The *opponents* among theists who have discussed the problem are relatively few. *Aristotle* was of the opinion that

God would be contaminated by beings of a lower nature, if lie were present among them. According to his view, the entire universe above the moon consisted of celestial spheres, and these spheres were composed of incorruptible matter. To safeguard God's purity of being, Aristotle placed Him in the periphery of the ultimate celestial sphere, in which place lie alone resides in eternal repose and self-contemplation. The theory of celestial spheres is now obsolete and discredited, due to the information supplied by astronomy and astrophysics. *Vorstius* (a Calvinist) and *Augustinus Steuchus Eugubinus* (a Catholic) maintained that God is omnipresent in all creatures through His power and knowledge, but He is not omnipresent through His essence and substance.

The *polytheists*, due to the decidedly anthropomorphic idea of their divinities, looked upon the gods and goddesses as very limited in essence and operation. As a result of this limitation, the divinities possessed neither immensity nor omnipresence.

The pantheists, since they identify God and the universe of reality, naturally admit the omnipresence of God, in the sense of God's absolute immanence (identity) in the world; God 'is' the world. That the immensity of God is an attribute of the Supreme Being transcendently distinct from the world of creatures, is something which they do not and cannot consistently admit. Christian philosophers, of course, are theists and as such opposed to the fundamental tenets of pantheism.

We claim that God *possesses the attribute of immensity*. Some authors contend that a stringent proof of God's

immensity and omnipresence cannot be furnished by reason without the aid of divine revelation. The proof, as formulated by D. Card. Mercier,³ is subjoined, and we think it is sound and valid. He says: "The infinite Being comprises every absolutely pure perfection; immensity is an absolutely pure perfection; therefore the infinite Being is immense.

"Proof of the minor premiss: To be endowed with an absolutely pure perfection means to possess a perfection which excludes all imperfection that can detract from it. Now the presence of a thing somewhere, inasmuch as it is something positive, a perfection; immensity is just this same perfection without the other impairing elements that are mixed with it when realized in creatures. In the case of a creature, presence involves imperfection for the double reason that it is a mode of being which depends on the creature itself, and that, as it is circumscribed or in some other way restricted, it is essentially subject to limitation. The immensity, however, of God is identical with His substantial being; that being has no extended parts but is indivisible reality unlimited in every line, and excluding by its very essence every limit, no matter what may be the number and size of the worlds to which His action extends.

"Therefore immensity is an absolutely simple perfection."

The conclusion is evident: God *is immense*.

The *omnipresence* or *ubiquity* of God, in relation to all existing creatural beings, follows as a necessary consequence from His absolute immensity. Immensity signifies the exigency on the part of God's being to be present to every existing creatural being. Consequently,

God must be present to all creatural existences as soon as they come into being, no matter what their size or number. And since God's immensity is identical with His essence, like all His other attributes, it is neither an accidental determination nor a mode of His substance; as a result, God's omnipresence does not in any way involve a change in God's being when He becomes present to a newly existing creatural being. As a further consequence, omnipresence is peculiar to *God alone, so that God alone is omni present.*

God's presence in creatural things is a presence of His essence, so that the total substance of God is in all things and in all real places; since God is absolutely simple, wherever God is said to be present, He must be there with His total essence or not at all. It is also a presence of *knowledge*; knowledge is a perfection, and consequently God must have complete knowledge of all the beings to which He is present. It is also a presence of *power*, because all creatural beings (as will be shown later on) are dependent on God in their being and operation. All this follows from the very nature of immensity and omnipresence.

If 'place' indicates 'where' a being is, the presence in a place is its *whereness* or *ubication* (Lat., *ubi*, where). Presence in a place may be either 'circumscriptive' or 'definitive' or 'repletive.'

A *circumscriptive* presence is the presence of an extended corporeal substance, so that it has parts outside parts quantitatively extended in the place which it occupies; all bodies fill extended space with their own extended

reality. A *definitive* presence is the presence of a spatially unextended substance in such a manner that it can exercise its activity only within certain limits of space. Such is the presence of spiritual creatures in the universe; and such, too, is the presence of man's immaterial soul within the limits of his body. Spiritual beings, since they are simple entities, have no parts outside parts in their substance, and thus they do not have a circumscriptive presence in space; but their activity is limited to certain restricted areas of space, so that they are 'localized' and are not present everywhere. A *repletive* presence is the presence of a spatially un-extended ('spiritual') substance in all places and spaces, past, present, and future; such a being is naturally 'everywhere.'

God's omnipresence in the universe (or universes) is not 'circumscriptive.' He is not circumscribed by a particular place or space; His infinitely perfect being cannot be restricted and limited. Nor is His omnipresence 'definitive,' in the sense that His activity and presence is localized like that of an ordinary spirit or immaterial substance; because that, too, would imply restriction and limitation. God's omnipresence is *repletive*. He is 'everywhere,' totally and compenetratingly. This 'repletive presence' is what is meant by 'omnipresence' or 'ubiquity,' and the infinite perfection which is its foundation is immensity.'

Pantheism

Opposed to theism, expounded so far, is the doctrine of pantheism. In general, pantheism (Gr., *πάν*, all, everything;

Θεός God) teaches the *identity of the Deity with the beings of this world*. In the course of the centuries pantheism has appeared in many diverse forms. The varieties of pantheism are too numerous to be discussed in detail. Yet, a brief outline of the main types of pantheism will not be amiss.

The *two main divisions* are partial (imperfect) and *total* (perfect) pantheism.

Partial pantheism maintains that God is not the totality of world-beings, but only a *part of the world*. This type of pantheism is always realistic, never idealistic.

Chief among the proponents of partial (imperfect) pantheism were the *stoics*. The school was founded by Zeno of Cittium (350—258 B.C.) and lasted for centuries. The material is the only reality; God Himself is but a finer sort of matter. God is conceived as the ‘soul’ of the universe. The reality of God and the world is at bottom identical, with only a relative difference existing between God (reality, regarded as a whole) and the world (reality, regarded in its various aspects). In medieval times, partial pantheism was revived by Amaury (Amalric) of Béne, who taught that God is the formal principle of all things, and David of Dinant, who held that God is universal matter; both lived in the twelfth and thirteenth century. In recent times Oscar Külpe expressed the view that God is the world-soul. Some modern pantheists identify God with world-energy or something similar. Generally speaking, partial pantheism was never very popular among philosophers; if they defended pantheism at all, it was a form of total pantheism.

Total pantheism (also called ‘perfect’ pantheism) maintains that *all reality is but one*. Because of this oneness

of being, Deity is totally identified with this 'one being.' Total pantheism is either 'realistic' or 'idealistic.'

Total *realistic* pantheism holds that the reality which is identified with God is a *physical entity* (not a mere product of mind or thought). This type appears in a variety of forms.

One form of realistic pantheism teaches that there exists but a *single physical reality*, and it is absolutely permanent and unchangeable; multiplicity and change are but an illusion. Among the early Greek philosophers who belonged to this group are those of the School of Elia, namely, Xenophanes (570 B.C.), Parmenides (540 B.C.), Zeno of Elia (490 B.C.), and Melissus. Most prominent in this group was Parmenides. He claimed that all 'becoming' was utterly impossible; hence, only the All-One exists, indivisible and immobile (see Chap. 4). In opposition to this doctrine is the pantheistic teaching that the only physical reality which exists is 'pure motion' and 'change.' Heraclitus (530 B.C.), among the ancients, best represents this type of pantheism (see Chap. 4). The principle of change is the divine, all-controlling 'fire,' and it is called by Heraclitus 'Zeus,' 'Deity,' 'Logos,' 'Justice.' His system is thus a system of dynamic monism. The origin of the world is explained as a transformation of primal fire.

Another form of realistic pantheism is that of the *evolution of the Deity* into the world. This evolution may be either 'transient' or 'immanent.'

Transient realistic pantheism is also called *emanationism*. Its general doctrine consists in the tenet that all beings in the world 'emanate' or flow from the divine substance, so that they originate, not by means of

God's causal action, but through a transformation of God's substance. The *gnostics* of the second century of the Christian era, particularly Valentinus, taught the origin of numberless 'aeons' through emanation from God. Plotinus (A.D. 205—270) and the *neo-platonists* defended a system of emanations. According to Plotinus, God is the One, the Good, the primal reality which is undifferentiated. Goodness gives rise to emanation; and emanation gives rise to the multiplicity of things, as a kind of overflow of the One. Mind is the first reality to emanate from God; then comes the world-soul; then plastic forces (forms, individual souls); and finally matter. Matter is the ultimate degradation of the One, because it is the source of multiplicity and evil. In medieval times John Scotus Eriugena (about 810—877) defended a transient, emanatistic pantheism.

Total *immanent* pantheism applies the principle of *evolution* to God and maintains that the divine reality has evolved into the present world. World-beings, therefore, are *modifications* of the divine reality, produced through a 'real' evolution of the divine entity. The philosophy of *India*, as laid down many centuries before Christianity in the Veda and the Upanishads, taught that originally there was but a single permanent reality, namely, 'Brahman' (God), which then evolved into the things of the world. A modern version of Indian pantheism is found in *theosophy*. Perhaps the best-known system of immanent evolutionistic pantheism is the one propounded by B. Spinoza (1632—1677). Spinoza began his system with an arbitrary definition of 'substance,' allowing but a single substance to exist, namely, God. This substance consists of infinite attributes of which two only

are known to man, 'extension' and 'thought'; these attributes are the same reality as God Himself, and for that reason are not really distinct among themselves. Besides these attributes, infinite 'modes' exist in God; and of all these modes man knows but the particular thoughts present in his own mind and the particular extensions constituting the various bodies found in the world. These modes, however, like the attributes, are not really distinct but are merely different aspects of one and the same substance of God. God thus evolves into 'nature' and 'spirit,' so that "God is a thinking thing" and "God is an extended thing." However, when Spinoza attempts to derive 'mind' and 'matter' ('spirit' and 'nature') from the infinite substance as the finite determinations of God's being, he explains the evolution of differentiation and multiplicity in a way which makes them unreal. At any rate, Spinoza's God is an impersonal substance.

Total *idealistic* pantheism proclaims as its fundamental tenet the principle that all being is actually thought-being, so that things have existence only in a mind and only in so far as they are thought. Hence, everything is derived from 'mind' and is essentially 'mental.' The main proponents of idealistic pantheism are the German philosophers J. H. Fichte (1762—1814), F. W. J. Schelling (1775—1854), and G. W. Hegel (1770—1831). Theirs is the pantheistic philosophy of the *Absolute*, and each of these thinkers sought, in his own way, to harmonize the phenomenal (appearance)' and 'noumenal (thing-in-itself)' of Kant's idealism by starting with a being which would be the unifying ground of these Kantian opposites.

The human mind invariably seeks a *principle of unification* for the multiplicity and diversity observed among the beings of the world. However, instead of finding this principle of unification in the efficient causality of a personal God, these thinkers placed it in the very being of God, and thereby they fell into the error of pantheism. Pantheism, as the materialist Ernest Haeckel once said, is nothing but “polite atheism.”

Refutation of Pantheism

In view of what has already been established concerning God’s existence and nature, it is clear that any type of pantheism, identifying Him either partially or totally with the things of the world, is erroneous. All that is required here is to point out how pantheism contradicts these established truths.

PARTIAL PANTHEISM MUST BE REJECTED.

Any theory that makes God a part of the world is erroneous. To be a part of anything means *composition*, and composition in this case would mean that the result is a ‘composite being.’ Now, the composite being, considered as a totality (whole), is more perfect than the parts which constitute the totality (whole). Hence God would be less perfect as a part than the totality (whole) of which He is the part. God, however, is infinitely perfect, and therefore He cannot be a part of the world.

TOTAL PANTHEISM MUST ALSO BE REJECTED.

According to the teaching of total pantheism, God is identified with the totality of the world, not merely with a part of it. Whether this pantheism be 'realistic' or 'idealistic,' it cannot be accepted.

Realistic total pantheism is erroneous. The origin of the world is explained either as an 'emanation' or as an 'evolution' of the divine substance. In either explanation God is identical with the world and the world with God. If this were so, the world would of necessity be a *single being*, because God Him self is one, undivided and indivisible. Such a view of the world, however, contradicts both experience and reason.

Idealistic total pantheism is also erroneous. Idealistic pantheists of modern times claim that the beings of the world are but 'modes' or modifications of the divine substance through a process of necessary evolution; and these modes are only 'thought-modes' or thought-modifications of God's evolving being. This system is an egregious error. Creatural beings are not 'modes' of any substantial being. As William J. Brosnan⁴ rightly observes: "They are complete substances in themselves, really distinct from God numerically and essentially, and really distinct from one another numerically and, in numberless cases, specifically and also generically. What is more, unless we wish to admit that our cognitive faculties are utterly and absolutely untrustworthy, we must admit that we ourselves and the rest of the creatures in the world are not mere thought-modifications of any being, but have an existence in the physical world, an existence, namely, really distinct

from, and outside of, the intellect or thought of any being, even God. To insist that the world is a mere illusion of God's intellect or of our intellects is intellectual suicide. To attempt to live practically in accord with such a theory is impossible. Even the Idealists themselves admit this."

The great *fallacy* underlying the system of idealistic immanent pantheism, especially of the Hegelian type, lies in the failure to distinguish between the *ontological* concept of God as the *ens a se* (ὁ ὢν) and the logical concept of *universal being* (τό ὄν). A comparison of the two concepts will bring out their radical difference. The concept of God is that of a *concrete* being; the concept of universal being is abstract. The absolute being of 'God' has the fullest 'comprehension,' because He comprises within Himself the *plenitude of being* in an infinite manner; but the concept of God is the smallest in 'extension,' because He is *only one in number*. The reverse is true of the abstract, logical entity of the concept of 'universal being.' From the standpoint of its 'comprehension,' it is the most meager of all concepts, because it consists of the single item of *being in general* and as such is next to 'nothing'; from the standpoint of its 'extension,' it is the widest of all concepts, since it can be predicated of every sort of actual and possible being, of substances and accidents and modes. Furthermore, 'God' and 'universal being' differ altogether in regard to the manner of their *origin*. The concept of 'God' is the result of reasoning, acquired through the process of applying the principles of reason to the data of experience. On the other hand, the concept of 'universal being' is formed through the logical process of abstraction, by ignoring the manifold

differences existing in the actual realities. Again, 'God' and 'universal being' differ completely in their *mode of existence*. 'God' exists as an individual being, independent of any creatural mind. 'Universal being' exists formally only in the abstracting mind and as such has only a mental existence; in actuality, individual beings alone exist, and 'universal being' does not exist as a real being anywhere in nature. Finally, 'God' and 'universal being' are totally different in their *properties*. Both are simple; but this 'simplicity' is predicated of them in radically diverse meanings. 'God' is said to be simple' in the sense that He is infinitely perfect; He possesses ontological indivisibility in the fullness of His Being. 'Universal being,' however, is said to be 'simple' only because of its indeterminateness, logical incompositeness, and poverty of content.

From all this it is clear that pantheism, no matter in what guise it appears, cannot stand the test of logical analysis. When examined carefully and objectively, pantheism always manifests itself as a system of flagrant contradictions. Any system of thought, however, which is inherently contradictory, must be rejected as erroneous.

God Is Personal

The term 'person' must not be confused with the term personality.' In ordinary parlance, 'personality' means the combination of all those mental, moral, and emotional traits, natural and acquired, which distinguish one human being from another. Philosophically, a *person* is defined as an individual, complete, subsistent, intellectual substance.

Originally, the notion of 'person' has been acquired by man through a study of his own being in comparison with lower beings. Then, finding that God, too, is an individual, complete, subsistent, intellectual substance, but in an infinite degree, man applies the concept of 'person' analogically to God.

God is *personal*.

God is a *substance*. He certainly exists in Himself and by Himself, so that He does not need another being as a subject in which He must inhere in order to exist. This follows necessarily from the fact that He is the first being and that He is infinitely perfect. It is certainly more perfect to exist independently of another being than to need another as a subject of inhesion.

God is an *individual* substance. Obviously, if God is unique, so that a plurality of Deities is excluded, He is an individual substance. A pantheistic deity does not possess individuality, but a theistic God certainly does.

God is a *complete*, individual substance. God is in no sense a part-substance like the human soul conjoined with matter to form 'man.' God is neither a part of the world at large nor of any being in the world. If God were not a 'complete' substance, He would not be infinitely perfect.

God is a *subsistent*, individual, complete substance. Something is said to be 'subsistent' when it is self-contained and autonomous (*sui juris*) in its existence, nature, and operations. Since God is the first being, the uncaused cause, and infinite substance, He must also be 'subsistent.'

God is an *intellectual*, individual, complete, subsistent substance. It is manifestly a greater perfection for a being

to have an intellect than not to have it. Hence, since God is infinitely perfect, he must be an intellectual being. Besides, God is the author of the order, harmony, and rationality observed in the arrangements present in the world.

God, therefore, is truly personal. The world at large is not personal, because it is lifeless and lacks an intellect. Hence, God is *distinct from the world*, even though *immanently present* to every being.

Summary of Chapter XI

In this chapter God's *immutability, eternity, and immensity* are considered. Pantheism is refuted.

1. *Notion of Immutability.* — The opposite of 'immutability' is *mutability*, and mutability means capability of change. 'Change' is the passage of a being from one state into another state. Change may be 'extrinsic' or 'intrinsic.' With reference to God's immutability, intrinsic change in the strict sense of 'physical,' 'moral,' or 'intellectual' change must be denied of God.

2. *Proof of God's Immutability.* — Intrinsic change means the acquisition or loss of some reality. If God could change intrinsically, He would have to *acquire* reality either from Himself or from another. Neither supposition is admissible. Nor can God lose reality. God is the first and necessary being and as such cannot acquire or lose any reality. Intrinsic change is also contrary to God's infinite perfection and absolute simplicity. Specifically, God cannot undergo physical, moral, or intellectual change.

God *alone* is immutable. All creatural beings are contingent and potential, and undergo change, so that they are constantly acquiring and losing reality in many ways.

3. *Notion of Eternity.* — Eternity is a form of duration; eternity is defined as a duration in existence which is essentially without beginning and end and which is essentially without real succession and intrinsic change.

Duration is either divine or creatural; either successive or permanent; either temporal or everlasting. The

everlasting duration of spiritual entities is termed 'eviternity.'

Boethius has defined eternity as "the simultaneously-complete and perfect possession of interminable life."

4. *Proof of God's Eternity.* — That God's duration is eternal, follows from the fact of His necessity and immutability of being.

God *alone* is eternal, because He alone is necessary; all creatural beings are 'contingent' in their existence and dependent on God for their being.

5. *Notion of Immensity.* — Immensity means that God must be necessarily present wherever any being exists which is not God. Immensity is an infinite, intrinsic, and absolute attribute of God, unconditioned by creatural existence or non-existence. *Omnipresence* or *ubiquity* is the relation of God's presence to the beings which actually exist and to the real space which they occupy. Omnipresence is the result of God's immensity.

6. *Proof of God's Immensity.* — The presence of a thing 'somewhere' is something positive and therefore a perfection. Immensity is this perfection without the limitation and imperfection found in creatures. Consequently, immensity is a pure perfection and as such must be an attribute of the infinitely perfect essence of God.

God *alone* possesses immensity, because no creatural being has the exigency to be present everywhere and in everything. God's presence is a presence of His essence, knowledge, and power. His presence is neither 'circumscriptive' nor merely 'definitive,' but *repletive*.

7. *Pantheism*. — Opposed to theism, pantheism teaches the identity of the Deity with the beings of this world. Pantheism is partial, when it identifies God with a part of the world; *total*, when it identifies God with the totality of the world. Total pantheism may be either 'realistic' or 'idealistic.'

8. *Refutation of Pantheism*. — Partial pantheism must be rejected. God cannot be the 'world-soul,' because such a supposition contradicts God's infinite perfection, simplicity, and immutability. Nor can He be 'universal matter,' because matter is essentially passive, potential, and changeable.

Total pantheism must also be rejected. In the *realistic* interpretation of total pantheism, the world would of necessity be a single being, because God Himself is one, undivided and indivisible. Such a view of the world, however, contradicts both experience and reason. In the *idealistic* interpretation, the beings of the world are 'thought-modes' of the Absolute's (God's) necessarily evolving being. This doctrine is contrary to fact, because man and other beings are complete substances in themselves, really distinct from God and among themselves. Idealistic pantheism would make our power of knowledge utterly untrustworthy, and so universal skepticism would be inevitable. The *fallacy* underlying idealistic pantheism lies in its failure to distinguish between the 'ontological' concept of God as the *ens a se* and the 'logical' concept of *universal being*.

9. *God Is Personal*. — Philosophically, a person is an individual, complete, subsistent, intellectual substance. This

definition is verified in God. Therefore, God is a personal being.

Chapter 12

GOD'S INTELLECT AND WILL

THE ATTRIBUTES DISCUSSED IN THE TWO PRECEDING CHAPTERS are essential' attributes, in the sense that they pertain directly, according to our human way of thinking, to the essence of God.

Next in line are the *internal operational* attributes of God. God's essence is not an inert, inactive reality, but one that is absolutely active and operative.

In God, since He is pure actuality and infinite perfection, everything is identical with His absolute essence. Man cannot conceive this complete identity. Man's ideas are derived from finite beings, and they are always finite in their comprehension of perfection. When applied to God, all limitation must be denied. Hence, even though we predicate 'operations' of God, we must always bear in mind that such operations are not something superadded to God's essence but are identical with His absolute being.

The operational attributes proper to God's essence, considered absolutely in itself, are *vital spiritual activities*, mainly those of *intellection* and *volition*. These will now be discussed.

Nature of God's Intellection

It is clear that God *cannot be a material entity*. A material entity consists of matter; and matter consists of two or more parts in a side-by-side position, existing in such a manner that normally they are spread out in space but form a unified reality. Whenever matter exists, there is a resultant *composition* of the material parts into a whole. In God, however, there can be no composition of any kind, because He is the first being and pure actuality. God, therefore, is not a material entity. As a consequence, He is an immaterial or spiritual entity.

Every spiritual being is a *living being*. Life is 'immanent' action, and immanent action is either vegetative or sensory or spiritual. Vegetative and sensory action, however, are essentially organic, and whatever is organic is material. God, since He *is* immaterial, is not organic; consequently, his life cannot be vegetative and sensory. Hence, the life proper to God must be spiritual, characterized by intellection and volition.

Intellection, in general, has subjective and objective elements. The *subjective* element is the act (operation) of the knower, namely, thought or knowledge itself in virtue of which the thinking subject actually 'knows.' The *objective* element is the *formal principle* which immediately and proximately orders the subject's power of thinking to elicit the act of thinking.

SO FAR AS THE *ACT OF KNOWLEDGE* IS CONCERNED, THE DIVINE activity of knowing is evidently very different from that of man. In man, the act of knowing is 'really distinct' from man's nature. This fact is manifest beyond doubt, because man's act of knowing comes and goes while his nature remains. Man's act of knowledge, therefore, is always an 'accidental determination' of his intellect, so that his intellect passes from the potentiality of knowing to the actuality of knowing. In God such a passage from potentiality to actuality cannot occur; He is all essence and actuality. While, therefore, man makes a distinction in God between His essence and intellection, this is only in accordance with the limited conception of God's nature characteristic of man's thought. This conception views divine intellection as an *operational attribute* proper to God's essence. It is necessary, however, to guard against certain false notions; otherwise the limitations of man's intellection will be predicated of God's intellection.

In God there are no 'accidents' of any kind, because there is no composition. Therefore, God's intellection is *identical with His substance*. For the same reason God's intellection may not be conceived as any sort of 'process' which unfolds gradually in the course of His existence. It must be absolutely *self-subsistent* and *immutable*; consequently, through a single, comprehensive act of knowledge God must exhaust the knowable, without change in Himself and without the necessity of progressive learning. And since God's intellection is identical with His essence, it is absolutely simple and infinitely perfect complete *understanding*, so that He need not reason from

premises to conclusions nor make distinctions nor combine subjects and predicates into judgments; God's knowledge is an infinitely penetrative insight into all things which can be known, and this knowledge must be absolutely *true* and *infallible*. Similarly, infinite perfection precludes in God's intellectual act the possibility of dependence on creatures. If God in His intellectual act were dependent in any manner on creatural beings, His very essence would be dependent because of the identity between His intellection and essence; that, however, is impossible in the self-subsistent being. Hence, God's intellection is unconditionally *independent*, even with respect to man's free acts.

The Object of God's Knowledge

All human thoughts are contingent realities, because they are not eternal in their existence but begin to be and cease to be at definite moments in time. As such, human thoughts demand specific causes which determine them both in their origination and in their character as representations of determinate objects. This cause of human thought is termed, in technical language, its *formal principle* (*principium formale*), and it is defined as that by means of which the intellect is determined or ordered to elicit the knowing act.

In man, the *formal principle* of thought contains a double element, one 'external' and one 'internal.' The *external* formal principle of knowledge is the known object itself, in so far as it impresses itself upon the intellect and through this impression prompts the intellect to elicit the act of

knowledge, thereby making the mind pass from the potentiality of knowing to the actuality of knowing. Unless such an object presents itself to the intellect, the intellect simply cannot know anything about it. However, the mere presence of an object is insufficient for the eliciting of the act of knowledge; the intellect is not completely passive in the process of knowledge. In the presence of the object the intellect actively abstracts a 'representation' of the object. This representative or cognitional image is the internal formal principle of knowledge in the knowing subject and is called the *intelligible species*; by its means the intellect is proximately determined to elicit the act of knowledge.

In the case of human intellectual knowledge, the intelligible species is a contingent reality and an accidental perfection superadded to the reality of the intellect. God, of course, cannot be the subject of an accidental perfection superadded to His essence, for He is pure actuality. The divine intellect is identical with the divine essence and substance, and as such it is in sense a 'power' or 'potency' which requires the help of an intelligible species, distinct from itself, to actualize itself. In God nothing is prior to His self-subsistent essence, and nothing is distinct from His essence. Hence, if we wish to speak of an 'internal formal principle' of God's knowledge, we must use the term 'intelligible species' in a wider and less proper sense than in the case of human knowledge. Taken in this *wider* and *less proper meaning*, we can say with St. Thomas¹ that "the intelligible species does not differ from the substance of the divine intellect, as it differs in our intellect when it understands actually; but the intelligible species itself is the

divine intellect itself, and thus God understands Himself through Himself.” And God’s intellect being identical with His essence, one must also say that His essence is the ‘internal formal principle’ (‘intelligible species’) of His infinite act of knowledge. It follows, then, that God Himself is the *primary object* of His knowledge, because His knowledge is the same as His essence. All other things are *secondary objects* of His knowledge, inasmuch as He is the source of their being and they are imitations in some way of His essence. God, therefore, knows Himself and all other things in the infinitely perfect perception of His own being. As St. Thomas² puts it: “God sees Himself in Himself, because He sees Himself through His essence; and He sees other things not in themselves, but in Himself; inasmuch as His essence contains the similitude of things other than Himself.”

First, then, God knows *Himself*. And He knows Himself through an infinitely perfect act of self-contemplation. Intellectual knowledge always implies that the knower knows that he knows; this, in turn, implies that the knower knows himself in the act of knowing. God, therefore, must know Himself. And since the act of knowledge is identical with God’s infinite essence, it follows necessarily that God knows Himself in an infinitely perfect manner. This means that God’s self-knowledge is absolutely *comprehensive*, because the act of divine knowledge is co-extensive with the divine object present to His intellect. If God did not know Himself comprehensively, He would be lacking in a most important phase of knowledge and would not be infinitely perfect. But God is infinitely perfect. Therefore, He must

have a comprehensive knowledge of Himself as the primary object of His intellect.

The objective of all knowledge is *truth*, and truth is the conformity between thing and knowing subject. Since God's intellect and essence are absolutely the same reality, the conformity between His intellect and His essence is absolute in every respect. Hence, God does not 'possess' truth; *God is Truth*.

Second, God knows *all things distinct from Himself*. This conclusion is a necessary consequence of His infinite perfection. If it is a perfection for man to know things other than himself, this perfection must also be present in God. And since everything in God is infinite, this perfection must also be infinite. Hence, God must know all things distinct from Himself in an infinitely perfect manner, comprehensively. Anything short of absolute comprehension would be a limitation and imperfection. This means that God's knowledge of things is not 'abstract' and through 'universals,' as in the case of human knowledge, but 'distinct' and 'adequate' and 'without confusion.' God knows man, therefore, better than man knows himself; He knows man and every other being down to the smallest and most intimate detail of reality. Furthermore, God not only knows every *operation* of creatural beings throughout their existence, but also every operation which they can possibly perform. Everything in the past and present and future is thus open to His view, and this knowledge of God is, like His essence, *eternal*.

From all this it should be clear that *creatural reality does not determine God's knowledge*, because it does not induce

His intellect to pass from potentiality into actuality. Creatural reality is merely the *term* of God's knowledge, because by the 'term of knowledge' we understand the 'object of knowledge,' namely, that which is known to the knowing subject; and creatural reality, obviously, is known to God, otherwise it could not even exist.

Hence, God knows *all beings* both extensively and intensively with complete comprehension.

SOME MODERN AUTHORS, ESPECIALLY THE *PANTHEISTS*, HAVE denied knowledge in the Absolute, on the grounds that every act of knowledge involves two distinct realities, the *knower* and the *object known*. Hence, they say, the God of theism would of necessity be a divided reality ('knower' and 'thing known') and as such could not be infinitely perfect. Furthermore, they claim, by the very act of knowledge God would be 'limited,' since every knowing subject is 'limited' by the object it knows consequently, God would be infinite (unlimited) and finite (limited) at the same time; and that is a contradiction. The objection is futile. Certainly, a creatural mind is distinct as knower from the object known when it knows objects distinct from itself; and it is 'limited' by such objects, because the act of knowledge is something acquired and as such is superadded as a new reality to the 'power' of knowing. If the knowledge present in God were like that of man or of any other creatural being, division and limitation would be carried over into His essence. But God's knowledge is not like that. His knowledge is identical with His essence. Hence, in knowing Himself there is a perfect

identity between God as the 'knower' and as the object known'; and because of that fact He is not 'limited' in any way by the object of knowledge. Unlike man who merely has knowledge of himself and other beings, God *is* His own knowledge; that is merely another way of stating that *God is Himself*, and such a statement contains no contradiction whatever. At most, there is but a *logical distinction* between God as the 'knower' and the 'object known'.

Practically all the difficulties which the moderns advance against the knowledge of God are based on a confusion of creatural knowledge and divine knowledge. They draw a complete *parallel* between the two and argue to their *parity*. It is unfortunate that these thinkers cannot rise above the essential imperfection inherent in human knowledge to the essential perfection of divine knowledge. Basically, they labor under the misconception of an 'anthropomorphic God,' and then they are guilty of the inconsistency of accusing the theists of 'anthropomorphism.'

Kinds of Divine Knowledge

Everything in God is fundamentally and ultimately a single reality. Man cannot conceive God in a single, comprehensive idea; if he could, he would be God Himself. Man must make distinctions, even though he knows that God's essence is absolutely one, because that is the only way man can form ideas of God's being. In a similar fashion, man forms distinct ideas of God's intellect and knowledge, although he is

aware that there is no multiplicity in God. Hence, man distinguishes various *kinds of knowledge* in God's intellect.

Viewed from the standpoint of the *objects themselves*, God's knowledge is either that of 'simple intelligence' or of 'vision'; many authors add to these 'intermediate knowledge.' God's knowledge of *simple intelligence* has as its object those things that are merely possible. Such things have never existed, they do not exist, and they will never exist, because they never leave the realm of mere possibility; but they could, absolutely speaking, exist, provided God had decided to give them existence. God's knowledge of *vision* pertains to objects which at some time, either in the past or present or future, have existence. Such realities, no matter at what point of time (past, present, or future) they have actual existence, are intuitively seen by God as they actually exist when they exist. Many scholastic philosophers posit a knowledge in God which is midway between simple intelligence and vision; it is termed *intermediate knowledge (scientia media)* and pertains to conditionally future events dependent on the free will of man. These events will never happen, because the conditions for their happening will never be actually realized; but they would happen by the free choice of man, if these conditions would be actually realized. Hence, such events refer to things which a man *would* do through free choice under certain unfulfilled conditions; since these hypothetical conditions are never fulfilled, the events will never actually occur. The 'conditionally future events' are also called *futuribles (futuribilia)*. The defenders of 'intermediate knowledge' maintain that this type of

knowledge has a midway position between 'simple intelligence' and 'vision.' It agrees with 'simple intelligence' in that it deals with events and things which will never actually exist; it differs from it in that these events and things 'would' actually exist if certain conditions were fulfilled. For example, if Napoleon had not lost the Battle of Waterloo, Europe would (or would not) have fallen under his sway. It also agrees with 'vision' in this that it deals with (conditional) existing events and things; it differs from it in this that these events and things never will exist *de facto* but would come into existence if certain conditions would have been fulfilled. In the case of the Battle of Waterloo, Napoleon did not win it, and so the fate of Europe, as a consequence of Napoleon's hypothetical victory, remains unknown to us but known to God.

Viewed from the standpoint of the *manner* of God's knowledge of beings, this knowledge is either 'abstractive' or 'intuitive.' God's *abstractive* knowledge deals with events and things which never exist; His intuitive knowledge, with events and things which actually exist at one time or another.

Viewed from the standpoint of *prospective use*, God's knowledge is either 'speculative' or 'practical' or 'speculative-practical.' *Speculative* knowledge looks solely to the truth involved in knowing. Thus, God's knowledge of Himself is speculative. Practical knowledge refers to the use of knowledge for the making of something, when the intention of making is present. The knowledge which God has of the things he intends to create is a 'practical' knowledge. *Speculative-practical* knowledge is the

knowledge required to make something, but the intention to make it is absent. For instance, God has the knowledge required for the creation of the purely possible beings; however, since He does not intend to create them and give them actual existence, this knowledge, though 'practical' in itself, remains 'speculative,' so that it is a 'speculative-practical' knowledge.

Viewed from the standpoint of God's *attitude* toward things, His knowledge is knowledge either of 'approbation' or 'simple cognition.' God's knowledge of *approbation* pertains to the good. God approves of all morally or (and) physically good things which have existed in the past, or exist in the present, or will exist in the future. *Simple cognition* in God pertains to all morally or (and) physically evil things; these He does not approve. Whatever is a moral or (and) physical evil is a defect, a privation, of a good, and as such it is a lack of being, something which is negative. God, of course, knows of the actual or possible existence of such an evil, because He perceives the defect in the good being, but He does not and cannot approve of the privation of what ought to be present. Every crime is thus known by God through the knowledge of 'simple cognition' without 'approbation' on His part.

It should be carefully noted that these various kinds of knowledge in God represent *no real distinctions* in God. Because of the limitation of his mind, man must form different concepts of God's intellect and speak of these kinds of knowledge *as if* they were diverse forms of knowledge. As has been said before, however, God is one

single, infinitely perfect essence and exhausts all knowable truth regarding Himself and all things distinct from Himself.

The problem of the *scientia media* (intermediate knowledge) has agitated the minds of eminent scholastic philosophers for centuries. It might seem that here is the logical place to discuss the problem of 'intermediate knowledge.' Inasmuch, however, as the divine will-act plays a prominent part in the controversy, the discussion will be postponed until later.

Existence of God's Knowledge

In giving the proof of the existence of intellectual knowledge in God, one can make use of a general argument or of a special argument concerning the various kinds of objects.

THE GENERAL ARGUMENT.

Knowledge is a *perfection*, because it is a vital activity, and vital activity is a perfection for a living being. Animals belong to a higher level of being than plants and minerals precisely in virtue of their knowledge. Man is more perfect than animals and plants and minerals because of his rationality, his intellectual knowledge. Therefore, God must have knowledge. God being the cause of the intellect and intellectual knowledge present in man, he must also have an intellect and intellectual knowledge. Since God is infinitely perfect and absolutely simple, His intellect and its thinking must be infinitely perfect and absolutely simple.

Because of His infinity, He must exhaust intensively and extensively everything knowable. Now, the knowable is the truth, and every kind of being is something that is knowable and in so far true. Therefore, everything that is a being must be known by God. But if God knows every kind of being, He must also know the privations affecting these beings, be they moral or physical. Consequently, nothing whatsoever is excluded from the knowledge of God, and *God knows absolutely everything*.

Everything is a 'being' which does not involve a contradiction, since only a contradiction is strictly a non-being, as it is also a non-truth. Now, whatever is *possible or actual* is really no contradiction; and this includes everything which is necessarily or freely possible, everything necessarily or freely actual (in the past or present or future), and everything conditionally future. These realities involve no contradiction and as such are 'knowable.' Hence, all these objects must be known to the infinitely perfect intellect of God. Consequently, *everything without exception* must be encompassed in an infinite manner in the act of God's knowledge.

THE *SPECIAL* ARGUMENT.

That God has infinite knowledge of *Himself*, has already been shown; it follows necessarily from the fact that His essence and knowledge are identical. The problem here, then, is to prove that His knowledge also extends to all beings other than Himself.

God knows *possible realities*.

Whatever is possible can exist. But a thing can exist only because God can give it being and existence. Such a being, if it received being and existence, would be an *effect* whose perfections must be pre-contained in their cause, God. God, in giving them being and existence, cannot communicate to them a *part* of His own essence, because that would be contrary to His infinite perfection and immutability. Hence, in giving them being and existence, God can only give them a perfection *similar* to His own. He could never make anything dissimilar to His perfections; because the only thing dissimilar to Himself is nonentity ('absolute nothing') and God cannot make nonentity. Hence, things are possible only in so far as they imitate God's own perfections. However, since God knows His own essence, He also knows the *imitability* of His essence; otherwise He would lack this great perfection of self-knowledge. But He can only then know His own imitability if He knows the things that can imitate His perfections. The things, however, which can imitate God and His perfections in their own being and existence, are precisely the things that are 'possible.' Consequently, *God knows all possible realities.*

God knows *actual realities.*

At some time or other, in the past or present or future, actual realities really exist. When they exist, they exist in the presence of God, because of the perfection of His *immensity* and *omnipresence*. Since God is present to them when they exist, He must certainly know them, otherwise His knowledge would be defective; and since His knowledge is eternal and immutable (being identical with His eternal and immutable essence), God must know them from

eternity. It follows, then, that from all eternity God knows whatever realities will be actual in the course of time. Consequently, *God knows all actual realities*.

God knows all *future free acts* which actually occur.

The future free acts are acts which a free agent (for example, man) actually performs at some time as the result of a free decision of the will; they will actually occur at some moment in the future. Due to His *immensity* and *omnipresence*, God must be present to these free acts, and these free acts must happen in God's presence, when they actually occur. Hence, God must know them at the very *moment* when they really happen. Now, this knowledge of the future free acts is absolutely eternal and immutable, since it is identical with God's essence. His essence being eternal and as such prior to the temporal occurrence of these future free acts, His knowledge must also be eternal and prior to them. Consequently, God knows future free acts before they actually take place.

Furthermore, God being infinitely perfect in every way, His knowledge must also be infinitely perfect. In order that God's knowledge be infinitely perfect, it is necessary that He know everything which is objectively true. Now, all future free acts are *objectively true*; they will actually occur, and this is a truth which can be expressed in a true judgment. For instance, I am writing these words at the present moment, and this writing is the result of a free decision on my part; last night it would have been impossible for me to say whether I would be writing at this moment or not, because I myself did not know at that time what I would freely decide to do at this moment. However,

now that I am writing, the 'fact' of my writing at this moment is an objective truth which can be expressed in the judgment that 'I am writing.' And since I am writing at this moment, the true judgment that 'I am writing' expresses a fact which God must have known from all eternity; He knew from all eternity that I would write at this moment, because He knows now that I am writing, and what God knows now He knows eternally. Hence, since God's knowledge is infinitely perfect, and since an infinitely perfect knowledge must know all truth, *God knows all future free acts* which actually occur.

It will be noticed that this thesis closely resembles the foregoing one. The difference lies in the fact that the acts under consideration are the result of a here-and-now free decision. The foregoing thesis dealt with actual realities in general.

God knows all *conditionally free acts* which will not occur. 'Conditionally free acts' are those which would have occurred as the result of a free decision, provided certain conditions had been fulfilled; the conditions, however, have not been fulfilled, and so these free acts *will never* actually happen. God must know such acts. All that is at stake in this proof is the establishment of the *fact* that God knows all conditionally free acts which will not occur, even though man may never understand 'how' God knows them. And now for the proof.

The infinitely perfect knowledge of God's intellect must embrace *everything true and knowable*. Now, even the free, conditionally future acts are true and knowable. Consider these two judgments: 'If the American Revolution in 1776

had miscarried, this country would be a colony of England today,' and 'If the American Revolution in 1776 had miscarried, this country would not be a colony of England today.' It is evident that one of the members of this disjunction is true and one is false, even though the condition has not been fulfilled. The two judgments are *contradictory*. Both simply cannot be true; one must be true, and the other must be *false*. We do not know which is the true judgment and which the false; but we do know that only one, and that a definite one, of these judgments must be true, while the other judgment must be false.

But now, since God knows 'all that is *objectively true and knowable*, He must, in virtue of the infinite perfection of His knowledge, also know which of these two judgments is true and which false. This, however, is only possible if He knows what event would happen in the hypothetical case mentioned above, *if* the condition given were verified, even though it was not and never would be verified. The fact itself is clear. In every case of conditionally free acts, though they will never actually occur because of the non-fulfillment of the conditions involved, something of a definite character *would have* occurred *if* the condition had been fulfilled. The truth contained in such conditionally free acts cannot be unknown to God.

Summing up, it is clear that *everything*, which in any way is *knowable*, must be known by God. If anything knowable escaped his knowledge, He would not be infinitely perfect.

Nature of God's Will

Will is a form of appetency, and an appetency (or, appetite), generally speaking, is the inclination or propensity of a being for something which is good for it. In a more special sense, appetency is the inclination or propensity of a being for an apprehended good. In this sense, it follows a cognition of the good, and this cognition may be either sensory or intellectual. In man, the appetency of an intellectually apprehended good is termed 'will,' so that the human will is defined as 'rational' appetency. In speaking of the human will as a 'rational' appetency, consideration is given to the fact that man possesses rationality and that man's intellect is a reasoning power or reason.

God, as we have seen, does not 'reason' from premises to conclusions. His intellectual knowledge is pure insight, pure understanding, not reasoning. Reason concludes from the known to the unknown. For God's intellect, however, there is nothing unknown. In attributing 'will' to God, the imperfection of knowledge implied in 'reasoning' must be excluded. Intellectual knowledge, strictly as such, does not necessarily involve knowledge due to 'reasoning'; intellectual knowledge is more perfect when it is pure 'understanding' than when it is 'reason.' God's knowledge, being infinitely perfect, must be pure intellectual insight and intellectual understanding. Hence, God's *will* must be described as an *infinitely perfect intellectual appetency*.

Like the divine intellect, the divine will is an attribute of God's being. Entitatively it is one with God's essence. The essence of a being is conceived to be prior to anything

which flows from the essence, and both intellect and will follow the constitution of the essence. Hence, although the 'will' in God is entitatively one with His essence, according to man's way of knowing God the will flows from His essence, and as such it is an 'attribute' of God. It is not a quiescent, but an active, attribute. Just as the intellect is the principle of knowledge (intellection) in God, so God's will is the principle of His volition. God's will, therefore, is an *operational attribute*.

The volition of God is identical with His being, as are all attributes of God. It is, therefore, self- subsistent. There is no real distinction between God's will, viewed as a 'power,' and His volition, viewed as an 'operation'; God's will is conceived as a 'logical power' with respect to its operation, so that there is only a 'logical distinction' between them. The volition of God is absolutely simple, because everything in God consists of one indivisible pure act; hence, God *is* His will and His volition. His volition is also *infinite* in perfection; this follows necessarily from the fact that His volition is one reality with His infinitely perfect being. Since volition always proceeds from the conscious apprehension of the good on the part of the intellect, it is obvious that there can be nothing blind and instinctive about the volition of God; it must be intellectually *conscious*. Similarly, there is nothing arbitrary about God's volition; it is essentially *well-ordered*, so that He wills or loves Himself because of His infinite perfection and all other beings because of their similitude to His perfection.

The *object* of intellectual volition is the intellectually apprehended *good*. Man, as we know, may be in error

regarding the nature of things and strive for an 'apparent' good rather than a 'real' good. God's intellect can neither be deceived nor be mistaken in its knowledge of what is good and what is evil: God knows all things as they actually are. God's will follows His intellectual knowledge. Now, the proper object of the will is the 'good,' just as the proper object of the intellect is the 'true.' There can, therefore, be no error in the object of God's operations of the will. If God has volition at all, it can only be centered on the 'good' as known by His intellect. God wills or loves all beings according to their intrinsic goodness and in proportion to their worth. He thus loves Himself as the Supreme Good supremely, and this love is a *necessary love*, without choice and with infinite intensity. His love for creatural beings, on the other hand, is a matter of *free choice*, so far as their existence and their amount of reality is concerned.

Existence of God's Volition

That God has a will and volition follows from His spirituality and intellectuality. According to sound psychology, an intellectual being, when in the presence of the 'good,' perceives that it is suitable to its own being and naturally desires it as an object to be sought and enjoyed. But 'seeking' and 'enjoying' are acts of a will in an intellectual being. Hence, unless this volition contains imperfection in some manner, it is a *pure perfection* and as such must be present in God. Naturally, man's volition is an operation superadded as a new reality to the power of the will and as such is an 'accident'; the will of man is 'dependent' on the

objects with which it deals, because it cannot desire a good except under the condition that the good be presented to the will by the intellect. These imperfections, however, are not inherent in the will and its operations strictly a 'will' and 'volition'; they pertain to man, because man is a being in which composition is a normal part of his nature. These imperfections removed, volition is a 'pure perfection.' God, however, possesses all 'pure perfections,' and in His being there can be no imperfections for the simple reason that everything in God is one infinitely perfect reality without accidents and without composition. Therefore, God has a will and volition capable of desiring the good presented by the intellect.

Furthermore, God would be *imperfect*, if He did not possess a will and volition. If God had no will, He could not control things or dispose of them as He wished; He could not issue any commands or prohibitions; He could not love anything, not even Himself. Under such circumstances, however, God would be very imperfect, less perfect than the ruler of a nation or the father of a family. Now, God cannot be imperfect from any standpoint. Consequently, He must possess a will and volition.

Finally, the very fact that *man* has a will and volition, is a clear proof that God must also have a will and volition. Man's nature is a contingent and caused reality given to him by God as the cause. Now, the cause must pre-contain the perfection of the effect either formally or eminently. Man, however, does not possess a will because he is an organic being; he is a man and more than an animal, plant, or mineral precisely on account of his *spirituality*. Hence,

man's spirituality and his *will resulting there-from* are not 'mixed' but 'pure perfections' which must exist formally (strictly as such) in God. Consequently, will and volition are formally, not merely eminently, present in God.

There must be an *object* toward which the will and its volition is directed, and this object must be some good. From this it follows that God loves Himself and all other beings distinct from Himself.

God loves *Himself*.

The will of God is not a power or faculty; it is absolute and pure act, infinite in perfection. Since the divine will is an infinite act, it must also love an infinite object. Now, God alone is infinite in His reality. Therefore, God is the infinite object of the divine will and its volition. Hence, God loves Himself with an infinite love.

God loves *all other beings*.

All beings other than God are contingent in their essence and existence. The sufficient reason for their essence and existence does not lie in them but in God. God gives them their essence and existence. Hence, all beings which actually exist, have existed, or will exist, receive their existence ultimately from God, because He *wished* them to exist. But to 'wish' is to 'will' and 'love.' Consequently, God loves all beings distinct from Himself. This follows also from the fact that all creatural beings, whether they be *actual* or *merely* possible, can have essence and existence only in so far as they are (actual or possible) imitations of His own perfections. Now, God loves His own perfections, because His perfections are absolutely identical with Himself, and

He loves Himself. Hence, God loves all other beings; otherwise He would not love His own being infinitely.

Only *being* can be a *good*. Only 'being' is something which is knowable in itself, and only the 'knowable' can be known in itself. Hence, only 'being' can be proposed by the intellect to the will as a 'good.' It is evident, then, that God's will *cannot love privations, defects, and evils* as an object, because such things (if we wish to call them 'things') are nonentities, non-beings, nothing; 'nothing,' however, since it is a negation of being, cannot be the object of volitional activity: there is nothing to will.

Necessity and Freedom in God

'Necessity' and 'freedom' are opposing concepts. What is 'necessary' cannot be 'free,' and what is 'free' cannot be 'necessary.' In a general way, freedom is the absence of necessity. In order to understand the question of 'necessity and freedom in God,' it will be advisable to clarify their meaning.

In a *wide* sense, freedom is the absence of external coercion or restraint which hinders an appetency from expressing itself in external action. Thus, a shackled person lacks the freedom of movement; when the restraining shackles are removed, he has 'freedom from coercion.'

In a *strict* sense, freedom is the absence of intrinsic necessity or determination in the performance of an act. Something is 'intrinsically necessary' when it is determined by its very nature to be what it is and to act as it does. Applied to the will, 'freedom' means that the will is not

necessitated by its nature to act in a determined manner, but is capable of choice even when all the conditions for acting are present.

There are *three types of freedom* in the acts of the will, so far as human volition is concerned. First, there is the *freedom of exercise* or contradiction; the will can choose freely between willing and not willing, between acting and not acting. For instance, a person can freely choose to read or not to read. Second, there is the *freedom of specification*; the will can freely choose between one object and another object and therefore also between one act of the will and another act of the will. Thus, a person can freely choose between the act of reading and the act of taking a walk. Third, there is the *freedom of contrariety*; the will can freely choose between a moral good and a moral evil. A person, for example, can choose between telling the truth and telling a lie. The 'freedom of contrariety' is reducible to one or the other of the first two types, since it is a choice either between acting or not acting or between one object or another object.

The *freedom of the will* is thus defined as *the ability of the will, all conditions for action being present, to decide whether to act or not to act and whether to act in this manner or in that manner.*

The essence of the freedom of the will, as just defined, consists in indetermination, so that the will, no matter what the nature of the antecedent external and internal conditions for action may be, is not determined to act by necessity. The absence of the freedom of the will is what is

meant by *necessity*, so that the will, the conditions for action being present, must act in a determined manner.

After these preliminary explanations of 'necessity' and 'freedom,' the problem of their presence in God's volition should not be difficult to solve.

GOD LOVES *HIMSELF NECESSARILY*.

God's willing is purest act. As such, it demands an *adequate* object. This adequate object is God Himself, since He alone is infinite, and the adequate object of an infinite act must be infinite. But now, since the infinite volition of God is identical with God's essence, it must be as necessary as God's essence is. And since the act of volition consists in love, God loves Himself *necessarily*; that is to say, His love of Himself is *not free*, but determined by His very nature.

GOD LOVES *ALL OTHER THINGS FREELY*.

All beings other than God are finite regarding their number and the *amount of perfection* present in their being. This is evident. There must be a sufficient reason for this number and amount of perfection. The sufficient reason cannot lie in the *essence of the beings*. Their essence being the same, all the 'possible' individuals of the same essence would have to have received existence also. Experience, however, shows that this is not so; for instance, there could be more human beings in existence than actually exist. Nor can the sufficient reason be found in the *necessity of creation* on the part of God. This necessity on the part of

God could find its proper explanation only in a *need* of God for creatural beings; unless this 'need' were present, there would be no 'necessity' for creation. However, God, as the infinitely perfect and self-sufficient Being, cannot have a 'need' for anything outside Himself. Since, therefore, we find the necessity for creation neither in God nor in the creatures, the sufficient reason for the definite number and amount of perfections in creatural beings must reside in the *free decision* of God. Hence, God wills, and therefore loves, all creatures freely.

Again, if there were a *necessary relation* between God's will and the existence of creatural beings, He would of necessity be constrained to create either nothing at all or everything possible or some beings to the exclusion of the rest. None of these alternatives is true.

The first alternative, that God would be necessitated to give existence to *nothing at all*, is manifestly *false*. We ourselves and many other creatural beings actually exist.

The second alternative, that God of necessity gave existence to *everything possible*, is also manifestly *untrue*. More things are possible and could, absolutely speaking, exist than actually do exist.

The third alternative, that God was necessitated to give existence to *some things to the exclusion of the rest*, is also *untenable*. Why should God be compelled to give existence to the limited number? At one time all creatural beings were merely possible and not actually existing. As 'possible' beings, they were all on a footing of equality. There can, then, be no reason in the possible beings *themselves* why God should be necessitated to create just some, and not

more or less. Since all possible beings can imitate God's perfections, all have the possibility of receiving existence, so far as they themselves are concerned. If, then, a necessity exists to give some existence rather than others, the reason for this necessity must be *in God*. But what could constrain God? Certainly, the infinite imitability of God's infinite perfections cannot be exhausted by the existence of some creatural beings to the exclusion of others, because all possible beings are imitable of God's perfections. If there were any reason for this necessity in God, it could only be that He were constrained by His nature to make the best things His power could produce. Such a supposition implies that the present world is the *best possible world*. But this is not the best possible world. To leave all other beings out of consideration, man knows from his own personal experience that he himself labors under many physical, intellectual, and moral defects; he could be better than he actually is. And that is also true of other beings. But if the necessity for creating the present world as it is lies neither in the creatural beings themselves nor in God, then there can be no necessity for God to create this world as it is, giving some beings existence to the exclusion of the rest. Now, 'necessity' and 'freedom' are opposites; if there is no 'necessity,' there must be 'freedom.' Consequently, God's will is *free* in relation to the existence of creatural beings. But if God wills them freely, He also loves them freely.

The conclusion, therefore, is inevitable that He loves *Himself* with an absolutely *necessary* love and *all other beings* with an absolutely *free* love.

Liberty and Immutability

The activity of the free will in man is connected with potentiality. The freedom of man's will is the result of a power or faculty which is indifferent to different acts and objects. Every act of man's will is an added perfection, an accidental determination, and this addition of perfection involves a change in the will. On account of His absolute simplicity, a change or a super-added perfection in God is an impossibility. Since God is *ens a se*, a self-subsistent being, He is pure actuality, and His infinite perfection is an absolutely *necessary* perfection.

God's will-acts being identical with His *necessary essence*, *how can they be free?* Must not His will-acts be just as necessary as the divine essence? But can a free reality be necessary and a necessary reality free? Is not a *contradiction* involved in the very concept of the freedom of God's will?

That the *reconciliation* of God's freedom and immutability presents a grave difficulty, is apparent. Immutability seems to exclude all self-determination. Can a higher unity be effected between them?

We must bear in mind first of all, that there must be many things in an infinitely perfect being which cannot be grasped and comprehended by man's finite mind; there must be many *natural mysteries*. Man would have to have an infinite mind to encompass infinite perfection. Man's inability to fathom certain truths, so long as these truths are firmly established, cannot as such shake their validity. The inability to understand something is no criterion of its

truth or untruth. *Contradictions*, of course, are not and cannot be true; and whenever contradictions are irrefutably shown to exist, man knows that an error must have been committed. But when speaking of the infinitely perfect being, we must be very careful in our assertions. Many things, when applied to creatures, may involve a contradiction in the very terms and would be physically and metaphysically impossible; but they need not be a contradiction in an infinitely perfect being. Thus, to speak of absolute simplicity or infinite perfection in a creatural being, or of free will in a brute, is a contradiction. When applied to a higher being, however, we perceive that no contradiction is necessarily involved.

Then how about God's *freedom and immutability*? Is no satisfactory explanation available? The following explanation, given by St. Thomas,³ is offered as a *solution* of the problem. He says:

"Sometimes a necessary cause has a non-necessary relation to an effect; owing to a deficiency in the effect, and not in the cause. Even so, the sun's power has a non-necessary relation to some contingent events on this earth, owing to a defect not in the solar power, but in the effect that proceeds not necessarily from the cause. In the same way, that God does not necessarily will some of the things that He wills, does not result from defect in the divine will, but from a defect belonging to the nature of the thing willed, namely, that the perfect goodness of God can be without it; and such defect accompanies all created

good . . . As the divine existence is necessary of itself, so is the divine will and the divine knowledge; but the divine knowledge has a necessary relation to the thing known; not the divine will to the thing willed. The reason for this is that knowledge is of the things as they exist in the knower; but the will is directed to things as they exist in themselves. Since then all other things have necessary existence inasmuch as they exist in God; but no absolute necessity so as to be necessary in themselves, in so far as they exist in themselves; it follows that God knows necessarily whatever He knows, but does not will necessarily whatever He wills."

— ST. THOMAS AQUINAS

The solution of St. Thomas can be expressed in a somewhat different way, as follows. The free act of the divine will, considered *entitatively*, is *necessary*, because it is identical with God's essence which is self-subsistent and necessary. This same act of the divine will is *free* in its *relation to the contingent object* to which it is directed. The reason for the freedom of the act of the divine will lies in the 'direction' of the act, and this direction brings in a *logical relation* between the act of the divine will and the contingent being. There can be no question of a physical or metaphysical composition or change in God on this account, because this relation is only 'logical.' In the human will there is an indifference of the 'faculty' (the will) in regard to its respective acts, and through its acts it is indifferent to

the 'objects,' and thus the will is free. In God, however, the will is not a 'faculty' but a *pure act*, and this pure act is *indifferent directly in regard to the contingent objects*. Man has one faculty and a real multiplicity of acts; God has one act and a virtual multiplicity of acts. In other words, *entitatively* (in so far as the act has 'being') the act of the divine will is one with God's essence and therefore *necessary; terminatively* (in so far as the contingent being is the 'object' or 'term' of the act), the act of the divine will is *free*.

Is the mystery hereby explained? It is not. But it is a solution which removes the apparent contradiction involved in the concepts of God's freedom and immutability. After all, a contradiction exists when one affirms and denies the same thing in the same respect of the same subject. Thus, if one were to say that 'God is immutable' and that 'God is not immutable,' that would be a contradiction; or, if one were to say that 'God is free' and 'God is not free,' that would be a contradiction. In both instances, however, it would be necessary to maintain the same respect or standpoint in the affirmation and denial; otherwise there might be only an *apparent* contradiction. The solution of St. Thomas is acceptable, because it leaves intact the established truth of God's necessity and immutability and also preserves the equally established truth of the freedom of God's will. At any rate, his solution avoids an open contradiction, and that is sufficient for a solution to be acceptable in a matter so deep and mysterious.

Much more could be said about God's intellection and volition. So much, however, should be clear from what has

been given above: God has an intellect and a will and also their corresponding operations of knowledge and volition. But intellect and will and their respective acts must ultimately be identified with God's infinitely perfect essence. *That* this is so, is manifest; *how* this is so, exceeds the capacity of the human mind.

Summary of Chapter XII

This chapter deals with God's internal operational attributes of *intellection* and *volition*.

1. *Nature of God's Intellection.* — God, being spiritual in essence, possesses intellectual life. God's *act* of knowledge is identical with His substance, self-subsistent, immutable, simple, infinitely perfect; it is an absolute understanding, true, infallible, and independent of creatures.

2. *The Object of God's Knowledge.* — The *formal principle* of knowledge contains a double element: the 'external' element of the 'known object' and the 'internal' element of the 'intelligible species.' The 'intelligible species' of God's knowledge is the divine intellect itself; the 'object known' is God Himself as the primary object and all things distinct from God as the secondary object.

3. *Kinds of Divine Knowledge.* — Man distinguishes various kinds of knowledge in God's intellect: simple intelligence and vision, and (as many claim) intermediate knowledge (*scientia media*); abstractive and intuitive; speculative, practical, and speculative-practical; knowledge of approbation and simple cognition without approbation.

4. *Existence of God's Knowledge.* — *General argument.* Knowledge is a perfection, because it is a vital activity. Since God is infinitely perfect, He must know absolutely everything knowable.

Special argument. Truth is contained in everything that is 'being.' It is therefore contained in the purely possible realities, in the actual realities, in the future free acts which

will actually occur, and in the conditionally free acts which will not occur because the condition of their existence was not fulfilled. Now, infinitely perfect knowledge must embrace everything true and knowable. Therefore, God knows all these objects of knowledge.

5. *Nature of God's Will.* — God's will is an infinitely perfect intellectual appetency. It is self-subsistent, absolutely simple, infinitely perfect, conscious, and well ordered. Its object is the intellectually apprehended 'good.'

6. *Existence of God's Volition.* — That God has a will and volition follows from His spirituality and intellectuality. God would be imperfect without a will and volition. Volition is not a 'mixed' perfection but a 'pure' perfection, because 'love' is a pure perfection.

There must be an 'object' toward which God's volition is directed, and this object must be some 'good.' God thus loves *Himself and all other beings*.

7. *Necessity and Freedom in God.* — 'Necessity' and 'freedom' are opposing concepts. Applied to the will, freedom is the ability, all conditions for action being present, to decide whether to act or not to act and whether to act in this manner or in that manner.

God loves Himself necessarily, because His will and volition are identical with His essence, and His essence is necessary.

God loves all *other beings freely*. The sufficient reason for the number and the amount of perfection present in contingent beings cannot be due to their 'essence'; otherwise all possible beings of the same essence would also have to exist. Nor can the sufficient reason lie in the

‘necessity of creation,’ because God does not ‘need’ creatures; He is absolutely perfect and self-sufficient. Again, if there were a necessary relation between God’s will and the existence of creatural beings, He would of necessity be constrained to create either nothing at all or everything possible or some beings to the exclusion of the rest. None of these alternatives, however, is tenable. Therefore, God loves (wills) all creatural beings freely.

8. *Liberty and Immutability.* — God’s will-acts being identical with His necessary essence, how can they be free? Entitatively, the act of the divine will is one with God’s essence and therefore *necessary*; *terminatively*, the act is indifferent toward creatural objects and therefore *free*. The whole matter is a natural mystery.

Chapter 13

OMNIPOTENCE AND CREATION

SECTION II: RELATIVE ATTRIBUTES

BESIDES THE IMMANENTLY OPERATIONAL ATTRIBUTES, WHICH produce no external effects, there are also present in God *virtually transitive* operational attributes and activities, which produce (or, at least, 'can' produce) external effects. Chief among these are omnipotence and creation, concurrence and conservation, providence and governance.

God, of course, need not have made any creatures. As the supreme and infinite good, He is absolutely and infinitely sufficient unto Himself. He is and would eternally have been 'omnipotent' even under the supposition that no creatures exist, because He could always have given them essence and existence had He so desired and decided.

As a matter of fact, creatural beings do exist. We ourselves, for instance, and many other beings have existence. The problem, therefore, arises: How did creatural beings come into existence originally? The solution to this problem is: through the omnipotent, creative activity of God. *Omnipotence* and *creation*, then, must now be discussed.

The Notion of Omnipotence

The core of 'omnipotence' is the concept of 'power,' and *power* is the ability to do something or produce something. Power is the principle of action. Action may be either performance or production. Action always results in some effect, either in doing something or in producing something. It is in creatural beings that man first notices

effects; and from such effects he concludes to the existence of 'power' capable of producing effects, because every effect demands a corresponding cause. Some effects are primarily 'immanent,' perfecting the active subject, as in the case of thinking, willing, and other vital operations; or, they may be primarily 'transient,' perfecting the passive recipient, as in the case of making steel out of iron or of throwing a ball. Whether the effects be the result of mere performance ('doing something' immanently) or efficient causality ('producing something' transiently), power is necessary to bring about the result.

In speaking of God's 'omnipotence,' reference is not made to His immanent (vital) activity but to His power to *produce* something transiently through efficient causality.

Omnipotence, as the word indicates (Lat., *omne*, all, everything; *potentia*, power), means that *God can produce everything*. Since there can be no 'passive power' in God, namely, the power to receive some perfection from some other being, omnipotence necessarily means 'active power,' namely, the power to produce all effects through efficient causality. And when it is stated that God can produce 'everything,' it is well to note the word 'thing.' The word *thing* is equivalent to *being*, and 'being' means whatever can exist. Omnipotence, therefore, implies that God can give existence to whatever can exist. In other words, God can produce whatever is *possible*.

The opposite of 'possible' is 'impossible.' Impossibility is either relative or absolute. Impossibility is *relative* when something exceeds the capability of a particular power; it does not involve a contradiction in itself, but the power in

question is lacking or is too feeble to produce it. Thus, an ordinary man cannot lift an object weighing a ton; it is not a contradiction in itself to lift a ton, but the power of an ordinary man is incapable of doing it. What is impossible for the ordinary man need not be impossible for a machine with hydraulic equipment. Relative to an ordinary man, then, the lifting of an object weighing a ton is an impossibility; relative to a greater power, however, it need not be an impossibility. Impossibility is *absolute* when something exceeds the capability of every power; it involves a contradiction in its very concept, so that it is really a non-being, a 'nothing.' God, for instance, cannot sneeze or cough, blush or have indigestion, become weak or grow old, and so forth. If God did any of these things He would be a 'material' being, while in reality He is a 'spiritual' being; a 'material spiritual being,' however, is a contradiction and as such a not being which cannot exist. Similarly, God cannot make a square circle or a stick with only one end or a stone so heavy that He cannot lift it. A 'square' consists of straight lines, and that excludes the round line of a circle; a 'circle' consists of a round line, and that excludes the straight lines of a square: since both the 'square' and the 'circle' are eliminated, there is nothing for God to make. In all such cases, the fault is not with God's power; the fault is with the supposed thing, because such a thing, involving a contradiction in itself, is a nonentity; where there is nothing to make, God cannot make it; where the effect cannot exist, no cause can give it existence. The only thing opposed to 'being' is 'absolute non-being,' sheer 'nothingness.'

Anything that is a 'being' at all can exist, and such a being is 'possible.'

The statement that *God is omnipotent* means that he can give existence to *any possible being without exception*, and a 'possible being' is one that does not contain a contradiction in its very concept or term.

Like other perfections of God, His omnipotence is *formally immanent* but virtually transient; that is to say, His omnipotence, considered from the viewpoint of its reality, is identical with God's essence, but it can produce beings distinct from the divine essence. God's omnipotence is 'extensively' and 'intensively' infinite. It is *extensive* because God's power can bring into existence anything and everything 'possible' and because it can never be exhausted. In other words, God can never come to a point where there would be nothing more to make, since there is absolutely no limit to His efficient causality. The *intensive* infinity of God's power consists in this that He produces beings with perfect independence; hence, He causes them without the assistance of an instrumental cause, without the influence of any extraneous causality, without difficulty or exertion. Having specified the meaning of omnipotence, its existence in God must be proved.

GOD IS OMNIPOTENT.

In God there can be no composition of power and essence. God's power is identical with the divine essence; and since the divine essence is infinite, the divine power must be infinite. Now, infinite power must be *omnipotent*;

that is, it must be able to bring to existence whatever can intrinsically have existence. Everything, however, which does not involve a contradiction in its concept is absolutely possible and as such can intrinsically have existence. God's infinite power, therefore, must be able to give existence to all that is absolutely possible. But to give existence to a thing is to produce it. Consequently, God's infinite power must be able to produce all that is absolutely possible. And that is the meaning of 'omnipotence.'

This capability on the part of God's power to produce all possible beings must be present in God. If God could not produce *everything* that is possible, He would be able only to produce *some* things, no matter how large the number might be, to the exclusion of at least one other possible thing. Evidently, that power would be greater and more perfect which would also include this one other possible thing. Consequently, a power that cannot produce *all* possibles is not the greatest and most perfect conceivable; it would surely not be infinitely perfect, because it would lack some perfection. But God's power is infinitely perfect, because it is identical with His infinitely perfect essence. God's power, therefore, must be able and is capable of producing all things which are intrinsically possible. Hence, God is truly omnipotent.

GOD'S POWER IS *INEXHAUSTIBLE*.

If ever God reached a point where His power would be exhausted in its productivity, so that nothing more could come into existence through His efficient causality, the

power of God would be gone. However, together with the cessation of God's power, His essence would be gone and cease to exist. This would be inevitable, because the divine power is identical with the divine essence. Hence, if God's power would be exhausted, *God Himself would cease to exist*. That, however, is impossible. Consequently, God's power cannot be exhausted in its productivity.

One cannot say that God's power would be exhausted if there were *no more objects to produce*. In such a case the divine power would not really be exhausted; the store of possibles would simply be exhausted. However, even this latter assumption cannot be consistently maintained. Since the divine essence is infinite in perfection, its imitability by creatural realities must also be without limit. As a result, the store of possibles could be exhausted only if the divine essence were limited in its perfections (and its imitability limited in consequence of this condition) or if the actual number of imitations were infinite. But either alternative involves a contradiction. The 'infinite' perfection of God cannot be 'limited'; if it were, the 'infinite' would be 'finite'; and that is a contradiction. That an 'actually infinite number' of creatural imitations also involves a contradiction, will be shown in a later section. Therefore, the store of possibles is inexhaustible, and God's power is also inexhaustible.

It follows, then, that God's power can produce whatever is intrinsically possible, and it is inexhaustible in its productivity. God, therefore, is truly *omnipotent in power*.

From the omnipotence of God one cannot legitimately conclude that He must be capable of producing an *infinite*

effect. An 'infinite effect,' like a square circle, belongs to the category of the absolutely impossibles; it involves a contradiction in its very concept. Since an 'infinite effect' is an *effect*, it is something that is *produced* and *dependent*. Now, 'being produced' and 'dependence' are absolutely incompatible with 'infinity'; a produced and dependent being is by the very fact of its production and dependence essentially 'finite.' The contradiction is evident. Being an 'effect,' it is finite; being an 'infinite' effect, it is 'infinite.' But a finite-infinite being is a contradiction, and as such it is an impossibility; it is a nonentity, a nothing, which cannot receive existence.

The Foundation of Possibles

A thing is said to possess *external* possibility when a power exists which can produce it. It possesses *internal* possibility, when the thing as such can have or receive existence, without regard to the actual existence of a power which can, as a matter of fact, actually produce it. The question now to be discussed is this: What is the *reason*, the *foundation*, for this 'internal possibility'? What is the reason, the foundation, why some things are intrinsically possible (and therefore 'can' exist) while other things are intrinsically impossible (and therefore 'cannot' exist under any circumstances)?

The answer to this question will be different, depending upon whether one asks for the *immediate* or *ultimate* foundation of internal possibility. Both answers will be given.

The *immediate foundation* of the internal possibility of the possibles lies in the *compatibility of the elements* which constitute the essence of a thing.

This is shown by the *idea* of 'internal possibility.' That thing is said to be intrinsically possible whose constituting elements do not contradict one another, but which can exist together; in other words, whose constituting elements are compatible and sociable. If one asks why a 'man' is intrinsically (internally) possible, it is because 'animality' and 'rationality' (the constitutive elements of the idea of 'man') can be united in one concept and realized as one being; these elements of man's nature are thus compatible and sociable.

Reversely, a thing is intrinsically or absolutely impossible whose constituting elements contradict one another and so cannot exist together; such contradictory elements are incompatible and insociable. Thus, a 'square circle' is intrinsically impossible, because 'square' and 'circle' contradict and mutually exclude each other; because of the incompatibility and insociability of the elements of 'square' and 'circle,' a 'square circle' is neither a square nor a circle, but absolutely nothing.

The immediate reason or foundation of internal possibility, therefore, is the *non-contradiction*, the *compatibility*, of the thought-elements constituting the idea of a thing. This is called the *formal principle* of internal possibility.

There must be a reason, a foundation, for the intrinsic possibility of the possibles which lies deeper than the essence of the possible things themselves. The question is:

What is the ultimate reason and ground why some constitutive elements are compatible, thereby making a being intrinsically possible, while other elements are incompatible, so that a being is intrinsically impossible?

God is the ultimate ground of the intrinsic possibility in all possible things.

This must be so. The intrinsic possibility of things must have its ultimate reason and foundation *outside the entire class of possibles*. Being only 'possible,' they themselves cannot give to themselves constitutive elements which would be either compatible or incompatible. If the ultimate ground for the compatibility or incompatibility of the constituting elements of their being were found in them, they themselves would be the reason or principle why some things are intrinsically possible (for example, a mountain of gold) and others intrinsically impossible (for example, a square circle). The possibles, however, are *subject* to the law of contradiction and non-contradiction (intrinsic possibility), regarding both their essence and their existence, and as such must *conform* to this law in order to be 'possible' at all. They cannot, then, be the reason or principle of this law. Hence, there must be some being outside the entire class of possible beings, which is the ultimate reason or foundation of their intrinsic possibility. Now, there is only one being outside the entire class of possible beings, existent and non-existent, and that is God. God, therefore, is the ultimate ground of the intrinsic possibility of all things.

What, precisely, is it in God that must be conceived to be the ultimate foundation of intrinsic possibility?¹

GOD'S ESSENCE IS THE ULTIMATE GROUND OF INTRINSIC possibility.

God is the ultimate ground for all possibility. But there must be something in God which is logically prior and deeper than His omnipotence, will, and intelligence, which is the ultimate reason why some constitutive elements of creatural essences are compatible or incompatible. This can only be God's essence.

A possible thing is fundamentally a 'being,' an 'essence,' while an impossible thing is fundamentally a 'non-being,' a 'non-essence.' Now 'being' ('essence') cannot have its ultimate ground in anything but 'being' ('essence'), because 'being' can proceed only from 'being' and 'existence' from an 'existent.' Consequently, God's existing *being* or *essence* is the ultimate foundation for the intrinsic possibility of things. Because God possesses 'being' to the fullness of infinite perfection, other things can obtain 'being' from Him in a limited and participated degree; they are *creatural imitations* of God's essence which He can *produce*. Thus, they are capable of receiving existence (that is to say, they are 'possible') from His omnipotence, through an act of His will, guided by His intelligence. On the other hand, a 'non-being,' a 'non-essence,' a 'nothing,' is the antithesis of God's being and essence and can, therefore, not imitate God in any way; for that reason such a thing is incapable of receiving existence from Him, that is, it is 'impossible.' Anything, consequently, which involves a contradiction in its very concept, is 'nothing'; and 'nothing' cannot exist. God

could never make it either extrinsically or intrinsically possible without contradicting His own intelligence and essence.

God's essence is thus seen to be the *ultimate* reason, or ground, or *foundation of all intrinsic possibility*, just as His omnipotence, guided by His will and intelligence, is the ultimate ground for all extrinsic possibility. This is equivalent to saying that God's essence is the ultimate reason why the constitutive elements of creatural essences are compatible among themselves; and God's omnipotence is the ultimate reason why creatural beings can be produced and thereby receive actual existence. The only thing which God cannot produce through His efficient causality is that which is 'nothing,' and 'nothing' imposes no kind of limitation on either God's being or His power.

The Notion of Creation

Closely related to God's omnipotence is the concept of *creation*. First, though, it will be necessary to obtain an accurate notion of what 'creation' means.

Creation is a type of productive action, and productive action always terminates in an effect. Correspondingly, creation may be defined either with emphasis on production as the starting point of the action (*terminus a quo*) or with emphasis on the produced reality as the goal or termination-point of the action (*terminus ad quem*). Some philosophers prefer the first method; others, the second. One thus finds different definitions of 'creation.'

St. Thomas uses both methods in his works. Thus, he says: "The proper mode of His action is to produce a whole subsistent thing"² "Creation is the production of a being"³ "to create is to make something from nothing"⁴ "creation is the production of the whole being."⁵ In these definitions he begins with the productive action as it proceeds from God. In the following definitions he places the emphasis on the produced thing: "Creation, which is the emanation of all being (*totius esse*), is from the *not-being* which is *nothing*"⁶; "Creation, whereby a thing is made according to its whole substance."⁷

Later scholastics have combined the two standpoints into one comprehensive definition. 'Creation' is thus defined technically as *the production of a thing hitherto not existing, without the use of any subject-matter from which it is produced (productio rei ex nihilo sui et subjecti)*.

Creation is said to be *productio rei*, 'the production of a thing.' It is a 'production,' and this word signifies the making of something through the positive action of an efficient cause. It is the production of a 'thing,' and 'thing' here means as much as a 'being' or a 'reality.' Creation is said to be *productio rei ex nihilo sui*, 'the production of a thing hitherto not existing.' This means that the 'being' in question is something new, something that did not have existence before the productive action gave it existence; it simply begins 'to-be,' to exist, in virtue of the efficient causality of the producing cause; before this cause gave it existence, it was a relative 'nothing,' something merely possible, but not as yet an actuality in the realm of existent beings. Creation is said to be *productio rei ex nihilo sui et*

subjecti, 'the production of a thing hitherto not existing, without employing any subject-matter from which to produce it.' The phrase *ex nihilo subjecti* excludes any and every kind of pre-existent substrate, such as matter, out of which the new being might be produced. In other words, creation is not a 'change' or 'generation' of one being out of another being. When parents beget a child, for example, their productive action is not a 'creation' in the technical sense of the term, because their action presupposes the previous existence of a material substrate (ovum and semen) as necessary conditions for the process of fecundation; this process is therefore called 'generation' or 'procreation' rather than 'creation' strictly as such. Similarly, when an organism changes nonliving food into its own living substance in digestion, its action is a 'productive action,' but it is not 'creation,' because the food is already in existence at the time. In order that a productive action be truly a 'creative' action, the new thing, both from the standpoint of its own being and from the standpoint of any kind of pre-existing substrate from which it could derive existence, must be 'nothing.' It is this *productio rei ex nihilo subjecti* which properly characterizes creation. That is what St. Thomas meant when he spoke of "the whole subsistent being," "substantial being," "whole being," "all being (*totius esse*) ," "whole substance"; and that is why he defined 'creation' as "making something from nothing."

By 'creative power' is thus understood the power to produce something *out of nothing*. The phrase 'out of nothing' does not imply that 'nothing' is some sort of material or substratum out of which something is made, as

a statue is carved out of a shapeless mass of marble or a cup is molded out of formless clay; the phrase means that there is *no pre-existent material of any kind* out of which the (created) thing is made, but that the 'total being' of the thing is produced by the creative power.

No one, except an out-and-out occasionalist or phenomenalist, denies that creatural beings exercise true productivity through efficient causality. Chemical compounds, plants, animals, and men are being continuously produced through causal action. The earth, the solar system, and the galaxies are constantly in a process of change through the interaction of bodies. Man unceasingly produces physical changes in himself and in other beings. In all these changes the effects observed are the results of *transmutative action*. These effects are either accidental or substantial, as the case may be, but they are always a *changing* of one kind of existing being into a different kind of existing being. Creation, as the production of the 'total being' out of nothing, is never observed to happen.

The problem of the divine action of creation is not concerned with *organic* or *cosmic evolution*. 'Organic' evolution pertains to the probable development of organisms here on earth or wherever they may be found to exist. 'Cosmic' evolution pertains to the probable development of the universe, as it presently exists, from a former state. Both types of evolution interest the philosopher because of the Principles of Sufficient Reason and Causality. Evolution is a factual problem which must be solved primarily by the natural sciences. Even if one

accepts the fact of evolution, evolution *presupposes* the things which evolve, whether these things be organisms or celestial matter: evolution cannot occur unless something exists which *can evolve*.

What is at stake is the *origin*, the *first beginning*, of things, not their subsequent change and development. If the universe is a development of matter which has existed from eternity without a beginning, it is evidently not a created universe; on the other hand, however, if it had a beginning in time, it is evidently a created universe. The question, therefore, is this: Must we accept 'creation' as the logical explanation of the existence of the universe?

Opponents of Creation

The *Jews* always maintained that the world was created by God. The first line of the Book of Genesis states expressly: "In the beginning God created heaven and earth." To 'create' was understood in the sense of a 'production out of nothing.' This can be seen from the words of the mother⁸ of the Machabees, addressed to her youngest son just before his martyrdom: "I beseech thee, my son, look upon heaven and earth and all that is in them: and consider that God made them out of nothing, and mankind also." The Christians, too, have defended creation at all times, both in their religious doctrines and in their philosophic dissertations.

To the pagans of antiquity creation was practically unknown. *Polytheism* is essentially an anthropomorphic religion, and its anthropomorphism is reflected in its

doctrines concerning the limited power of the deities. Even the greatest of the *Greek philosophers* (not to speak of the lesser ones) never quite succeeded in arriving at the concept of creation as a 'production out of nothing.' Plato expressly taught that matter was eternal. Aristotle, although he argued to the existence of a personal God, presupposed the eternity of matter; matter became 'transformed,' but it never had a real beginning.

It remained for the modern *pantheists* and *finitists* to have the dubious distinction of reviving the pagan concept of God by eliminating creation entirely or by reducing the creative action of God to a production of limited effectiveness. Ever since Spinoza, Fichte, Schelling, and Hegel launched their pantheistic systems, many thinkers, tired of the superficiality of materialism, have found mental refuge in the identification of divinity with the world. God, in their view, is 'immanent' to the world, in the sense that God and the world are one ultimate reality. A goodly number of modern scientists, weaned away from their Christian heritage, subscribe to the doctrine of a modified pantheism. Science, strictly as such, is neither pantheistic nor theistic, for the simple reason that the field of scientific research is limited to the physical facts which are observable and measurable. Scientists, however, are not so restricted, and thus it frequently happens that scientists leave their field of science (in which they are recognized as authorities) and enter the field of philosophy (in which they are not authorities). But they think they can justifiably carry their scientific ideas over into the domain of philosophy. Many scientists are now convinced that the universe is

limited, finite; the universe also shows intelligent purposiveness, and so they are also convinced of the existence of 'mind' in the universe. Not being able (or willing) to dissociate this mind from the reality of the universe, they identify Mind or God with the universe as a whole. The result is a *finite God*. Edgar Sheffield Brightman⁹ gives expression to the view of modern finitists when he says: "We need a temporalistic rather than a purely eternalistic view of God.... Thus our finite God is not one of finished perfection; his perfection and the perfection of this world consist in their perfectibility."

Pantheists and finitists find the concept of creation as a production out of nothing' unpalatable. As Eddington¹⁰ says. "Philosophically the notion of an abrupt beginning of the present order of Nature is repugnant to me, as I think it must be to most." Or, as James Ward puts it:¹¹ "The ordinary notion of creation — viz, that at a given moment there was no world and at a subsequent moment the world was there — is rejected as having no sort of analogy with experience, and as therefore unthinkable." Pringle-Pattison¹² has the following to say: "The more thoughtfully we consider the idea of creation, as a special act or event that took place once upon a time, the more inapplicable does it appear... God exists as creatively realizing Himself in the world, just as the true Infinite is not a mere Beyond, but is present in the finite as its sustaining and including life." One can quote many modern authors expressing themselves in a similar vein.

All we are interested in from the standpoint of philosophy is the establishment of the *ultimate cause* of the

world. Neither the age of the world nor its original arrangement (whether as 'formed' or as 'chaotic') is a philosophic problem. God's existence has already been established; now His creatorship must be established.

Proof of Creation

In proving creation, the purpose is not to prove *how* God produced things out of nothing, but simply to prove *that* God produced them in this manner. The *fact* of creation is what must be proved, and this fact is proved as follows.

God is omnipotent; and to be omnipotent means that the infinite power of God can produce (give existence to) whatever is *intrinsically possible*, that is, to anything which does not involve a contradiction in the constitutive elements of its concept. Now, the concept of 'producing a thing out of nothing' *involves no contradiction*. The crux of the whole problem resides in this last statement; hence, it cannot be accepted without proof, and this proof must now be given.

The concept of creation is *not self-contradictory*, like the idea of a square circle or of an animate-inanimate organism. The 'production' of things is a common occurrence in the world. New beings are continually being produced, as is evidenced by daily experience. They originate through change and generation through the causal efficiency of other beings. Atoms are made and unmade; chemical compounds are formed and dissolved; plants, animals, and men come into existence and die. In every such instance of 'production,' of course, a pre-existent substrate of some kind is present. 'Production'

itself, therefore, offers no difficulty: 'What is, can be.' But production 'out of nothing' contains no more contradiction than mere 'production' itself, when it is a question of the *first origin* of finite beings. Everything in this world is *finite and contingent*; that was shown in the proof for God's existence. Now, 'finite' and 'contingent' being does not have the sufficient reason for its existence in itself; or such a being would be 'infinite' and 'necessary.' Since all beings in this world are 'finite' and 'contingent,' they must have the sufficient reason for their existence in a being outside the world, namely, in the infinite and necessary being of God. But if they have the sufficient reason of their existence in God, that means that God gave them existence, that God *brought* them from nonexistence to existence. However, outside of 'everything in this world' there is nothing but God. Therefore, God, if He gives them existence, can give them existence by 'producing them without a pre-existing subject,' that is to say, 'out of nothing.' In fact, there is no other way that God *can* bring about the *first origin* of the contingent beings of this world. 'Production,' in the strict sense of the word as 'giving existence to a new being,' necessarily includes the concept of 'efficient cause'; but the concept of a 'pre-existent subject (material cause)' out of which the new being is effected is neither included nor excluded. The elements of 'efficient cause' and 'absence of a preexisting subject' are thus seen to be compatible, at least in the omnipotence of God. It follows, then, that 'efficient cause' and 'production out of nothing,' since they are not contradictory, *may be united* into the single concept of 'creation' without contradiction. Creation, therefore, must

be intrinsically possible because it involves no contradiction in the concept.

Now, omnipotence can perform anything intrinsically possible. Creation, however, is intrinsically possible, as has just been shown. Consequently, creation is possible to God.

God, therefore, can create.

THE ENTIRE UNIVERSE IS CONTINGENT, BECAUSE THE UNIVERSE IS nothing more than the sum of all the beings which form the parts of it, and all the single beings in the universe are not necessary but contingent. Hence, the entire universe must have had its *first origin* from God. In other words, the entire universe must have been 'produced out of nothing.' One cannot say that the entire universe was made out of preexistent matter, because matter is an essential part of the universe. If, then, the entire universe, together with its constituent matter, had to be given existence through the efficient causality of God's omnipotence, it had to be produced 'out of nothing.' But the universe exists. Therefore, its *first origin* could not have been achieved except through a production out of nothing. That, however, is 'creation.' Consequently, *creation is a fact.*

The fact of creation also follows from the infinite perfection of God's power. Being infinitely perfect, it must be *absolutely independent* of any assistance in the exercise of its efficient causality. Hence, God's power must have been absolutely independent of any pre-existent subject, such as primordial matter.

God, therefore, created the world out of nothing.

THE REASON WHY CREATION IS NECESSARY FOR THE FIRST ORIGIN of things is not difficult to find. Whenever creatural beings produce something, production is always the result of *changing* one kind of thing into another kind of thing; it is the changing of a 'this' to a 'that.' But in the case of the first origin of things, the *whole being* of these things is involved, not merely a 'this' and a 'that.' Hence, in the case of the first origin of things, they cannot be produced by a mere 'change.'

St. Thomas expressed this truth very admirably, when he said:¹³

"We must consider not only the emanation of a particular being from a particular agent, but also the emanation of all being from the universal cause, which is God; and this emanation we designate by the name of creation. Now what proceeds by particular emanation, is not presupposed to that emanation; as when a man is generated, he was not before, but man is made from not-man, and white from not-white. Hence, if the emanation of the whole universal being from the first principle be considered, it is impossible that any being should be presupposed before this emanation. For nothing is the same as no being. Therefore as the generation of a man is from the *not-being* which is *not-man*, so creation, which is the emanation of all being (*emanatio totius esse*), is from the not-being which is *nothing*... If therefore God did

only act from something presupposed, it would follow that the thing presupposed would not be caused by Him. Now it has been shown above (Q. 44, AA1, 2), that nothing can be unless it is from God, Who is the universal cause of all being. Hence, it is necessary to say that God brings things into being from nothing.”

— ST. THOMAS AQUINAS

God Alone Can Create

The questions to be answered are these: Can God alone create? Can a creature act as the principal cause of creation? Can a creature act as an instrumental cause of creation? The pertinent terms are obviously ‘principal cause’ and ‘instrumental cause’.

A *principal cause* is one which has a fully proportionate and sufficient power to produce the entire effect either alone or by using something else as instrumental cause in its productive action. An *instrumental cause* is insufficient of itself to produce the entire effect but causally influences the production of the effect under the direction and in the service of another (the principal) cause. A normal person, for instance, has the power to open his eyes in order to see; his own power is fully proportionate and sufficient to produce the effect of opening his eyes, and he does not need the assistance of any other thing to produce this effect. This same person, in order to drive a nail into a board, uses the instrumentality of a hammer; he is the ‘principal cause’ of this effect, because without his causality

the hammer would not function. The hammer is the 'instrumental cause,' because its own peculiar causality of driving the nail into the board is used under the direction and in the service of the person acting as the principal cause.

God, of course, can create; that has been established. The *question* then arises: Can a creature be either the 'principal' or the 'instrumental' cause of creation? In answering this question, the matter under consideration refers to the *natural* power of a creature to be either the principal or instrumental cause of creation. Whether a creature can exert instrumental creative power in the 'supernatural' field is a disputed question which does not properly belong to philosophy.

The *Arians* taught that God created the Logos (Word), and the Logos in turn created all else. Avicenna maintained that the material world was created by the angels. *Frohschammer* defended the theory that parents create the souls of the children they generate. *Durandus* and *Arriaga* claimed that creation was at least possible to creatures.

NO CREATURE CAN BE THE PRINCIPAL CAUSE OF CREATION.

Creative power does not produce a particular kind of being, but being as such (*esse quod esse*). This is clear, whether we view the creative act in its starting-point or in its terminal point.

Viewed in its *starting-point* (*terminus a quo*), the creative act begins with not-being as such, because there is nothing present from which the created being is produced.

To this 'not-being as such' is opposed, not a specific kind of being, a 'this' or 'that,' but simply and absolutely 'being as such.' Viewed in its *terminal point* (*terminus ad quem*), namely, in the effect of the creative act, the effect is *being as such*, because that which is produced is always 'being as such' and not merely a particular kind of being. True, creation produces 'this' or 'that' kind of reality, so that a definite, specific kind of being receives existence; but the peculiar and proper effect of creation is the production of the *first being* (*primum esse*) of the whole thing, since the latter existed in no way and in no part before. Change and generation can produce a definite, specific kind of being (for instance, man can generate man), but it cannot confer 'being as such' to the new reality.

Now, the most universal effect demands as its sufficient reason the most universal cause. But 'being as such' (*ens qua ens, or esse qua esse*) is the most universal effect, because enters in the concept and essence of everything *real* and *possible*. Hence, creative power must be able to produce everything that is real and possible. Such a power, however, must be *infinite*, because the store of possible imitations of God's infinite perfections is inexhaustible. Hence, if a creatural being could be the principal cause of the creative act, it would have to be capable of giving existence to everything real and possible. That, however, necessarily exceeds the power of any and every creatural thing, because its very being, and consequently also its power, is something essentially finite and limited. God alone is infinite, and there can be no more than one infinite being. Hence, no creatural thing can possess infinite power, so

that it would or could be the principal cause of creation. It follows, therefore, that no creature can, in its natural capacity, be the *principal* cause in the creative production of any reality.

NOR CAN THE CREATURE BE THE *INSTRUMENTAL* CAUSE OF creation.

In order that something be an 'instrumental' cause in a productive action, it would really have to *influence the effect causally*, according to whatever way it acts as an instrument. A hammer, for instance, contributes its share toward the production of the total effect by pounding; a knife by cutting; and so with every type of instrument acting as a partial cause. An instrumental cause acts only under the direction of, and in the service of, a principal cause; but it must contribute its influence, in its own characteristic way, according to its nature.

Now, in the creative act this effect of the instrumental causality of the creature would have to either precede or follow or accompany the effect of the principal cause (God). But none of these alternatives is possible. The characteristic effect of the instrumental causality of the creature *cannot precede* the effect of the divine principal cause, because before creation there is nothing to which its causality could be directed. It *cannot follow*, because, once God as the principal cause has effected creation, there is nothing afterward for the instrumental cause to effect. It *cannot accompany* God's creative action: it would have to produce the entire existence of the created being, since existence is

an indivisible reality, and then it would be the principal cause; or, it would not produce existence at all, since existence is an indivisible reality, and then it is no cause whatsoever. Now, a creatural being cannot be the principal cause of creation. Consequently, no creature can be the instrumental cause of creation.

This argument follows the line of St. Thomas¹⁴ on this matter. To quote:

“It happens that something participates in the proper action of another, not by its own power, but instrumentally, inasmuch as it acts by the power of another; as air can heat and ignite by the power of fire. And so some have supposed that although creation is the proper act of the universal cause, still some inferior cause, acting by the power of the first cause, can create... But such a thing cannot be, because the secondary instrumental cause does not participate in the action of the superior cause, except inasmuch as by something proper to itself it acts dispositively to the effect of the principal agent. If therefore it effects nothing, according to what is proper to itself, it is used to no purpose; nor would there be any need of certain instruments for certain actions. Thus we see that a saw, in cutting wood, which it does by the property of its own form, produces the form of a bench, which is the proper effect of the principal agent. Now the proper effect of God creating is what is presupposed to all other effects, and that is absolute being. Hence nothing else

can act dispositively and instrumentally to this effect, since creation is not from anything presupposed, which can be disposed by the action of the instrumental agent. So therefore it is impossible for any creature to create, either by its own power, or instrumentally that is, ministerially.”

— ST. THOMAS AQUINAS

GOD ALONE CAN CREATE.

This conclusion is a necessary consequence from what has just been said. If a creatural being is neither the principal nor the instrumental cause of creation, it simply cannot create. But it is neither the principal nor the instrumental cause of creation. Therefore, a creatural being cannot create. God, however, can create. And since no other being can create, *He alone can create*. Creation, therefore, is the essential and incommunicable privilege of the omnipotent power of God.

As St. Thomas¹⁵ states: “If a greater power is required in the agent in proportion to the distance of the potentiality from the act, it follows that the power of that which produces something from no presupposed potentiality is infinite, because there is no proportion between *no potentiality* and the potentiality presupposed by the power of a natural agent, as there is no proportion between *not being and being*.”

Eternity of Creation

God exists from eternity. The question, therefore, naturally arises: Can God create from all eternity? This question leads to the next: *Can a created thing exist from eternity?*

God being omnipotent, it is manifest that He can give existence to anything which is intrinsically possible. Whatever is intrinsically impossible (that is, is contradictory in its very concept), cannot receive existence from God because it is essentially 'nothing'; and 'nothing,' of course, cannot exist. The problem thus simmers down to the question: Is an 'eternal creation' a contradiction in terms, or not? If not, God can create an 'eternal creature'; if it is, God cannot create it. God could not create it, not because of a lack of power on His part, but because there would be nothing positive on the part of the creature which He could produce.

The problem has puzzled philosophers a great deal, and three opinions have been advanced in an effort to solve it. The *first* view affirms the possibility of an eternal creation of things, both of those things which form a 'successive series' and of those which are 'permanent.' Among the advocates of this view are St. Thomas¹⁶ (who claimed that the impossibility of an eternal creation cannot be 'demonstrated' by reason, although it is clear from revelation that the world had a beginning in time), Vasquez, the nominalists, and many thomists. The *second* view affirms the possibility of an eternal creation regarding 'permanent' things, but denies the possibility regarding 'successive' things. This view is defended by Suarez,

Molina, John of S. Thomas, Urráburu, and others. The *third* view denies the possibility of an eternal creation regarding every type of created being, 'successive' or 'permanent'; they claim that an 'eternal creature' is a contradiction in terms, because of the contingency of the creature, and so an 'eternal creation' is intrinsically impossible. The majority of scholastics adhere to this third view.

The *third* view seems the *more probable*, both with regard to 'successive' and 'permanent' things.

AN ETERNAL CREATION OF SUCCESSIVE THINGS IS IMPOSSIBLE.

The supposition is twofold: there is a series of successive realities, and this series is created. In this series of members, one succeeds the other. Since these members of the series succeed one another, some are later and some are earlier than the others in this succession. Such a succession, however, must inevitably lead to one member before which there was no other and after which all the others follow. This first member of the series is the *beginning of the succession*, and the entire series can thus be measured according to a *before* and *after* in its succession. But a succession measured according to 'before' and 'after' is the characteristic of *time*. Consequently, the first member of the series represents the *beginning of time*. Eternity, however, is not time and has no beginning. Hence, such a series would have creatures which are in time and are not in time, are eternal and not eternal, are arranged according to a 'before' and 'after' and are not arranged according to a 'before' and 'after,' have a

beginning and have no beginning. In other words, an 'eternal creature,' created by God in eternity, is a *contradiction in terms* and as such impossible. God, therefore, cannot create from eternity; and this impossibility is due to the nature of the 'creature as a creature, not to God as omnipotent.

AN ETERNAL CREATION OF PERMANENT THINGS IS IMPOSSIBLE.

An eternal 'permanent' being, one in which there is no change, must be indestructible. Eternity means duration without beginning and without end. Therefore, an eternal being is one which has all possible duration simultaneously. Now, what the omnipotence of God creates it can also destroy; if He is capable of giving existence, He must also be capable of taking existence away. No created being has necessary existence; this is clear from the very fact of its creation. Hence, it can be destroyed by God in any moment of its duration. A being, however, which can be destroyed by God and lose its existence in any moment of its duration, can have an *end to its duration*. But where there is an end to duration, there must also be a *beginning* to duration; a duration, however, which has a beginning and (or) an end, is not eternity but *time*. Either, then, God does not have the power to destroy such a creature, or the creature is not eternal. But it is evident that God possesses this power of destruction. Therefore, the supposedly 'permanent' creature is not eternal. But if the creature cannot be eternal, God cannot create a creature from eternity without contradiction. Consequently, an *eternal creation* of any kind

is impossible because it is contradictory to the very nature of a created being.

Infinite Number of Creatures

God is infinitely perfect, and He can, absolutely speaking, be imitated by creatures in any number of ways. It is, therefore, pertinent to ask: *Can God create an actually infinite number of creatures?* The answer is very much like the one given in the foregoing section. There is no limit to God's omnipotent power or to His imitability by creatures. But an 'actually infinite number' of creatures involves a contradiction in terms and as such is impossible. It makes no difference whether one postulates the simultaneous or successive existence of these creatures; the number would exist simultaneously or successively, but it would be 'actually infinite' in either case.

AN ACTUALLY INFINITE NUMBER OF CREATURES IS IMPOSSIBLE.

That an actually infinite number of *successive* beings or events implies an actually infinite number of *simultaneously existing* beings, is clear. God could, for example, create an immortal soul every time one being or event succeeds the other. And thus there would exist an actually infinite number of 'successive' and 'simultaneous' things at the same time.

Now, it is intrinsically impossible that an actually infinite number of beings exist simultaneously.

An actually infinite number is limitless and inexhaustible. If it were limited, or if it could be exhausted, it would obviously not be infinite but finite. Now, the concept of an infinite number or multitude ends in a *contradiction*. Any number is made up of units; it is also made up of couples and tens, etc. Consider the result. There must be twice as many units as there are couples in such a number, and ten times as many units as there are groups of ten. For example, if an actually infinite number of human persons were created by God, the number of arms would be twice the number of human beings, and the number of fingers would be ten times the number of human beings. But the number of human beings is supposedly 'infinite,' that is, limitless and inexhaustible; and yet the number of human beings is only half as large as the number of arms and one tenth as large as the number of fingers. It follows that there are *different infinities*, some smaller and some larger, some half and some twice the amount of the other, some one tenth and some ten times the amount of the other; and yet they are *the same*, because all are infinite. Halving the infinite number would result in two infinities, and yet only one, because two finite numbers cannot add up to infinity; since two finite numbers are limited and each is exhaustible, their addition cannot result in an infinite number, and still they would. In fact, since an actually infinite number is limitless and inexhaustible, it would remain the same notwithstanding an infinite number of divisions and subtractions. All this, of course, is *self-contradictory*.

Hence, an actually infinite number of created beings is *intrinsically impossible*. In other words, no matter how many creatures God produces, His being can still always be imitated by other creatures without limit; other creatures are possible, and their possibility is inexhaustible. This means that the number of creatures which can exist, either simultaneously or successively, is *negatively infinite*; that is to say, the existing number can only be *actually finite*, but it is *potentially without limit*.

Therefore, God cannot create an infinite number of actually existing creatures, due to the fact that such a number is intrinsically impossible in actuality. God being actually infinite in perfection, his imitability by creatural beings, and as a consequence also their creatability, is limitless and inexhaustible.

A few more strokes have now been added to the portrait of God's nature: His power is almighty and creative. Obviously, God does nothing aimlessly, because He is an intelligent being. The reason why God created the world at all, and the reason why He created just this amount of beings in the world, cannot lie in the creatures themselves, but must lie wholly in Himself. He did not create because He needed them; He is absolutely self-sufficient, and He was infinitely happy from all eternity. The only assignable reason for creation, therefore, can be this: God, being *infinite goodness*, freely decided, under the guidance of His intelligence, to communicate being to creatures in order that they might *share* in His infinite being and goodness. *Bonum est diffusivum sui*, goodness tends to diffuse itself.

Summary of Chapter XIII

This chapter treats of two virtually transitive (or transient) operational attributes of God, namely, *omnipotence* and *creation*.

1. *The Notion of Omnipotence*. — The basic concept underlying omnipotence is 'power.' Omnipotence means the power to produce everything which is possible (can exist); and something is 'possible' whose existence does not involve a contradiction in its very concept.

2. *Existence of God's Omnipotence*. — Since the divine essence is infinite, the divine power is also infinite. God's omnipotence, therefore, must be able to produce everything existible, without exception. Hence, God is *omnipotent*.

God's power is *inexhaustible*. His power is identical with His essence. If His power would or could be exhausted, God Himself would cease to exist and He would not be infinitely perfect.

God cannot produce an *infinite effect*. An 'effect' is something produced and dependent; as such it is finite. An 'infinite effect,' therefore, involves the contradiction of a being which is 'finite-infinite.'

3. *The Foundation of Possibles*. — The ultimate reason (or foundation) why some beings are non-contradictory (possible) and others contradictory (impossible) lies in *God*; not in the creatures themselves, because they are subject to the law of contradiction and non-contradiction.

God's *essence* is this ultimate ground. A thing is possible because it denotes a 'being,' and something is a being because it is an imitation of the 'being' of God.

4. *The Notion of Creation.* — Creation is the production of a thing hitherto not existing, without the use of any subject matter from which it is produced (*productio rei ex nihilo sui et sub jecti*). It means, therefore, the production of a thing out of nothing.

5. *Opponents of Creation.* The opponents of creation are the ancient' pagans and modern pantheists and finitists.

6. *Proof of Creation.* — The problem is that of the first origin of the universe. The concept of creation does not involve a contradiction. 'Production' itself occurs constantly. Production 'out of nothing' is not self-contradictory, when it is a question of the first origin of creatural beings on the part of God's productive power. There is no other way that God can give existence to the first things than by producing them 'out of nothing.' Therefore, God can create.

If the universe exists, it must, therefore, have been produced by God out of nothing. But it exists. Consequently, creation is a *fact*.

7. *God Alone Can Create.* — If a creature can be neither the principal cause nor the instrumental cause of creation, then God alone can create. The creature, however, can be neither the principal nor the instrumental cause of creation.

No creature can be the *principal* cause, because the effect of creation is 'being as such,' and no creature has the power to give existence to 'being' absolutely; it can only change a 'this' to a 'that.' It takes infinite power to bring something from a not-being to being. Nor can a creature be

the *instrumental* cause of creation. If it were, its own proper causality would have to either precede, follow, or accompany the effect of the divine principal cause; none of the alternatives is possible. Therefore, *God alone can create*.

8. *Eternity of Creation*. — An eternal creation of successive things is impossible. Where there is such a succession, there is a 'before' and 'after' in succession; that, however, is *time*, not eternity.

Neither is an eternal creation of *permanent* things possible. If such a creature is eternal, it is indestructible; if it is a creature, it can be destroyed by God, and then its duration would not be eternal.

9. *Infinite Number of Creatures*. — God cannot create an actually infinite number of creatures, because an actually infinite number would involve a *contradiction in terms*.

Chapter 14

CONSERVATION AND CONCURRENCE

OMNIPOTENT power is creative power. Because creatural beings are contingent, they do not have the reason for their essence and existence in themselves. Of themselves, they are nothing. The sufficient reason both for their essence and existence must reside in the necessary being, in the self-existent essence, in God. God *is* His existence; all other beings have received existence. They were 'created,' and for this reason they are rightly termed 'creatures.'

What most people do not realize, however, is the fact that creatures are dependent on God for more than the initial giving of existence. They seem to think that, once created, all creatural beings are capable of enduring in their existence and of performing their proper functions without any further action on the part of God. This view is erroneous.

For continued endurance in existence, creatures need the active *conservation* of God, and for the performance of all their functions they need the active *concurrence* of God. While the conservation and concurrence of God are not as clear to the average mind as the dependence of all

creatures for their initial existence on God, a little thought will show their necessity.

Notion of Conservation

By *conservation*, in general, one understands continuation in existence through dependence on a cause. Taken 'passively,' it means that a being continues in its existence through some cause; taken 'actively,' it means that something is the reason why a being continues in its existence. Since we are concerned here with God as the cause of the continued existence of creatures, conservation is taken in its meaning of *active* conservation.

Active conservation can be either 'negative' or 'positive.' *Negative* conservation occurs when a being continues in existence *by not being destroyed* by another, although the other has the power to destroy it. Thus, a person negatively conserves a building by not demolishing it; or, a person conserves some papers by not throwing them into the furnace to be consumed by fire. In all such instances, the 'negative' conservation consists in refraining from performing the action required to make the thing cease to exist, although the person could execute the required action if he so desired.

Positive conservation occurs when a being is made to remain in existence *through some action* which is performed. This action may be either 'indirect' or 'direct' in its conservative power. *Indirect* positive conservation takes place when the action *hinders* destructive causes from destroying a thing or *provides the means* needed for the

thing to remain what it is. Thus, rescuing a drowning person is indirectly the cause of preserving this person's life by hindering the water from filling his lungs and making breathing impossible; or, giving food to a starving person enables him to continue living and not to die of starvation. *Direct* positive conservation takes place when the continued duration of a thing is the immediate effect of the positive action of a cause. In such a case the thing in question cannot continue in existence without the continuation of the influence of the cause. Thus, color vision is possible only so long as the causal influence of light persists; vital activity in a living body is dependent on the immediate action of the soul, the principle of life in the body.

In speaking of divine conservation, it is necessary to guard against certain misconceptions. That God does not preserve in existence all things in their specific nature for all time, is clear from the mere fact that very many beings (for example, individual atoms and compounds, plants, animals, and men) come into existence, remain for a while, and then disappear as specific entities. That He preserves all things for the time of their actual existence with a 'negative' conservation, is evident from the fact that many things actually do exist at the present moment and actually have existed during the past; God certainly could annihilate them at any time in the past or present, but He does not do so. That not all beings which exist are preserved in their existence by God with a positive 'indirect' conservation (in the sense mentioned above), is manifest in the case of spiritual beings, such as immaterial human souls; spiritual beings, since they are simple in essence, cannot be

dissolved and destroyed by natural agencies, and thus they need no 'indirect' conservation on the part of God to keep them in existence.

Proof of Divine Conservation

In recent years *E. Iglesias* proposed that divine conservation need not extend to all creatures without exception. According to him, God conserves in existence all subsistent beings which He has created; these 'subsistent' beings are primordial matter, angelic spirits, and human souls. On the other hand, 'non-subsistent' beings, such as 'material forms' and 'accidents' (the latter are qualifications or determinations of substances), are not necessarily conserved by God in their existence; they can be conserved by other natural causes without any direct operation of God's conservative power.

This view is in opposition to the doctrine of all scholastic philosophers. *St Thomas* summarizes¹ the common doctrine on divine conservation in the following manner: "The being of every creature depends on God, so that not for a moment could it subsist, but would fall into nothingness were it not kept in being by the operation of the divine power."

We agree with St. Thomas and contend that *God preserves all things without exception by a positive and direct influence*. The proof rests upon the contingency of all beings distinct from God.

Every being, distinct from God, must be one of three types: it must be either a 'spirit' or a 'material being' or a 'compound of matter and spirit.' But these things are all

contingent, that is to say, they have been created and have not the reason for their existence in their own essence; of themselves and in virtue of their own essence they are nothing. Consequently, they must have the sufficient reason for their essence and existence in another. So long as they have a contingent essence, they have the sufficient reason for their existence in another. Now, they retain their contingent essence during the entire period of their existence, from the first moment until the last. Therefore, during the entire period of their existence, from the first moment until the last, they are contingent and have the reason for their existence in another. Hence, they owe the entire period of their existence, from the first moment to the last, not to themselves, but to another.

This sufficient reason for existence cannot be found in their 'spiritual substance' or in their 'matter,' because both this spiritual substance and this matter are contingent and constitute the contingent essence of the being; hence, since they are totally contingent, they must also have the sufficient reason for their existence in another. And this truth applies to the entire universe and every being in it, because every created being as such is contingent. It follows, then, that the sufficient reason for the existence of the entire universe and of every being in it and of every created being as such, from the first moment to the last, must be found in a *non-contingent being*.

Now, there is no 'non-contingent being' except the *ens a se*, because the self-subsistent being alone has the reason for its existence in its own essence. But the *ens a se* is God. Consequently, just as the *initial* existence of the creatural

being is contingent and, because of this contingency, needs the positive and direct activity of God to give actual existence to the being, so also its *continued existence*, because it remains contingent from the first moment until the last, demands the same *positive and direct influence* of God's activity. Hence, all creatural beings are preserved in their existence, from the first moment until the last, by the positive and direct influence of God's activity. That, however, is what is meant by divine conservation. Divine conservation, therefore, is a necessity.

One cannot validly say that a created *substance* can *preserve itself*, once it has acquired existence. This existence is contingent, not necessary, and as such demands a *cause*. The substance itself cannot be this cause; if it were, a patent contradiction would be involved, since such a situation would presuppose existence as well as non-existence at the same time in the same thing. It presupposes *existence*; because, if a being is the cause of its own continued existence, it must exist in order to exert its causality. It presupposes *non-existence*; because existence is the effect and result of the being's preserving action. Hence, the cause for the being's 'continuation' in existence must be in another, just as the cause of its 'beginning' had to be in another. Now, the entire universe is but the sum-total of creatural beings. Consequently, the entire universe (and every single being in it) must have the cause of its continuation in existence in the extra-mundane Being, namely, in *God*.

Nor can one validly say that the cause of the continuance of a being in existence lies in some *force* or *faculty*. Every

force and faculty needs a substance as its basis. Every substance, however, owes its existence to God's positive and direct influence, as was just shown. Hence, since every force or faculty is by nature posterior to its substance and depends for its existence on the existence of the substance, it is incapable of preserving the substance in existence. In other words, both the substance and its force or faculty demand the positive and direct influence of God's conserving power in order to receive existence and to remain in existence.

Just as God has the power to create, He has the power to *annihilate*. He is the Supreme Lord over all things. He gives existence, and He can also make a thing cease to exist. Since annihilation means to 'make a thing cease to exist,' it cannot consist in any sort of positive activity. Every positive activity must have as the term of its influence a positive effect. Annihilation, however, has as its term a 'nothing,' a 'nil.' Hence, it cannot consist in a positive action on the part of God. Still, annihilation is something. Consequently, since it is no positive activity itself and still must be something on the part of God, it must consist in the *withdrawal of some positive activity* on the part of God. Now, if annihilation ('making a thing cease to exist') consists in the withdrawal of some positive activity of God, then the *perseverance* in existence on the part of the creatural being must be due to the *positive activity* of God which is withdrawn in annihilation. Hence, perseverance in existence, or continued existence, must be due to a positive activity of God; and that is divine conservation.

Creatural beings can neither create nor annihilate. All that creatural beings are capable of doing through the influence of their efficient causality is to *change already existing bodies*. Such changes are either accidental or substantial; but in every such change *matter* is always present as the existing subject of change. Since creatural beings cannot give existence to matter, they are incapable of producing anything *ex nihilo sui et subjecti*; that is to say, they are capable of generation and corruption, so that they can change a ‘this’ into a ‘that,’ but they cannot produce the *total reality* of the thing. The existence of this ‘total reality’ is not due to creatural beings but to God alone. And since creatural beings cannot *produce* the total reality of any being, they cannot *preserve* this total reality in existence either. This preservation in existence, or conservation, must be due to the uncreated being who produced the total reality by creation in the first place, namely, to God. This agrees with what St. Thomas² writes:

“God cannot grant to a creature to be preserved in being after the cessation of the Divine influence: as neither can He make it not to have received its being from Himself. For the creature needs to be preserved by God in so far as the being of an effect depends on the cause of its being. So that there is no comparison with an agent that is not the cause of *being* but only of becoming.”

— ST. THOMAS AQUINAS

Creatures, of course, also possess the power of conservation and exercise it in behalf of other beings. But it must be remembered that whatever creatures can accomplish in the line of conservation depends on the specific essence they have; they themselves, however, are not the real reason why they have this essence rather than another. It is God who gave the specific essence to things and who established the order between things. Hence, *God* is the *principal cause* of creatural conservation in all beings, while creatures are only the *secondary causes* (*con-causes*, together with God as the principal cause) of conservation in a *limited* measure.

What is the *relation* between God's power of *creation* and His power of *conservation*? Fundamentally they are one, with a logical distinction between them. As St. Thomas³ expresses this truth: "The preservation of things by God is a continuation of that action whereby He gives existence." For this reason conservation is often called a 'continued creation.' The phrase must not be confused with 'iterated creation,' as Pierre Bayle (1647—1706) interpreted conservation. An 'iterated creation' would mean that creatures fall back from moment to moment into nothingness and then are continuously recalled from moment to moment into existence by God. That such an interpretation is false, is evident, because man knows from his own conscious experience that he remains constantly in existence from moment to moment.

The nature of the conservative action on the part of God consists in the *omnipotent will-act* of God which, after

creating a being, makes a being already created *remain* in existence.

Notion of Divine Concurrence

Divine *concurrence* (*concursus*) is defined as God's influence operating with the creatures in producing the same effect as they produce through their own activity. This concurrence or co-operation may be of different kinds.

Concurrence is either 'moral' or 'physical.' *Moral* concurrence consists in some sort of moral action, such as commands, exhortations, promises, rewards, and punishments. The 'moral' concurrence of God is not in question here. God's *Physical* concurrence consists in a physical action through which He cooperates with the actions of creatures, so that He influences the effects produced by creatures through their actions.

The divine 'physical' concurrence will be either 'mediate' or 'immediate.' God's physical concurrence is *mediate* in so far as He *prepares* the creatures in such a way that they are fit for action and *preserves* them in that condition. Thus, God creates a thing with certain powers of action (operative powers); He preserves the thing and its operative powers, so that it is capable of action; He is the ultimate cause that the thing in its own proper order is the sufficient cause for a certain action. In mediate concurrence God sees to it that the 'causes' of action are present and fit to operate under proper conditions, but mediate concurrence does not bring about the effects of creatural actions strictly as 'effects.'

By means of His *immediate* physical concurrence, in the very moment when the creature acts in the production of an effect, God *effectively and directly* influences the creature in the production of the action itself. In other words, God and the creature are the two coefficient principles in every creatural action; every creatural action owes its efficacy and existence to God as the *primary* and *superior* cause and to the creature as the *secondary* and *subordinate* cause. The meaning of this statement is not, of course, that the action of the creature is due under all respects to the immediate concurrent action of God; that would be 'occasionalism,' which denies any real action of the creature, and occasionalism is false.

The *real meaning* of the immediate physical concurrence of God in all creatural actions has been well expressed by B. Boedder:^{[4](#)}

"What we do assert is that, although under one aspect the action of a creature is truly its own action depending on its own activity, under another it is at the same time dependent on God, and this not only mediately but immediately. In other words, the creature in action depends upon a causal exercise of the omnipotent Divine Will, not only for the existence and preservation of its nature and faculties, but also for the actual exercise of those faculties; so much so that it can use none of them unless the Creator, in the very moment when the faculty is used, supports it with the efficacy of His Divine power. To this power

the creature owes not only its faculties as applicable for action, but also as applied to act.”

— B. BOEDDER

Both together, God and creature, produce the *totality* of the action, and the action could not occur without the causality of both effectively influencing the action. Each assists in the production of the effect to such an extent that the effect simply would not exist if either cause would not operate. Illustrations for this principle are readily available. In order, for example, to have an organ recital, a player, a wind pumper, and organ pipes are required; each agent contributes toward the totality of the effect (the music), and without the effective contribution of each cause the entire effect would be absent. Similarly, for every creatural action without exception divine concurrence is necessary for the totality of the effect. And this divine concurrence is not merely moral but *physical* in character.

The creature is really active according to the nature and powers it has ultimately received from God the Creator of all. It stands to reason that the creature's nature and powers must first of all be 'conserved' by God, so that the creature is 'fit to act' under proper conditions. Besides conservation, however, 'physical concurrence' on the part of God is required so that the creature can pass from potentiality (power) to actuality (action); then, and only then, can the creature really produce the action natural to its power.

Proof of Physical Concurrence

Scholastic philosophers universally accept the fact of God's physical concurrence as a necessary agent in the production of every type of creatural action. However, in the fourteenth century *Durandus of St. Pourçain* (he died probably in 1332) maintained that God's conservation of the creature's power to act is required, but there is no immediate physical influence of God's causality on the action itself; so long as the creature has the power to act, it can proceed to the action without assistance from God. In recent times, *E. Iglesias* and *J. Stuffer* have sided with Durandus on this question.

In opposition to Durandus and his modern followers, we maintain that *an immediate physical concurrence of God is necessary for all creatural action*, whether this creatural action be necessary or free.

The relationship between creature and Creator in this regard is that of an essentially 'subordinate' and 'secondary' cause to the absolutely 'superior' and 'primary' cause. Two 'coequal' causes cannot produce an identically same effect through their respective actions, because each of the two causes would produce its own effect through its respective action. The result would be that each cause would produce only a *part of the effect*, but would not be the cause of the *total effect*. It would be like two horses pulling a load too heavy for either one to move alone jointly they can move the load, because each horse pulls a part of it. Such a situation does not happen in divine concurrence. The *superior* cause can concur with the subordinate cause

in the production of the same action and its effect. Both causes, superior and subordinate, co-operate in the production of the *total effect*, but each agent is responsible for the 'total effect' under a different respect: the Creator-cause attains it under the respect of a 'contingent' being considered strictly in its contingency, while the creature-cause attains it under the respect of a being restricted to a definite class of effects (not to 'being as such'). The combination of Creator-cause and creature-cause then brings about an effect whose *totality* is dependent on God as the 'superior' and 'primary' cause of its *contingent* being and also dependent on the creature as the 'subordinate' and 'secondary' cause of its *specific* being (inasmuch as the effect is 'this' or 'that' particular reality, and not 'being as such'). The creature-cause really and truly produces the effect, but with the immediate and physical co-operation of God who, through His assisting action, also really and truly produces the effect. This immediate and physical co-operation of God with the action of the creature-cause in producing an effect is what is meant by God's *concurrence*.

AND NOW FOR THE *PROOF*.

The proof is based on the *complete contingency of the creature*. The creature is contingent in every respect. In no phase of its being, whether in its nature or in its action, is it self-sufficient. Nothing that it is or has or does is due to its own self; everything in a creatural being is 'contingent.' Contingency implies the ultimate and absolute dependence of the creature on God as the first and necessary cause.

God as Creator is the supreme cause of all that has existence outside Himself. Since every creatural being is contingent in its very essence and nature, it can exist only in perfect and absolute dependence on God. Action follows nature. Consequently, also in its *action* the creature is dependent on God in a perfect and absolute manner; otherwise the creature's dependence on God (and God's dominion over the creature because of the latter's complete contingency) would not be perfect and absolute. But now, in its essence and existence the creature is dependent on God on intrinsically, essentially, and immediately. Hence, the dependence of the creatural action and its effect must also be intrinsic, essential, and immediate. However, there will be an immediate dependence of the creature's action upon God only if God gives His divine concurrence to the action. Any other assistance of God would not be 'immediate' at all; because, if God gave and conserved only the nature and operative powers of the creature, the action itself would be immediately dependent only on the creature and not on God. It follows, therefore, that the complete contingency of the creature demands the *immediate assistance* (concurrence) of God in *its actions*.

Again, whatever exists depends for its *existence* directly on the power of God. God alone is self-existing and exists necessarily; all other beings (creatures) exist contingently and as such cannot have the *adequate reason* for their existence in themselves or in any other creatural being, but in God alone. Now all *actions* and *effects* of creatures are a positive reality in the order of existence. Hence, they are, as existing realities, dependent on God for their existence.

This dependence must be *immediate*. If this dependence were only 'mediate,' namely, if the creatural actions were dependent on God only through the intermediation of some other being, they would not be dependent on God just inasmuch as they are *existing*. No being can be dependent on a finite being inasmuch as it has 'existence'; otherwise whatever has 'existence,' and in whatever the concept of 'being' is verified, would have to be dependent on this finite being. This, however, is manifestly impossible. Consequently, every creatural action must be immediately dependent on God in its existence.

Finally. God can *hinder* any creatural being from performing an *action*, and that without destroying the creature's power of action or the object to which the creature's action might be applied. Since God has absolute dominion over all beings distinct from Himself, He can do anything which does not involve a contradiction. Now, it certainly involves no contradiction if a creature's power of action does not go into operation, even when all the requisite conditions for action are present. Hence, God can hinder any creatural being from performing an action, even when all the requisite conditions for action are present. This hindrance of creatural action, however, would be impossible for God, if He did not *co-operate* in the creatural action *in a positive manner*. The reason is obvious. Unless God withdrew His immediate, physical assistance (concurrence) accompanying the creature's action, there would be nothing to stop the creature from performing the action, if the power fit for action and the required

conditions for action remained intact. Hence, every creatural action also demands God's concurrence.

A NUMBER OF *OBJECTIONS* HAVE BEEN RAISED AGAINST THE doctrine of divine concurrence. The more important ones will be discussed.

First objection. According to the view expressed above, God must also be a *coefficient principle in sin*. But it is against God's infinite sanctity to give active assistance to sin. Hence, He gives no concurrence.

Answer. God in His concurrence is a coefficient principle in the production of the *reality* of the sinful act, but *not of the sin itself*. Sinfulness is not a positive entity but the absence of conformity of the act to the moral law; sin is, therefore, no reality in the strict sense of the term, but something negative. The real cause of sin is that which is the 'determining' cause of the sinful act, namely, the human will. God wills the act in so far as it is a positive reality; only if He were the determining cause of the sinful act, could the sin (sinful act) be imputed to Him. God gives an *indifferent* assistance for the act with regard to its positive reality, not with regard to its sinfulness as such (deviation from the moral law). The physical and physiological act is not wrong as a physical and physiological reality; otherwise such an act (for instance, killing a person, sexual excitement, pronouncing sacred names, etc.) could never be allowed. The sinfulness of such an act lies in its disagreement with the demands of morality.

Second objection. God created beings with the necessary *powers of operation*. Then why should divine concurrence be necessary? Divine concurrence is *superfluous*.

Answer. God gave operative powers, and they are used by the creature in its actions. But nothing can take away the *contingency* of the creature in its entire being; it is and will always remain essentially contingent and therefore an essentially dependent principle of action.

Third objection. If divine concurrence were a fact, God would be only a *partial cause* in the action. However, it would be an *imperfection* in God to be a partial cause.

Answer. To be a 'partial cause' would be an imperfection for God only if He could not perform an act by Himself; not, however, if He *gives* a creature power to act itself, since that is a sign of divine benevolence. God is still always the *total cause of the totality of the effect*.

Mode of Divine Concurrence

With very few exceptions, noted above, scholastic philosophers agree in maintaining the necessity of God's immediate physical concurrence in creatural actions. It is in the discussion of the particular *mode of divine concurrence* that agreement ceases. A heated controversy arose in the sixteenth century concerning the 'mode' of divine concurrence, and the controversy is still very much alive in our day. This discussion gave rise to two main schools of thought — *bannesianism and molinism*. Previously, some philosophers expressed ideas akin to those incorporated in

these two rival theories, but they did not eventuate into distinct schools of thought.

The system of 'bannesianism' derives its name from *Domingo Bañez* (1528—1604), while that of 'molinism' had its origin with *Luiz de Molina* (1535—1600). Bañez was a Dominican and Molina a Jesuit; historically, the Dominicans generally have followed Bañez, and the Jesuits, Molina. Similarly, the thomists usually defend the doctrines of bannesianism.

In the beginning, the controversy centered on the theological problem of 'grace' and 'free will.' The operation of 'grace' is an instance of supernatural divine concurrence. Supernatural concurrence has its counterpart in the general concurrence of God with creatural action in the field of natural activity. Even in the field of natural activity, however, the crux of the problem is found in the action of man's free will.

The chief point of the controversy thus resides in the answer to the question: How reconcile the *absolute dominion of God* over all creatural actions (including the free acts of man's will) with the *self-determination of man's free will*? Both the 'absolute dominion' of God and the 'freedom of the will' must be maintained and safeguarded. But how should this be done?

The bannesianists and the molinists attempt to give the answer. And their attempt at an adequate answer has precipitated a never ending controversy. Some of the greatest minds have attempted a solution and failed. Here an explanation of the rival systems will be given.

The Answer of Bannesianism

Leaving aside the question of grace as not germane to philosophy, the answer of the bannesians to the problem indicated above is briefly as follows.

The bannesians (and, generally speaking, the thomistic school) contend that a mere simultaneous concurrence on the part of God is insufficient to maintain His supreme dominion over creatures. They therefore claim that God applies a *physical premotion*, a *physical predetermination* (*concursus praeuius*) directly to the creature's operative power. This 'physical premotion' is not an act of the divine will or of divine power or anything else identical with God's nature; it is a *finite created entity*, a quality (according to the general view), which is applied to the creatural faculty and gives it the immediate preparation for action (places it in *actu primo proximo* for action). Only when the creatural operative power has received this physical assistance ('physical premotion, determination') from God, can the power perform its proper action (*actus secundus*); without it, it cannot pass from potentiality (of action) to act.

The physical predetermination is *prior* to the activity of the creature, not with a priority in time, but with a priority of nature; it is prior in nature as the cause is always prior to the effect. This physical premotion removes the creature's indifference to action, thereby determining it to act (hence the terms 'premotion' and 'predetermination'). Premotion is not merely a 'moral' influence whereby God 'induces' the creature to act; it is a 'physical' assistance and influence *determining* the finite cause to its last actuality, so that the

act naturally results of itself. This physical premotion (predetermination) is necessary for every creature's every activity and therefore also for man's free acts of the will.

This teaching on physical premotion and predetermination leads to some interesting results. Physical premotion, by its very nature, *infallibly* brings the operative power of the creature into act. Not only 'can' the power act in virtue of this physical divine assistance; it infallibly does act, and that not in any *manner* and *direction*, but in that particular manner and direction which corresponds to the nature of the predetermination given by God. That is also true of the *free acts* of the rational creature. As long as the will is not predetermined, it is absolutely impossible for the will to act; if and when it is predetermined by God, it is absolutely impossible for the will to produce any kind of act except that to which it is pre-determined.

The will has no means of *choosing* a certain predetermination in preference to another, because without a previous determination it cannot be active at all. Hence, the will cannot decide for or against predetermination, nor for or against any particular kind of predetermination. *Whether* and *when* and *how* it be predetermined lies alone in the *decree of God's will*; and if and when the free will of the creature is predetermined, it *infallibly performs* the act for which the predetermination is given by God.

Nevertheless, the bannesians (and thomists) say, man's *will does not* thereby become *un-free*. God predetermines every creature according to its particular kind of nature. If the creature, because its constitution is such, acts necessarily, the predetermination is given by God so that it

acts necessarily. If the creature possesses a free will, the will is predetermined so that it acts infallibly, but it still acts in a perfectly free manner.

One can now understand the position of the bannesians (and thomists) with regard to *God's knowledge* of the future free acts of man. God knows what the free will of man can and will decide by simply knowing the *predetermining decrees* of His own will concerning these acts of man's will. Just as there are only two classes of acts, namely, those which will not occur in the future and those which will (depending on God's physical premotion), so there are but two kinds of divine knowledge, namely, *simple intelligence and vision*. As a consequence, the bannesianists reject absolutely all 'intermediate knowledge.'

The Answer of Molinism

The answer of *molinism* to the problem of the mode of divine concurrence differs radically from that of bannesianism (and thomism).

The molinists, in order to distinguish their doctrine of immediate divine concurrence from that of the bannesians (and thomists), call it *simultaneous concurrence*. In doing this, they want to express their rejection of any kind of an immediate 'previous' assistance (physical premotion, physical predetermination) to creatural activity on the part of God. According to the molinistic view, God has *decreed from all eternity* to give His concurrence to a certain creatural act which will take place in time; however, the concurrence itself is *given in time*, at the very moment

when the act is performed. This decree is one of the prerequisite conditions placing the creature in immediate preparation to act (*in actu primo proximo*). Since the concurrence is given, not prior to the act, but at the time when the act is performed, it is 'simultaneous' and not 'previous.'

From the standpoint of God it is a 'readiness to concur' with the creature's activity, and this is termed the *offered concurrence* (*concursus oblatus*). The act of the creature, if it is a necessary act, will now proceed with necessity from the creature's nature; thereby the 'offered' concurrence becomes *actual* (*concursus collatus, concursus in actu secundo*).

Concerning creatural *free* acts (as in the case of man's free choosing) God's concurrence will be *indifferent*; that is to say, it will not be 'determined,' as is the case with beings acting necessarily. God's decree of concurrence, therefore, with regard to 'free' acts will not be: "I will give this creatural action my determined concurrence"; such a decree applies only to the necessary' actions of creatural beings. In 'free' acts, God's decree will be: "I will give this creature in its free acts such a concurrence which does not compel it to act, but which *enables* it to act and that in any of the different ways which it *can choose* under the circumstances." Divine concurrence is thus, with regard to the free acts, eternally and entitatively one but indifferent and virtually multiple.

Only such an 'indifferent' divine concurrence, molinists claim, is compatible with that active indifference and self-determination which is the essence of the freedom of the

creature's will. Only under the supposition of an 'indifferent' concurrence is the creatural will capable of *omitting* an act which it could otherwise perform or of *performing* one particular act instead of another. By omitting an act (although it could perform it) or by performing one kind of act (although it could omit it or set a different act), the will makes use of its God-given freedom of action; thereby it determines both itself and the actual concurrence of God. God is thus a partial cause of the creatural free act; and so also is the free will a partial cause of the same act. Every free act of the will thus has two partial causes, two coefficient principles; but only one is the 'determining' cause, and that is the creatural will itself. The totality of the effect, however, depends on each of these two partial causes, so that, if either one were missing, the total effect (the act in its entirety) would also be missing.

The molinists strenuously oppose the doctrine of the bannesians (and thomists) that God knows all actually and conditionally future free acts of man in His predetermining decrees; they claim that in such a view the freedom of man's will is sacrificed. God's decrees, they say, are not the source of His knowledge. And yet it must also be maintained that God's knowledge of the free acts of man is absolute and eternal; it cannot be conditioned by man's free will, so that God would know of man's free decisions only at the time they are made. To solve this very great difficulty, the molinists have recourse to *intermediate knowledge* (*scientia media*) in virtue of which God infallibly and eternally knows all that a free will *can* or *would* do in every combination of circumstances. By means of this

‘intermediate knowledge’ God foresees every actually or conditionally free act of the will, because each such act contains within itself a *formal* and *objective truth* which must be known to the omniscient mind of God prior to any decision of His own will regarding it. This ‘intermediate knowledge’ of God is independent of any divine decrees and is logically prior to them. In this manner the molinists seek to harmonize the eternal and infallible foreknowledge of God and the freedom of the created will.

The Defense of Thomism

At the present time the *thomists* defend the tenets of the bannesian theory.

Two main questions are constantly in the foreground of the controversy: the question of divine physical premotion in general concerning all creatural activity; and the question of maintaining the freedom of the human will during divine physical premotion.

THE QUESTION OF *PHYSICAL PREMOTION IN GENERAL*.

The thomists, who are the chief defenders of Bañez and bannesianism, base their argument for divine physical premotion on the ‘principle of motion.’ This principle reads: *Quidquid movetur ab alio movetur. Whatever is moved is moved by another.*

The ‘principle of motion,’ say the thomists, is a strictly universal principle and law, and it admits of no exceptions. Now, all creatures are ‘moved’ in their actions, since they

pass from *potentiality* to *actuality* (from 'potency' to 'act') in their activities. The passage from potentiality to actuality in creatural beings always implies the acquisition of some new reality; if they possessed the reality already, they could not acquire it by passing from potentiality to actuality. Consequently, the new reality is not present in the creatural being beforehand. Yet the new reality cannot come from nothing, because 'nothing is nothing' and has nothing to give. The new reality must, therefore, come from a being already 'in act,' and this being must be 'other' than the being acquiring the new reality by passing from potentiality to actuality. However, *all* creatural beings pass from potentiality to actuality and thereby constantly acquire new reality, and so they must be 'moved' in this acquisition by another.' But there is only one 'being in act' outside the sum of 'all creatural beings,' namely, God. Therefore, whatever new reality creatural beings acquire must be received from God. *God is the mover.*

To be 'moved by another' means to be 'educated from potency to act by another,' because the very action of the 'passage' from potentiality to actuality is a new reality which was not previously present in the being. It follows that the creatural being must be *intrinsically dependent* in its passage from potency to act on the action of the mover, so that there exists a priority of nature between the action of the mover and the transition from potentiality to actuality. But a merely 'collateral' or 'simultaneous concurrence, as the molinists interpret God's concurrence, is insufficient to account for the *entire* transition. The molinistic theory always supposes the creature to move

itself at least in some part of the action, namely, when the creature, in passing into act, makes the 'offered concurrence' become 'actual concurrence.' Such an action on the part of the creature is against the above-mentioned 'principle of motion' and therefore impossible. More, then, is needed than a 'simultaneous' concurrence. God must give a physical premotion in order that a creature can really act.

George Hayward Joyce⁵ (a Jesuit, by the way) expresses this view admirably:

"Inasmuch as all action is a transition from potency to actuality, it is totally impossible that it can take place without the continuous agency of a cause external to the immediate agent: that otherwise we should be driven to admit that a being can confer on itself a new reality which it does not possess, giving to itself that which it has not got to give. The principle that the transition from potency to actuality supposes the operation of a cause which itself possesses the perfection actualized, is, we maintain, self-evident — though, of course, the perfection may exist in the cause in a higher manner, and not in the manner in which it is found in the effect. It follows that the operations of a finite agent can only take place in virtue of a premotion, ultimately referable to the First Cause. The finite cause is instrumental in regard of the Prime Mover: and apart from a 'previous' concurrence, its efficient powers lack their final complement."

— GEORGE HAYWARD JOYCE

Since every act of man's free will entails a transition from potentiality to actuality, the free will in its action is also moved by God by means of a *physical premotion* into action.

The free will, under the influence of the physical premotion of God, *wills infallibly* that to which it is predetermined. It does not follow from this, thomists contend, that the will is moved with *necessity* to act as it does; rather, it is placed by God in the act of *freely willing* something. The will of God not merely sees to it that something comes into existence by the thing which it moves, but it also sees to it that this is done in the manner which agrees with the thing's nature and is demanded by the thing's nature. Now, it is demanded by the nature of the will that it be moved *freely*. Hence, it must be held that the human will, in virtue of this physical premotion, is placed by God in the act of willing something 'freely.'

Garrigou-Lagrange⁶ (a thomist) says in this connection: "Who could demonstrate that there is any contradiction in maintaining that the *Creator of the free will*, who is *more intimately associated with the will than freedom itself is*, can *infallibly move the will to determine itself freely to act*? Infallibility is not necessity." In a footnote to this passage Garrigou-Lagrange remarks: "Thus in the case of a regularly constructed syllogism, in which the major is a necessary proposition and the minor is contingent, the conclusion follows *infallibly* though being at the same time in itself a contingent statement. In other words, there is *necessity of consequence* and not necessity of *consequent*, as in the following example: The virtuous person is deserving of credit. Now the Apostles were models of

virtue. Therefore they were deserving of credit.” A little farther on⁷ he says:

“How can the finite being exist apart from the infinite Being? It can exist only on condition that it is caused by Him and remains absolutely dependent upon Him. How can a secondary liberty exist apart from the primary liberty [of God]? It can exist only on condition that it is caused and moved by the latter, so that the faculty of willing passes from a state of passive indifference to one of active indifference contained in the very choice made by the faculty. Thus all the perfections of this secondary liberty pre-exist eminently from all eternity in the primary liberty. Why would God not have the power to produce infallibly in us and with us the freedom of our acts? . . . To maintain that God, as first cause, cannot produce with us and in us the free mode of our acts, is to maintain that a mode of being cannot be produced by the prime Being, who is the Creator of all the being there is outside Himself.”

— GARRIGOU-LAGRANGE

The reason, therefore, why the thomists insist on a ‘physical premotion’ for all creatural activity, including that of man's free will, is the *absolute dependence* of the creature on the Creator. God is the Lord and Master of all, and this, they feel, would not be so unless God

predetermined all creatural activity by means of a 'physical premotion.'

The Defense of Molinism

The molinists take as the starting-point of their discussion of the problem the *freedom of the will*. The freedom of the will is admitted, at least in principle, by both the thomists (bannesians) and the molinists; the fact itself, whether viewed from a theological or philosophical point of view, is indubitable, and the freedom of man's will must be safeguarded against all attacks. But the thomistic position, molinists contend, destroys free will in their doctrine of 'physical premotion (physical predetermination).' As a result of this conviction, the molinists attack the doctrine of 'physical premotion' as the proper interpretation of 'divine concurrence'; in its stead they advocate simultaneous concurrence.

Physical predetermination, molinists claim, is not necessary. And the freedom of man's will cannot be upheld under the influence of physical premotion.

Physical premotion is superfluous for the purpose intended. The thomists demand this physical premotion, first of all, in order to make it clear that God is the absolute *Prime Mover* of all creatures and to show their *complete dependence* on Him in all actions. However, the molinists say, all this will be upheld, and God can do everything described above, without 'physical premotion.' Hence, physical predetermination is superfluous for the purpose.

The *absolute dependence* of every creature on God is sufficiently clear and safeguarded when the following points are accepted:

The creature owes its entire *being* and all its *powers* directly to God; thereby its absolute dependence on God is assured under all circumstances.

No creature can pass from the state of *insufficient preparation* for action to the state of sufficient preparation, unless God (either alone or through creatures entirely dependent on Him) brings the creature into a state of immediate preparedness for action.

No creature, even when in a state of immediate preparedness for action, can pass from potency to act *unless assisted by divine concurrence* in the very act, that is to say, unless God, as a coefficient principle, produces (together with the creature) the actual application of the operative power to its connatural and proportionate action by willing this action to be produced and to proceed from the creature's operative power.

For all this, however, 'simultaneous' concurrence is sufficient, and 'physical premotion' is not required. Hence, physical premotion (predetermination) is not necessary for *complete dependence* of the creature on God.

Furthermore, thomists demand the existence of 'physical premotion (predetermination)' so that God *can direct all creatural actions to His purposes and ends*. Certainly God must be able to do this if He is the Master of all things. Molinists agree that God must be able to direct all creatural actions so that His supreme purposes and ends will prevail, but God can do this *without a physical premotion*.

With regard to the creatures which act *necessarily*, God knows from all eternity just what forces for action lie in them. By giving them their particular nature and powers and by arranging the order existing in the universe, God can produce, through 'simultaneous' concurrence (without which they cannot operate), any result that He wishes and direct them to any purpose that He desires by the very fact that He arranges them in their respective order and that they act with necessity. More is not needed.

With regard to the creatures which *act with freedom of the will*, God, since he created the will with freedom of action, leaves the free will intact. Still, He can direct the free will of men to any particular purpose that He wishes. Through His 'intermediate knowledge' God knows from eternity what every person *will actually decide* to do and what he *would* decide to do under any and every possible condition. God thus knows, infallibly and eternally, that this or that person will actually and freely do something in the circumstances as given. Consequently God knows with absolute certainty what He should decree and what circumstances He should bring about, in order that the free will of man fulfill His own purpose in a free manner; all this should cause no difficulty for the omniscient and omnipotent Creator of man's free will.

There is, therefore, *no necessity* for any kind of 'physical premotion (physical predetermination),' so that God can bring about any result He wishes. 'Physical premotion' is thus superfluous for the purpose intended; 'simultaneous concurrence' is all that is required. Why, then, postulate physical predetermination of the will, especially when the

theory presents insurmountable difficulties in maintaining the will's freedom?

PHYSICAL PREMOTION CONTRADICTS FREE WILL.

The freedom of the will consists essentially in an *active indifference* which makes the will master of its own acts and places it in its power to act or not to act (freedom of exercise), to will 'this' or 'that' (freedom of specification), and that even if all the requisite conditions for action are present. But this active indifference' is made impossible by physical premotion, whether one considers the will as predetermined or not as yet predetermined.

The *will as predetermined* by God has no active indifference. Under the influence of physical premotion it is metaphysically impossible, as the thomists and bannesians assert, for the will to *omit* the act to which it has been predetermined by God or to *change* it. The will simply *cannot* act in a manner *different* from that to which it has been predetermined by God. Hence, it has no active indifference or choice, so that it could perform or omit the act or choose 'this' rather than 'that.'

The *will not as yet predetermined* has no active indifference either. This physical premotion, according to the thomists, is a necessary *prerequisite condition* for every act of the will, and as such the will, without physical premotion, is absolutely incapable of performing an act at all.

Now, if the human will lacks active indifference before and in and after predetermination, then it cannot be said to

be free in its choice. Hence, free will is incompatible with physical premotion (predetermination). And yet, the *human will is free in its choice*. Consequently, physical premotion (predetermination) must be said to destroy free will. Physical premotion, herefore, must be rejected as the proper interpretation of the mode' of divine concurrence.

Thomists, of course, assert that God applies His physical premotion according to the nature of the agent, and He therefore applies it in such a manner to the will that it acts freely under the influence of the predetermination. Molinists say to this that the thomists uphold free will *in words*, but their *explanation really destroys* the will's indifference and thereby its *freedom* also. Their explanation involves, not a mystery (as some of them claim), but a *contradiction*: man's will would be actively indifferent and undetermined (because the will is 'free,' which implies self-determination) and yet be determined through physical premotion. Now, an 'undetermined-determined' will is a contradiction pure and simple.

PHYSICAL PREMOTION CONTRADICTS GOD'S SANCTITY.

For all acts without exception, thomists and bannesians claim, God must give His physical premotion, or they cannot be performed. Molinists contend that such a view makes *God the author of sinful acts*; and they argue in this manner.

God alone is the *author* of physical predetermination, and the influence of this premotion on the will is such that it has an irresistible, infallible effect. Hence, God is the

'determining cause in every concrete act according to its entire concrete being, while the position of man is that he *cannot omit* the act. God's will in this respect is to man's will as the irresistibly determining to the irresistibly determined. But one who is the determining factor in a concrete act which, under the circumstances of time, person, etc., is sinful, is in the real sense of the word the *cause of the sin*; otherwise there is no cause for sin at all. For example, some person likes a 'drink.' He has drunk to the limit of soberness and realizes that he ought to stop; but he continues to drink until completely intoxicated. For every glass he needed a physical premotion from God; with a physical premotion he could not possibly have stopped to drink. In virtue of the physical premotion and predetermination given to his will by God, he simply had to drink on to intoxication; he not only could drink on, but he could not possibly have prevented it. Without physical premotion the very possibility to drink was taken away, and with it the very possibility of avoiding intoxication was excluded. The cause of intoxication, therefore, is the influence of the physical predetermination; rather, God, the author of physical premotion, is the responsible author of the sinful act of intoxication. And so with all other sinful acts. Now, God, the infinitely holy, cannot be the author of anything sinful. But He would be, according to the theory of physical premotion. Therefore, the theory is wrong. Thomists resent this interpretation of their theory. God, they say, merely predetermines man to the *material* sin (to the positive reality found in the sinful act), *not to formal sin* (to the sinfulness of the act precisely as sinful). To this the

molinists answer that it is true that God predetermines the creatural will merely to the physical reality of the act. However, we impute the physical act as 'sinful' to the creatural will because the will actively determines itself to this concrete physical act which, considering all the circumstances, does not agree with the moral law. When, therefore, God actively *predetermines* the will by means of physical premotion to this same act, He is, even more than the creature, the responsible agent of the sinful act.

That thomists dislike this imputation and its conclusion, is obvious. As Garrigou-Lagrange⁸ writes: "The opponents of the Thomist thesis would have it that we say: 'God determines our choice,' whereas we say: 'God *moves* our will to *determine itself* freely in a certain manner.' After thus misrepresenting our thesis, they find it easy to add that, like Calvinism, it destroys liberty because it leads to the conclusion that free will, moved and prompted by God, cannot resist." For this reason the thomists constantly repeat their distinction between the 'infallibility' and the 'necessity' of the creatural act proceeding under the influence of God's physical premotion.

The molinists counter by claiming that the thomists are guilty of *inconsistency* when, in view of their doctrine of physical premotion and predetermination, they ascribe the sinful act to the will of the creature. In their explanation of the sinfulness of an act, and in order to make the creature responsible instead of God, they *surreptitiously introduce self-determination into the creatural will*. So they *do* admit (contrary to their avowed principles) that the will of man can 'actively determine itself,' irrespective of the divine

premotion. But then why postulate physical premotion and predetermination? 'Simultaneous concurrence' suffices. In any case, molinists insist, self-determination on the part of the creatural will is incompatible with complete predetermination.

Evaluation

Both thomism and molinism have their good points and also their obscurities. The two theories approach the problem from different angles, due to the emphasis on certain truths.

Thomism stresses the *absolute sovereignty of God* over the creature and, as a consequence, the absolute dependence of the creature on God. God is the creator of everything outside Himself, so that everything, including the action of creatures, owes its existence to the almighty power of God. Without God the creature is nothing. And since God does not act blindly but with evident purpose for all things, it is clear that creatures cannot frustrate the ultimate purpose of God. In order to safeguard the infinite sovereignty of God, thomists are convinced that it is necessary to make all creatural action (and that includes the action of the free will) dependent on a divine *physical premotion* and *predetermination*.

Molinism, on the other hand, while admitting the absolute sovereignty of God, emphasizes the *freedom of man's will*. The freedom of the will is the basis of all morality, for without this freedom there can be no responsibility, no reward, no punishment, no

commandment. Take away man's effective freedom and man is lowered to the level of a beast or of an automaton. The freedom of man's will must be safeguarded at all costs. And so also must God's absolute sovereignty. God cannot force man's free will, because in His infinite goodness He decided to create man as a free agent capable of good and evil through active self-determination. As they see it, physical premotion and predetermination would destroy this freedom of man's will. *Simultaneous concurrence*, based on intermediate knowledge, suffices to safeguard God's absolute sovereignty and also man's freedom. And thus complete harmony is established between God's sovereignty and man's freedom of the will.

No reference to the teaching of St. Thomas Aquinas has been made in the foregoing sections outlining the views of thomism and molinism. The reason for the omission is simple: both schools of thought quote passages of St. Thomas in support of their theory, and their interpretations are naturally influenced by their respective views.

Summary of Chapter XIV

The divine *conservation* of creatures and the divine concurrence in creatural action is the subject of the present chapter.

1. *Notion of Conservation.* — By *conservation* one understands continuation in existence through dependence on a cause. It is either passive' or 'active.' The issue in question here is the 'active' conservation of creatures on the part of God, namely, that He is the cause of the continued existence of creatures. Active conservation is either 'negative' or 'positive,' and positive conservation is either indirect' or 'direct.'

2. *Proof of Divine Conservation.* — We claim that God preserves all things without exception by a *positive and direct influence* (direct conservation).

All creatural beings are *contingent* and as such do not have the sufficient reason for their being in themselves but in God. This insufficiency pertains to the entire period of their existence. Hence, the sufficient reason for the entire period of their existence (not merely for their beginning in existence) lies in the non-contingent being, in God. Hence, their *continued existence*, because it is contingent like their beginning, demands the same positive and direct influence of God's activity. That, however, is what is meant by *divine conservation*.

God has the power to *annihilate*, that is, to make a being cease to exist. But annihilation, since it is no positive activity directed toward a positive result, must consist in the

withdrawal of some positive activity of God. Consequently, the perseverance in existence on the part of the creature must be due to a positive activity of God; and this positive activity is divine 'conservation.'

3. *Notion of Divine Concurrence.* — Divine *concurrence* is the influence of God operating with creatures in producing the same effect as they produce through their own activity. It is either 'moral' or 'physical,' and physical concurrence is either 'mediate or immediate.' God's concurrence to creatural action is physical and immediate.

4. *Proof of Physical Concurrence.* — The complete contingency of the creature affects not only its nature but also its *action*. Hence, also the action of the creature is dependent on God intrinsically, essentially, and immediately. Consequently, God must give His physical and immediate concurrence to the action of the creature.

Again. Whatever exists depends for its *existence* directly on the power of God. Now, all actions and effects of creatures are a positive reality in the order of existence, and as such depend directly on the power of God for their existence.

Finally. God can *hinder* creatural *action*, because no contradiction is involved. This hindrance, however, would be impossible for God, if He did not co-operate in the creatural action in a positive manner.

5. *Mode of Divine Concurrence.* — Bannesianism (and thomism) and molinism attempt to give an explanation of the *mode* or manner of divine concurrence. The problem is how to reconcile the *absolute dominion* of God over all

creatural actions (including the free act of man's will) with the *self-determination* of man's free will.

6. *The Answer of Bannesianism.* — The bannesians (and thomists) claim that God applies a physical premotion (predetermination) to the creature's operative power, thereby determining the finite cause to its last actuality so that the act naturally results of itself. The action 'infallibly' follows the kind of premotion given. But 'infallibility' is not the same as 'necessity'; the free acts of man follow infallibly but 'freely,' because God premoves according to the nature of the being He assists in its action. God's *knowledge* of the creature's free acts is based on His predetermining *decrees*.

7. *The Answer of Molinism.* — Molinism rejects physical premotion and in its stead advocates *simultaneous concurrence*. In actions of the free will this concurrence is 'indifferent,' enabling the will to choose and determine itself. Instead of God's knowledge resulting from His predetermining decrees, molinists postulate an *intermediate knowledge* (*scientia media*) in connection with the free acts; each such act contains a formal and objective truth which must be known to God's omniscient mind prior to any decision of His will regarding it. Only in this way, molinists are convinced, can the freedom of man's will be safeguarded.

8. *The Defense of Thomism.* — As regards *physical premotion* in general, thomists base it on the universal principle that 'Whatever is moved is moved by another.' Every creatural action is a passage from potentiality to actuality, and as such the new reality acquired can come

only from the *Prime Mover, God*. This principle applies also to the *free acts* of man. Since 'infallibility' is not 'necessity,' the free will acts infallibly but freely under the influence of physical premotion.

9. *The Defense of Molinism*. — Physical premotion, the molinists contend, is *superfluous* for the purpose intended. The thomists assert that physical premotion is required in order to make it clear that God is the Prime Mover of all creatures and to show their complete dependence on Him in all actions. Both purposes are achieved with simultaneous concurrence.

Physical premotion *contradicts free* will because it deprives the human will of the 'freedom of exercise' and the 'freedom of specification.' A physically determined will has not the 'active indifference' necessary for freedom.

Physical premotion *contradicts God's sanctity*, because it makes God the author of sinful acts. Thomists say that God premoves the will to act freely. But, the molinists assert, what the thomists say in words they contradict in their explanation, or they surreptitiously introduce, contrary to their avowed principles, self-determination into the creatural will.

10. *Evaluation*. — Thomism stresses the *absolute sovereignty of God*; molinism emphasizes the *freedom of man's will* in its actions.

Chapter 15

PROVIDENCE AND GOVERNANCE

ALL CREATURES OWE THEIR EXISTENCE TO GOD. GOD CREATED them because He is infinitely good and wished them to share in His goodness. Creatures thereby imitate the perfections of God in a limited fashion.

More, however, is required than creation. For creatures to endure in their being and existence, they need the 'conservation' of God; without this, they would immediately return to nothingness. For them to be active, both with regard to their own being and in relation to others, they need the 'concurrence' of God. Under all circumstances and conditions, creatures are thus dependent on the First Cause for their being and activity.

Another transient activity of God, relative to creatures, is His *providence* and *governance*. All theists agree in this. Even the pagans in their religious observances manifest a belief in the providence and governance of God, at least implicitly, because they pray and offer sacrifices to their deities for protection and assistance.

Belief alone, however, is insufficient to establish the providence and governance of God; solid reasons are

required, in order to establish this activity of God to the satisfaction of the philosophic inquirer.

Notion of Providence

Etymologically (Lat., *pro*, for; *videre*, to see, to look) the term *providence* means as much as ‘to look out (care) for something.’ And that is the common significance of the word. From a philosophical standpoint, all that is further required is a deepening and broadening of the term.

St. Thomas¹ defines God’s providence as the “type (plan) of the order in things towards an end.” And in another passage² he calls it “the type (plan) of the order of things foreordained towards an end.” What St. Thomas wants to say is that God has *in His mind* a definite plan of the order which He intends and foreordains in His creatures, so that the particular purpose of their being will be in accordance with the universal purpose of all creation. In other words, God did not give existence to His creatures and then let them fend for themselves, without bothering about them and their future in any special manner. On the contrary, God not only gave them their being, but also ‘foreordained’ the order of their being in themselves and in relation to other beings in this world; and He sees to it that this order is directed toward an end and is carried out toward the end He desires.

Two things, therefore, are involved in the providence of God: an act of His intellect containing the *plan* of the order which shall exist in creatural beings; and an act of the will containing the *decree* that this order shall prevail according

to the particular and ultimate purpose (end) He has assigned for them.

So far as the *purpose* of creatural beings is concerned, a distinction is necessary. Each individual being has its own inherent purpose, namely its own particular fitness and well-being. But each individual is also a member of a wider group and of the universe at large, and as a member it is subordinated to the purpose of the entire universe as a whole, namely, to the order of the universe as God has foreordained this order. And all beings, whether considered as individuals or as members of the entire universe, have as their ultimate purpose the manifestation of God's perfections, namely, the external glory of God.

The *whole* has more intrinsic value than the parts constituting the whole. In the designs of God's providence, therefore, the well-being of the parts of an individual being are subordinated to the well-being of the total individual, and the well-being of the individuals is subordinated to the well-being of the universe as a whole; all, however, whether viewed as individuals or as a universe, have as the ultimate purpose of their being and existence the manifestation and exaltation of God. This arrangement of creatural beings, both in themselves and in their relation to other beings as members of the entire universe, is what is meant by 'the order of things' foreseen and decreed by God in the designs of His providence. We maintain that every being, nonliving and living, material and spiritual, is subject to the loving direction of God's providence.

God's providence thus extends to the well-being of the individual beings and of the universe at large.

Correspondingly, a distinction is made between 'particular' and 'universal' providence. God's *particular* providence is the practical ordering of the individual beings for the achievement of the various ends proper to them. His *universal* providence is the practical ordering of the universe of things for the attainment of the end proper to the universe as a whole.

Now, if an 'end' is intended, the 'means' required to achieve the end also must be intended. God, then, through the plan of His providence supplies each creature with the means needed for its physical well-being; this is *physical* providence. Man, however, is also a moral being, and God gives man the means needed by him to live in conformity with his moral nature; this is the *moral* providence of God.

Notion of Governance

The *governance* of God is the execution of the plan of providence among existing beings; in other words, whereas providence pertains to the 'plan' of the order among things in the mind of God, governance is the 'actual direction' of things toward the end established for them by God.

Providence, considered as the plan of the order of things, is an exemplary idea present in the intellect of God which the divine will decrees shall be carried out; as such it is identical ultimately with God's infinite essence and exists in Him from all eternity. Governance (or 'government'), on the other hand, considered as the execution of the plan of providence, presupposes the fact of creation and of the existence of creatural beings, so that, if creatures did not

actually exist, there would be no governance on the part of God. As St. Thomas³ expresses the matter: “Two things pertain to the care of providence — namely, the reason of order, which is called providence and disposition; and the execution of order, which is termed government. Of these, the first is eternal, and the second is temporal.”

In a *strict* sense, therefore, providence and governance are by no means identical. Providence exists in the mind of God *prior* to the existence of creatures, while governance is *posterior* to (that is, follows) their existence.

In a *wider* sense, however, providence may be considered, as a matter of actual fact under present circumstances, to include governance. Creation need not have occurred; if it had not occurred, there would have been providence but not governance. Creation, however, actually having occurred, the providence of God involves its execution in fact. For this reason most authors include governance in the general concept of providence.

Henceforth in this chapter, since creatural beings actually exist, the concept of ‘providence’ will be used in the wider sense as including ‘governance.’

Proof of God’s Providence

The fact of divine providence is denied by the materialists, pantheists, finitists, fatalists, and many deists. We maintain that *God, through His providence, directs the world in general and man in particular* in a most wise manner toward the end He has decreed.

FIRST, GOD'S *GENERAL PROVIDENCE*.

The general providence of God can be proved either indirectly or directly. Both proofs will be given.

Indirectly, God's general providence is proved by showing the *absurdities* which necessarily follow its denial. A person could deny the existence of divine providence, only by maintaining that God either does not know how to direct all things to their proper and ultimate end, or that He has not the power to do it, or that He could do it but does not care to do it. None of these alternatives can be reasonably defended. God is infinite in His wisdom, His power, and His goodness. The first alternative is contrary to His infinite wisdom; the second, contrary to His infinite power; the third, contrary to His infinite goodness. Consequently, God's general providence directs the world and all creatures toward the end He has decreed.

Directly, God's general providence is proved from the *nature of God and of His creatures*. The nature of every single creatural being is such that it is immediately dependent in essence and operation on God as the First Cause. The end and purpose of each creature has been designed by the Creator. The creature attains its proper and ultimate end through action, and action follows nature and essence. As a result, creatural action necessarily requires not only that God give the creature a nature capable of, and fit for, action, but also immediately and directly assist it in the realization of its actions. This assistance on the part of God is conservation and concurrence. Now, to assist a creature immediately and directly in the achievement of its end and purpose of being

through concurrence in its every action is the same as to 'direct' it toward its end and purpose of being, because without God the creature can do nothing. Therefore, God directs all beings, from the smallest to the largest, toward the end and purpose of their being. That He does this in a most wise manner is evident from the fact that every act of God is infinitely perfect and consequently infinitely wise. Now, such an infinitely wise direction of all creatures toward the end and purpose of their being is what is meant by 'general providence.' God, therefore, directs the entire universe by means of His general providence.

It is obvious that every single being has its *own proper end* and purpose. Its 'proper end' is indicated by the specific nature it possesses, and every being has its specific nature. Man, because of the constitutional limitation of his mind, may and, in most cases, will be ignorant of the specific nature of the beings he encounters in the world; but this ignorance does not alter the fact that such a specificity is present. By the very fact that God gave a specific nature to each being He *intends* the realization of this specific nature as the proper end and purpose of the individual being; and what God 'intends' He realizes.

Besides the proper end and purpose inherent in its nature, each individual being and all together have an *ultimate end* and purpose. Whatever is inseparably connected with something that is intended must be intended with it. Now, the manifestation of God's goodness is inseparably connected with creation, inasmuch as creatures are things which are 'good.' Therefore, the manifestation of God's goodness in His creatures is

intended by God. But this manifestation of God's goodness is what is understood by God's 'external glory.' Consequently, the ultimate end and purpose of all creatural beings, singly and collectively, is God's external glory. God, therefore, intended His external glory as the ultimate end and purpose of all creatural beings. What God intends, however, will and must eventually come about; God's will cannot be frustrated by creatures. Hence, whether creatural beings know it or do not know it, consciously strive for it or do not consciously strive for it, they actually manifest the goodness of God and thus carry out the 'ultimate end' and purpose of their existence.

Since it is the 'intention' of God that all creatures, singly and collectively, realize the particular and ultimate end and purpose of their being, and since God's intention is always effective, His providence extends over the entire universe and every being in it. In other words, God's providence is truly universal.

NEXT, *GOD'S SPECIAL PROVIDENCE CONCERNING MAN.*

Moral philosophy, or ethics, shows that man strives naturally and necessarily for *perfect happiness*; it also shows that man cannot find this perfect happiness in creatural goods, but only in God the supreme good. Man is unable to achieve this goal in his life here on earth. Hence, the perfect happiness of man can consist only in an intimate union with God in eternity through contemplation and love of God.

Now, the entire world and every creature in it is by its very nature *fit to dispose* man for this final happiness. Hence, it must be the *intention* of God that all creatural beings do this.

Man uses the things within his reach for food, shelter, clothing, ornamentation, and the commodities of life. Directly or indirectly, the world has the natural function of ministering to man's vegetative and sentient life. Man's vegetative and sentient life, however, is the foundation of his intellectual life, and this intellectual life is the preparation for his ultimate happiness. The things present in the universe thus give occasion to man to develop his intellectual powers by study and contemplation, and thus man can mediate himself for a more perfect knowledge and love of God by acquiring a deep knowledge of God's creatures. The world leads man's mind to God. Creatural beings furnish man with abundant material to know God, acknowledge His dominion, love Him above all things, and to show his complete dependence on God in many ways. In this manner all things conspire to man's benefit.

After all, man is a *moral* being, subject directly to God as the eternal lawgiver. Morality can exist only when there is a conformity of man's actions with the norms of moral living. Man's ultimate happiness is closely bound up with the observance of the moral law. And since the moral law has God as its author, it is evident that God *intended* man to live according to the dictates of the moral law and also intended to be the supreme object of man's ultimate happiness. God, therefore, in making man a moral being and in giving him

an eternal goal of happiness to strive for, has *ordered* the things of this world in such a way that the inferior beings are in existence for the *well-being and happiness of man*. Man, consequently, is not subordinated in any way to the material things of this world, but they are subordinated to him; *man is subordinated to God*, inasmuch as all things should lead him to know and love God as the ultimate truth and the supreme good. Man may, of course, violate the moral law and thus frustrate the innermost purpose of his being, but he cannot thereby frustrate the purposes of God. Man, too, exists for the external glory of God. He will glorify God either in His goodness or in His justice.

God having intended that man observe the moral law here on earth and thereby find his eternal happiness in union with God, it is evident that *He has given man a special end* and purpose. Man is thereby a special object of God's providence. According to his bodily nature, man is a part of the universe at large; according to his spiritual nature, man has a purpose in life which is much nobler than that of the whole physical universe. Mere size means nothing in the eyes of God. It is man's moral well-being that counts in the estimation and intention of God. And because God loves man with a special predilection of His providence and governance, man must love God with his whole heart, his whole mind, his whole soul, and with all his strength. Only in this way will man make himself worthy of God's special providence and achieve his eternal happiness.

God does not do things by halves. Just as a wise architect, in contemplating the erection of a building, not only designs the plan but also makes provision for all the

requisite materials and then supervises the actual construction; so, too, God in His infinite wisdom not only plans the nature of each individual being and of the universe as a whole, but also orders the requisite means for them to realize their particular and ultimate end. Any other procedure would reveal a lack of wisdom. Man, therefore, since he occupies a special position in the scheme of things and has a special purpose as a spiritual and moral being, can be sure that the providence of God directs all things in such a manner that his specific and ultimate end can be realized. God will never abandon man to be a mere piece of driftwood tossed about aimlessly on the sea of the world.

St. Thomas⁴ proposes the argument for divine providence in the following clear and succinct manner:

“It is necessary to attribute providence to God. For all the good that is in created things has been created by God, as was shown above (Q.6, A.4). In created things good is found not only as regards their substance, but also as regards their order towards an end and especially their last end, which, as was said above, is the divine goodness (Q.21, A.4). This good of order existing in created things, is itself created by God. Since, however, God is the cause of things by His intellect, and thus it behooves that the type of every effect should pre-exist in Him, as is clear from what has gone before (Q.19, A.4), it is necessary that the type of the order of things towards their end should pre-exist in the divine mind: and the type of things

ordered towards an end is, properly speaking, providence.”

— ST. THOMAS AQUINAS

Providence, therefore, is a fact.

Physical Evil

The problem of the existence of physical and moral evil in the world is by no means modern. It has exasperated the mind of man from time immemorial. The *existence of evil* has always been adduced as an argument against divine providence.

Already the *epicureans* denied divine providence and governance because of the presence of evil. But that was like spilling the child out of the tub in spilling out the water of the bath; then the manifest order existing in the universe could not be explained. Later on, the *Manicheans*, taking over the two supreme principles of light and darkness from the Persian religion, maintained that all the good in the world owed its existence to the ‘principle of light’ as the source of good and that all the evil owed its existence to the ‘principle of darkness’ as the source of evil. Both principles are supreme in their respective spheres and are in perpetual war with each other, but eventually the ‘principle of light’ will conquer the ‘principle of darkness’ and the good will triumph over the evil. They overlooked the fact that ‘darkness’ and ‘evil’ are negative in concept and being and that the ‘principle of darkness’ can have no existence

as such without it being a 'good.' *Pluralists* and *finitists*, like William James and many moderns, identify God with the finite world and consider Him to be subject to all the limitations and defects present in the things of this world; God, in their view, is continuously combating evil through self-improvement. That their 'God' is not the infinitely perfect God of the theists, is obvious; in fact, this world-god is not God at all, at least in the traditional sense of the term. There is no need of proving here the existence of the Supreme Being as distinct from finite beings.

The existence of *physical evil is admitted* unreservedly. The fact is too evident to be denied. What is not admitted, however, is that the existence of physical evil in the world is a valid argument against the providence of an all-wise Creator. Man's mind, of course, is very limited in its power and knowledge, and man cannot expect to penetrate the depths of God's infinite wisdom; many things, therefore, will always remain obscure and mysterious to man.

Unfortunately, too, the real force of the argument of physical evil lies in its emotional appeal, particularly if someone has suffered personal loss or injury. The problem, of course, must be met on a *rational, not an emotional, basis*. If this is done, much of the difficulty vanishes.

Of primary importance in properly judging the presence of physical evil is the fact that *God freely created the world as it is*. He was under no compulsion to create at all; nor was He under compulsion to create this particular world rather than another. Much less was He under compulsion to create the best possible world. Undoubtedly, God could have created a world without physical evil in it, had He so

desired. The fact is, He created this particular world with a *hierarchy of inferior and superior beings*, and to these beings He gave the power of action. The individual being is a member of a group, and the various groups constitute the universe. In this way each individual being has a definite place in the *order of the universe as a whole*, just as the constituent parts of the individual have a definite place in the order of each being as an individual.

Now the parts, although they have their own proper being, exist for the whole; the inferior is subordinate to the superior. The well-being of the whole may well require the sacrifice of the well-being of the parts, and the well-being of the superior may well require the sacrifice of the well-being of the inferior. Subatomic particles furnish the material for the elements; the elements, for the compounds; the compounds, for the plants; the plants, for the animals; the animals, for man; and all, for the order of the universe as a whole. In this *hierarchy of order*, therefore, the lower beings must give way to the higher. And so it happens that in the interplay of action between lower and higher beings some lose their physical integrity, and *physical evil results*.

What is wrong with such an arrangement? Nothing whatsoever. The individual being thus has its own proper end as an individual and also an end in the order of the group and of the universe. As an individual being it is less important than as a member of the group and of the universe. God's providence extends to all beings, whether they be considered as individuals or as members of a higher order. But if God wanted the order of the physical world to be such that the inferior beings exist for the superior and

that the well-being of the individuals be subordinated to the well-being of the groups and of the universe as a whole, then that is the way the world should be. And that means that *physical evil is a normal feature of the world*.

St. Thomas⁵ develops this point very plainly, when he writes:

“The perfection of the universe requires that there should be inequality in things, so that every grade of goodness may be realized. Now, one grade of goodness is that of the good which cannot fail. Another grade of goodness is that of the good which can fail in goodness, and this grade is to be found in existence itself; for some things there are which cannot lose their existence, as incorruptible things, while some there are which can lose it, as things corruptible. As, therefore, the perfection of the universe requires that there should be not only beings incorruptible, but also corruptible beings; so the perfection of the universe requires that there should be some which can fail in goodness, and thence it follows that sometimes they do fail. Now it is in this that evil consists, namely, in the fact that a thing fails in goodness. Hence, it is clear that evil is found in things, as corruption also is found; for corruption is itself an evil... God and nature and any other agent make what is best in the whole, but not what is best in every single part, except in order to the whole, as was said above (Q.47, A.2). And the whole itself, which is the universe of creatures, is all

the better and more perfect if some things in it can fail in goodness, and do sometimes fail, God not preventing this. This happens, firstly, because 'it belongs to Providence not to destroy, but to save nature,' as Dionysius says (Div. Nom. IV); but it belongs to nature that what may fail should sometimes fail; secondly, because, as Augustine says (Enchir. 11), 'God is so powerful that He can even make good out of evil.' Hence many good things would be taken away if God permitted no evil to exist; for fire would not be generated if air was not corrupted, nor would the life of a lion be preserved unless the ass were killed. Neither would avenging justice nor the patience of a sufferer be praised if there were no injustice."

— ST. THOMAS AQUINAS

Physical evil is thus no valid argument against the providence of God. The deficiencies of nature are the necessary result of the *limited perfection* of created nature and its powers. There must be some limitation and some deficiency somewhere. Hence, God can permit physical evil and indirectly will it as a normal feature of the order of the universe.

BUT WHAT ABOUT *PAIN* IN BRUTE AND MAN? PHYSICAL PAIN IS real; not a mere illusion, as Christian Science claims. Does not the presence of pain bespeak cruelty in the Creator?

Not at all. In organic sentient beings pain has a normal function in the economy of their system.

Brutes have two classes of supreme tendencies — the preservation of the individual and the conservation of the species. For this purpose brutes possess senses and instinct. Together with these powers they have *pleasure and pain*, and they are the sanction of the preservation or violation of their fundamental natural tendencies. Since brutes do not possess reason, they have pleasure and pain to guide them in the preservation of the order stamped upon their nature.

Physical *pleasure* accompanies the normal exercise of every natural faculty in the service of the well-being of the individual animal and in the service of the conservation of the race. Physical *pain* is the natural result of the overuse or the lesion of some bodily organ; as such, pain prompts the animal nature to repair the damage suffered. Since the brute by its very nature seeks pleasure and avoids pain, the natural order is maintained or restored. Organic disorder would become a permanent disability, if there were no pain to force it to seek relief. To suffer no pain under any condition of life would be equivalent to destroying the animal itself. Pain is never present for itself; it is merely an indication that something is wrong, and its function is the restoration of normal function. That is why *pain is exceptional*; it is never the rule.

The same principle applies to *man*, taken according to his sentient nature. Man would refrain from doing many things conducive to his physical well-being, if it were not for pain. But here, too, pain is a means of preservation, of

preventing injury, and of restoring proper function and structure. Every pain indicates some kind of organic need, and thus physical pain is a wise ordination of providence.

From an *ethical standpoint*, pain has an even greater significance. It prevents moral evil and *stimulates* moral good. It is an occasion for great virtue. Self-control, self-sacrifice, fortitude, patience, forbearance, charity — all are hardly possible without a certain amount of suffering and pain. Pain also shows the *value of life*. It plainly and persistently calls to man's mind the truth that he is not made for this life, that the earth is no playground and life no play, that he was created for something nobler than this transient world, that there is a better existence to come for which he must prepare himself. Pain is also a *means of penance*, a restoration of the violated moral order which demands satisfaction and atonement.

But what about the *calamities* and *catastrophes* which destroy human life? An earthquake, for example, occurs in a thickly populated territory. All are sleeping. In a moment the walls of the home rock and crash. There is a shriek, a gasp, a groan — and hundreds and thousands of persons die a violent death. To the unthinking such an occurrence may seem to be against the providence of an all-good God. The answer, however, is relatively simple and clear. Man's ultimate happiness and destiny does not consist in this earthly life; it consists in his *eternal happiness* after death, and the sudden cessation of man's earthly existence does not affect his eternity. Hence, God is in no way obligated to suspend the established laws of nature for the sake of saving human lives, since this does not really influence

man's eternal soul and does not hinder him from attaining the ultimate purpose of his existence — happiness in eternal union with God. Besides, such fatalities are a great warning which may deter many from sin and keep hundreds of thousands on the path of righteousness. If some human beings thereby lose their destiny, the fault is not God's but man's. Death is by no means the greatest evil; sin is.

The fact of an eternal life also explains why many good people suffer misfortune on earth, while the wicked frequently prosper: the latter have their reward here; the former are to receive it in the life to come.

Physical evil, therefore, cannot be adduced as a valid argument against the providence of God.

Moral Evil

In relation to divine providence, some thinkers find an insoluble difficulty in the *existence of moral evil*, of sin, in the world. Yet, like physical evil, moral evil is no valid argument against God's providence.

There is a great difference between *permitting* sin to happen and *approving* sin when it does happen. The 'approval' of sin on the part of God would indeed be contrary to His infinite holiness. To 'permit' sin to occur means merely 'not to hinder' it from occurring, although one could, *per se*, hinder it from taking place. In committing sin, the created will is the sole cause of the transgression; God merely gives His concurrence to the physical or

physiological act of man, and thus He does not hinder' man from setting

the act, but He does 'not approve' of the act in so far as it involves a violation of the moral order. Specifically, moral evil is neither against God's goodness nor against His wisdom.

It is not against *God's goodness*.

So long as man has a *free will*, he can choose to perform an action or refrain from an action which is in conformity or in disconformity with the moral law. Man knows this from personal experience: he is forced neither to obey nor to disobey the dictates of conscience. The *possibility* of moral evil (sin) is thus necessarily connected with the created will because of its 'freedom.' 'Where there is necessity, there is no freedom; and where there is no freedom, there is no possibility of sin. God could, of course, have decided to make moral evil impossible by simply *abstaining from creating* the human will as free; but in that case such a creature would not be 'man.' Man as man is a being endowed with freedom of choice; man as man, therefore, will always be able to decide to act contrary to his conscience and disobey the moral law. Consequently, if God decided to create man, He foresaw the possibility of moral evil in the free will of man. Or, God could have decided to give *such assistance* to man's free will that he would, as a matter of fact, never disobey the moral law. Such an assistance, however, cannot be demanded of God's goodness, because God gives *enough* assistance (conscience, promises of reward, threats of punishment) to deter man from committing sin. Besides, man is not

compelled to sin; sin is a *free* act, and it can always be avoided by a person of good will. So long, then, as God gives man the power and the means to avoid sin, there is no fault on His side. If man sins, the fault is entirely his. Hence, moral evil is not against God's goodness.

Nor is it against *God's wisdom*.

The truly wise person always acts for a definite end and uses the proper *means* to achieve the end. The final end to be achieved by creation and by man is the greater glory of God. The existence of moral evil would be contrary to God's wisdom only if moral evil would frustrate this final end. But it cannot and it does not. Even if a human will obstinately persists in moral evil unto death, God's wisdom triumphs. For God directs even moral evil to the ultimate purpose of creation, because, by means of his sanctions in the life to come, God leads man to glorify His infinite *justice*. Even in this life God's wisdom uses moral evil for the *welfare of man*: He does this for the welfare of those who have done evil by leading them to repentance, as in the case of St. Paul, St. Augustine, and of countless others; and for the welfare of those who suffer the ill effects of moral evil at the hands of others, by leading them to greater virtue, as in the misfortunes of the martyrs and in general of those who are persecuted unjustly. In this way God uses the presence of moral evil, which He never approves but tolerates, as a means of showing His infinite mercy to man. Sin thus is the condition and occasion for much moral good; and this good is a sufficient reason for God to *permit* sin to occur. Ultimately, the ways of God's wisdom are vindicated.

The following quotation from St. Thomas⁶ is pertinent to the matter under discussion:

“Providence multiplies good things among the subjects of its government. Therefore any thing that would deprive things of many good things does not belong to providence. Now if the will were deprived of freedom, many good things would be done away: for no praise would be given to human virtue; since virtue would be of no account if man acted not freely: there would be no justice in rewarding or punishing, if man were not free in acting well or ill: and there would be no prudence in taking advice, Which would be of no use if things occurred of necessity. Therefore it would be inconsistent with providence to deprive the will of liberty.

“Hence it is said (Ecclus. XV, 14): ‘God made man from the beginning and left him in the hand of his own counsel’; and again (*ibid.*, 18): ‘Before man is life and death, good and evil, that which he shall choose shall be given him.’

“Hereby we refute the opinion of the Stoics who held that all things happen of necessity according to the order of infallible causes, which order the Greeks called *εἰμαρμένη*.”

— ST. THOMAS AQUINAS

The evidence for the existence of Providence, as seen especially in the order prevailing in the universe, is so great

that it would be un-philosophic to doubt or deny providence merely because some facts seem to be irreconcilable with it. Isolated facts, particularly when not too well understood, can never be a valid argument against a well-established law. In our shortsightedness we see only the immediate causes, effects, and purposes of things, and we are unable to penetrate into the deeper meanings of God's wisdom and knowledge. Ignorance is neither an excuse nor a fit argument.

Fate and Chance

Is there such a thing as *fate*?

The answer will depend on what meaning is given to the term. Seneca⁷ defines 'fate' as "the necessity of all things and actions which no force can break." If 'fate' is taken in an *absolute* sense, namely, in the sense that all creatures and their actions are so controlled by other creatures and creatural forces (for example, by the stars) that the course of their existence is absolutely determined for them beforehand, then fate is non-existent. Fate in such an absolute sense implies the denial of the freedom of God and man and leaves no room for divine providence and governance in the affairs of men and of the world. But if 'fate' is taken in a *relative* sense, its existence can be readily admitted. In this relative sense 'fate' would merely mean the arrangement of secondary (creatural) causes so as to produce the effects foreseen by God and decreed by Him according to the purpose of His providence. It is in this sense that St. Thomas⁸ speaks of 'fate.' Generally speaking,

however, it is better not to use the term 'fate,' because people usually take the word in an absolute sense.

Is there such a thing as *chance*?

The term 'chance' can be taken in one of two ways: either with regard to the intellect or with regard to the cause. With regard to the *intellect* something is said to happen 'by chance' when the intellect is ignorant of the *cause* producing the effect. With regard to the cause something happens 'by chance' when it occurs outside of the intention and arrangement of the cause. Taken in the first meaning, many things can be said to happen 'by chance' in so far as man's intellect is concerned, because man is naturally ignorant of many of the causes which operate in nature; God being omniscient, however, nothing can happen 'by chance' with regard to His intellect. From the standpoint of the operating causes, it is evident that many things can and do happen 'by chance' where particular causes are concerned. For example, when a brick slips from the hand of a bricklayer high up on a scaffold and in falling hits a passerby on the head, it does so by chance, because it does not lie in the nature of the brick to strike a passerby on the head. However, with regard to God as the provident universal cause concurring in all creatural actions, nothing can ever happen 'by chance.' Chance, therefore, occurs with respect to creatural beings, both from the standpoint of knowledge and causality, but never with respect to the providence of God.

It is, therefore, a grave error of judgment to speak of good fortune and misfortune as if they occurred independent of the rule of divine providence: whatever

happens, happens either according to God's intention or at least with His permission.

Optimism and Pessimism

Optimism, as a philosophic system of thought, is the doctrine that the present universe is the best of all possible worlds. G.W. Leibnitz (1646—1716) was an advocate of absolute optimism. He admitted the existence of evil, but attributed its ultimate source to the imperfection intrinsic to all limited existence. In order to vindicate God's absolute perfection, therefore, he maintained that the present world is the best which God could create.

While we assert that God is infinitely good and perfect in all that He does, so far as He Himself is concerned, we deny that the present world is *absolutely the best* which God could create. Not only does experience reveal many physical and moral evils in this universe as it is presently constituted, but an absolutely perfect world, the best which God could create, is a *contradiction in terms*. God being infinitely perfect is indefinitely imitable by creatural beings. Every creatural being, however, is necessarily finite in its perfections. More perfect beings must be possible to God's creative power; otherwise a limit is set either on God's power or on His perfections. God cannot be necessitated to create, much less to create beings with greater perfection than that which the present world contains. God freely created the present world, and it is *relatively perfect*, namely, as perfect as He intended it to be; but it is not the

best possible world, because such a world is self-contradictory.

Pessimism, as a philosophic system of thought, is the opposite of optimism. Its doctrine contends, at least as far as man is concerned, that there is nothing good in life and in the world. Absolute pessimism is just as erroneous as absolute optimism.

Buddhism as expounded by Gautama (or Gotama) looks upon living as essentially full of sorrow. Existence itself is an evil, and the main problem of life is to obtain the extinction of all desire (the source of all pain and suffering) in nirvana and of all being in parinirvana. *Modern pessimism* owes its vogue mainly to the philosophies of Arthur Schopenhauer (1788—1860) and Eduard von Hartmann (1842—1906). From their writings pessimism was carried over into the field of literature.

That there is much suffering in life, is an evident fact. But that life is essentially a failure and an endless source of pain and sorrow, is contrary to all experience. Pantheism and finitism can never succeed in giving an adequate explanation of the existence of physical and moral evil in the life of man. Theism alone can. Just as this world is not absolutely the best, so it is also not the absolutely worst. The infinite goodness of God is reflected in His creatures; it cannot be otherwise. Hence, in so far as beings have essence and existence at all, they *must be good*. Now, if the world is essentially good, pessimism is false.

The ultimate explanation of life, of course, is not found in the natural order. It is found in the *supernatural destiny of man*.

Miracles

From the standpoint of its etymological derivation, a 'miracle' (Lat., *mirari*, to wonder) is anything that causes wonderment. Wonderment, however, can be caused in a person for reasons of ignorance. For instance, an electric storm or the rise and fall of the tides may produce wonderment in an uneducated rustic, although they are purely natural phenomena. More is needed for a 'miracle' properly so called.

In traditional usage, a *miracle* is defined as a perceptible event which exceeds the order and power of nature and has God as its author. The terms need clarification.

Miracles are viewed as a testimony of God's intervention in the course of nature on behalf of man. For this reason the definition of a 'miracle' is formulated as given above. A miracle is an *event*, that is, an occurrence, a happening, an effect of some sort. It must be a *perceptible* event. One could just as well say that it must be a 'sensible' event, because only something sensible is perceptible. Man derives his knowledge through the senses, and purely spiritual realities make no impression on the senses. For instance, the spiritual transformation of a soul is of a higher order than a sensible occurrence; but it is not classed as a 'miracle' in the strict sense of the term, because its existence cannot be proved by means of the regular channels of information. Then, a 'miracle' *must exceed the order and power of nature*. The word 'nature' here means the assemblage of all creatural beings, whether they be material or spiritual, together with all the powers flowing

from their essence. The phenomena of spiritism (if they are genuine) would be performed by spirits; however, since such spirits are creatures belonging to the realm of 'nature,' such phenomena are not 'miracles' in the accepted meaning. The 'order of nature' is presupposed as existing; and on this account divine creation and conservation and concurrence are excluded from the concept of a 'miracle' since they are prerequisites for this order itself. To be a real 'miracle' the occurrence must exceed the powers of any and all creatural beings, so that it *has God as its author*. The mere fact that an event is rare and extraordinary does not make it miraculous; nor does the fact that man is ignorant of the forces at play. The circumstances must be such that man is certain that the existing forces of nature are incapable of producing the effect in question, so that recourse must be had to the omnipotence and wisdom of God as the only logical explanation of the occurrence. Every 'miracle' is thus a *suspension of the ordinary laws of nature* on the part of the Almighty.

Some events exceed the order and powers of nature *substantially (quoad substantiam)*. Such effects simply do not occur at all in the realm of nature. Effects of this kind would be, for example, the restoration of life to a really dead person, the actual compenetration of material substances (physical bodies), the giving of sight to a person born blind because of some organic deficiency. These effects lie entirely beyond the range and power of natural causes and laws; only God can produce them. Other events exceed the order and power of nature because of the *manner (quoad modum)* in which they are performed. The

events themselves occur in nature and are produced by natural causes and forces, but not in the particular 'manner' as in the miraculous occurrence. Thus, it is a natural event that diseases are cured and broken bones mended. But when such facts occur instantaneously, by means of a mere word or command, then this 'manner' or 'mode' is not in accordance with the procedure of natural causes and laws; hence, in such cases it is the manner of the occurrence, not the event itself, which must be ascribed to the omnipotent power of God in whose name they are performed.

Miracles Are Possible

Whether miracles have ever actually occurred is a matter of historical evidence. The philosopher is primarily concerned with the twofold problem of the *possibility* and *cognoscibility* of miracles.

Pantheists of all shades deny the possibility of miracles. To be consistent, they must. According to their doctrine, God is identified with the world; God (or nature) is the only reality which exists. There can be nothing outside of, or above, or contrary to, nature; that would be equivalent to saying that something exists outside the entire range of being, or above, or contrary to, all existing being. Granted their premise, the possibility of miracles must certainly be denied. *Deists*, as a rule, assert that God has indeed created the world, but after that He leaves it entirely to the forces and laws which operate in nature, so that no exceptions occur in the natural course of events. *Fatalists*

maintain that every being in the world, man included, is controlled by the iron law of necessity which nothing can abrogate or alter. *Materialists* admit of no beings but those which are material. God, providence, and miracles can have no place in their system. *Many physical scientists* deny the possibility of miracles. They, perhaps more than others, perceive the admirable order of the universe and the complete reign of law in nature and in each single being, and from this constancy of order and uniformity in nature they argue that the possibility of miracles is precluded. A miracle, they claim, would be a violation of nature's inflexible laws, and to admit the possibility of that would be tantamount to the destruction of science. Others, like *Spinoza, Locke, and Kant*, admit the possibility of miracles in principle. Practically, however, they deny it. What man calls a miracle, they say, is really a natural event, only he does not and cannot discover the natural laws and causes that govern the phenomena.

WE CLAIM THAT *MIRACLES ARE POSSIBLE*.

If miracles were impossible, the reason would have to be sought either in God or in the laws of nature. But neither is true.

The reason does not lie *in God*.

Certainly, miracles would be impossible on the part of God, if they would imply an *imperfection* of some kind in God, either because of the 'fact' that a natural law has been suspended or because of the 'manner' of the action or

because of the 'purpose' of the miracle. That, however, is not the case.

Every miracle, of course, is a suspension of a law of nature in a particular instance. But this fact does not oppose God's *immutability*. Together with the uniformity of nature which God has undoubtedly decreed, He also decreed the exception involved in the miracle. Hence, in wishing both the laws and the exception to some law, He does not change His plans and decrees, but merely His works. Nor does the fact of a miracle contradict His *wisdom*. If God worked a miracle in order to correct some mistakes in the creation of the world or to remedy a positive defect which He had somehow overlooked, then an imperfection in God would be implied. However, it is preposterous to think that the all-knowing and all-wise Supreme Being could make mistakes or overlook a defect. If, then, God decreed from all eternity that a miracle should occur at a particular point of time, the miracle would be a result of His wisdom and not contrary to it.

The same line of reasoning applies to the *manner* in which a miracle is worked. If a miracle were worked because of *arbitrariness and fickleness* in God's will, it would involve an imperfection in God's being and be impossible. But why would a miracle be the result of arbitrariness and fickleness on God's part? It certainly need not be so. And if it is not, a miracle must be, to say the least, in accordance with His perfection.

So far as the *purpose* of a miracle is concerned, a miracle would be impossible on the part of God if His purpose in working a miracle were against His sanctity. But

that could only happen if God's purpose were contrary to holiness itself. God the all-holy, however, cannot have an unholy purpose in any of His operations. Hence, His purpose in working a miracle cannot be contrary to His sanctity.

The *laws of nature* do not make miracles impossible.

The present order of nature is not necessary. It is an effect of creation, and creation came about through an act of *free choice* on the part of God. God, therefore, was in no way constrained to create just this particular order. Consequently, in decreeing the present order God could also include exceptions to this order.

Of itself, the *order* of the world *could be different* from what it actually is. This order had to be known by the divine intellect before God's will brought it into being. Now, God's intellect could and did see in the imitability of His perfections other worlds and other natural orders capable of imitating His perfections. It is evident, therefore, that of itself the present order of nature could be different. Hence, exceptions to this order, that is, miracles, are not intrinsically impossible.

All creatural beings exist in *absolute dependence* on God as their creator. Because God gave to these beings their entire substance and all their powers, He can, immediately and most intimately, influence them in any way He desires. It follows that the order of nature and the laws governing nature are not *immutable* in relation to God. If He can annihilate the creatures completely, He can certainly change them in their substance and powers, and He can

certainly also suspend their operations any time He so decrees.

One must never forget that a miracle is not an 'abrogation' of a natural law; rather, it is an *exception* to an existing law. When a miracle occurs, the law remains in full force throughout the universe except in this particular place and at this particular time and on this particular occasion. Fire, for instance, does not cease to burn and consume on earth, because the three youths were spared by God in the furnace of Babylon. Men are not cured instantaneously now, because Christ cured a man born blind in an instant by His mere word. A body heavier than water would sink into the water anywhere, even though Christ once walked on the waters of the Sea of Galilee. If God designs to work a miracle, the natural tendencies of creatural beings remain intact. God does not change the 'nature' of being through the performance of a miracle, nor does He disturb the uniformity of the order of nature; all He does is *suspend the effects* of nature and its forces in a particular instance.

It is thus evident that neither on the part of God nor on the part of the laws of nature is a miracle impossible. When, therefore, certain scientists fear that a miracle would tend to destroy science and scientific knowledge, their misgivings are utterly unfounded.

Miracles Can Be Known

The intrinsic possibility of miracles is thus established. However, it is one thing to say that miracles are possible,

and quite another thing to claim that miracles can be objectively recognized as having actually occurred. Can this claim be established beyond reasonable doubt?

Two considerations enter the problem. The first is: Did such and such an occurrence actually happen? This is a question of *historical fact*. The second is: Does this occurrence exceed the order and powers of nature? This is a question of *philosophical judgment*.

So far as the actual occurrence of a miracle as a *historical fact* is concerned, its acceptance will be conditioned by the 'evidence' furnished by the witnesses. All events, whether miraculous or not, are on an equal footing as historical facts. They depend entirely on the competence of the witnesses, and this competence is determined by their *knowledge* of the facts and their *trustworthiness* as witnesses. Since a miracle is a 'perceptible' event, the knowledge required is simply the knowledge obtained through ordinary observation. That a man limps because his one leg is shorter than the other is an ordinary observable fact; and that his walk is afterward normal because both legs are now of equal length, is also an ordinary observable fact. That a person has tuberculosis of the lungs in an advanced stage, any competent physician can verify with the help of X rays; that the destroyed tissue of the lungs is later restored, the physician can also verify with the help of X rays. The trustworthiness of the witnesses, as we see in courts of law, can also be established to the satisfaction of reason. Hence, the *fact* of a certain occurrence, considered to be miraculous, should not be too difficult to establish,

provided one takes all the significant circumstances into account.

The miraculous character of an occurrence presents a more serious problem of *philosophical judgment*. For this judgment knowledge of the cause of the event is necessary: if the cause is a natural force, the event itself is natural; but if a natural force cannot have produced the observed effect, the event is miraculous. Some thinkers, especially some scientists, claim that man can never know that a miracle has actually occurred because some 'hidden force' of nature may have produced the effect. In order to be certain, they say, man would have to know *all* the forces of nature, and such a knowledge man can never acquire. This is an extravagant demand, one which these scientists never exact in their own field of research. All that is required is a knowledge of the *pertinent* forces, and such a knowledge man may have in many instances.

For example. *Decomposition* of the body and *rigor mortis* are true signs of the death of a person, and they are readily observable. Suppose they are present; death has most certainly overtaken the organism. Everybody, especially the scientist and physician, knows that no pertinent natural force can restore life to the corpse. The restoration of life to a dead person, therefore, cannot be the effect of a natural power. If then, this dead person is restored to life, the restoration must be adjudged a miraculous event. Another example. Every physician is aware that *muscular atrophy*, resulting in paralysis, may possibly be cured through prolonged exercise; but he also knows that a mere verbal command will not be a sufficient cause to restore the

atrophied tissue. Yet it is done. What must be his verdict in the case? That some 'hidden natural force' produced the effect? Not at all. He knows that no 'pertinent' force of nature was present in the verbal command, and the cure was therefore 'miraculous.'⁹

Miraculous events, therefore, are possible and their occurrence can be verified under proper conditions. That is all that logically pertains to philosophy.

God and Man

Philosophy, by its very nature, is restricted to the findings of unaided, natural reason. The supernatural is thus excluded from philosophical investigation. It is on this foundation that the science of theodicy has been built.

But the supernatural is also a fact, although philosophy is incapable of proving it. God has given man a supernatural destiny, culminating in the Beatific Vision in heaven. This is the sublime purpose of man's existence. It explains everything. And the supernatural means which God gave man to attain his eternal goal is sanctifying grace. Grace makes man truly a son of God by adoption; and God is truly man's Father. But if man is a son, then he is also an heir. His inheritance is the immortal possession of God in never ending glory and in everlasting bliss. This is an end eminently worth striving for and living for through a lifetime of loving God. Therein lies the wisdom of the ages.

As it is said in the Book of Wisdom:¹⁰

"Wisdom is glorious, and never fadeth away, and is easily seen by them that love her, and is found by them that seek her ... For she goeth about seeking

such as are worthy of her, and she showeth herself to them cheerfully in the ways, and meeteth them with all providence. For the beginning of her is the most true desire of discipline. And the care of discipline is love: and love is the keeping of her laws: and the keeping of her laws is the firm foundation of incorruption: and incorruption bringeth near to God. Therefore the desire of wisdom bringeth to the everlasting kingdom.”

— WISDOM 6

Summary of Chapter XV

God's *providence* and governance are the subject of this chapter.

1. *Notion of Providence.* — *Providence* is "the type (plan) of the order of things foreordained towards an end." God's intellect has the 'plan,' and His will decrees that this order shall prevail. As an individual, each being has its 'proper' end; and as a member of the universe at large, it has an 'ultimate' end. The providence of God is thus 'particular' (pertaining to the 'proper' end of each individual being) and 'universal' (pertaining to the ultimate end of all beings in the universe at large).

2. *Notion of Governance.* — *Governance* is the execution of the plan of providence among existing beings. Since the world actually exists, governance is often viewed as an integral part of divine providence.

3. *Proof of God's Providence.* — As regards *general providence*, it can be proved 'indirectly' and 'directly.' *Indirectly*, God's providence is proved by the absurdities which follow the denial of it; such a denial involves the denial either of God's wisdom or power or goodness. *Directly*, God's providence is proved from the nature of God and of His creatures. Since God created each being and the universe and the order prevailing in them, He had to 'intend' this order and its execution.

As regards God's *special providence concerning man*, it is proved by the nature of man as God created him. Man seeks 'perfect happiness' naturally and necessarily, and this

happiness can be found only in the life to come after death. Man is a 'moral' being, and his happiness is dependent on the observance of the moral law. This being man's nature, God *intended* that man observe the moral law and find his eternal happiness in the union with God. God, therefore, has created man with a special end and purpose. That man can fulfill this end and purpose, demands a special providence which directs all things so that his special end will be realized.

4. *Physical Evil*. — The presence of physical evil in the world is no valid argument against God's providence. God created this world *freely* and with it the *hierarchy of order* consisting of inferior and superior beings. In this order the interplay of action is such that some beings lose their physical integrity, and physical evil results. Physical evil is thus a normal feature of the world, due to the limited perfection of created nature and its powers.

5. *Moral Evil*. — The presence of moral evil is also no valid argument against God's providence. God 'permits' moral evil, but He does not 'approve' it. If moral evil were contrary to God's providence, it would have to be either against His goodness or His wisdom. It is neither.

Moral evil is not against *God's goodness*. The possibility of moral evil (sin) is necessarily given with the freedom of man's will. If God wanted to create man, then He had to give him a free will; and 'free will' involves the free choice of man to choose sin. That God created man, is a sign of His goodness. Nor is moral evil against God's wisdom. God gave to man a definite end and the proper means to achieve this end; that is wisdom. Moral evil does not frustrate the

ultimate end of man; if he does not glorify God's goodness, he glorifies His justice.

6. *Fate and Chance*. — *Fate* in an 'absolute' sense is non-existent, because it would be contrary to the freedom of God and man. It exists in a 'relative' sense, as the arrangement of creatural causes so as to produce the effects intended by God's providence.

Chance occurs with respect to creatural beings, both from the standpoint of knowledge and causality; but with respect to God's providence, nothing ever happens 'by chance.'

7. *Optimism and Pessimism*. — *Optimism* is false. The present world is not the best of all possible worlds. God, because of His infinite perfection and power, could always create a better world. The 'best possible world' is a contradiction.

Pessimism contends that there is nothing good in life and in the world. This system is false. In so far as beings have essence and existence at all, they must be good.

8. *Miracles*. — A *miracle* is a perceptible event which exceeds the order and power of nature and has God as its author. It may exceed nature either 'substantially' or in the 'manner' of its occurrence.

9. *Miracles Are Possible*. — They are possible from the standpoint both of God and of the laws of nature. In no case do they imply an *imperfection in God*. From the standpoint of the *laws of nature*, these laws are not absolutely but only relatively necessary.

10. *Miracles Can Be Known*. — Two things are involved: the *historical fact* of the occurrence, and this depends on

the knowledge and trustworthiness of witnesses; the *philosophical judgment* that the effect cannot have been brought about by a natural cause, and for this a knowledge of the 'pertinent' laws of natural causes is sufficient.

11. God and Man. — Although theodicy, as a department of philosophy, is restricted to the 'natural,' the 'supernatural destiny of man' is all-important.

9 Read the account of the cure of the blind man in St. John, Chap. 9, and of the lame man in Acts, Chap. 3. On the presumption that these narratives are historically true, the cures are 'miracles.'

10 Wisd. 6

GLOSSARY

ABIOGENESIS. The theory that living beings ultimately came into existence through a development on the part of the forces indigenous to nonliving matter. Spontaneous generation.

ABSOLUTE. The unconditioned, the ultimate ground of all reality.

ACCIDENT. A being, incapable of existing in itself, which needs another being in which to inhere.

ACT. The condition or state of existing; whatever exists is 'actual being.' Act, therefore, is the perfection, determination, or degree of reality present in a thing as it exists.

ACTUAL. See Act.

ACTUALITY. See Act.

AGNOSTICISM. The doctrine which denies or doubts the constitutional ability of the human mind to know ultimate reality. It usually concludes with the recognition of an intrinsically Unknowable.

ANNIHILATION. The reduction of an existing being into non-existence; the complete destruction of a being.

APPETENCY. The inclination or propensity of a being for something which is good for it.

APPROBATION. See Knowledge of Approbation of God.

ASEITY. The state of God considered as not owing His existence to another but to Himself, so that existence is of His essence; He is, therefore, 'of Himself' (a se).

ATHEISM. The doctrine that no divinity or God exists.

ATTRIBUTE. That which follows by natural necessity upon a fully constituted essence. Another term for 'attribute,' practically synonymous with it, is property. The 'divine attributes' are all those perfections which flow necessarily from the divine essence and which are found in no other being but God.

ATTRIBUTE, ABSOLUTE. An attribute which pertains to God's essence as such.

ATTRIBUTE, RELATIVE. An attribute of God that has a relation to things other than God.

BANNESIANISM. The doctrine that God applies a physical premotion, a physical predetermination, directly to the creature's operative power, and therefore also to the will of man in making its free choice. The bannesians claim that such a physical premotion is required in order to safeguard God's absolute dominion over His creatures.

BECOMING. See Change.

BEING. Whatever exists or is capable of existence. Expressed negatively, 'being' is that which is opposed to 'absolute nothing'; expressed positively, 'being' is anything which has actual or possible existence.

BEING, RELATIVE. Anything which is 'capable of existence,' though now does not actually exist.

BEING, SELF-SUBSISTENT. A being which exists or subsists in virtue of its own essence.

BEROSONIANISM. See Evolution, Creative.

CAUSE. Anything which assists in the production of a thing through some positive influence.

CAUSE, EFFICIENT. Anything which produces something, that is, brings it from non-existence to existence by the positive influence of its own action.

CAUSE, INSTRUMENTAL. A cause which is insufficient of itself to produce the entire effect but influences the production of the effect under the direction and in the service of another (the principal) cause.

CAUSE, PRINCIPAL. A cause which has a fully proportionate and sufficient power to produce the entire effect either alone or with the use of an instrumental cause.

CHANCE. A mode of causal activity, not purposive in character, regarded as determining an event.

CHANGE. The actualization of something potential; it implies the passage of a being from one state to another.

CHANGE, EXTRINSIC. Change is extrinsic, when it is the result of an 'extrinsic denomination.'

CHANGE, INTRINSIC. Change is intrinsic when some reality is either acquired or lost in the passage of the subject from one state to another.

COGNITION, SIMPLE, IN GOD. See Knowledge of Simple Cognition in God.

CONCURRENCE, DIVINE. God's influence operating with creatures in producing the same effect as they produce through their own activity.

CONCURRENCE, IMMEDIATE PHYSICAL. As applied to divine concurrence, concurrence is physical in as far as God effectively and directly influences the creature in the production of the action itself.

CONCURRENCE, MEDIATE PHYSICAL. As applied to divine concurrence, concurrence is mediate in so far as God prepares the creatures in such a way that they are fit for action and preserves them in that condition.

CONCURRENCE, MORAL. Concurrence based on some sort of moral action, such as commands, exhortations, and promises.

CONCURRENCE, PHYSICAL. Concurrence based on some sort of physical action.

CONSERVATION. Continuation in existence through dependence on a cause.

CONSERVATION, ACTIVE. The activity of a cause producing continuation in existence.

CONSERVATION, DIRECT POSITIVE. Positive conservation is direct when the continued duration of a thing is the immediate effect of the positive action of a cause.

CONSERVATION, DIVINE. God's influence in the continuation in existence on the part of creatures.

CONSERVATION, INDIRECT POSITIVE. The conservation which occurs when an action hinders destructive causes from destroying a thing or provides the means needed for the thing to remain what it is.

CONSERVATION, NEGATIVE. Conservation is said to be negative when a being continues in existence by not being destroyed by another, although the other has the power to destroy it.

CONSERVATION, PASSIVE. Continuation in existence on the part of a being through the activity of some cause.

CONSERVATION, POSITIVE. Conservation is said to be positive when a being is made to remain in existence through some action which is performed.

CONTINGENCY. That state in virtue of which something can be otherwise than it is in its being or existence or both; if a contingent being actually exists, its non-existence would involve no contradiction because existence does not belong to the constitution of its essence.

CONTINGENT. Something is said to be 'contingent' when it actually exists but need not exist.

CONTRADICTION, FREEDOM OF. See Freedom of Exercise.

CREATION. The production of a thing hitherto not existing, without the use of any subject-matter from which it is made; *productio rei ex nihilo sui et subjecti*.

CREATION, ETERNAL. Creation from eternity, so that the created being has no actual beginning in time.

CREATOR. One who creates or produces something out of nothing.

CREATURE. Anything created; any being apart from God.

DEISM. A quasi-philosophic movement in opposition to revealed religion. Chiefly, deism defended a universal

natural religion; it conceded that it could be proved on rational grounds that God exists and is the Creator. Many deists, however, contended that God, after creating the world, took no interest in mundane affairs.

DESIGN. The arrangement of various items into a system or whole, so that the order obtained is the result of plan and intention. The 'purpose' of design consists in the achievement of a definite end through the use of definite means.

DISTINCTION. The difference or diversity between various realities or between the concepts of the same reality. Distinction always implies an absence of identity between things or concepts.

DISTINCTION, MENTAL. The difference between concepts of the same reality.

DISTINCTION, PURELY MENTAL. The difference between concepts of the same reality without a foundation in the thing itself. *Distinctio rationis ratiocinantis*.

DISTINCTION, REAL. The difference between things that are not alike in their reality, independent of the consideration of the mind.

DISTINCTION, VIRTUAL. The difference between concepts of the same reality, with a foundation in the object itself for the distinction. *Distinctio virtualis, distinctia rationis ratiocinatae, distinctio rationis cum fundamento in re*.

DISTINCTION, VIRTUAL, WITH AN IMPERFECT FOUNDATION. A virtual distinction is said to have an imperfect foundation when the concepts of the same reality

are distinct in such a manner that they are not mutually exclusive but rather include each other implicitly.

DISTINCTION, VIRTUAL, WITH A PERFECT FOUNDATION. A virtual distinction is said to have a perfect foundation when the concepts are so distinct in comparison to each other (although they apply to the same reality) that they are objectively different in content.

DURATION. The permanence of a being in its existence.

DURATION, PERMANENT. Duration which remains constant and intact.

DURATION, SUCCESSIVE. Duration in which one part continuously follows the other.

EMANATIONISM. See Pantheism, Transient Realistic.

EMINENTLY CONTAINED PERFECTION. A perfection present in a producing cause in such a manner that it is precontained in some higher perfection of the cause.

EMPIRICISM. The doctrine which denies or doubts the validity of all intellectual knowledge and admits only the certainty of sense-knowledge or 'experience.'

ENS A SE. Being independent of any other being; self-subsistent being.

ESSENCE. That through which a being is just what it is (id quo res est id quod est).

ESSENCE, METAPHYSICAL. An essence consisting of all those elements which are necessary for the concept of the thing and without which this thing cannot be conceived. The 'metaphysical essence of God' is that perfection which is conceived by man as being the most basic to an understanding of God.

ESSENCE, METAPHYSICAL, OF GOD. 'Self-subsistent Being' is the metaphysical essence of God.

ESSENCE, PHYSICAL. The complex of all the fundamental elements without which this thing cannot exist in the order of reality, independent of the consideration of the mind contemplating it.

ESSENCE, PHYSICAL, OF GOD. 'Omniperfection' is the physical essence of God.

ETERNITY. Duration in existence which is essentially without beginning and end and which is essentially without real succession and intrinsic change.

EVIL. The privation of a good.

EVIL, MORAL. The privation of a good pertaining to the moral order; sin.

EVIL, PHYSICAL. The privation of a good pertaining to the physical order.

EVITERNITY. The everlasting duration of a naturally incorruptible being in its existence.

EVOLUTION. The gradual unfolding of something precontained.

EVOLUTION, CREATIVE. The doctrine of Bergson and his followers that everything is in a continuous flux of becoming and change, without any underlying subject which becomes and changes.

EVOLUTION, EMERGENT. The theory that nature is the product of evolution in such a manner that entirely new and unpredictable properties originate through synthesis and thereby form new and higher levels of reality in a continuously ascending process of development.

EVOLUTION, ORGANIC. The theory that the various species and types of animals and plants derive their origin, not through distinct and separate creative acts of God, but through development from other pre-existing species and types, all differences being accounted for by modifications acquired in successive generations according to purely natural laws.

EVOLUTION, PURPOSIVE. The theory that the Supreme Intelligence endowed nature with a purpose and with the necessary principles of action to realize this purpose through evolution.

EXISTENCE. Something is said to 'exist' or 'to have existence' when it is outside the producing power of a cause and is actually present in the world of reality, so that it has 'being' of its own; hence, the condition or state of being outside the mind and outside the productive power of an efficient cause.

EXPERIENCE, RELIGIOUS. The doctrine that man has an experience, either intellectual or emotional, of God's existence; this experience is supposed to be 'non-inferential.'

EXTRA-MUNDANE. Not a part of the present universe, but existing apart from it.

FATE. Necessity controlling all creatural actions of whatever kind, so that these action are predetermined

FATE, ABSOLUTE. Fate is absolute, when all creatures and their actions are so controlled by other creatures and creatural forces that the course of their existence is necessarily determined for them beforehand.

FATE, RELATIVE. The arrangement of secondary (creatural) causes so as to produce the effects foreseen by God and decreed by Him according to the purpose of His providence.

FIDEISM. The theory or attitude that human reason is incapable, of its own native ability, of reaching certitude regarding any truth or at least regarding truth of the philosophic and religious order; it affirms that knowledge of truth consists in an act of faith.

FINITISM. The theory which holds that God is always in a process of becoming.

FORMALISM. The doctrine which holds that the necessity of judgments is due to native a priori mental forms.

FORMALLY CONTAINED PERFECTION. A perfection precontained in the producing cause in such a manner that the actuality of the perfection is present according to its real being in the efficient cause.

FREEDOM. In a wide sense, the absence of external coercion or restraint which hinders an appetency from expressing itself in external action; in a strict sense, the absence of intrinsic necessity or determination in the performance of an act.

FREEDOM OF CONTRADICTION. See Freedom of Exercise.

FREEDOM OF CONTRARIETY. The freedom to choose between a moral good and a moral evil.

FREEDOM OF EXERCISE. The freedom to will or not to will, to act or not to act. Also called freedom of contradiction.

FREEDOM OF SPECIFICATION. The freedom to choose between one act of the will and another act of the will, between one object and another object.

FREEDOM OF THE WILL. The ability of the will, all conditions for action being present, to decide whether to act or not to act, and whether to act in this manner or in that manner.

FUTURIBLES. Conditionally future events; events referring to acts which a man would do through free choice under certain unfulfilled conditions.

GENERATION, SPONTANEOUS. See Abiogenesis.

GNOSTICISM. The doctrine which maintains the origin of numberless 'aeons' through emanation from God.

GOD. God is the ultimate author of all change in the universe; the absolutely necessary being and the sufficient reason for the existence of all contingent beings; extra-mundane, unchanged and unchangeable; the uncaused cause, the ens a se; the intelligent designer of the order present in the universe; pure act and pure spirit, possessing unlimited perfection and life; a substance, absolutely simple, devoid of all potentiality and composition, without accidental determinations of any kind; absolutely unique; personal; omnipotent; omnipresent; the creator of the world; the supreme being, incomprehensible and ineffable.

GOOD. Something suitable for a being.

GOVERNANCE, DIVINE. The execution of the plan of divine providence among existing beings.

IMMENSITY. The intrinsic attribute of God in virtue of which He is necessarily present wherever any being exists which is not God.

IMMUTABILITY. The impossibility of undergoing change.

IMPOSSIBILITY, ABSOLUTE. Impossibility is absolute when something exceeds the capability of every power, because it involves a contradiction in its very concept.

IMPOSSIBILITY, RELATIVE. Impossibility is relative when something exceeds the capability of a particular power, but does not involve a contradiction in itself.

IMPOSSIBLE. Something is said to be 'impossible' when it does not exist and cannot exist. Such a being is either absolutely or relatively impossible.

INFINITE. Without limits or bounds.

INFINITE, ACTUALLY. A being is said to be actually infinite, or to possess actual infinity, if its reality exists without limitation.

INFINITE, POTENTIALLY. A finite being is said to be potentially infinite, or to possess potential infinity, if its reality can be increased without limit.

INTELLECTION. Exercise of the intellect; knowing.

INTELLIGENCE, SIMPLE. By the 'simple intelligence' of God one understands God's knowledge which has as its object those things that are merely possible.

KNOWLEDGE, ABSTRACTIVE, OF GOD. God's knowledge of events and things which never exist.

KNOWLEDGE, ANALOGICAL. Knowledge based on unlike, but related, realities, so that such knowledge is partly the same and partly different. Our knowledge of God

is analogical, since the terms referring to the perfections common to God and creatures are neither absolutely identical nor absolutely equivocal in meaning.

KNOWLEDGE, INTERMEDIATE. With respect to God, intermediate knowledge pertains to conditionally future events dependent on the free will of man. *Scientia media*.

KNOWLEDGE, INTUITIVE, OF GOD. God's knowledge of events and things which actually exist at one time or another.

KNOWLEDGE, PRACTICAL, OF GOD. God's knowledge for the making of something, when the intention of making is present.

KNOWLEDGE, SPECULATIVE, OF GOD. God's knowledge which looks solely to the truth involved in knowing.

KNOWLEDGE, SPECULATIVE-PRACTICAL, OF GOD. God's knowledge required for making something, but the intention to make it being absent.

KNOWLEDGE OF APPROBATION OF GOD. God's knowledge of all that is good.

KNOWLEDGE OF SIMPLE COGNITION IN GOD. God's knowledge of evil.

LAW OF PROBABILITY. Probability, on the basis of chance, follows the ratio of geometrical progression.

LIBERTY. See Freedom.

LIFE. Immanence of action.

LOGICAL DISTINCTION. See Distinction, Mental.

MANICHEISM. The doctrine that there are two supreme principles governing the world, one good and one bad.

MATERIALISM. The philosophic system of thought which considers matter to be the only reality and attempts to explain everything in the universe as the result of the conditions and activities of matter.

MIRACLE. A perceptible event which exceeds the order and power of nature and has God as its author.

MODERNISM. The doctrine which holds that God is present in man through 'vital immanence,' in consequence of which man is emotionally conscious of God's presence and has a 'vital experience' of God dwelling and working in him.

MOLINISM. The doctrine, opposed to bannesianism and its theory of physical premotion, of simultaneous concurrence on the part of God in free actions. The molinists claim that a simultaneous concurrence is required to safeguard the freedom of man's will.

MONISM. The doctrine which seeks to deduce all phenomena from a single principle; specifically, the doctrine which holds that there exists but one fundamental reality or being, either mind (idealism), or matter (materialism), or a neutral reality that is neither mind nor matter but is the substantial ground of both: opposed to dualism and pluralism.

MONOTHEISM. The doctrine that there exists only one divinity; the worship of a single Deity.

MOTION. In reference to the existence of God, motion means the same as 'movement.' See Movement.

MOTUS. See Movement.

MOVEMENT. In Aristotelian and scholastic technical language, movement is 'the act of a being in potency in so far as it is in potency.' Substantial or accidental change; the reception or loss of any reality in the process of change.

NATURAL THEOLOGY. See Theology, Natural.

NATURE. A 'nature' is an essence considered as the ultimate principle of operation in a being.

NECESSARY. Something is said to be 'necessary' when it actually exists and also must exist.

NECESSITY. That state in virtue of which something cannot be otherwise than it is. With regard to existence, a thing is said to be 'necessary' when it must exist and cannot not exist.

NECESSITY, ABSOLUTE. Necessity for a being is absolute when it exists in such a manner that it must exist, independent of any condition; the non-existence of such a being would imply a contradiction.

NECESSITY, HYPOTHETICAL. Necessity for a being is hypothetical when its existence is dependent on a cause, but which, once the condition of its existence is given, must be (cannot not be) a definite reality.

NON-BEING. Whatever does not exist or is incapable of existence.

NON-BEING, ABSOLUTE. The total absence of being, so that it neither actually exists nor is it 'capable of existence'; its very idea involves the impossibility of existing. Absolute nothing.

NON-BEING, RELATIVE. Something which does not now actually exist, either because it has ceased to exist or has

not as yet received existence although it is 'capable of existence.' Such a being, because it is 'capable of existence,' is also by that fact a 'relative being.'

NOTHING, ABSOLUTE. See Non-Being, Absolute.

NUMBER, ACTUALLY INFINITE. An existing number greater than which none can be conceived, so that it is incapable of increase and cannot be exhausted by successive subtractions.

NUMBER, POTENTIALLY INFINITE. A number which is finite and limited in itself, but is capable of being increased indefinitely, without limit.

OBJECT, FORMAL. The formal object of a science is that special aspect of the common (material) object which is distinctive for a particular science. In theodicy it is 'God as known by natural human reason.

OBJECT, MATERIAL. The material object of a science is the general subject-matter which it treats. In theodicy it is 'God.'

OMNIPOTENCE. The capability to produce anything intrinsically possible, i.e., which does not involve a contradiction; the ability to give existence to whatever can receive existence.

OMNIPRESENCE. The relation of God's presence to the beings which actually exist and to the real space which they occupy. Ubiquity.

ONTOLOGISM. The doctrine which holds that God and Divine Ideas are the first object of our intelligence and the intuition of God the first act of our intellectual knowledge.

OPTIMISM. The philosophic doctrine that the present universe is the best of all possible worlds.

ORDER. The arrangement of various items into a system or whole according to some relationship existing or placed between them. It is 'static,' if the items are ordered with regard to their entity; it is 'dynamic,' if the items are ordered with respect to the performance of a unified function.

ORGANISM. Biologically, an organism is an individual constituted to carry on the activities of life by means of parts and organs more or less separate in function but mutually dependent.

PANTHEISM. The theory which holds that God is identical with either a part or the whole of the physical world.

PANTHEISM, EVOLUTIONISTIC. A form of realistic pantheism which maintains the evolution of the Deity into the world.

PANTHEISM, IDEALISTIC TOTAL. The form of total pantheism which holds that all being, including God or the Absolute, is actually thought-being, so that things have existence only in a mind and only in so far as they are thought.

PANTHEISM, IMMANENT, TOTAL. A form of pantheism which applies the principle of evolution to God and maintains that the divine reality has evolved into the present world, so that world-beings are modifications of the divine reality and that God is 'immanent' in the world.

PANTHEISM, PARTIAL. The type of pantheism which maintains that God is not the totality of world-beings, but

only a part of the world.

PANTHEISM, REALISTIC TOTAL. The type of pantheism which holds that the reality which is identified with God is a physical entity (not a mere product of mind or thought).

PANTHEISM, TOTAL. The theory which maintains that all reality is but one, so that God is identified with total reality.

PANTHEISM, TRANSIENT REALISTIC. The form of realistic pantheism which holds that all beings in the world emanate or flow from the divine substance, so that they originate, not by means of God's causal action, but through a transformation of God's substance. Emanationism.

PERFECTION. Any reality or real entity which is present in any kind of being. It may be potential or actual, mixed or simple.

PERFECTION, ABSOLUTE. Perfection which pertains, not to a certain type of being, but to every line of being without restriction.

PERFECTION, ACCIDENTAL. Perfection which does not belong to the essence or nature of a being, but is connected with the essence or nature as a superadded modification or determination.

PERFECTION, ACTUAL. Perfection which exists in reality.

PERFECTION, ESSENTIAL. Perfection referring to the essence or nature of beings.

PERFECTION, EXTENSIVE INFINITE. Possession of all perfections possible.

PERFECTION, INFINITE. Perfection which is actually and absolutely without limit.

PERFECTION, INTENSIVE INFINITE. Possession in the supreme degree of all perfections possible.

PERFECTION, MIXED. Perfection which in its very concept implies limitation or imperfection.

PERFECTION, POTENTIAL. Perfection which does not exist but is capable of being brought into existence.

PERFECTION, PREDICAMENTAL. Perfection representing generic concepts; for example, 'animal,' 'body,' 'plant.'

PERFECTION, RADICAL INFINITE. A being is said to possess radical infinite perfection when it is intrinsically determined in such a manner that it demands both extensive and intensive infinity of perfection.

PERFECTION, RELATIVE. Perfection that pertains to a certain type of being.

PERFECTION, SIMPLE. Perfection which does not include in its concept limitation or imperfection.

PERFECTION, TRANSCENDENTAL. Perfection which is found in, or can be applied to, all beings; for example, 'one,' 'being,' 'good,' 'true.'

PERFECT PANTHEISM. See Pantheism, Total.

PESSIMISM. The philosophic doctrine which contends, at least as far as man is concerned, that there is nothing good in life and in the world.

PHILOSOPHY. The science of beings in their ultimate reasons, causes, and principles, acquired by the aid of human reason.

POLYTHEISM. The philosophic and religious doctrine which maintains that a plurality of deities exists.

POSITIVISM. The theory which holds that man's knowledge cannot reach beyond the phenomenal.

POSSIBILITY, EXTERNAL. A thing is said to possess external possibility when a power exists which can produce it.

POSSIBILITY INTERNAL. A thing is said to possess internal possibility, when it can have or receive existence, without regard to the actual existence of a power which can, as a matter of fact, actually produce It.

POSSIBLE. Something is said to be 'possible' when it does not actually exist but is capable of existence.

POSSIBLE, FOUNDATION OF.. The reason or ultimate ground for internal possibility; the imitability of God's essence.

POSTULATE. A proposition which is either self-evident or which is taken over without proof by one Science from another science because it has been proved by this other science. The postulates of theodicy are the existence of the physical world and the trustworthiness of human reason in its search for facts and truths.

POTENCY. The condition or state of 'being possible'; capable of receiving existence, though not actually existing as yet. It is the aptitude to receive a perfection, determination, or degree of reality.

POTENCY, OPERATIVE. The capacity for doing something.

POTENCY, RECEPTIVE. The capacity for receiving an act.

POTENTIAL. See Potency.

POTENTIALITY. See Potency.

PRAGMATISM. The doctrine, or rather attitude, which places all knowledge and truth in a direct relation to life and action; it judges the value of ideas, judgments, hypotheses, theories, and systems, according to their capacity to satisfy human needs and interests in a social way. Truth is thus 'made,' not 'discovered.'

PRIME MOVER. God, as the ultimate author of change in the universe.

PRINCIPLE OF CAUSALITY. 'Whatever happens or becomes must have a cause for its happening or becoming.'

PRINCIPLE OF CONTRADICTION. 'A thing cannot be and not be the same thing at the same time under the same respect.'

PRINCIPLE OF EFFICIENT CAUSALITY. 'That which begins to exist demands a cause (an efficient cause) for its beginning; that is to say, it demands an existing being to bring it from non-existence to existence.'

PRINCIPLE OF EXCLUDED MIDDLE. 'A thing either is or is not (something).'

PRINCIPLE OF IDENTITY. 'Whatever a thing is, it is'; 'Everything is identical with itself.'

PRINCIPLE OF NON-CONTRADICTION. See Principle of Contradiction.

PRINCIPLE OF SUFFICIENT REASON. 'A thing must have a sufficient reason for its being and existence.'

PRINCIPLES, FIRST. The ultimate, most fundamental principles of thought and being. Such are the Principles of Identity, Contradiction, Excluded Middle, Sufficient Reason, and Causality. 203

PRODUCTION. The positive influence of an efficient cause making a being or perfection pass from non-existence to existence.

PROOF, ONTOLOGICAL. A proof for God's existence, based on the idea of God as the most perfect being.

PROVIDENCE, DIVINE. The plan of the order of things in the world foreordained by God toward an end.

PROVIDENCE, MORAL. The plan of God's providence providing man with the means needed by him to live in conformity with his moral nature.

PROVIDENCE, PARTICULAR. The practical ordering of the individual beings for the achievement of the various ends proper to them.

PROVIDENCE, PHYSICAL. The plan of God's providence providing each creature with the means needed for its physical well-being.

PROVIDENCE, UNIVERSAL. The practical ordering of the universe of things for the attainment of the end proper to the universe as a whole.

SCIENCE. A body of proved truths concerning a general subject-matter, resting on fundamental principles and arranged into a system.

SCIENTIA MEDIA. See Knowledge, Intermediate.

SERIES, FINITE. A series which is limited in the number comprising it, so that it can be counted. A finite series always presupposes a first number.

SERIES, INFINITE. A series without beginning and end; a series consisting of a number of items in such a manner

that no amount of subtraction or division will be able to exhaust it.

SIMPLE COGNITION IN GOD. See Knowledge of Simple Cognition in God.

SIMPLICITY. The absence of composition in the reality of a being.

SIMPLICITY, ABSOLUTE. Simplicity is said to be absolute, when the being excludes all parts of whatever nature, be they real or conceptual. Such a being is not only actually undivided but also potentially indivisible.

SIMPLICITY, RELATIVE. Simplicity is said to be relative when the being in question excludes parts of one kind but has parts of another kind. Such a being is indivisible in one respect but divisible in another.

SPINOZISM. The immanent evolutionistic pantheism propounded by B. Spinoza.

SPONTANEOUS GENERATION. See Abiogenesis.

SUBSTANCE. A being which exists in itself and needs no other being in which it must inhere.

TEMPORAL. Pertaining to time.

THEODICY. The philosophical science of God, or the science of God acquired by means of natural reason. Same as 'natural theology.'

THEOLOGY, DOGMATIC. The science of God acquired by the application of reason and of the reasoning process to truths furnished by supernatural revelation.

THEOLOGY, NATURAL. The philosophical science of God, or the science of God acquired by means of natural reason. Same as 'theodicy.'

THEOLOGY, SUPERNATURAL. See Theology, Dogmatic.

THEOSOPHY. A modern version of Indian pantheism, a form of immanent pantheism.

TIME. The measure of movement according to 'before' and 'after.'

TRADITIONALISM. The theory or attitude which holds that human reason is incapable, of its own native ability, of reaching certitude regarding any truth or at least regarding truth of the philosophical or religious order; it maintains that the supreme criterion of certitude is the authority of revelation as given to man through tradition.

TRANSCENDENTALISM. The name given to Kant's philosophy, which maintained that all human knowledge is conditioned by certain innate a priori forms present in the mind antecedently to all experience. Such innate forms, on the level of reasoning, are 'God,' 'World,' and 'Soul'; we can think these Ideas, but we cannot know them.

UBICATION. Presence in a place. Whereness.

UBICATION, CIRCUMSCRIPTIVE. The presence of an extended corporeal substance, so that it has parts outside parts quantitatively extended in the place which it occupies.

UBICATION, DEFINITIVE. The presence of a spatially unextended substance in such a manner that it can exercise its activity only within certain limits of space.

UBICATION, REPLETIVE. The presence of a spatially unextended ('spiritual') substance in all places and spaces, past, present, and future.

UBIQUITY. See Omnipresence.

UNICITY. Singleness or uniqueness, the absence of plurality.

UNICITY, IMPERFECT. Unicity is imperfect when no other being of the same kind actually exists, but another being of the same kind is possible.

UNICITY, PERFECT. Unicity is perfect when no other being of the same kind actually exists, and another being of the same kind is impossible.

VIRTUALLY CONTAINED PERFECTION. A perfection pre-contained in the actuality of an efficient cause in such a manner that the latter can produce it.

VISION. With respect to God's knowledge, 'vision' pertains to objects which at sometime, either in the past, or present or future, will have existence.

VOLITION. The exercise of the power of the will; willing.

WAY OF AFFIRMATION. The affirmative predication of 'pure perfections' of God.

WAY OF EMINENCE. Affirmatively ascribing to God a 'pure perfection' and then raising the perfection to the highest degree conceivable.

WAY OF NEGATION. Denying of God every sort of imperfection and attributing to Him the corresponding perfections in such a manner that they apply to Him alone.

WHERENESS. See Ubication.

WILL. Rational, intellectual, appetency.

WILL OF GOD. An infinitely perfect intellectual appetency.
